It wasn't like a sudden understanding of "intelligence", nor even like a sudden light in a darkness or half-light. Rather, it was like a deep wave born within me and suddenly surging through me, and in its vast waters bringing me that sense which had eluded me until then: that I was at this moment reuniting with a very dear and precious being, whom I had lost since childhood... .

That moment felt like a **birth**, like a profound renewal. This feeling remained strong throughout that day, and again in the days that followed. Looking back over eight years, that moment still seems to me to be the most creative of all in my life, and an essential turning point in my spiritual adventure. It had certainly been prepared by many other "moments" in the days and months leading up to it. Perhaps the first precursor was that "salutary uprooting", more than ten years earlier, from an institution where I had intended to end my days<sup>40</sup> (\*). These earlier moments seem to me to be the ingredients, or rather the **means** at my disposal, with which I was able to cross this other "threshold" that lay before me unnoticed, at a deeper, more hidden level than others I had crossed. Everything was in place, for a few days or hours, for me to cross it - and I could cross it, just as I could not cross it, day after day for the rest of my life. ...

And with this threshold well and truly crossed, the way was opened to other crossings, to other "awakenings", each of which by its very nature is also a renewal, and to some extent, a "new birth", a re-birth. I've avoided some of them for months, even years, before finally taking the plunge, relieving myself of some nagging illusion that for a lifetime had stood between me and the full flavor of my life and the world around me. And surely, there are some I continue to evade, even as I write these lines. ...

p. 480 □ In the light of reflection over the last few days, it's that moment of reunion with my childhood, believed lost and dead for a long life, marking the end of the "second period" of my spi- ritual itinerary: that of the predominance, in my personal life, of **egotistical mechanisms**, against the creative forces, the forces of knowledge and renewal, which had gone through an almost complete stagnation of forty years. It was also the time of the predominance of a "certain force", of a force of an almost exclusively "virile" nature, in the image of the values in honor in the surrounding world, at the expense of the "masculine".

<sup>39</sup>(\*\*) See "Desire and meditation", n° 39.

<sup>40</sup>(\*) See note n° 42, of the same name.

deep "feminine" aspects and forces of my being, ignored and repressed (with never complete success, thank God!).

The very first intuition about the destructive nature of this force, which had dominated my life as well as my mother's, and that of other women who had been important in my life - this intuition made a brief appearance in these days of intense maturation, thanks no doubt to the re-emergence of yin, "feminine" energy, in my conscious apprehension of things. Contrary to my hasty recollection earlier, this appearance did not take place during meditation on the eve of the reunion, but a few hours afterwards, in a short meditation on the meaning of what had just happened. The intuition is born and takes shape at the very end of the few pages of notes from this meditation. I perceive the destructive nature of this "force" (which today I would call "superyang force", i.e. excessively yang-dominant) first in my mother, then in other women, and then in these final lines:

"As for the 'strength' in myself, it was certainly this that made me the target and object, expected throughout a young life, of the secret hatred and resentment of M., then J., then S. - of a hatred deposited in them long before they knew of my existence, in the distraught days of a childhood deprived of love."

In fact, the word "childhood", in the last line again, which bears witness to one of the most important days of my life, appears for the last time for almost three years! As for the intuition about the nature of the superyang force in me, as provoker of antagonistic reactions, even of hatred and resentment, it tended (it seems to me) to sink a little into oblivion until the very last few days. To be more precise, it remained present only in my perception of certain important relationships in my life (and especially, relationships with women I've loved). On the other hand, she hardly penetrated really p. 481 situations.

<sup>41</sup> (\*), with certain students in particular, as I've had to examine or evoke many times in the course of Harvest and Sowing. Throughout all this reflection, the fact that I myself, by a kind of involuntary "provocation", made my own contribution to the conflict situations I evoked or examined here and there - this fact often remained completely hidden, whereas the protagonist's contribution was quite clear to me. This is, of course, a very common reflex, not to say universal! My reflections over the last few days have defused this reflex and, at the same time, brought it back into focus for me - by bringing me face-to-face with myself - with **a certain** me, at least - at the end of the road (a reflection on yin and yang. . . ).

My brief reflection of four days ago barely scratches the surface of the many aspects of my personality that made the yang imbalance in the "character" I'd been playing since childhood felt; and the crushing effects this imbalance could sometimes have on others. On those in particular where the yang-type strength was still lacking - and first and foremost on my own children. I'm thinking here above all of a certain "mode" of peremptory assurance on which I operated, in all the things (and there were many) about which I had, rightly or wrongly, a way of seeing or feeling, or strong opinions. Of course, the idea would never have occurred to me to impose these ways of seeing on anyone, least of all on my children - and thanks to this absence of any desire for constraint within me (at least on a conscious level), I was unable for most of my life to realize the extent to which these ways of being within me (which seemed spontaneous and natural to me, and whose complex nature I was far from discerning. . . ) - the extent to which they had an impact on my life. ) - to what extent they had the same effect on my children and others as a constraint; or rather, an even more insidious effect: that of arousing or maintaining in others an **insecurity** about the value of their own feelings, ways of seeing, opinions - as though

---

<sup>41</sup>(\*) Or treated as such. ...

these (in the face of my unwavering assurance, even my pained astonishment) didn't even **need to exist**.

I have a feeling that the development of this propensity in me, particularly in relation to my children, could well be quite complex, intertwining intimately with the vicissitudes of my married life. This is not the place to try and follow its mysteries; nor is it the place to make a more or less inventaire  
There were many other aspects of my person that manifested this imbalance, one of which I tried to identify in the previous note: the "deployment of force".

p. 482

We shouldn't think that this imbalance, cultivated over a lifetime, and the multitude of psychological mechanisms through which it manifested itself, disappeared overnight as if by magic. I didn't expect anything like it, not on that day of our reunion, nor in the days and weeks that followed.

(October 10) These were days of melting ice, buoyed by a powerful influx of new energy - days of inner work and wonder, before the new worlds I saw opening up day after day, taking birth in the humble weave of daily minutiae and unfolding under the intense action of eyes eager to see. These were also the days when the first inkling of the richness of this unknown suddenly calling out to me, which I had ignored only the day before, began to dawn on me. I apprehended it through these "bits" that had just made themselves known to me, in the very instant of the reunion, and in the unpredictable and unforeseen journey that had followed it. I felt that this "birth" through which I had just passed was just the **beginning of** something entirely unknown, or rather the **recommencement of** something that had been interrupted, cut off or stifled one day, and then mysteriously started again. To tell the truth, this intense "becoming" had already been in motion again in the preceding months, but at a level where introspective **thinking** had hardly had any part to play. ...

One of the most profound aspects of this new-found becoming, this new-found work, was the gradual restoration of the original balance of "woman" and "man", of yin and yang within me, over the course of days, weeks and years. In a way, I can say that since the moment of my reunion, "childhood" or the state of being a child has remained present, "in power", through a deep and indelible knowledge within me of my own nature, of my essential, indestructible unity, beyond the effects of a certain "division".

which often continues to agitate the surface of my being. The very word "child" or "childhood" to designate the thing, this unity of being, <sup>didn't</sup> appear until years later, around the time I began to become acquainted, at the level of conscious thought, with the dual yin-yang aspect of all things. This was also the moment when the knowledge (or at least, the presentiment) emerged that the state of childhood, the creative state, is that of the perfect balance of yin and yang forces and energies, that of the "marriage" of yin and yang, manifesting itself in a state of creative harmony.

p. 483

It seems to me that, at a certain level, this knowledge of my fundamental unity is present at all times, and that it **acts** at all times. It is also true that this action is more or less sensitive and effective according to the moment, and that it is by no means in the nature of a more or less permanent elimination, or even a wholesale destruction of the egotic forces, of the "boss" therefore - nor even of an elimination of the forces of repression (which form a good part of the "I", if not quite its totality. . . ). These are the forces of surreptitious concealment of the reality that surrounds me and the reality that unfolds within me - the forces silently and obstinately at work to maintain against all odds the tenacious illusions, which without them would immediately collapse under their own weight... . Some of these repressive mechanisms have been identified one by one and have disappeared. I got rid of certain **illusions** that had weighed heavily on me, and I cleared up the few stubborn **doubts** that, over a lifetime, had been relegated (by the care of the

"boss") rotting in garbage-undergrounds, never examined. Their message finally heard, these doubts have disappeared, leaving a peaceful and joyful knowledge. I've also spotted some very powerful mechanisms of repression, deeply rooted in the ego, which I've come to realize (over the last few years) have had a considerable impact on my life, today as never before. They go in the direction of yang imbalance, in the direction of the occultation of certain yin forces and faculties. I don't know if these mechanisms will ever be defused - and I know it's up to me. No doubt they will vanish on the day, and only on the day, when I have entered into the origins of the conflict in my life much more deeply and fully than I have done so far.

For the moment, with my life currently focused on a major mathematical investment, I can safely say that it's not going anywhere!

#### 18.2.2.4. (d) Acceptance (the awakening of yin (2))

**Note** 110 □(October 11) I've been wanting for a day or two to take stock, in a few words, of where p .484 (after eight years) this "gradual restoration of the yin-yang balance" in me.

Perhaps the most important change of all is in a much greater **acceptance** than in the past of who I really am from moment to moment. Another way of putting it is that the mechanisms of repression within me have softened considerably. As I said yesterday, some have disappeared after being discovered and understood, and others, which I had ignored all my life, have become familiar to me in their everyday manifestations. I see them in action, not as enemies I must try to extirpate at all costs, but as part of the multiplicity of facets of my conditioned being, and thus of the richness of the present "given", which faithfully reflects my past history; both the "ancient" history of my conditioning and the roots of division in my being, and the more recent history of my maturation, the work by which I end up unpacking, "eating" and assimilating the initial package bequeathed to me by my parents and their successors. This "acceptance" within me therefore includes not only the impulses and traits of the "child" that I had long ignored and repressed (particularly those reflecting the feminine aspects within me), but also the repressive mechanisms specific to the "boss", i.e. the inveterate mechanisms of "non-acceptance"! Accepting the latter has nothing in common with "cultivating" or fortifying them. On the contrary, it's an indispensable first step towards unravelling them or defusing them to some extent, through the effect of curious and loving attention. The experience of the last eight years has convinced me that, if this attention goes deep enough and to the very root of the repression, the latter can be resolved and disappear, releasing a considerable amount of energy - that which until then had been immobilized to maintain against all odds such and such a set of repressive mechanisms, and the habits of thought and other things that serve to maintain them.

But it wasn't in relation to the inherently "knotted" aspects of myself that this new acceptance of myself first appeared in my life. It came without fanfare, even before the discovery of meditation, and therefore even before the "reunion" that closely followed it. It was in July 1976, during a brief love affair with a young woman, G., perhaps a little more "homely" in her ways than the women I'd loved previously. As fate would have it (?), Les

The material circumstances surrounding these loves were such that I saw myself placed in a typically "feminine" role. I did the housework and prepared the□evening meals, waiting for the spouse to return from a p .485 long and tiring working day: tending a herd of one hundred and fifty goats in the hills, which she also had to milk in the evenings. It just so happened that this unusual role of housewife suited me like a glove. It may seem a small thing, but it clicked. I made the connection with some of my friends.

impulses and desires in my love life, expressing themselves for the first time in certain love poems, where the experience of love appears, without any ambiguity, as "feminine". I understood then, without reflection or "effort", without any hint of reticence or embarrassment, that in my body as well as in my desires, in my feelings and in my spirit, I was a woman, as well as a man - and that there was no conflict of any kind between these two profound realities in my being. In those days, the dominant note was feminine - and I accepted this gratefully, in mute astonishment. When I thought about it, there was a quiet, gentle joy in me.

This joy was self-sufficient, it didn't need to be expressed in words, either to myself or to others. I don't know if I spoke about it to the woman whose lover I was, or perhaps whose lover I was... . Surely, on some level she knew, without my having to say so.

This joy has not faded, it has remained alive to this day. It comes from living knowledge, like the fragrance that accompanies a flower. In some moments or periods of my life, this knowledge, and the joy that is a sign of it, is more present than in others, more strongly active. But I don't think it ever leaves me.

When I have spoken of this experience and knowledge here and there, in the weeks and years that followed, it has always been as if I were communicating something of great value to others, in a moment when I felt open to receive, if only for a few moments, something of this joy within me. I've never felt embarrassed to talk about it, as if it were something a little scabrous (perhaps there would have been such embarrassment at times, however, if the reality and strength of the "man" in me hadn't been above suspicion!) And I remember one occasion when I was really showing off, showing off and winning on both counts - all I needed was to get my period like everyone else and give birth to a kid that dry.

My new feminine identity, superimposed on my masculine one, had an immediate renewing effect on my love life. It aroused a very strong echo from the women I subsequently fell in love with, by awakening masculine impulses in the lover, which had been carefully repressed throughout her life, and had hitherto only found expression "on the sly", as a kind of burr, unworthy of appearing in the conscious experience of love.

p. 486

The unconscious experience of love is rich in archetypal impulses, one of the most powerful of which is that of returning to the Mother, to the original bosom. Such an archetype is present in the deepest layers of the amorous experience, in both men and women. In women, resistance to the satisfaction of such an impulse in the couple's experience of love is even stronger than in men, where it comes up against a key taboo, and not two as in men. In both cases, the satisfaction of these impulses in the shared experience often remains more or less symbolic and, above all, hidden from awareness. When such an archetype and this experience rise up from the deepest layers to the light of day, in the field of conscious awareness, this experience is immediately transformed, acquiring a new dimension. At the same time, considerable energies previously compressed by repressive mechanisms or bound by repressive tasks are released. The effect is an immediate **liberation of** the erotic impulse, manifesting itself in a renewed intensity and a new fullness in the experience of love.

From the foregoing, it's already clear that this new acceptance of myself has gone hand in hand with an acceptance of others. The two are inextricably linked. Of course, I'm talking here about "acceptance" in the full sense of the word, which in no way means a (often bittersweet) **tolerance** of such and such "foibles" or "faults", felt as a sadly unavoidable evil for which one is obliged to "make do". What I sense in such an attitude is resignation, not to say abdication,

and certainly not a source of joy, nor a surge of awareness of something worth knowing: the presumed, unknown depth behind the flat surface of such "faults" or "shortcomings" that we're willing to tolerate... ..

The fact that this is a joyful, creative acceptance in no way implies that this acceptance is total. An attentive reader will already have noticed this for themselves

more than once in the course of Harvest and Sowing, as I happened to en□rendre in passing,

p. 487

(But when it comes to myself, this mechanism more often than not has the effect of not even taking note of the unpleasant thing in question. . . )

The acceptance I'm talking about is rooted in an **interest** in the thing being "accepted", whether in oneself or in others. Whereas acceptance is in itself a typically "yin" inner disposition, this connotation of "interest" that it takes on in me is of a "yang" nature - it's the "yang in the yin", in the delicate Chinese dialectic of the infinite interweaving of yin and yang. ... I was about to venture that there was a pure and simple identity between acceptance (the real thing!) and this interest, this curiosity. And yet, as I reflect a little on the matter, I realize that there's another way of accepting, one that's more totally yin in nature than the one I'm used to. It's like **welcoming** the accepted thing, rather than rushing towards it to probe it. (This nuance of welcome seems to me to be the "**yin** within the yin", here we go!) The impulse of interest, and the attitude of welcome, can both form the keynote of acceptance of others or of oneself. What both have in common is **sympathy**. This, too, is one of the forms of love. If there is any profound identity to be identified here, it would be the observation that **acceptance is a form of love**. Love of self, love of other, both indissolubly linked. ...

Except in rare moments, my interest is more intensely involved in my own person than in that of others. It's this passionate interest in myself that has animated the long periods of meditation over the last eight years. It's true that self-knowledge is at the heart of knowledge of others and of the world, and not the other way round - and I feel that it's towards the heart of things, towards what's most essential, that my new passion, meditation, has carried me and still does. My interest in others has become more fragmented and reluctant over the years, as has the acceptance that comes with it. One of the ways it has manifested itself concretely is in a lesser propensity to talk when I'm in company, and in an attitude of listening. Most of In my life, this ability to listen had been almost entirely lacking. Even after the great turning point of the reunion, I still had to realize quite often □ that I had spoken out of turn, for lack of listening etp . 488 of discernment, before this inveterate propensity began to pass me by. If it has become much less invasive, and has even almost disappeared, it's in no way the result of some self-imposed discipline (such as: you won't open your mouth unless. . . ). It's simply because I've lost the urge to talk, at times when I feel that it's useless, that it doesn't contribute anything to others or to me - at least nothing of any value to me. If I can now often feel such things, it's undoubtedly because I've become more attentive. This too has not come about as a result of discipline ("you'll be careful to open your ears wide when..."), but I can't say how. In any case, I feel better for it, and life is that much more interesting (and, above all, less noisy!). And other people feel better too...

I think I really started to talk less, as soon as this

It's the force within me that drives me to always want to rectify what appear to me (rightly or wrongly) to be "errors" in others - as if it wasn't enough for me to detect and rectify my own! It's the same force that drove me (and sometimes still drives me) to want to convince others of this or that, instead of simply looking at why so-and-so prefers to stubbornly believe this rather than that (which seems like "that" to me, and which I'd like to convince him of!); or why I'm so keen for him to believe that, rather than this. This almost universal force within us, which constantly pushes us to seek in the approval of others (and even just one. . . ) the confirmation of the validity of what we hold to be true - this force deeply rooted in the ego has finally, I believe, let go of me. It was a great relief, the end of a tremendous dispersion of energy. It was when I finally realized, two years ago, the extent of this force in my life, its nature, and the extraordinary dispersal of energy it represented, that it was defused - and I found myself lightened by "a hundred tons of weight". To be aware, without reluctance, of the echoes that others reflect back to us, without being bound by any desire or "need" (however hidden) for approval or confirmation - that's really what it means to be "free of him". It's such a need or desire that really constitutes the discreet, yet unfailingly solid "hook" by which conflict can "hang" in us, and by which we are (whether we like it or recognize it, or not) under the dependence of another, of his good will - by which in short he "holds" us, and (minutely) us maneuvers as it pleases...

p. 489

Logically, accepting others should also mean accepting their way of seeing things, whether or not they seem wrong to us, and even when it comes to their way of seeing our own precious selves (including our own ways of seeing. . . ). But that's where the problem lies - it's the crux of our acceptance of others, not the acceptance of more or less embarrassing common "faults" that don't directly involve ourselves. Quite often, moreover, if we reject such "faults" in others, it's above all because they make us feel directly implicated, by the very fact of being confronted with ways of being that seem to us (rightly or wrongly still) to be the opposite of our own. In other words, it's an **insecurity** within us, manifested in reactions (more or less overt or hidden) of vanity, which is the great obstacle, opposing our acceptance of others. But this deep-rooted insecurity, compensated for by the movements of vanity, seems to me to be indissolubly linked to the non-acceptance of ourselves, like an inseparable shadow.

So it's full self-acceptance that appears here as the key that opens us up to acceptance of others. And this link, which has just appeared to me here, links up with another profound link, which I've known for a long time, perhaps for as long as I can remember: that self-love is the heart, peaceful and strong, of love for others.

## 18.2.3. The couple

### 18.2.3.1. (a) The dynamics of things (yin- yang harmony)

**Note** 111 (October 13) Yesterday I didn't continue writing the notes. Instead, I amused myself by reviewing a number of yin-yang "couples". Starting with the ones that popped into my head, a bit luckily, I then got into the game, and ended with a sort of "census" of all the ones I could get my hands on. I'd started because I figured that a lot of what I'd written lately was likely to go entirely "over the head" of a reader who wasn't already at least a little familiar with the double yin-yang aspect of things. Perhaps it wouldn't be out of place to take the trouble to give at least a few striking examples of such couples, in addition to those that had crept in by the tape in recent days. Then, driven by the little devil (or angel, I don't know. . . ) of

p. 490

the systematics within me, I ended up digging out my old thoughts on the subject from five years ago. Over the course of a week or two, I had "collected" a hundred or two of these suggestive couples, which had then been assembled by affinity into some twenty groups. As this reflection took place on the bangs of the famous "poetic work" I was writing, I couldn't help arranging these groups as best I could, by affinities and filiations of meaning from one group to the next. Last night, taking a step back, and without a poetic straitjacket around my neck, I came up with eighteen groups (instead of twenty), by grouping them perhaps a little more rigorously. I suspect, moreover, that there must be many more groups, perhaps even an unlimited number, corresponding to modes of apprehending reality that I haven't thought of in the course of the work (nor, perhaps, ever yet).

As for the eighteen groups I have actually identified, I have endeavored to assemble them into a diagram (or "graph") following the main affinities linking them to one another. Some of these links only came to my attention in the course of drawing successive drafts of the diagram. The work here was really very close to the familiar mathematical task of graphically capturing, as strikingly as possible, a more or less complex set of relationships (given, for example, by "applications", represented by arrows) between a number of "sets" or "categories", appearing as the "vertices" of the "diagram" we were endeavouring to construct. Here too, essentially aesthetic requirements, notably symmetry and structural transparency, frequently lead us to introduce (and if necessary, discover or even invent) "arrows" or links that we hadn't thought of at the outset, and sometimes even new "vertices". In any case, after five or six successive drafts, I ended up with a vaguely Christmas-tree-shaped diagram that satisfied me for the time being - especially as it was getting prohibitively late!

I went to bed happy, feeling that I hadn't wasted my time, even if my notes hadn't progressed a hair<sup>42</sup> (\*). But I was back in contact with some decidedly juicy

f - every one of thesep

each of these couples has something delicate and important to tell me about the nature of this world in which I live, and often about my own nature. I've rediscovered with renewed strength a feeling that was already present five years ago: that the delicate interplay of yin and yang, of the "feminine" and the "male" in all things, is an incomparable thread leading to an understanding of the world and of oneself. It leads us straight to the essential questions. Often, too, the very "yoga" of yin and yang - I mean, the very act of paying attention to the aspect of things and events that is expressed in terms of yin-yang balance and imbalance - provides a first key to a better understanding of these questions, and to an answer.

I apologize if, for the last page or two, I have given some readers the impression that I'm talking about the sex of angels, when they wouldn't even really see what these famous yin-yang "couples" I'm talking about are, let alone these "groups" into which some of them come together, which groups are finally supposed to assemble into a "diagram" (maths is useful, after all!). I should give at least one of these groups here - and I feel like taking the one I spontaneously started with yesterday, the one that ended up appearing in the course of reflection as the "primitive" group(\*), from which all the others seem to gradually emerge, through some sort of successive "filiations" (continuing on my famous diagram of eight "generations". . . ). Here's a list of the "couples" I've identified that make up this primitive group (which we could call by the first of these couples, "the **action - inaction** group").

<sup>42</sup>(\*) In compensation, I could apply for a patent on the invention of a new poetic form, namely the "non-linear" or "diagrammatic" poem.

## 2. A walk through a work or the Child and Mother

- Action-inaction
- activity-passivity
- sleep-wake
- subject-object
- generate-design<sup>43</sup> (\*)
- execution-design<sup>43</sup> (\*)
- dynamism-balance
- élan-assise
- perseverance
- enthusiasm-patience
- passion-serenity
- tenacity-detachment.

p. 492

I'd like to add the following two couples, among a dozen or so "latecomers" who came to me again this morning, following on from my thoughts yesterday:

- know-how
- explain-comprehend.

Needless to say, in these couples, it's the term "yang" or "masculine" that is put first, following the usage of our patriarchal society, where the man gives the name to the couple? On the other hand, while traditional Chinese society is considerably more patriarchal than our own, when we follow Chinese usage to speak of the relationship between yin and yang, we always put yin ("feminine") first, for example when speaking of "yin-yang balance" (instead of yang-yin). The meaning of this usage surely lies in the archetypal intuition that it is yang that is born of yin, which is the "most primitive" principle of the two, and not the other way round... ..

This is not the place to comment on any of these couples. For the reader who doesn't "feel" anything when he sees them, it would in any case be wasted effort; but for the reader who feels challenged by them, who senses (albeit obscurely) that each of them has something to say to him about the world and about himself - about balance and imbalance, about the internal dynamics of beings and things... . can dispense with detailed commentary, and take this challenge as a starting point for his or her own reflection.

### 18.2.3.2. (b) Enemy spouses (yang buries yin (3))

**Note** 111 There's just one point I'd like to stress here, common to all yin-yang "couples" without exception. It is also the most crucial thing of all, it seems to me, for an understanding of the nature of the relationship between yin and yang, and hence of the nature of each of these two principles (or energies, or aspects, or forces. . . ) in the Universe. It's this: each of the two terms of one of these couples, such action-inaction, **in the absence<sup>44</sup> (\*) of the other term**, constitutes a state of serious imbalance, and at the limit

p. 493

<sup>43</sup>(\*) (November 6) In fact, there's an even more primitive group, which can be called the "**father-mother**" group. On this "omission", see the note "Our Mother Death - or the Act and the Taboo" (n° 113). The "engendering-conceiving" and "execution-conceiving" pairs, which I've included below in the (so-called "primitive") action-inaction group, fit in visibly more naturally in the "mother group" formed around the "father-mother" pair.

<sup>44</sup>(\*) (October 16) In fact, this "absence" is never total, it seems to me - in no thing is yin or yang present in a pure state, without the simultaneous presence of its complementary, however infinitesimal. The "imbalance" I'm talking about is therefore characterized, not by the total absence of one of the two complementary terms (something never achieved), but by a state of excessive **weakness** of that term. Another type of imbalance, or morbidity, occurs when **both** terms are "absent", or more precisely, present but very weakly. Thus, in the case of the "action-inaction" couple, a state of **agitation**, which doesn't "act" as such (except to perpetuate itself, to maintain confusion), while dispersing energy,

(when the "absence" in question is almost complete, and prolonged) a state that leads to the destruction of the thing (or being) in which this imbalance takes place, and even of himself and those around him.

Thus, a state of uninterrupted **action**, which does not alternate with sufficient periods of **inaction**, of rest, leads to exhaustion, illness and (ultimately) death - something which has been most topical lately, for me!<sup>45</sup> (\*\*) But conversely, a state of excessive inaction leads to a weakening and sclerosis of the body's or psyche's capacities and functions (depending on the case), and ultimately, to destruction. In the case of my "incident-disease", moreover, I have a simultaneous example of **both** imbalances: excessive action of the mind, inaction of the body (and sufficient rest for neither. . . ).

This "explanation", in this case of the "philosophy" of yin and yang imbalance, remains superficial, in the sense that it does not touch upon an inveterate cultural bias, valuing the term yang, action, in **opposition** to the term yin, inaction. Inaction is seen as a "negative" thing, not productive or interesting from any point of view, accepted at best as a stop-gap measure, which, alas, is imposed even on the best will in the world, since it is necessary to rest from time to time in order to continue to invest oneself in action (on pain, as I have just explained, of overwork and God knows what else. . . ). In short, inaction is seen as the humble handmaiden of action - indispensable, alas, but otherwise unworthy of attention or esteem.

□ Bien entendu, une telle valorisation "officielle" de l'action au détriment de l'inaction, a a immédiatement comme p. 494

The consequence is to set in motion resistance mechanisms (which often remain hidden or at least very blurred), expressing themselves through an **opposite** valorisation: action, as a result, appears as something imposed by the hard necessities of life, like **work** in short, boring as can be, in the office or the factory or even in the fields, and exhausting in any case, even if it's not too boring. The real raison d'être of action is to earn a crust and make a living (that's the essential), and beyond that and above all, to have fun (during your working life), and a nice retirement and pleasant permanent leisure activities later on, when you're freed from the regrettable obligation of "work". This time, it's inaction (aka "leisure") that's more or less consciously valued, and it's action that's its humble servant. There is thus **a reversal of roles**, but always with the same imbalance: that which consists in **the antagonism** established by the interested party (under the pressure of cultural conditioning) between two essential aspects or poles of his life; an antagonism which is expressed and perpetuated by a state of despotic preponderance of one of its aspects, and servitude of the other.

It seems to me that, more often than not, the two attitudes and values overlap in the same person, one dominating the pavement at the conscious level, the other at the unconscious level. The superimposition of these two opposing imbalances obviously doesn't produce balance! Balance, on the other hand, flows naturally from an understanding of the true nature of action and inaction (even when such an understanding remains purely "instinctive", manifesting itself directly in balanced behavior, and in no way in verbalized "knowledge"). **In action in the full sense of the word, there is also inaction - in the very moment**, I mean, and not just "after", because you have to rest after action! This "inaction" within the "action", the "yin within the yang", is like a deep calm that serves as a foundation for a movement that would take place on the surface. It is manifested, for example, by the impression of perfect relaxation that emanates from a feline in motion, whether it's the first alley cat to come along, or a lioness with a powerful build... .

And **in true inaction**, even total **inaction**, **there is action**. So **sleep** is rich in its dreams that speak to us about ourselves, through which we live <sup>another</sup> □ more intense and delicate **life**, p. 495

---

can undoubtedly be seen as such a "default" imbalance (of yin and yang).

<sup>45</sup>(\*\*) On this subject, see the first two notes (n° 98, 99) of Cortège XI, "Le défunt (toujours pas décédé. . . )".

that we're often too sleepy or too pusillanimous to live in the waking life. And it's enough to contemplate a sleeping baby, or just to be roused from a deep sleep, to feel that even without dreams, truly good sleep is **work** in its own way: something that absorbs us completely, "replenishing" in short, an energy that has been dispersed and that we come to **replenish at** its source... . Once again, this is the "yang in the wine", without which yin itself would be destructive.

Similar considerations could surely be developed for **waking** inaction, outside sleep time. All we have to do is observe carefully, on the spot, any state we perceive as "inaction". You'll realize that in inaction, there is action, even the sterile cackling of a thought that continues to go round in circles, even though it has stopped working. But in truth, it's a misnomer to call this purely mechanical movement "action", a movement that continues purely because of inertia - because of the inability to stop the machine! And it's certainly not this inner agitation that will bring yin-yang harmony to "inaction", making it beneficial. On the other hand, this can be the case with various activities designed to fill leisure time (when these are nonetheless experienced as a state of inaction). But even in the state of complete rest of a convalescent state, let's say, there can be action, otherwise this rest or "inaction" becomes **sluggishness**, certainly not conducive to convalescence (i.e. the restoration of a disturbed equilibrium!). For example, this state of rest can give rise to attention to one's own body and its immediate surroundings (which are like a second skin. . . ), an awareness or even a communion, which in itself has an authentic character of "action"; for there can be no doubt that **learning** is indeed an **act** (since it has an irrefutable **effect**: the appearance of knowledge. . . ).

Looking at the fourteen couples I've included in the action-inaction group (and I'm sure we could find many more that fit in naturally), we can see that for all but perhaps one, it's the first term, "masculine", that is invested with prestige, with "value", according to the attitudes-reflexes.

and inculcated since childhood. It's the sign of the same inveterate imbalance in our culture'□the imbalance marked by the exclusive valorization of yang, to which I happened

p. 496

<sup>46</sup> (\*). The same can be said for almost all the yin-yang pairs I've come across - a very striking fact indeed, which I'd never before taken the time to verify in such detail.

Among the pairs written earlier, the only one that seems to me to be an exception is the **passion-serenity** pair, given that in common usage, the word "passion" is often associated with the image of unleashing, violence, or if not **laissez-aller**, annoyingly bordering on the cloud of associations surrounding a word like "**turpitude**". As if by chance, sloppiness and turpitude refer to states of psychic imbalance characterized by an excessive **yin**, feminine preponderance! And symmetrically, following the same push-button mechanisms (which reveal our current conditioning, and by no means the nature of something like "serenity"), the word "serenity" is associated (as opposed to "passion") with the image of **self-control** - a quality, therefore, that is appropriately **masculine** in essence. (In fact, the yin counterpart of "control" is by no means "passion", but "abandonment").

What's happening here, then, is that as a result of a general confusion in people's minds about the nature of certain things, expressed by an equal confusion in the use of certain words, supposed to designate them, there is a confusion of the yang-yin couple "passion-serenity" with the whole of the two notions

release - control,

whose terms are yin-yang (but not a "couple", as the two terms have no desire to marry!). It seems to me, then, that the so-called "exception" to the rule (of valuing

---

<sup>46</sup>(\*) See note "Yang buries yin (1) - or muscle and guts", n° 106.

yang) is, on the contrary, a particularly interesting confirmation! And I wouldn't be surprised if the same were true of the other few examples I've come across, where in a yang-yin pairing, it's the yin term that seems to be valued.

In fact, I'm not at all sure that this distortion in worldview that I see in the civilisation, stemming from this systematic bias in favour of the masculine as opposed to the feminine.

- that this distortion, this imbalance are so much less in the Chinese tradition, □ or even in the p . 497

Chinese world (or, more generally, the "Oriental" world) today. There's no sign of this in everyday life, either through my Oriental friends or through the echoes I've heard of tradition and life in China or other Far Eastern countries - quite the contrary. Rather, it seems to me that a fine perception of yin-yang dynamism has been confined almost exclusively to the **practice of certain arts** - such as calligraphy, poetry, the culinary arts and, of course, the medical arts<sup>47</sup> (\*).

It is the latter in particular, under the name of "Chinese medicine" and thanks to the spectacular successes of acupuncture, that over the past twenty years has come to be regarded as a prestigious discipline. Yet many people are still unaware that, in Chinese medicine, the alpha and omega of understanding the body, the circulation of energy in the body and its disturbances (which constitute the morbid states we call "illnesses"), lies precisely in a very fine dialectic of yin and yang. The fact that this dialectic "works", since "Chinese medicine" based on it is effective (including in many cases that escape the means of the Western panoply), can be seen as a kind of "proof" of the reality of yin and yang "principles" or "aspects" or "modes" (of apprehension, or existence) - that they are not pure speculations out of the hats of certain philosophers and other poets (not to say fumists).

We may well ask what is the meaning of such proof, and indeed of any "proof" whatsoever of the validity of such and such a worldview. Even supposing that the proof was convincing (i.e., that the interested party was willing to allow himself to be convinced), and even and above all, that the vision in question was valid. is profound and therefore beneficial - the best proof in the world is powerless to **communicate**

□ **une vision**, let alone a vision of the world. It does you good to be "convinced" mordicus p . 498

of a vision that remains foreign, misunderstood. In fact, it doesn't even make sense - or more precisely, the true meaning of his "conviction" is no more understood by the interested party than the vision he pretends to incorporate into his heavy cultural baggage.

When the vision is understood and assimilated, the very question of "proof" seems strangely preposterous. - a bit like proving that the sky is blue when you can see it's blue, or that the scent of a flower you love is good... .

### 18.2.3.3. (c) The half and the whole - or the crack

**Note 112** (October 17) My first thoughts on the dual aspect of "feminine" and "masculine" came from a reflection on myself. It was around the beginning of 1979, at a time when I still didn't know the Chinese words "masculine" and "feminine".

---

<sup>47</sup>(\*) (October 21) I've left out the **divinatory art** of the **I Ching** or "Book of Changes", which today enjoys great popularity in certain circles in both Europe and America. The 64 "hexagrams" that constitute the basic "words" of the divinatory language of the I Ching are none other than the 2, <sup>6</sup> possible combinations of sequences of six yin and yang "signs", from pure yin (six repetitions of yin) to pure yang (six repetitions of yang). There seems to be a kind of fine alchemy of yin and yang combinations, which (it seems) had fascinated Jung. The interest of this alchemy (as a "collection of archetypes" in particular) seems to me a priori independent of its use in divinatory art, and of the credit one is willing to give to such use.

"yin" and "yang", and the existence of a kind of subtle "philosophy" of the incessant interplay of yin and yang, in the Chinese cultural tradition. I learned about this towards the end of the same year, I believe, from my daughter and especially from my son-in-law Ahmed, who was just beginning to take an interest in Chinese medicine, which he latched onto strongly in the years that followed. Most of what he told me overlapped and confirmed the vision I'd arrived at, which came as no surprise. If there was any surprise, it was rather in the few cases of "couples" where the "natural" yin-yang role seemed to me to be reversed, in the Chinese tradition. My reflex (strongly "yang" in this case!) had been a skin-deep conviction that this "reversal" must be due to a cultural distortion, without actually looking too closely<sup>48</sup> (\*) - it was at one point where my past games on the feminine-masculine seemed far away, while I was engaged in an otherwise more personal meditation on my parents' lives and my childhood. It was months

p. 499

or years later, I think, that, through a certain amount of cross-checking, I realized that in some cases my apprehension of the yin and yang roles in such and such "couples" had remained a tad superficial; that I had hastily lumped together situations of a different nature that Chinese yin-yang dialectics were careful to distinguish (112'). Now, I realize that my apprehension of yin and yang is still relatively crude and static, especially when compared to the finesse required for the practice of certain traditional Chinese arts such as medicine (also closely linked to dietetics and the culinary arts), where this apprehension ends up becoming like second nature.

More than once, I've had the impression that among practitioners of these arts, whether Eastern or European, this finesse of apprehension remains fragmentary, in the sense that it remains, to a very large extent, carefully confined to the practice of the art. In everyday life, it acts more like ordinary "knowledge", simply superimposed on the "knowledge" of cultural (and other) conditioning, and remaining more or less a dead letter vis-à-vis the latter. To put it another way, I've had the impression that the vision of the world and of oneself, and the mechanisms of repression in the perception of reality, are in no way different in these "well-informed" people than in ordinary mortals.

This impression overlaps with another, which I had while perusing a couple of texts, written by Europeans supposedly "in the know", who: rest to give an overview of the traditional Chinese philosophy of yin and yang. (One of the authors is a well-known French orientalist, whose name now escapes me). The thing that struck me was that in these texts, yin and yang are presented as "**opposing**" (or "**contrary**") or even **antagonistic** principles (the latter term recurs several times in one of these texts), rather than **complementary**. This "opposition" or "antagonism" would have its typical expression in that which would take place between man and woman within human society, and within the couple instituted by society.

Antagonism between husband and wife is a reality in both East and West. It is deeply rooted in culture, so much so that it can sometimes appear as one of the (sometimes confusing!) aspects of the human condition, or even as the root of conflict in man or in human society. The reality of this antagonism is incontrovertible, and it certainly goes beyond the common clichés that try to exorcise it 500% as best they can. This "social" reality is the product of conditioning.

---

<sup>48</sup>(\*) This reaction of peremptory assurance towards a thousand-year-old tradition, which could have encouraged me to be more cautious, is the same one that, as a child, led me to reject the formula (quite complicated, my goodness!)  $\pi = 3, 14 \dots$  taught by books, in favor of  $\pi = 3$ , which I had convinced myself by my own means. (See the note "Squaring the circle", n° 69.) It's true that with this story of yin and yang, I'd had ample opportunity to realize the extent to which the apprehension of the nature of the "feminine" and the "masculine", and of their interrelationships, is distorted by inveterate cultural distortions of considerable force. What I didn't realize, however, was the extent to which a precise and delicate apprehension of these relationships was also essential in the practice of certain traditional Chinese arts, and pushed to a degree of great finesse.

It's an immemorial reality, which very early on takes root in and structures the developing "I". And yet, beyond this reality, there is a deeper reality, coming from much further back, which is decisive in the love drive itself. It's the reality of a profound, essential **complementarity** between the sexes, where there's no room for any kind of "antagonism". It's also the reality that is clearly evident in all living species, with the sole exception of our own, where it is largely obscured by cultural antagonism, and thus by a state of **division** specific to man and human society.

The common romantic clichés, such as "Nous Deux", which dominate much of literature and the media, make a mockery of "complementarity", while casting a modest veil over the troubling male-female antagonistic aspect, or (at best) treating it as a kind of spicy accident, welcome to spice up a meal that's otherwise a little too bland or syrupy. As soon as you get beyond these reassuring clichés, you're immediately confronted with the reality of this male-female antagonism - a reality that's apparently universal, and, what's more, tough as nails, tough as weeds! But to start from this omnipresent and irrefutable reality, to institute a kind of cosmic antagonism of yin and yang, of "feminine" and "masculine", is to project onto the entire Universe the state of tearing apart, of profound division of human society and the individual, a disease therefore peculiar to our species. It's also perpetuating our own ignorance of **another** reality within ourselves (joining this cosmic reality of complementary harmony), a reality just as tenacious (or, to put it better, indestructible), but more hidden. This reality runs counter to the conditioning that tacitly establishes a de facto antagonism between woman and man, wife and husband, as well as between that in ourselves which is "woman" and that which is "man".

To tell the truth, this **dualistic** or **warlike** vision of the Universe, where one aspect of things is at constant war with an equally essential "symmetrical" aspect - this vision is in no way the fruit of **reflection**, which would "start" (as I just wrote) from the reality of conflict in the human couple and in human society, and then "deduce" (or "institute", as I wrote more aptly) it in the entire Cosmos. It's no more, no less, than the faithful, automatic expression of cultural conditioning, and it's in line with one of the 501 essential functions of this conditioning: **the maintenance of conflict, of division in the very person**, visibly, the maintenance of this instituted antagonism between "woman" and "man" in me would be impossible, or rather, this antagonism would already be resolved, **as soon as** I took the time to contemplate the Universe with the eyes I received at birth, and where I note that everywhere, except (apparently . . .) in myself and among my fellow human beings, the "feminine" and the "masculine" are your indissoluble complements; that it is from their marriage and union that harmony, creative force and living beauty are born in all living and "dead" things of Creation. On the other hand, if I claim to "see" "oppositions" and "antagonisms" everywhere in the Universe where they don't exist (and even though in doing so I'd be following a venerable tradition that goes back thousands of years), I wouldn't be using my eyes at all, but rather confining myself to **repeating** (like everyone else) what has been repeated from generation to generation since perhaps the dawn of time ; and, in any case, to obey the silent, imperative injunction of cultural consensus - the very injunction that has firmly established within me a division, a conflict that I would claim to rationalize (and thereby perpetuate) as a "cosmic necessity".

There's certainly a lot to be said about antagonism in couples, and more generally about female-male antagonism - and I trust my peers that much has been written on the subject, including some relevant stuff. This is not the place to dwell on this most interesting of themes, particularly on the particular form this antagonism takes in our patriarchal society. It seems to me that among those who have

Clearly, many hold the structure of society, reflecting and embodying the preponderance of men over women, to be responsible for this antagonism. They're probably right - and I suspect that in a society with a pronounced matriarchal tendency, we must find a similar antagonism, manifesting itself more or less symmetrically. What I would like to add, however, is that this causality appears to me to be **indirect**, that it seems to be exercised through the intermediary of a more hidden causality, touched upon in today's reflection. This more hidden and more essential cause of division in the couple is the state of division **within the person**, both woman and man, with regard to his or her own impulses (and in particular those of sex) and faculties. I see this as the real root of the antagonism between man and woman, as well as their **mutual spiritual dependence**,

p. 502

□ I mean the **lack of inner autonomy** of both.

This division within ourselves consists in the intimate and secret conviction, in both of us, that we are only **half**. One of the signs of this conviction is this diffuse and insidious feeling, never examined, of **cracking**, of **mutilation** perhaps, from which only the partner of the other sex could deliver us, temporarily at least. Behind the circumstantial airs of "macho" or "Circe" (and many others), everyone, men and women alike, find themselves in the position of a **beggar** vis-à-vis their potential or actual partner, of one who expects an ephemeral deliverance from the other's (more or less) goodwill, which he hopes will be complete, but which always turns out to be lame, from his pitiful state as a cracked, not to say broken, pot - **half a pot**, in short, looking for another half to glue him back together as best he can (and rather badly than well, as you might guess). . . ).

This feeling of fracture, or rather, this **ignorance** of our true nature, of our fundamental **unity** beyond the physiological specificity linked to our sex - this deep division within us seems to me to be the product of social conditioning alone. There's no trace of it, at least in the first days and months of infancy. This conditioning is by no means reduced to valuing the "masculine" to the detriment of the "feminine", or vice versa. After all, if I feel, accept and am accepted as both "male" **and** "female", with a "background note" that can vary from one facet of my person to another, and which is by no means limited to the dominant (albeit very important) genitalia - then it doesn't really matter whether it's the "masculine" or the "feminine" that is valued around me. At the level of my sexual drive, my personal "valorization" would in any case tend to gravitate towards the sex opposite to my own (sorry, complementary I meant), without feeling inferior (any more than superior) in front of this being **different** in body, towards whom I'm drawn by a deep and imperious drive. Moreover, whether it's a question of gender or any other kind of value, the importance of the "value" or prestige attributed by social consensus (to oneself or to others) is relatively secondary, not to say minimal, in a person who is not (or not very much) affected by this feeling of "fissure" I'm talking about - in a person, therefore, in whom lives this spontaneous **self-confidence** that is not, in fact, a "flaw".

It's a manifestation of an intact knowledge of one's own nature.

p. 503

□ A sign, among others, that the "crack" or division<sup>49</sup> (\*) in the person is not only The product of a In other words, it's the one who's supposed to be the "beneficiary" of this consensus that claims to "enhance" him, while (in a certain sense) it's breaking the backs of both him and his partner. We can see that this division is all the more acute, all the more violent, the stronger and more ruthless the repression of one sex for the "benefit" of the other. It could be said that the principle followed by "Society" (the source and instrument of repression) in establishing

---

<sup>49</sup>(\*) I'll refrain here from using the rather fashionable expression "castration", a term of great violence (superyang for that matter!), which has the added disadvantage of suggesting the image of an irremediable, irreversible mutilation, and thereby stimulating reactions of dismay, revolt or resignation likely to reinforce a state of blockage, rather than encouraging its evolution in the direction of a gradual resolution.

of repressive mechanisms is: "**divide and conquer**"! But this "division", created by the Consensus to break and enslave both men and women, is played out on **two levels at once**. The most visible picture is that of **division within the couple**, achieved<sup>50</sup> (\*\*) by instituting a more or less tyrannical preponderance of one of the sexes over the other - of man over woman, or vice versa. One is supposed to reign over the other - and both end up as slaves<sup>51</sup> (\*\*\*). Because when the wife or husband is scorned, it's **both** of them who are scorned - sometimes by others, but more profoundly and above all, **by themselves**.

And here we come to the second, more hidden aspect of the game of division. This is the **division within the person himself**, the hidden springboard of the couple's division. It is accentuated by the latter, without however being reduced to it, and it is by no means produced solely by the valorization of one sex to the detriment of the other. Rather, it's the product of a silent, incessant **constraint**, exerted on us by those around us from our earliest years.

young years. This constraint pushes us to deny, on pain of rejection, an entire "side" of our identity.

our person (the □ "yin" side, or the "yang" side<sup>52</sup> (\*)), dismissed as ridiculous or unseemly, and in p. 504 in any case, as unacceptable.

#### 18.2.3.4. (d) Archetype knowledge and conditioning

**Note 112** <sup>53</sup> (\*\*) Thus, in the **matrix-embryo** and **vagina-penis** pairs, the distribution of yin-yang roles is unmistakable, and the yin term surrounds and contains the yang term. This had led me to hastily conclude that in the **container-content** pair it was the "content" that was yang, without being put on guard by the **form-ground, exterior-interior, periphery-center** pairs (where, as I had clearly sensed, the first term is indeed yang, as well as being the "container"). In fact, in the matrix-embryo and vagina-penis pairs, I had wrongly emphasized the "geometrical" or configurational aspect of the relationship between the two terms, a secondary aspect to the main one, which in this case determines the distribution of roles: **that which nourishes** is yin in relation to **that which is nourished**, which is yang, and **that which penetrates** is yang in relation to **that which is penetrated**, which is yin (as is **that which gives** in relation to **that which receives**).

My reflections on yin and yang, however limited they may be, have founded an intimate conviction in me that, beyond differences in individual apprehension about yin-yang role distributions (or, let's say, about the yin or yang "background note" in a given person), an apprehension highly subject to "cultural distortion", such a "natural" distribution (or "background note") does indeed exist. It is as irrefutable, "cosmic" and immutable (as far as the distribution of roles in universal-nature couples such as those discussed so far are concerned), as a physical law, or a "natural" relationship.

mathematical, even if it cannot be "established" either by experience (in the sense in which this term is understood in the practice of the natural sciences), or by a "proof" or even a "demonstration". This reality □ au ying et du p. 505 yang is apprehended by direct perception, which can be developed and refined (among other things) by sufficiently deep reflection.

It seems to me that one of the main effects of this kind of thinking is to take us beyond

<sup>50</sup>(\*\*) (October 21) At least on the surface. But as suggested above, if we go deeper into things, we realize that this division in the couple, maintained by the preponderance of the man over the woman, has a deeper "root", which I'll come back to a few lines later.

<sup>51</sup>(\*\*\*) Slaves, moreover, who for nothing in the world would part with Their chains, which are dearer to them than life. . .

<sup>52</sup>(\*) In principle, and barring accidents, the sense of constraint pushes men to deny their yin side, and women to deny their yang side. The situation is more delicate for the woman, who is supposed to deny the very traits in her that are given prestige by social consensus, and which she would therefore feel encouraged to cultivate. She thus finds herself subject to two opposing pressures, and the task of structuring an "operational" identity for the unconscious is further complicated.

<sup>53</sup>(\*\*) This footnote is taken from a footnote to the previous footnote (see reference in the first paragraph of the previous footnote).

cliché reflexes, programmed into us by the surrounding culture, to regain contact with reality itself. This, it seems to me, is already present in deep layers of the psyche, as a kind of archetypal knowledge, beyond the reach of cultural conditioning. The role of reflection is to enable us to regain contact with this knowledge already present, and to carefully decant it from superficial "knowledge", i.e. from cultural conditioning.

The work I've begun in this direction has been important for my understanding of the world and of myself, and hence for my daily "doing" and the conduct of my life. This work (as on many other occasions) seems to me like a **first breakthrough**, like a door I've just pushed open onto a vast panorama, which I still have to explore. I've got everything I need to do it - but I don't know if I ever will<sup>54</sup> (\*). Mathematics aside, there's no shortage of equally "juicy", even more personal and even more burning topics for reflection, which will undoubtedly take precedence over the deepening of a more general reflection on yin and yang. ...

## 18.2.4. Notre Mère la Death

### 18.2.4.1. (a) The Act

**Note** 113 (October 21) Three days have passed without writing any notes. My days have been absorbed by other tasks and events. One of these was the visit of Pierre, accompanied by his granddaughter Nathalie, who arrived last night. He plans to stay until tomorrow evening, and by then to read what's been written about the Funeral. It's likely to be a bit short, for a text that took me almost three months to write...

p. 506

The time I was able to devote to reflection, I spent continuing □ to play with "couples". yin-yang and the groups they form. It's a fascinating subject, combining the very special flavor of the investigation of a mathematical "structure", whose very nature gradually becomes clearer as the work progresses, with that of a reflection on the world and on existence. Each of the main yin-yang pairs represents a kind of "**keyhole**" (among an infinite number of others), revealing a certain aspect of the world, or of a corner of it. The "groups" of couples I've identified so far seem to correspond rather to different possible ways of apprehending things in the Universe, like so many **doors** opening onto it and showing it to us from so many different angles. Each of these "doors" has a large number of keyholes, perhaps even an unlimited number, through which to look - until perhaps we simply push the door open? For the time being, I've confined myself to detecting a good number of these holes (I've found well over two hundred), and sticking my eye to each one, if only for the space of a few moments, while realizing each time that there would be something to look at for a good while without wasting my time - quite the opposite, in fact! But I'm even more impatient to go and have a look at such and such a hole through which to look again, and also to go round all these doors and orientate myself as best I can how they are arranged in relation to each other, and perhaps also according to which "patterns" are arranged in one or other of these holes that made me detect their existence... .

Finally, the eighteen "doors" I'd detected a little over a week ago were augmented by three more, making a total of twenty-one, laid out in a diagram (which I'd described as "vaguely Christmas-tree-shaped"), now comprising a "trunk" of nine "vertices" (or "doors", or "gates").

---

<sup>54</sup>(\*) Just as I don't know if the kind of work I see opening up before me has ever been done before (the study, in short, of a kind of local and global "map" of the qualities of things in the Universe and their modes of apprehension, in the light of the harmony of complementary yin-yang). It's not a question of presenting a doctoral thesis on this or that, but of deepening an understanding of the world and of oneself, which can only be the fruit of personal work.

"groups", or "angles"), connected by vertical "edges" or "links", with on each side of the trunk six other vertices connected to it and to each other, so as to form the "branches"(\*).<sup>55</sup> □ Somewhat comical, among thep . 507

three "new" groups that have appeared in recent days, one is the most obvious, the most primordial or primitive of all: it's the one that corresponds to the very first intuition of yin and yang as the "feminine" or "female", and the "masculine" or "male". It seems to me most strikingly expressed by the "**father-mother**" archetypal couple (in preference to "man-woman", which is part of the same group). This group is highly charged with sexual connotations, appearing in pairs such as "**beget-conceive**" or "**penis-vagina**", themselves part of the cloud of associations around **the act** par excellence, the Act-archetype: the creative embrace that transforms (potentially at least) the woman into a mother and the man into a father through the appearance of **the child**, the Work resulting from the Act.

These connotations of the love drive were constantly at the forefront of my thinking five years ago. What's more, they were given almost uninterrupted lyrical emphasis throughout the 130-odd pages of the famous "poetic work" into which the reflection had then been condensed, producing a wearying effect on even the best-disposed reader. It's surely a reaction of annoyance towards this double "deliberate intention", poetic and erotic<sup>56</sup> (\*) in my only reference text for my reflections over the last few days, that I simply "forgot", among the famous groups of yin-yang couples, the one who of course opened the procession (and rightly so) in this text of woe.

The title of the work in question, "Eloge de l' Inceste", was a tad□provocative too, and of a nature to give a false idea of his intentions and his "message". In fact, these evolved quite considerably as I wrote - the poetic straitjacket didn't prevent the work from going deeper and decanting. My first and main aim was to probe a certain aspect (which I felt to be profound and essential) of the love drive, as I knew it from my own experience. It was primarily a question of the erotic drive in men, or more precisely: the "**yang**" drive, which corresponds to the "male role" in the game and in the act of love, but which is present with varying degrees of strength<sup>57</sup> (\*) in women and men alike. For a long time, perhaps forever, I've known that this drive, by its very nature, is "**incestuous**": it's also the drive to "**return to Mother**", to return to the original womb.

p. 508

<sup>55</sup>(\*) (October 24) I'd be at a loss to predict whether or not yin-yang couples will emerge that don't fit naturally into any of the groups I've identified so far, i.e. whether there are **other** yin-yang groups or "doors" opening onto the world, or even an unlimited number of them?

The fact that I couldn't find another would in no way mean that there couldn't be an infinity of others, perhaps even an infinity of others that escape human experience, our means of perceiving the Universe. This reminds me that more than once in recent years, I've been struck by the intuition that, from the ant or the tiny aphid, to the mammals already close to us, every animal species has means of perceiving and apprehending the Universe that escape all other species, including our own ; so that, in terms of the wealth of sensory apprehension (let's say) of what surrounds us, our species does not "cover" or "contain" any other, any more than any other contains us.

The "no more than" I've just hazarded seems hasty, even overcautious, given that in terms of the richness and fineness of purely sensory perception, the evolution of our species would tend to go in the opposite direction, **to regress**. It seems to me that it's only at the level of the intellect, of the fineness of mental images, and in particular those linked to language, that we excel over other species. It's no coincidence that most of the yin-yang pairs that spontaneously came to my attention belong to this register, specifically "human", while only a handful have (among others) an obvious sensory connotation, such as shadow-light, cold-hot, low-high, and a few others.

<sup>56</sup>(\*) (October 24) This deliberate statement in form reflected an inner attitude, the choice of a certain role - the role of **apostle** of a message. On this subject, see the end of the section "The Guru-not-Guru - or The Three-Legged Horse" (n° 45), and the related note n° 43.

<sup>57</sup>(\*) (October 24) This presence is often more or less totally suppressed by powerful repression mechanisms. I have the impression that in men, this yang drive tends to predominate over the complementary y in drive, and that the opposite is true in women. But cultural conditioning, and the various ways in which it is internalized, both "positive" and "negative", interfere so drastically (and often complexly) with the play of original drives, that it's sometimes difficult to detect them behind sporadic, furtive and often degraded manifestations.

This great return is "staged" and relived in the course of the amorous game, culminating in an **annihilation**, an **extinction** of being, a **death**. To experience the fullness of the act of love is also to experience **one's own death**, like a "birth in reverse" that returns us to our mother's bosom.<sup>58</sup> (\*\*)

p. 509

But it also means transgressing **two** extremely powerful **taboos** at once: the **incest** taboo, which excludes "the Mother" as an object of amorous desire, and the one too that (in our culture at least) separates and opposes, like irreconcilable enemies, **life** and **la mort**, **being born** and **dying**. Yet I already knew, that the act of love is **both** a **death**, accomplished in the orgasmic spasm, and a **birth**, a renewal of being, **emerging** from this death. ... like a new shoot delicately springs up from the nourishing earth, itself formed from the creative decomposition of beings that have been damaged in it. ...

It was during this reflection on the meaning of the act of love, five years ago, that I finally understood that "death" and "life" were the wife and husband of the same tightly entwined couple<sup>59</sup> (\*), that eternal life was born of death, to be eternally abysed in it. Or, to put it better, that life eternally abysed in Death, to be eternally reborn from Her, the Mother, fertile and nourishing - She herself nourished and renewed ceaselessly by the eternal return to Her of the countless bodies of Her children.

And the human couple of wife and husband, lover and lover, when they live to the full the impulse that draws one into the other, is like a **parable** of these endless espousals of life and death: at the end of each night of love, the lover abysed and dies in the lover, to be reborn with her from this death in their common embrace... .

At the beginning of this same reflection, I visualized an essential aspect of division within the person, as a kind of "cut", a "**horizontal**" cut: that established by the taboo of incest, which "cuts" the child from the mother, just as it cuts life from its mother Death, and just as it also cuts a generation from the one that precedes it.

If I saw this cut first, it's probably because it's the very one I was exempt from. However, my life, like everyone else's, has been profoundly marked by this other great cut, which I saw later in the course of reflection and which I called the "**vertical**" cut: the one that separates, to set them against each other, the two "halves" of the feminine and masculine in each being, tolerating only one to the exclusion of the other. This is precisely what we've been talking about in this long digression on yin and yang, which I've been involved in for the past week or two.

p. 510

□ It now seems to me that this division ("vertical") is even more crucial than the other ("horizon-"). tale"), that in some sense it implies or "contains" it. After all, to **separate** the child from the mother, and life from death; to associate with death, as with the impulse that links the child to the mother, a feeling of **defilement**, **repulsion** or **shame** is also to **cut off** from each other, to set them against each other, the husband and wife in those two indissoluble and primordial cosmic couples: mother - child, death - life<sup>60</sup> (\*).

<sup>58</sup>(\*\*) I'm convinced, moreover, that this content of the yang love drive is present in all living species and even beyond; that it corresponds to the same profound dynamic of all things in the Universe: that every creative process (or "act") is an embrace of yin and yang, of "the Mother" and Eros the Child, returning to and abysing in her. From this "death" (or "birth in reverse") of the child returning to the Mother, emerges, as from a nourishing womb, the **fruit of the act**, the "work". It is the appearance of the "child", the **new** thing, through the act of death and renewal of the "**old**" that gives birth to it. In this cosmic dimension, the original sex drive has been present since time immemorial, long before the appearance of the human species and even before the appearance of life (in the biological sense) on our planet.

<sup>59</sup>(\*) (October 24) It's strange, then, that among the yin-yang pairs I'd noted a few weeks later, the "death-life" pair doesn't appear. Perhaps this was due to confusion with the related pairing "death - birth" (or better still, "dying - being born"), so that the former might seem to duplicate the latter.

<sup>60</sup>(\*) I've written the pairs here in "natural" yin-yang order, starting with the yin term, the "original" term.

On the subject of the "mother-child" couple, note that the term "mother" also figures in a second important archetypal couple, the primitive "mother-father" couple, giving its name to the group it describes. (The

Interestingly, these last two couples are not among those I had identified in the "Eloge".

The "death-birth" couple, on the other hand<sup>61</sup> (\*\*)'□ <sup>more</sup> directly linked to my love experience, is included. The couples

p. 511

"Mother-child" and "death-life" only came to mind in the course of my reflections over the last few days, among many others that had previously escaped my attention, one of the most interesting of which is "evil-good". This is one of those couples (like "death-life") that can be called "difficult", in the sense that such powerful conditioning makes us apprehend the two terms as antagonistic "opposites", rather than as inseparable complements. Clearly, these conditionings were stronger in me five years ago, when I wrote the Eulogy, than they are today. Yet there were already a good number of "difficult couples" in the Eulogy, including "chaos-order" and "destruction-creation" . .

In retrospect, a somewhat deeper understanding<sup>62</sup> (\*) of the nature of the various yin-yang couples, as forming a harmonious entity of inseparable complements, now appears to me as so many "thresholds" to be crossed in our journey of discovery of the world and ourselves. Such a "threshold" is all the more notable the more "difficult" the couple in question, i.e., the more its apprehension as a "couple" comes up against stronger inner resistance, an expression of cultural conditioning.

#### 18.2.4.2. The beloved

**Note** 114 (October 26) Yesterday's reflection<sup>63</sup> (\*\*) was a little difficult to get going. This is no doubt due to the many interruptions of the last few days. However, since the day before, there was something still warm inside me that I was anxious to put down on paper, if only in a few lines. Afterwards, I was ashamed to realize that it had been lost along the way, ousted by everything that came along! Today, I couldn't bring myself to part with it prematurely, as if by misunderstanding, before I'd even really got to know it.

In the recent reissue of "Zupfgeigenhansl"<sup>64</sup> (\*\*\*), I leafed through this classic old song

---

In fact, the "mother-child" couple is a different group, the one I call the "cause-effect" couple). Moreover, the yang term "child", of this same "mother-child" couple, is also part of another archetypal "old-age-child" couple, close to the very interesting "maturity-innocence" couple. These two couples are part of the group I call "high-low", which is the richest (if only numerically) of all those I've detected so far. It contains many other remarkable pairs, such as **decline-essence, dying-birth, destruction-creation, forgetting-learning, finding-beginning**... . In enumerating these few couples, I had to go to great lengths to name them in yin-yang order, against ingrained habits. On the face of it, the new order looked a little zany, even bizarre - the world turned upside down! On closer inspection, however, we realize that this unusual order reveals **another** aspect of the relationship between the two terms, a complementary aspect to the usual one where (for example) "to be born" precedes "to die". - whereas we've just seen that "dying", in a deeper sense, precedes "being born".

The same goes for the overall name of my reflection, "Harvest and Sowing", which is undoubtedly a yin-yang pairing (which I'm just discovering!). It's named again in reverse order to the usual yang-yin order, with harvesting supposed to **follow** sowing, not the other way round. Yet the name came to me without any ambiguity whatsoever, and without at any time even the idea that it might have been the reverse, "Sowing and Harvesting". It was being confronted with unwelcome harvests that each time drew my attention back to the sowing from which they sprang; as if the profound meaning and function of the harvest had been to stubbornly **bring me back** to the long-forgotten sowing of my own hand... .

<sup>61</sup>(\*\*) Please note that in this "death-birth" pairing, the term "death" does not have the same meaning as in the "death-life" pairing: in the former it designates an **act** (synonymous with "death"), in the latter a **state**. In German, there are two different words: "Sterben" (without the rather cavalier connotation of "trépas") and "Todt". In French, I think it's preferable to refer to the couple as "mourir-naître", which eliminates the ambiguity surrounding the meaning of the term "mort".

<sup>62</sup>(\*) By this I mean an understanding that is not purely intellectual, but manifests itself concretely in a changed relationship to others, to the world or to ourselves, in changed ways of being.

<sup>63</sup>(\*\*) This is the reflection in yesterday's note (n° 116), which I have placed **after** today's.

<sup>64</sup>(\*\*\*) In Wilhelm Goldmann Verlag (1981).

compiled and published around the turn of the century. I'd heard it had become impossible to find, but some German friends □ who were passing through my house had brought me a copy. That day (so the day before yesterday) I had

I had a quick look around before getting down to work, a bit like shaking hands with an old friend in passing. I came across the song "Wohl heute noch und morgen", which I skimmed through without really stopping, in a hurry to get back to my work. Still, something clicked. I sensed that these simple, seemingly naïve words were delicately touching something deep inside me - something, moreover, very close to what I had been trying so hard to evoke three days before. I was just about to rewrite my notes on the subject. Perhaps I had a vague feeling that the stanzas I had just gone through were more faithful and convincing messengers of what I would have liked to communicate, than my notes of preemptory brevity, written in the rush yet again towards something else, as if in passing, while the emotion of an immediate experience remained absent.

When I got up this morning, I tried to translate into French these stanzas, whose tune I didn't know, yet which had been singing inside me for two days. Surely it was a way of finding them better, of letting their flavor and melody penetrate me. To my surprise, it wasn't too difficult to find some of the rhythm and music of the German text in another language, which at first seemed reluctant, while remaining very close to the literal meaning. So here are the seven stanzas, rendered as best I could<sup>65</sup> (\*).

"This day again and  
tomorrow by your side will  
be  
but as soon as the third day dawns,  
I'll be on my way."

"But when will you come again  
m'amour, my sweet beloved?"  
"When the snow falls on red roses  
et quand pleuvra vin frais!"

"Roses do not snow and  
wine does not rain  
so, m'amour my sweet beloved  
neither do you return!"

I lay down in my father's  
garden, and a lovely  
dreamlet came to me as I  
slept.  
white snow on me snowing.

□ And when I awake, here is pure  
emptiness pure nothingness -

---

<sup>65</sup>(\*) (October 29) The following version was revised over the following three days. In the evening we sang and I was able to learn the tune of the song. Most of the changes to the initial version were made to take into account the requirements of rhythm and tonal accent in the sung text. Even if it's necessary to divide the syllables appropriately between the notes of the tune, it can be sung with the French text, without at any point having to do violence to the tonic accent (as is unfortunately common in some recent French consonants).

it was the pretty red roses on top of  
me blooming...

Come back boy and pass, all soft  
inside the beautiful garden  
wears a wreath of roses and  
a goblet of wine.

With his foot he stumbled,  
gentle to the pretty  
monticulet  
fell - and snow roses also  
rained fresh wine. ...

There was a joy, a happiness inside me, as I groped for a way to render what I was reading, which with each passing moment became like a part of me. There was this gentle, bare beauty, at once calm and poignant, a grave beauty made up of joy and sadness intimately entwined. I don't think there are many people who aren't touched to some degree by a song like this, even though they'd rather not be - as so often we defend ourselves against an unexpected emotion, when something deep inside us that we didn't know existed suddenly resonates, and speaks to us in silence about what we'd rather not know.

It's the dream, above all else, that has the power to make that resonance in us which must remain hidden, ignored, that which must remain silent. Perhaps only the language of dreams has the power to touch those secret chords within us and make them sing in spite of ourselves. And when, for a moment, you have allowed them to sing, even if it's a song of pain or heavy sorrow, you suddenly feel light and as if new - **washed** clean, as if abundant water had passed through your being and dissolved and carried away all that in faith that is knotted and hard and old. ...

When the poet is about to strike one of those chords whose song unleashes the inner waters, he instinctively borrows the language of dreams, at once limpid and charged with mystery - a language of images and parables, which baffles reason by its apparent absurdity, and by its secret obviousness goes straight to where it wants to touch!

There's no need here for the word "death" to be uttered, or any other word that for the awakened mind would be related to it.

reports. Yet **she** is present, and her misty face is that of the Beloved. The distant, sleeping Beloved you left behind long ago, and yet so close - both snow and falling roses.

into snow and is born of the snows. ... The force that draws you in□It is like a very deep and powerful wave, a wave coming from She who calls and bringing you back to Her. And the call is poignant sadness and the return is joy that sings in a very low voice, and joy and sadness are **one** and the same, and **are** this wave that carries you into the Beloved, with the unreplicated strength of childbirth. p. 514

And there was no need to evoke, even in a single word, this longing and the surge of desire for you, **the child** - for the "boy" that the Beloved calls to Her. All it took was for a dream to speak of Her sleeping in her father's garden, dreaming of snow and waking up to roses, for that long-forgotten wave to awaken in you too, responding to the longing of Her who dreams and wakes, calls and waits... .

#### 18.2.4.3. The messenger

**Note 114** This old Silesian song is one of many love songs, old and not so old, singing of the mysterious and poignant amalgam of the **beloved** and **death**. The one I

I've just transcribed is perhaps exceptional for the profusion of images charged with meaning, and for the wealth of associations it elicits. It's not my intention here to go through them one by one, after evoking one or two that struck me most strongly. When, yesterday and the day before, my thoughts returned to these hastily-read stanzas, it was not then in the sense of deepening an emotion, which at first remained epidermal. Rather, it reminded me of the extent to which the themes of love and death, or of the beloved and death, appear to be linked, as if by some mysterious spell! And beyond the theme of death on the beloved's face, they join that of birth - of awakening - roses out of sleep - snows, both mysteriously united in the poignant image of roses falling in snow, on Celle who is both dreaming and awakening, asleep in her father's garden.

The taboo may well inculcate the repulsion of death, its incompatibility with life as with love! You'd have to believe that it runs counter to some deeply-rooted knowledge, or an impulse as powerful as it is secret, for what must be separated at all costs to seem so tenaciously to want to come together, taking the circuitous routes of symbol and dream, through songs and myths handed down from generation to generation, century to century.

p. 515 No doubt many scholarly volumes have been written on the subject of these troubling amalgams. to exorcise them as best we can. *Nobstant de tels efforts, sûrement aussi, "quelque part" en chacun de nous, le sens profond de ces associations tenaces est perçu bel et bien - en Les moments, tout au moins, où* we don't deliberately close ourselves off to the emotion within us that welcomes these messengers, speaking to us about ourselves in the elusive and powerful language of dreams.

This "deeper meaning" is revealed to us anew, directly and with elemental force, by the experience of love, provided we dare to live it fully and listen to its obvious message. It speaks to us of the mystery of death and birth, indissolubly linked in the Act that transmits life and renews lovers.

No doubt I'm not the first person in whom this "deep-rooted knowledge" has risen from the obscure depths where it had long been exiled, to become fully conscious and permeate all the more strongly my relationship to death and life, to the world and to myself. I have the impression, however, that written and published testimonies of such knowledge on a conscious level must be rare. The only ones I've come across so far are three or four stanzas from Lao Tseu's Tao Te King<sup>66</sup> (\*). On the other hand (and somewhat paradoxically), I also have the impression that the amalgam "love-death" must, at some point, have become a kind of romantic poncifix, a very safe "cream pie" to draw a tear - complacent from even the most reluctant eyes. It's a fact that the process, over time, has

p. 516

---

<sup>66</sup>(\*) (October 30) I came across these passages from the Tao Te King towards the end of 1978. It was a striking, entirely unexpected confirmation of things I had felt strongly about (some for a long time, others only recently. . . ), and which I seemed to be alone in feeling this way. This "encounter" was experienced as a great goose, a silent exultation. This joy and exultation carried the gestation and writing of *L'Eloge de l'Inceste* over the next six or seven months. The conception took place in the days or weeks following this encounter. On a more modest or humble note, I've felt a similar joy in recent days, "recognizing" the emotion that had animated an anonymous poet (dead for centuries) when he sang of those roses falling in snow, born absurdly, miraculously from "l'auter Nichts" - from "pure emptiness, pure nothingness"; or to put it better, in rediscovering, through my own intimate experience, this **same** emotion, a sign of the same knowledge. It's the same knowledge that can be found in the Tao Te King, over more than four millennia - with the difference that, in the Chinese text, this knowledge is expressed in the pictorial, but by no means symbolic language of a highly awakened consciousness, and not in the language of dreams (which is also the code-language of the deepest layers of the psyche).

The content I recognized in these few stanzas from the Tao Te King has obviously escaped the translators of the five or six different versions (in French, German and English) I've had in my hands. I'm not surprised. Such messages, expressions of an understanding that runs counter to millennia of conditioning, communicate their true meaning (beyond the words and images used to express it) only to those who already know it through what they have assimilated from their own experience, or to those in whom the work of assimilation is ongoing and who are already very close... .

has come into disrepute - so much so, alas, that even among people with delicate sensibilities, there is a tendency to confuse pure gold with its crude tin counterparts. Some see an old-fashioned or even ridiculous air, even where there is a keen perception of a hidden reality, and a delicate expression, foreign to all "fashion". Here, a consensus of "good taste" comes to the aid of all kinds of inner resistance, which automatically screens out the eruption of any vivid, authentic emotion, be it joy or sorrow, pleasure or torment, that comes to shake up the familiar routine.

It's the same mechanism that so often blocks the original force of the love game and its orgasmic outcome. Fortunately, the mere fact that they remain hidden, banished from the field of consciousness, in no way prevents the archetypes that drive the love drive from being present - from making what must disappear vanish, so that the meaning of the love game can be expressed and fulfilled, and the final act can be a creative act, a renewal. Often, however, a secret **fear** stands in the way of the very "pleasure" we think we're looking for, frightened as we are by the very presence of an unknown and formidable force, which risks (if we're not careful. . . ) sweeping away like chaff the one in us who insists on keeping "control" at all costs. Such fear cannot tolerate that pleasure never approaches that threshold of poignant intensity where it is both pleasure **and** torment, united to each other in a long and intolerable embrace that seeks deliverance, to finally resolve itself and sink into orgasmic nothingness... .<sup>67</sup>(\*)

(October 27) I think I've understood the secret message of songs and dreams like "Ce jour encore et tomorrow... .", in the **essentials** they share. The question then remains: what is this force that

□ pushes with such insistence to give voice to this "deeply rooted knowledge", older

p. 517

that our species; to express it against all odds, nobosting the vigilance of the surly, narrow-minded **Censor**, by taking the key to the fields and giving free rein to the symbolic language of dreams, with its unlimited resources?

If myths, songs and dreams breathe the same message with countless faces, it's also true that the prisoner to whom they're addressed never tires of hearing them! It's true that he's a willing prisoner, but he never **listens**. He's frustrated with air, space and light, yet reassured by the four walls that surround an existence devoid of any great surprises or mysteries, except perhaps death, which lies at the end, infinitely far away... . His prison protects him from **the Unknown** that lies beyond these walls, and which he pretends to ignore. It both frightens and fascinates him. It's because the Beyond its walls frightens him, that his prison-refuge is dearer to him than life itself. And yet it fascinates and attracts him, unwillingly, just as the messengers who come from far and wide to tell him about it attract and fascinate him. And sometimes he gives in to this unusual attraction, as long as it's in secret from the Censor-Supervisor General: while he lends an ear, he is nonetheless "thumbs up" - he hasn't heard anything, and above all, he hasn't listened to anything!

The question I was asking myself just now seems to have disappeared, swallowed up by a convincing image. It reappears, as soon as I remember the **effect of** the message - that **emotion** that comes before the message, and the **benefit of** that emotion.

But the truth is, **any** emotion that strikes a deep chord is a messenger from beyond the four walls, a messenger from the open sea. Even though we would strive to erase all trace of it the next moment, it is beneficial, it has already left its mark, like a delicate perfume - as if these dull walls

---

<sup>67</sup>(\*) (October 28) It's this same fear, manifesting itself as a kind of **refusal** of pleasure, which at the same time pushes us to **isolate** pleasure from the whole experience of love, reducing it to the finality of love (sometimes tacit, sometimes clearly expressed). "Love" is thus reduced to a "search for pleasure" - an exchange of courtesies, in short, between two partners, like inviting each other to dine in four-star restaurants, if not at the Folies Bergère. This "pleasure", fearfully kept on a leash, is just as foreign to the original impulse, as dry paint chips scraped off a painting by the hand of the Master would be to the painting; or as a hairdryer is foreign to the great offshore wind, laden with the perfumes of the sea and the land... .

or as if, through some unsuspected opening in the sanitized air, we could catch even the slightest whiff of the scents of woods and fields.

p. 518

□(October 28) Over the last fortnight or so, I've been reluctantly giving the matter some thought. It's a move in a direction I hadn't planned, with no apparent connection to the theme of L'Enterrement, or even (it might seem) to myself. I know deep down that this is not the case, that I continue to be involved in these notes as much and more than ever. Nevertheless, I'm torn between the desire to "get it over with", and the desire to delve into what is glimpsed day by day, to follow the most compelling associations.  
- A desire that goes hand in hand with my concern not to let anything slip that might shed light on my "investigation" into the Burial. What seems most distant is sometimes also most intimately close. ...

The fact remains that for the past fortnight, if not ever since I resumed writing after my illness, I've had the impression (a little painful at times) of doing things "in a hurry", as if each new note were another parenthesis that I opened (in front of an imaginary reader who would cry for mercy) and that I had to close as quickly as possible! I'm sure it's this attitude, perhaps even more so than the unusual number of friends I've had over the last few weeks, that has led to my writing being hasty and a little jumbled at times. I've had to rewrite most of the notes I've written recently as I went along, retyping them on the net. This further slowed down progress, and kept my impatience to see the work move forward!

It's also true that these themes - which I sometimes pretend to want to deal with at once, as if they were "well known" and that I'd take the trouble to spell them out for the benefit of a reader who'd just "arrived" - are both too delicate and too far-reaching to bear such casual dispositions. I couldn't help noticing this as the pages went by, and "rectifying" the situation, by which I mean readjusting my inner attitude, under the weight, so to speak, of what I claimed to be able to tackle on the sly!

It reminds me that this long reflection on y in and yang, in which I've been engaged for almost four weeks and which is by no means finished yet, is in fact merely **the clarification of** an instantaneous intuition, which seemed to me quite simple, not to say obvious; an intuition that came "in flash" the day after May 12, when I had just written the first note on a certain "Eloge...".

Funèbre". When I took up the rest of this note, a month ago<sup>68</sup> (\*), willing myself to follow this association of ideas, in preference to others which seemed to me of lesser interest' □<sup>1</sup> foresaw that it would engage me in another five or six pages at the most. Now I'm over sixty. ...

p. 519

Yesterday I pondered the meaning of the symbolic evocation of the links between love and death, or death and birth, or life and death - and the meaning, too, of the emotion such evocation arouses in us. What is the force at work in myth, or song, or dream, that drives them to "breathe into us without tiring of the same message with countless faces", - and what is the force in **us**, willing prisoners of reassuring prisons, that so often responds to them with this emotion, going ahead of the evocation and showing that it has "hit the nail on the head", that it has touched where it wanted to touch? And also: where does this strange power of dream language come from, language that evokes without naming, that communicates what no other language knows how to communicate?

Pursuing these questions also means delving deeper into the role of the love drive and the dream, and the profound links that bind them; each nourishing the other and nourished by it, each expressing itself, and communicating with the other, through a language that is common to them and that escapes the Censor. It is also

---

<sup>68</sup>(\*) In the note "Muscle and tripe (yang enterre y in (1))", n° 106.

further explore the role of archetypes and symbols in the love drive, and the role of "symbolic" satisfactions of the drive.

All this is taking me far beyond the limits of what I can reasonably hope to "fit" into this "digression" on yin and yang, continuing (it's about time I remembered) right in the middle of a certain Funeral Ceremony! I think it's time to leave this new "thread" there, and return to another "thread" left hanging three days ago<sup>69</sup> (\*), which brought me back to myself.

#### 18.2.4.4. (d) Angela - or farewell and goodbye

**Note** 115 □(October 30) For a day or two a few lines have been running through my head, from a poem written yp . 520

three years ago. I wrote it first in German, and the next day took it up again in French. It was the first two stanzas that had come to the fore - the third and last seemed to have faded from memory, except for the first line "Ein Kreis schliesst sich" - "A circle is perfected". (And apart from the last line, which repeated that of the first stanza). When I woke up last night, my thoughts returned to it again, and I finally got up to rummage through my papers. I found the poem with no trouble at all - every cloud has a silver lining! And here it is.

Dense, ripe,  
heavy fruit  
my life is bending  
over backwards  
in Her

The sweet, thick juices  
soaked me  
have blossomed  
fragile milk flowers become  
fruit and wine

A perfect circle -  
from my lap  
mounts softly  
describes its orbs  
and bends over to turn  
in Her...

I think this is the only poem I've ever written in which the thought of death<sup>70</sup> (\*) is clearly present. Here it appears under the name "She". In the primitive version of the previous day, it was evoked by the German word "Erde", earth. The German "translation" of the three stanzas is far from literal; the first came as follows:

Voll und schwer

---

<sup>69</sup>(\*) In the note "Le paradis perdu" (n° 116), placed after the present note (n° 114).

<sup>70</sup>(\*) I should rather write: the thought of my death. Two poems (each a few lines long) written in 1957, the year of my mother's death, are imbued with the presentiment of this death.

## 2. A walk through a work or the Child and Mother

rei fe Frucht  
neigt sich me in Leben  
gen Ende  
Der Erde zu

Die sussen Säfte  
die mich durchtränken  
haben geblüht  
weiche Blilten und wurden Frucht und Wein

Ein Kreis schliesst sich  
aus meinem Schoss  
steigt Süsse  
kreist  
und neigt sich  
gen Ende  
der Erde zu...

□

p. 521

Finally, rewriting the original German version just now, I couldn't help but write it all the way through, so much so that the next two stanzas seemed to flow spontaneously from the first! For me, these three stanzas are a love poem (in fact, I've hardly written any poems other than love poems). If this one is addressed to anyone other than myself, it's to **Her** - to She who waits in silence, ready to welcome me...

On the same day, I had written two other poems, one before and one after. They were addressed to a flesh-and-blood "beloved", Angela, "l'Ange" - a tall, slender, blonde girl, very much alive, whom I'd met the week before, on the hot summer road where she'd been hitchhiking. In an hour or two we'd had time to say a lot to each other, and we'd parted on that note. I would have liked to give her the poems she had inspired, including another one written on the very evening of the day I had met her, and yet another (always in German, our common language), which came the day after the "three (almost) at once". And I wish we'd loved each other too... . But I lost track of her, just as she must have lost mine.

One thing the poems inspired by this encounter have in common is that each is either very strongly "yang" or very strongly "yin". They are some of the most intense I've ever written, and each came in one go, almost without retouching - as if they'd been there all ready and waiting only for the signal of this encounter to take shape in tangible words.

At first glance, it may seem strange to find among these poems charged with intense erotic tension, this other poem in autumnal tones, about to enter the long sleep of winter. There was, in those lonely days, an intense perception of life, amplified by erotic emotion and by the profusion of archetypal images that underlie it - and at the **same time**, the serene detachment of a life fully lived, nearing its end, ready to "return to Her".

Such dispositions of communion with death, our silent Mother, felt as a friend and very close, are surely favored by a state of great fatigue of the body, bringing us back to simple and essential things: our body, love, death... . I was just coming out of a "long period of mathematical frenzy",

which I have already mentioned in the introduction to *Récoltes et Semailles*<sup>71</sup> (\*). I was just beginning to recover from unp. 522 state of physical exhaustion in which this somewhat demented period had left me. It had just come to an end (as suddenly as it had come) under the impact of a dream-parable of lapidary force, which I kindly then listen to the message<sup>72</sup> (\*\*). These were days of availability, of listening - a "sensitive period" of an in-between wave: behind me a long and ample "mathematical" wave, and in front of me a no less ample "meditation" wave that was already announcing itself... . It would gain momentum ten days later, with another dream, the account of which opens the introduction to *Récoltes et Semailles*, this vision of myself "as I am".

These were weeks of intense inner work, of silent gestation, of change. And these love poems, different in tone from any I'd written before, are a fruit and a testimony of this intensity, this plenitude.

They're also the last love poems I ever wrote. Perhaps there was a prescience in me that this was the last time I would be in love, and that the great fireworks of songs for the beloved would unfold! A prescience that these poems addressed to an unknown girl, whose beauty I could feel intensely without having known her, were at the same time a farewell to love songs and to the women I had loved.

- a farewell to my passion for love, which was about to be consumed in this sparkling spray, and which was about to leave me. And, more secretly and profoundly still, that it was a farewell (or a goodbye, perhaps) to **all** women, merging and becoming **One** under a new face. A more distant face perhaps, drowned in mist, at the other end of the road - but at the same time very close, and very sweet. ...

## 18.2.5. Refusal and acceptance

### 18.2.5.1. (a) Paradise lost

**Note 116** □(October 25)<sup>73</sup> (\*) Again three days have passed without my finding the time to continue on my momentum. The first day, Monday, was taken up mainly by a visit from Pierre and his two-year-old daughter Nathalie, whom I saw off late in the evening to catch the night train to Orange. In a few days' time, I'll be able to take stock of what I've gained from this visit - a visit I wasn't counting on any more. . . For the moment, I'd prefer to continue my rambling reflections on yin and yang.

This reflection may seem like a philosophical digression, suddenly bursting into a certain investigation where it would have no place - except that it emerged unannounced from some vague associations of ideas around a certain Funeral Eulogy. ... However, I feel that it is precisely with this "digres- sion" that I'm beginning to go beyond the stage of uncovering all the "**raw facts**" that make up *L'Enterrement*<sup>74</sup> (\*\*), to finally approach, if only a little, the **forces** at work behind the "facts".

<sup>71</sup>(\*) See "Dream and Fulfillment", especially page (iii). The "period of frenzy" in question extends from February to June 1981. It is also that of the "long march through Galois theory" (see "Galois' legacy", n° 7). It leads into a long period of meditation on my relationship with mathematics (see the sections "Le patron trouble-fête - ou le marmite à pression" and "Le Guru-pas-Guru - ou le cheval à trois pattes" n° s 43 and 45). This runs from July 19 to December 1981. The poems to Angela (and the poem to "Elle") are dated July 8 and 9 (except for the very first, dated July 1).

<sup>72</sup>(\*\*) See the beginning of note no. ° 45, quoted in the previous footnote.

<sup>73</sup>(\*) (November 1) This note predates the two preceding ones, written between October 26 and 30, which form a direct continuation and deepening of the one that immediately precedes them, "L'Acte" (n° 113, October 21). The present note, "La moitié et le tout - ou la fêlure" (The half and the whole - or the crack), is more closely linked to the end of the preceding note of October 17 (n° 112). From this point onwards, the reflection had split into two parallel tracks: one (on the feeling of death and its link to the love drive) continuing in the three notes (presented as consecutive) 113, 114, 115, and the other initiated with the present note n° 116.

<sup>74</sup>(\*\*) (November 14) This assertion, made "in the heat of the moment", has not been carefully weighed up, and is only partially founded. For a more detailed and nuanced overview, see the note "Rétrospective d'une méditation - ou les trois volets", d'un tableau", n°

acts and behaviors that seem strangely aberrant... . It's surely no coincidence that it was precisely through this "digression" that I was also led, without having planned it, to involve myself in a deeper way than at any other time in Harvest and Sowing. This is one of the unexpected fruits of the recent illness-episode, which occurred at a time when I was about to bring the seven-week investigation to a swift conclusion... ..

This "digression", then, in which some will see a kind of intimate confession, and others a metaphysical speculation, is for me (more than any other part of Harvest and Sowing) at the very heart of Burial, at the **heart of the conflict**. It's only the optics that have changed, the "point of view" from which the thing is seen. is looked at - but suddenly, changed so drastically, that the thing we'd just been examining seems to suddenly disappear!!! I think it won't be long before we □recover the contact that might have seemed lost in road, with the news item l'Enterrement.

p. 524

But we can also forget about the news item, whose main merit will then have been to encourage "digression". . .

Part of yesterday was spent retyping the draft of the previous note, written four days ago, which I finally named "Our Mother Death - or the Act". Much of this draft was quite heavily crossed out, a sign that the wording had remained a little muddled, while some important and delicate themes had crept into the reflection a little "by the by", in the stride towards something else. To tell the truth, when I began this note, I was mainly intending to pick up the thread of the previous note, entitled "The half and the whole - or the crack", written just a week ago. But in the end, this thread remains unfinished, and it's about time I picked it up again.

For this note too, I had to retype a large part of the text, essentially for the same reasons, rectifying clumsiness and obscurities along the way. This is the beginning of a reflection on the **division in the couple**, intimately linked to the **division in the person**, and pi us precisely to what I called (in the "Act" note of four days ago) the "vertical cut": that which "cuts", or subtracts, one of the yin or yang "halves" of the original "whole" within us.

At a level which now remains that of an intuitive, non-verbalized understanding, I "understand", it is "clear" to me, that it is the division within the person himself (a division created from scratch, it would seem, by conditioning) which is the root cause of the omnipresent conflict in human society; be it the conflict within the couple or the family, or the conflict within larger groups or that which sets such groups against each other, right up to the armed confrontation of peoples and nations against each other. The conflict within a couple, which pits two antagonist-types against each other, distinct and easily recognizable as such, could not without reason appear as **the** fundamental parable, as **the** elementary, irreducible case of conflict in human society. The "point" of the "Crack" reflection was

above all, to bring the case of conflict within a couple back to that other more fundamental, even more "elementary" conflict: that of conflict within □each person himself, which pits one "part" of himself against another part.

p. 525

In the light of this reflection of seven days ago, it was natural to think first of the conflict between the yin and yang "parts" within us, one of the two being accepted and duly put forward and inflated, the other more or less completely rejected and repressed. I was aware, however, that there were other antagonisms within the person, linked to taboos other than that of **the univocity of sex**. It's true that this last taboo, just as strong as that of incest, is even more insidious because of the obviousness with which it is clothed, which seems to obviate the need even to formulate or name it, so much so does it seem to go without saying! Although I haven't yet taken the time to verify it step by step, I have the impression (since the reflection on the Praise) that this taboo is the most crucial of all; that the division or "cut" it institutes in the person is the most important one.

the ultimate root of each of the multiple aspects of inveterate division in the human person. Carefully clarifying the extent to which this is the case would surely be a most attractive starting point for a "journey of conflict discovery". This is not the place to launch into it, however - not to mention the fact that, as far as the journeys ahead of me are concerned, I can think of more burning starting points than this... .

In retying the text of this note "The half and the whole - or the crack", I realized that in writing it, I hadn't thought to explain in the slightest **why** I saw conflict within the person as the root cause of conflict within the couple, and of conflict within society. As I said earlier, this is one of the things I've "understood" (without ever having had to "explain" it to myself), which have been taught and confirmed by the silent and eloquent language of a thousand little everyday facts, over the days and years<sup>75</sup> (\*). I'm not saying that it's pointless to spell out or "explain" here the "why" and the "how", whether in a few pages, or in imposing volumes perhaps. And no doubt a few pages on the subject, here, would be no more or less "out of place" than any other page on yin and yang and conflict, which has already found its place in these notes. I'm sure I'd learn lots of things, like I'd also learn more by pursuing this other theme of reflection, on the conflict instituted in us between yin and yang, and yang as the ultimate cause of division within us. □ One of these themes visibly extends p. 526 the other, which makes both even more appealing! However, that's not the direction I'd like to pursue right now, if at all. It's not the "thread" I've been wanting to pick up for a week now, and which is still unresolved.

When I finished the reflection in this note<sup>76</sup> (\*), a week ago, I suddenly felt very happy and delighted: the reflection had unexpectedly reconnected with something important, which I had somewhat lost sight of in the previous days: **acceptance**. It was through the negative that this contact was re-established, by virtue of the word that ends this reflection like an unexpected climax - the word "**unacceptable**". It's because a whole "side" of us is rejected as "unacceptable" by those around us, and first and foremost by our parents who set the tone (or by those who take their place, when parents fail) - it's through this **non-acceptance** that conflict sets in within us. The conflict and division within us is nothing other than our **abdication of** a repudiated part of ourselves - the abdication of our undivided nature. This abdication is the price we pay, the price we **must** pay, to be "accepted" both in our own right and by others.

by those around us. This "acceptance" is not acceptance in the full sense of the word, acceptance of who we really are. It is, rather, □ the **reward** for our submission to p. 527

This is the reward for a **deformation** and **mutilation** of our being, just as those around us have undergone from an early age.

In the reflections in the previous notes, there was mention of acceptance of repeated games, and both times the ac-

---

<sup>75</sup>(\*) This "understanding" or conviction is not really contradicted, it seems to me, by the observation I've made many times, that the division in the couple formed by mother and father, and the antagonistic attitudes that express it, leave a deep mark on the child, and often dominate adult attitudes and behaviour. It is surely fair to say that, to a large extent at least, the division within us is the mark and legacy of the division that, in the days of our childhood, pitted our mother against our father. So the question of whether the division in the person is more fundamental or "elementary" than that in the couple, or vice versa, may seem a little like deciding whether the chicken comes out of the egg or the egg out of the chicken!

I'm convinced, however, that in a couple where one of the spouses is "one", not in conflict with himself or herself, and even if his or her spouse maintains an antagonistic attitude towards him or her, the conflict would **not** be transmitted to the couple's children. The reason for this belief, I believe, is that the child in such a case would be totally **accepted** by one of the parents. The appearance of division in the young child seems to me to be no more and no less than the effect of the **rejection** of a part of his being by those around him, and first and foremost, by **both** parents.

<sup>76</sup>(\*) The note "The half and the whole or the crack", n° 112.

ception appeared as a crucial thing, the first time being in the note "Innocence (The marriage of yin and yang)" (n° 107), where I take up an observation that goes back to a meditation four years ago: that the blossoming and full flowering of an undivided force in me could take place in the context of from a family torn apart by conflict and latent hatred, **simply because I was fully accepted by my parents** and those around me, conflict didn't take root in my being until later, after the age of five, in a much more "peaceful" environment than my birth family. Conflict between close relatives was certainly far from reaching (in my day at least) such exacerbated (if veiled) intensity as in my family of origin. And yet, in my family of origin, I myself remained **outside the conflict**. Even when I sometimes took sides, it wasn't a heartbreak, it was the spontaneous expression of an undivided being, who had never known the bite of rejection by his own kind, or the fear of rejection.

I realize now, with half a century's hindsight, that even in my new environment, this force of innocence in me exerted a radiance, a kind of fascination I'd say; like that of a **lost paradise**, infinitely far away, for which we might be nostalgic for a lifetime, and which suddenly calls out to us through the voice and gaze of a child. It won me strong and lasting affections, which followed me into my adult life, and right up to the death of those who loved me in this way<sup>77</sup> (\*). But **at the same time**, it was obvious that this force **could not be tolerated** - any more than one tolerates it in a tidy pleasure garden, in a vigorous, exuberant tree or bush that one thinks one loves, while stubbornly pruning it into the shape of a cube, cone or sphere. ...

According to my reconstruction of events<sup>78</sup> (\*\*), this force held out for perhaps two, two and a half years, before plunging deep, relegated into the underground, after I had finally decided to be and do what everyone else was doing: all muscle all brains, you guessed it, and never mind the guts - and be left in peace! I ended up following suit, **rejecting** and denying (while ignoring) everything that needed to be rejected and ignored, thanks to the unwavering consensus of all the adults around me. And also by the consensus of my parents themselves, who had almost given up, living their true love as far away from their children as possible... ...

p. 528

### 18.2.5.2. (b) The cycle

**Note 116** (November 1) I'm resuming the thread interrupted exactly one week ago, when I unexpectedly (on October 26) launched into a kind of "poetic digression" on the feeling of death in love and in the song of love.

I've just reread the previous pages from October 25 and retyped the last one. I seem to see a circle that began two weeks ago with the note "Ecllosion de la force - ou les épousailles" (n° 107). This trace ends with the preceding pages, which repeat and amplify the final "climax" of the note of October 17, "La moitié et le tout - ou la fêlure" (n° 112). This climax, or "final word", which brings that day's reflection to a close, is summed up in the categorical imperative of the final word, **"unacceptable"**.

Among the bewildering multitude of conditioning of all kinds that have shaped our lives, this fine word seems to me to perfectly encapsulate **the** decisive cause of division within us: it's the **non-acceptance, the rejection** of ourselves, in the first years of our lives<sup>79</sup> (\*). It takes the form of non-acceptance, of the rejection of certain forces and impulses within us, which are an essential part of our being, of our power.

<sup>77</sup>(\*) I see seven people who have given me their affection in this way, only one of whom is still alive today.

<sup>78</sup>(\*\*) I made this reconstruction of the key events of my childhood in March 1980.

<sup>79</sup>(\*) My own case was exceptional in this respect, as I was only exposed to such attitudes from my immediate entourage from the age of six.

to know and create. Their repression, taken into our own hands by a worried and implacable inner Censor, is a mutilation of this power within us. Its effect is often to paralyze our creative faculties<sup>80</sup> (\*\*).

□ This unacceptable power, or these "faculties," are also nothing other than the humble ability to be ourselves. p.

529

It also means living our own life, through the humble and full use of our own faculties, rather than a stereotyped, programmed life, driven above all (and often exclusively) by reflexes of **repetition** and **imitation**. These enclose us and isolate us like a heavy, stiff, impermeable shell from which we would never part<sup>81</sup> (\*).

The shell is built up from our earliest years, growing thicker as the years go by. Its initial function was undoubtedly to protect us from aggression (often well-intentioned) by those closest to us, and to ensure a more or less benevolent tolerance on their part. But this shell doesn't just protect us from the outside world - it also has, and perhaps more profoundly and essentially, the function of isolating us, of protecting us from **ourselves**: from that knowledge and strength within us, declared "unacceptable", having no place, by the mute consensus that rules around us. It was in our childhood, and has become more and more over the years, a **two-sided** shell, one "outer", the other "inner". They protect the "me", the "Boss", on the one hand from the aggressions he fears from the outside world (and he tends to become more fearful with each passing year!), and on the other hand and **above all**, from the disturbing and inadmissible fantasies and incongruities of the "Worker"; the dirty **brat** to put it better, unpredictable or possible, worrying still even though he's kept at bay by a triple layer of thick horn, guaranteed to resist fire and water... .

(November 2) After the note "Innocence" (n° 107 ), highlighting the role played by my acceptance by my immediate entourage in my early years, there was a second moment when "acceptance" and "non-acceptance" were at the center of reflection. It was in "Acceptance the yang

in the yin," (note n° 110), where I make a partial assessment of the changes that have taken place in me since the day a "reunion" with the child king. They are moving towards a gradual "return" to a "state of childhood".

□ This return is by no means a "regression" to a previous state, which would have the virtue of erasing the traces in me, p. 530

the traveler, of the path that was once mine. It's only through **maturation**, the fruit of inner work, that we can regain contact with an innocence that seemed to have disappeared, with a child in us that seemed long dead and buried. And there's no maturing that isn't also a return in some small way - a return to the child, and to the simplicity, the innocence of the child. This is how a life fully lived is like a circle still "perfecting" itself; it's old age returning to childhood, it's maturity returning to innocence - and ending in a death, perhaps, that prepares a new birth, as a winter prepares a new spring... .

In this sort of "balance sheet" of an unfinished road back, it became clear that the "final word" was **acceptance**, just as the final word of my path of rupture, of the path of departure, was that of **non-acceptance**, rejection, refusal. My maturation was nothing other than the process, the inner work, by which I gradually accepted, welcomed, the things in me that for a long time I had refused, eliminated as best I could, ignored.

This is by no means a "backtracking", a path travelled once that I would retrace again in the opposite direction; a "regression" therefore, to use the expression from earlier. Rather, it's like the upper arc of a cycle, extending and continuing the lower line already traced, **born** from it, which has become like its

<sup>80</sup>(\*\*) (November 2) Often, and more ostentatiously, it manifests itself in "blocking" effects - the inability both to "function" in such and such a situation in which we are engaged, and to disengage ourselves from this dead-end situation. ...

<sup>81</sup>(\*) Apart from the hours of sleep and dreaming, when the carapace becomes lighter: sometimes even disappears. ...

and the springboard for new momentum. ...

(November 3) Yesterday's notes ended with an unexpected image, springing from reflection without my having called for it. I greeted it with some reluctance at first, out of concern that the vision of reality that the image in turn immediately suggested might be artificial; that the image might "force my hand" and make me say things that would be "far-fetched". But once the last lines had been written and I'd stopped to think about them for a moment, I knew I'd put my finger on an unexpected and important aspect of a certain reality; an aspect I may know about, but haven't fully assimilated, an aspect I tend to neglect or forget.

p. 531 □ I've tended for many years (118) to value what goes in the direction of "acceptance", and, on the contrary, to see in a mostly negative light what goes in the direction of "refusal". Although perhaps not always clearly expressed, I felt that these two attitudes, acceptance and refusal, were "opposites", one of which would be "good" for myself and for everyone, and the other "bad".

In this informal way of apprehending things, I remained trapped (without realizing it, of course) in the age-old "dualistic" vision of things, the one I had also previously called the "warrior" vision, which opposes as antagonists things that a deeper vision reveals to us as **complementary** and inseparable **aspects of the** same reality. When I began (on October 25, ten days ago) the present reflection on Acceptance and Refusal, I had just realized that these are the wife and husband of one of those famous yin-yang or "cosmic" couples we've been talking about for the past month - since the beginning of this "digression" on yin and yang. So I anticipated that this aspect of things would come to the fore. Over the past couple of days, it may have seemed as if we were moving away from it. But now, the lines that conclude yesterday's reflection, with the image of the two arcs of the same cycle extending each other, have unexpectedly brought me back to this initial intuition, which had remained unexpressed.

I've tended to see the **rejections** that dominated my life from my eighth to my forty-eighth year in a predominantly (if not exclusively) **negative** light: as a sometimes crushing **weight** that I dragged around for quarter-century years of my life, and which I finally got rid of (or rather, **started to** get rid of) over the past eight years. This "day" began to reveal itself to me after the discovery of meditation and the "reunion" with the "child" in me. This was precisely the moment when I began to discover the process of refusal in my life, expressed in a kind of "superyang conformism". This aspect of things is by no means imaginary. To perceive it where before there had been a kind of "blank", a total emptiness, has been one of the fruits of the maturation that has continued over these eight years. Yet there is another aspect of the same reality, no less real and important, the "positive" aspect of the **"powerful principle of action"**. This aspect appears for the first time (and very discreetly) in the October 5 meditation "Yang buries yin - or the Superpère" (n° 108), when I write:

□ "The "I'll be like them" (and not "like me") also meant: I'm going to "bet" on "the head", not worse in me than in anyone else, after all, and 'beat' them with their own weapons!"

p. 532 It was this motivation that was the driving force behind my disproportionate investment in mathematics from 1945 to 1969 - the force that fuelled a quarter-century's worth of discoveries<sup>82</sup> (\*). Whether one chooses to view such investment in a "positive" or "negative" light, what's clear is that there was indeed **momentum**, intense **action**. On the learning side of life, there was that "sometimes crushing weight", never examined, so to speak.

---

<sup>82</sup>(\*) It was, more precisely, the egotic component of this impulse, the **egotic** "factor" of this "living force".

not to say total stagnation - and yet this same "weight" at the same time fuelled a surge of knowledge, gave it its living strength.

Since my "departure" in 1970, I've tended to downplay, and sometimes deny, the "value" that should be attributed to such an impulse, in the direction of a so-called "scientific" discovery and understanding of the outside world. I've tried several times in the course of Harvest and Sowing to identify the common aspects of such discovery and self-discovery, and how they differ<sup>83</sup> (\*\*). It's certainly true to say that the impulse to discover in a scientific direction (be it biology, or "psychology". . . ) leads us away from ourselves and an understanding of ourselves. When the role of such an understanding is fully understood, we might be tempted to see the impulse to scientific discovery (and any other that "distances us from ourselves") as an "evil", or at the very least, an "obstacle" to maturation, and hence to full self-fulfilment (at least in the case, which has been mine for a long time, where this impulse mobilizes most, if not all, psychic energy). Yet it's also true that **everything** we experience is raw material for learning about life and ourselves. It's a **material that it's up to** us to allow to transform into knowledge, by allowing a process of maturation to begin and continue within us. That's also why I don't regret anything I've experienced, seeing in the end that "it's all good, and there's nothing to throw away"; including the deserts of long periods of spiritual stagnation, which were the main reason why I'm so happy with my life.

price I paid without skimping (and with my eyes closed. . . ) for my inordinate investment in a passion  
□devouring

. Now I see that these very deserts had something to teach me, that only they can- p . 533  
be could teach. I couldn't have done without it - at the very most, I might have been able, after a few years, to start this "second arc" of the cycle, which I'd been putting off for several decades.

It was on this day, too, that it became clear that the acceptance of myself and of others, which was born and developed in the years of my maturity, was "nourished" by the refusals that had marked the longest part of my life - this "lower arc" of the cycle evoked yesterday, and its "nourishing foundation". Certainly, in the first six years of my life, there was indeed a total acceptance of myself, which had in no way needed previous "refusals" to be, and to unfold and assert itself. On the contrary, it was able to blossom precisely because it was not countered, not trimmed by the scissors of a certain refusal. But this "acceptance" that was in me as a child is not **"the same"** as that of my mature years. It lacked a dimension that the mere acceptance of me, by those who had surrounded my childhood, could not have given it. It was a **knowledge of refusal**, of the rejection of myself (or a part of myself) by others, or by myself. This knowledge came to me through the experience of rejection, and also through the experience of contempt, which is one of its many faces.

Perhaps some people are born with a knowledge, an understanding of refusal, that enables them to remain **one**, innocent and knowing, despite the refusals to which their childhood is exposed. I am well aware that this was not my case. I could not do without the experience of refusal and contempt by others and myself, as a breeding ground for the blossoming of an understanding (however imperfect) of refusal and contempt.

### 18.2.5.3. (c) Spouses - or the "Evil" enigma

**Note** 117 I've just probed an unexpected aspect of the relationship between refusal and acceptance in my own life, which had appeared unexpectedly in yesterday's reflection. The "refusal" in question here is not, however, a refusal in the full sense of the word; I mean, a fully assumed refusal - not by a long shot. This refusal was also a

---

<sup>83</sup>(\*\*) See in particular "Desire and meditation", "The forbidden fruit", "The solitary adventure", n° s 36, 46, 47.

long **flight** in the face of the thing refused. It consisted in **not seeing it, ignoring it**, and thereby, to a certain extent, making it disappear from the field of my conscious apprehension and also, from the field □ visible to others. It

was both the cause and the outcome of a state of disharmony, of imbalance - in this case, a "superyang" imbalance, which marked my adulthood, and certain crucial mechanisms of which remain in action to this day. This "refusal" therefore in no way appears here in a role of symmetry, or even yang-yin complementarity, opposite the "acceptance" (of myself and others) mentioned earlier. The latter, on the contrary, is part of a process of self-awareness, aimed at re-establishing a disturbed harmony. It's an acceptance in the full sense of the word - and not just another flight, in the opposite direction to the flight sometimes called "refusal".

There is, however, a more obvious relationship between "refusal" and "acceptance" than the one probed earlier. It appears when both are taken "in the full sense of the word". They are then **simultaneous** and complementary aspects of the same harmony, of the same fully-assumed attitude (whereas sometimes they were two **consecutive** aspects of a path or progression, passing through a state of imbalance, of disharmony, on the way to renewed equilibrium). From this point of view, there is no such thing as "true" acceptance, which would exclude or close itself off to refusal. And there is no "true" refusal that is not born of acceptance, that is not a tangible manifestation of it; that is not one of the two "faces" - the "yang" face - of the same indivisible thing that comprises two, and whose "yin" or "mother" face is acceptance<sup>84</sup> (\*).

An "acceptance" that excludes refusal is not acceptance, but complacency (to others or to oneself, or both), or complicity or connivance (when it comes to the "acceptance" of others).  
trui). Total acceptance of a being, whether oneself or another, in no way implies approval.

□ unconditional approval of his actions, habits and inclinations. Such unconditionality is in itself an **escape**, a refusal to acknowledge (often eloquent) reality, and by no means an acceptance of it. Far from creating a "force field" conducive to renewal, to reconnecting with a forgotten unity, it reinforces inertia, and helps to keep us in a rut.

A refusal that is not at the same time an opening, that is not also like a hand (or "a perch") extended to others, or like a start that marks a point of rupture and renewal in one's relationship with oneself.

- such a "refusal" is truly a cut, which "cuts" and isolates both the one who refuses, and the one who is refused. It is yet another flight from a reality felt to be unpleasant, even disturbing, fraught with threats to our well-established lives, to our conveniences - a reality we believe we can escape from with a slashing blow: "there's no point"... . And yet **it is!** And our imperative "refusal" in no way prevents things from being what they are, even at the risk of displeasing us. On the contrary, just like the complacency of automatic approval, such a refusal reinforces inertia against creative change, and is like a **verdict**: unacceptable you are, and such you will remain... .

I don't pretend to realize in myself the harmony of fully assumed acceptance and rejection. On the contrary, I know I can't - and I'm not sure I've ever met anyone who could. To achieve it is also to have solved, in my own person, the great enigma of "evil": of iniquity, of lies, of wickedness, of spinelessness, of contempt - and of the suffering of those who are "evil".

<sup>84</sup>(\*) It's interesting to note that this "natural" distribution of yinyang roles in the acceptance-rejection couple (expressed in French by the feminine and masculine genders of each term of the couple) is **reversed** in the image that had spontaneously presented itself to me at the end of the previous day's reflection. That there can be such reversals is hardly surprising - just as in a lover-lover couple, where the love relationship is undefined, there are bound to be moments when the roles in the love game are reversed, giving free rein to the "yang" erotic impulses in the lover and the "yin" erotic impulses in the lover. I talk about the importance of such occasional role reversals in the note "Acceptance (the yang in the yin)" (n° 110, last paragraph of the first part of this note).

stricken and speechless. It is also, surely, to have fully understood the "good" that lies in what an inner awakening so often designates as "evil".

To refuse war, while seeing and accepting that it is everywhere and in everyone; that the very people I love carry it within them and propagate it, just as I myself have taken it up, carried it, propagated it and passed it on. To refuse war, while accepting that it exists, while loving its countless blind soldiers. This and nothing else, surely, is what it also means: to have come out of the war, to have emerged from the conflict - to have stopped propagating war.

#### 18.2.5.4. Yang plays yin - or the role of Master

**Note 118** □(November 4)<sup>85</sup> (\*) The appearance of this "tendency"<sup>86</sup> (\*\*) was in the early '70s, i.e. in the years following my "departure" from the mathematical scene. Under the influence of an environment and friends quite different from those before, there was a drastic turnaround in all "values" of which I was a member. With hindsight, I can describe this shift as a passage from a "superyang" or "patriarchal" value system, to an almost opposite one, with a strong "yin" dominance - a "matriarchal" system. Among the influences that played a part in this reversal were sporadic readings of

Krishnamurti - on this subject, see the note "Krishnamurti - or liberation become hindrance" (n° 41).

If I then allowed these influences to play a part, which were to lead me to such an "ideological" turn, it's undoubtedly (without realizing it at the time) that there was a deep and urgent need for renewal within me, and first and foremost, the need for liberation from the weight of inveterate "superyang" attitudes. This same need had surely already come into play in 1969, when in the midst of intense and fruitful mathematical activity, I suddenly "dropped out" of maths to take an interest in biology<sup>87</sup> (\*\*\*); then the following year, leaving (with no spirit of return) the mathematical scene and even scientific research. There was then a sudden and drastic change of environment and activities, to which I've had occasion to allude several times during "Fatuity and Renewal" (the first part of Harvest and Sowing).

However, it would be inaccurate, or only partially true, to consider these spectacular changes of environment, activities and finally "values", as a "renewal", a "liberation". I've already said I've made this point quite clear in the section entitled "Rencontre avec Claude Chevalley - ou liberté et bons sentiments" (n° 11). In the more penetrating light of the present reflection on yin and yang, I can say that the change that appears to be the most significant of all, that of yang values evacuated (even before myself, let alone examined) in favour of yin values - this change, however, in no way altered the structure (superyang) of the "I", and at most somewhat tempered the attitudes of the "I".

and behaviors that followed. It's true that my understanding of the outside world □s'était consid- But this transformation remained fragmentary, limited almost exclusively to the intellectual level, that of "options". It could not have been otherwise, precisely as long as this transformation was limited to my vision of the "outside world", in which my own person did not figure, or figured only incidentally or superficially, above all through my "social role" and its ambiguities and contradictions. No more than in the past, I had not the slightest suspicion that in **my own person**, there could be ambiguities and contradictions! On the contrary, I was driven by an unshakeable conviction that **my** person was free of all contradictions (even though I was beginning to discern contradictions in others, all around me),

<sup>85</sup>(\*) This note is taken from a footnote to the "Cycle" note (n° 116). See the reference at the beginning of the November 3 notes.

<sup>86</sup>(\*\*) The tendency to value "acceptance" as opposed to "refusal".

<sup>87</sup>(\*\*\*) I first became interested in "molecular biology", under the influence of my biologist friend Mircea Dumitrescu, who introduced me to this fascinating world.

that there was a perfect match between my conscious desires and my conscious knowledge of things on the one hand, and my unconscious (if there was one in my case, if it wasn't a mere carbon copy of my conscious. . . ).

The first crack in this conviction only appeared in the spring of 1974, when I finally understood that something must be wrong with **me** too, and not just with others, as the cause of this inexorable deterioration in my relationships with all those close to me (to which my life then seemed to have been reduced, throughout my adult life). The effects of this salutary crack remain limited, in the absence of a genuine **curiosity** about myself, which would have been a feast to dig into, to look at what was behind it, and to see in the process the collapse of a heavy edifice, made of abracadabra illusions and never examined... .

This stubborn blockage of a natural curiosity surely stemmed above all from the fact that I had never before encountered such curiosity in others, which might have made me suspect that in life as in maths, whenever a problem presents itself, there's plenty to look at and, in the process, learn lots of unexpected and very useful things - in other words, that there was such a thing as **self-discovery**. I had been reading Krishnamurti at the time, and had come to realize that some of the things he said were deep and important. So I tended to take him at face value all the way.

88□

p. 538 I had more or less tacitly adopted the Krishnamurtian(\*) worldview .

I'm talking about, this baggage has indeed acted as a "hindrance" to true liberation, to renewal in the full sense of the word. I explain myself on this subject in the aforementioned note (which I've just reread), where I try to pinpoint the role of the "Teachings" (of Krishnamurti) in my own itinerary. The first "awakening" in the full sense of the word came only two and a half years later, with the discovery of meditation. It was also the discovery of self-discovery; that there is an **unknown thing** that is "me", and that I have the power to penetrate this thing, to know it. This crucial discovery was made at a time when all teaching (whether capitalized or not) had been forgotten. It was also the moment when, for the first time, the "edifice", built of received ideas and "teachings" of all kinds, held together by immense inertia, collapsed - and the moment when an active curiosity appeared, often mischievous, and always caring.

It was after this turning point, with the blossoming within me of a curiosity about myself first and foremost, and about "life" in addition and as a natural fruit, that I was able to see both Krishnamurti and his message with new eyes. With hindsight, I was able to appreciate the richness of the message, and at the same time discern its limitations and shortcomings, as well as certain fundamental contradictions in the Master ("the Teacher", for his disciples and followers). The most serious of these shortcomings and contradictions seems to me to be the one I've just touched on again: the absence of any curiosity in the Master himself. There's nothing in his writings to suggest that, in those distant days, this vision was **born** in a **person** - a person caught, like you and me, in the net of ready-made ideas and contradictions never spotted; that the vision was **decanted from error** in the course of intense, sometimes painful **work**, against the current of

p. 539 immense forces of inertia; that the stages of this work, or the "thresholds" crossed in the course of these labors, were so many unexpected **discoveries**, each overturning a whole set of inveterate ideas'□ **perpetuated** by

<sup>88</sup>(\*) (November 5) The effect in my life of this "adoption" of a vision, becoming a kind of cultural baggage, has remained most limited. My attention was drawn to certain aspects of reality that had previously escaped me entirely, but without any in-depth work of sorting and assimilation, with the power of renewal. If Krishnamurti was important in my itinerary between 1970 and 1976 (between my "departure" from the mathematical scene and the discovery of meditation), it was not so much because of the "baggage" I borrowed from him, as because he had become (unbeknownst to me, of course) a tacit **model**, to which I conformed without wanting to appear to do so - the model, in short, of the "Guru-not-Guru", of the Master who denies himself to be one.

the universal mechanisms of imitation and repetition<sup>89</sup> (\*).

All these things, the child one day knew them, and even experienced them, having lived them intensely. But the Master has forgotten them, and never remembers. Rather than being a child, who passionately discovers and **learns**, and transforms himself in the process, he wanted to be the unchanging **Master** who **knows**, of unchanging infused science, and who devotes his life to spreading his **Teachings**, for the benefit of ordinary mortals. He made himself what his followers and disciples, those who believed in him, wanted him to be: the embodiment of a static, repetitive and therefore reassuring message, the apostle of a new ideology. A **Guru-not-Guru**, in short, like myself (emulating his example, perhaps<sup>90</sup> (\*\*)) once was... .

(November 15) I have named the preceding note (from November 4) "Yang plays the yin - or the Master". As befits a meditation on myself, the main name of the note concerns my own person, referring to a certain "game" I played, however, for a few years after my departure from the scientific world in 1970<sup>91</sup> (\*\*\*). As for the second name "The Master", it can be interpreted indifferently as referring to myself, through a designation of the role or pose I held in this game of "yang playing yin", or to that of Krishnamurti, who served as my tacit model.

In fact, the values that emerge from Krishnamurti's books are almost exclusively yin values. When I first read Krishnamurti (in 1970 or 1971), it was the first time I'd seen such values put forward, and the limits and flaws of my (and "everyone else's", with variations) yang vision of the world identified with penetration. This must have been the reason for the very strong impression this reading of a few chapters made on me. Six or seven years later, I also had the opportunity to read Mrs. Luytens' fine biography of Krishnamurti. It confirmed a

certain impression of his person that already emerges from his books (nobosting the fact that he never appears in them in person). Today I would express it by saying that the basic tone in his temperament is □ strongly yin. p. 540  
What's more, throughout all his writings, we see, like a constant leitmotif, the emphasis on yin qualities, attitudes and values, and the devaluation (explicit or by omission) of yang qualities, attitudes and values.

Krishnamurti's life and teachings thus embody the quite exceptional attitude of "**yin buries yang**", which runs in the opposite direction to the by far more common attitude of "yang buries yin", of which my own life (until my forty-eighth year at least) offers an equally extreme illustration. Krishnamurti's "superyin" options<sup>92</sup> (\*) have the great merit of running counter to the basic values of the surrounding culture. Nevertheless, they seem to me to be no less repressive (of one part of him by another part) than mine have been.

There is, however, a very pronounced and striking "yang" aspect to Krishnamurti's life, which was undoubtedly first imposed on him by the role of figurehead, of (future) "spiritual master", decided upon by his prestigious theosophist tutors when he was still a child. Subsequently, after the great turning point in his life marked by discoveries that radically altered his vision of things (discoveries that became by

---

<sup>89</sup>(\*) (November 5) These mechanisms are clearly part of the basic mechanisms of the psyche, in both humans and animals. They pre-exist all conditioning, all learning (such as that of language by the young child, and that of almost all the acts of daily life), which could not be established or carried out without them. They were no less present and efficient in the young Master-to-be than in anyone else.

<sup>90</sup>(\*\*) (November 5) Decidedly, the dubious nuance of this "maybe" is out of place! See the penultimate footnote written today.

<sup>91</sup>(\*\*\*) The moment of the discovery of meditation, in October 1976, marks a sharp decline in this game, which continues as best it can, in a more discreet register, until 1981, when it is finally detected and defused. On this subject, see the section already quoted "Le Guru-pas-Guru - ou le cheval à trois pattes", n° 45.

<sup>92</sup>(\*) These "options" undoubtedly go back to his childhood, and more precisely to his first contacts with his theosophical tutors.

The role of "master", or "guide", was (it seems) entirely internalized, and taken over by the propagation of a doctrine that was personal to him, and not taken over from his theosophist masters. This propagation represents an intense, even exhausting activity. It hardly seems to me to be in keeping with a **balance of** yin and yang, but rather a **constraint** imposed on an eminently contemplative temperament, by an "ego" as strong and invasive in the master as in anyone else. Seen in this light, the present note "Yang plays yin", which deals mainly with Krishnamurti, could also be called "**Yin plays yang**".

Thus, on two different occasions and in two different ways, I have played "games" in my life that are like an **inversion of** the attitudes that dominated the life of the person who, at a certain point in my life, was to become the tacit model of my (equally tacit) brand image, and of certain attitudes.

p. 541 and poses within me. But through styles of expression that are inverses of each other, I now recognize an obvious kinship. One is in the presence of **repression** (unconscious, it goes without saying), general<sup>93</sup> trice of a disruption of the natural balance of yin and yang<sup>93</sup> (\*). The other is to be found in the choice of a **role**, and in the **weight of this role**, its effect of slowing down, even blocking, in a blossoming, in a maturation, in the progression of an understanding or knowledge. This role (or pose) was the same for me as it was for my role model, from whom I may have simply borrowed it as it was. This is the **role of the Master**.

## 18.2.6. Yin and yang mathematics

### 18.2.6.1. (a) The most macho of arts

**Note** 119 (November 5) I've been meaning to talk about yin and yang in mathematics for some time now. The two aspects of yin and yang in mathematical work, or in an approach to mathematics, only became apparent to me in the course of my reflections on yin and yang over the last few weeks. I foresaw that probing this dual aspect to some extent in these notes would be the most natural way of "getting back to my sheep", in these notes which are supposed to be a retrospective on "a mathematician's past".

What's been clear to me from my first thoughts on yin and yang (five years ago) is that "doing maths" is perhaps **the most yang**, the most "masculine" of all human activities known to date. In fact, any entirely intellectual activity, such as scientific research in particular and, more generally, any activity commonly described as "research", is a very strongly yang-dominated activity. I was going to write: "marked by a strong yang imbalance", and this is indeed the case when this activity absorbs almost all a person's energy. This yang predominance (or imbalance) is evidenced by a number of yin-yang couples, where it is clear that it is the yang term above all, not to say exclusively, that is "present" in intellectual work. I'll just mention a few, all of which belong to the same "group" (or "door to the world"), which I call the "vague - precise" group. (NB in this last couple and those that follow, the term yin comes first).

- sensitivity - reason (or intellect)
- instinct - reflection
- intuition - logic
- inspiration - method
- vision - coherence

p. 542

---

<sup>93</sup>(\*) We're certainly in very good company!

- the concrete - the abstract
- the complex - the simple
- the vague - the precise
- dream - reality
- indefinite - definite
- the unexpressed - the expressed
- the informed - the trained
- the infinite - the finite
- the unlimited - the limited
- the whole - the part
- global - local (or parcel-based).

I've just gone through my yin-yang repertoire, and come up with a whole bunch of other pairs that give a sense of the superyang character of pure intellectual activity. I'll just mention the first of all those I thought of earlier: the **mind-body** pair.

Having said this, it seems to me that among the various types of intellectual activity, mathematical work represents the ultimate extreme-yang. This is undoubtedly due above all to its character of extreme abstraction, the fact that it is, to a very large extent, independent of any "support" by sensory experience and reasoned observation of the external world, the world in which we live and in which our bodies move. This extreme abstraction distinguishes mathematics from all other sciences, and mathematical work from all other intellectual work, making it a science or work "of pure reason". In contrast to the experimental and observational sciences, it is also the only science whose results are established by **demonstrations** in the most rigorous sense of the term, following a rigorously codified and in principle infallible **method**, the so-called "**logical**" **method**, to arrive at **certainties** that leave no room for doubt or reservation, or for the possibility of exceptions that would have escaped the cases observed so far. These are the extreme-yang features of mathematical work, and mathematical work alone.

Certainly, these traits had a way of attracting me from childhood, me who had opted for "the head" and for "the head".

the extreme yang!<sup>94</sup> (\*) Particularly after the experience of war and the concentration camp, faced with discriminations and prejudices that seemed to defy even the most rudimentary reason, what fascinated me most was

in mathematical activity (from what little I knew of it □ during my high school years), it was this **pou-**

p. 543

**I could see that**, by virtue of a simple demonstration, I could win over even the most reluctant of people, in short, **force** their assent, whether they were well-disposed or not - provided only that they agreed with me to the mathematical "rules of the game". When I first came into contact with school mathematics in 1940 at the Lycée de Mende (where I was able to attend, despite being interned at the Rieucros camp five or six kilometers away), I seemed to know these rules, to feel them instinctively, as if I'd always known them<sup>95</sup> (\*). Surely, I felt them better than the teacher himself, who unconvincingly recited the usual platitudes about the difference between a "postulate" (in this case, Euclid's, the only one he and we had ever heard of... ) and an "axiom", or "**the** demonstration" of the three "cases of equality of triangles", by following the textbook like a First Communion pupil would follow his breviary.

Five years later, seduced by the sudden prestige of atomic physics, it was for studies in

<sup>94</sup>(\*) Except, however, for the military and warlike variant, with parades, uniforms, standing to attention with a bulging torso, and impeccably organized massacres and mass graves. ...

<sup>95</sup>(\*) These first contacts took place shortly after my childish reflections on squaring the circle, referred to in note no. ° 69.

physics that I first enrolled at the University of Montpellier, with the idea of learning about the mysteries of the structure of matter and the nature of energy. But I soon realized that if I wanted to learn about mysteries, I wouldn't be able to do it by taking courses at university, but by working on my own, alone, with or without books. As I didn't have the flair, nor the equipment, to learn physics that way, I put it off until a more propitious time. I then started doing maths, while following a few courses "from afar", none of which could satisfy me, nor bring me anything beyond what I could find in current textbooks. But I still had to pass my exams. ...

### 18.2.6.2. (b) The beautiful

**Note** 120 (November 6) Looking back over yesterday's notes just now, I was able to confirm that I had made-

p. 544

tention to avoid a certain confusion between mathematical **work**, a very yang-dominant activity, and "mathematics". It's surely no coincidence that in both French and German, the word for it is feminine, as is "**la science**", which encompasses it, or the even broader term "**knowledge**"<sup>96</sup> (\*), or also "**substance**". For the mathematician in the true sense of the term, by which I mean the one who "does mathematics" (as he would "make love"), there is no ambiguity about the distribution of roles in his relationship to mathematics, to the unknown substance that he therefore knows, that he knows by penetrating it. Mathematics, then, is as much a "woman" as any woman he has ever known or even desired - whose mysterious power he has ever felt, drawing him into her, with a force that is both gentle and unrelenting.

I first became aware of the profound identity between the impulse that drew me to "women", and that which drew me to "mathematics", a few months before my encounter with the stanzas of the Tao Te King that were to set me off on the Eloge de l'Inceste (and, along the way, on my first systematic reflection on the "feminine" and the "masculine", whose Chinese names "yin" and "yang" I didn't yet know). That was six years ago, when I wrote a two-page text entitled "En guise de programme" (by which I meant: for the (C 4) "Initiation à la Recherche" course, of which this text constituted an introduction, or more exactly a declaration of intent about the spirit of this "course". After writing this text, which came to my pen most spontaneously, I was struck by the abundance of images springing from one another, charged with erotic connotations. I was well aware that this was no accident, nor the result of a simple literary intention - that it was an unequivocal sign of a profound kinship between the two passions that had dominated my adult life. Without thinking at the time of deepening the matter through systematic reflection (which would appear only a few months later, when I wrote the Praise), or even (I think) of formulating clearly for myself what was suddenly perceived, I think I can say that in that moment I learned, without fanfare, something important - I had "discovered" something<sup>97</sup> (\*\*), something that had entirely eluded me before.

p. 545

Of course, like everyone else, I'd heard of Freud and libido sublimation and all that, but that's beside the point. Even tons of books on psychoanalysis and whatnot can't do the trick. to spare such moments, when all theory, all "baggage" is forgotten, and suddenly some□que thing "clicks!". It's at moments like these that our knowledge of things is renewed. It has nothing to do with

<sup>96</sup>(\*)On the other hand, "**le savoir**" is masculine, and is indeed "l'époux" in the yin-yang couple "la connaissance - le savoir". The German is less clear-cut here, since both "Kennen" and "Wissen" are **neuter** (as substantivized verbs).

<sup>97</sup>(\*\*) It was then a "discovery" in the "yin", "feminine" mode - which takes place by welcoming new knowledge into ourselves, in a state of silent openness to what comes to us. Such moments have been rare in my life, I think. In any case, the moments of discovery I remember are almost all yang, "masculine" in tone.

read books, listen to lectures, i.e.: increase knowledge<sup>98</sup> (\*).

When I think of "mathematics", I certainly don't mean the totality of **knowledge that** can be described as "mathematical", recorded from antiquity to the present day, in publications, preprints or manuscripts and correspondence. Even if you eliminate the repetitions, that's probably a few million pages of compact text; a dozen tons of books perhaps, or even a few thousand thick volumes, enough to fill a spacious library: nothing to get a hard-on about, quite the contrary! Talking about "mathematics" only makes sense in the context of a **vision**, an **understanding** - and these are essentially personal, not collective. There is as much "mathematics" as there are mathematicians, each of whom has a certain personal experience of it, more or less vast or limited, one of the fruits of which is his own understanding, his own vision of "mathematics" (the one he has known), always more or less fragmentary. It's a bit like "**the** woman", which may seem to some as

a mere abstraction, or as a hollow formula and yet has a deep, powerful, irrefutable (for me at least) "reality", of which every woman met or known is an embodiment and represents p. 546

one aspect; and the **same** woman in another's experience undoubtedly represents yet another incarnation, yet another aspect.

My intention here is in no way to confront the difficulty of "integrating" this vast multiplicity of experiences, understandings and visions of "mathematics" into a totality, a unity - and this, moreover, at a time when we are witnessing (it seems to me) a kind of relentless "divergence" in mathematical production, and when no mathematician can flatter himself that he knows, even if only in outline, the totality or essence of what has been accomplished in our science. Rather, my aim was to examine the interplay of yin and yang in mathematical **work**, i.e., in the relationship between the mathematician (or any mathematician, starting with myself) and "mathematics". The thing under scrutiny, then, is "the mathematician" or "that mathematician" (in his or her relationship to mathematics), rather than "mathematics" itself.

### 18.2.6.3. (c) Desire and rigor

**Note 121** (November 7) At the level of our intellectual faculties, of reason, to "know" something is, above all else, to "**understand**" it. And in a work of discovery that takes place in this register of our faculties, the impulse to know that drives the child in us (independently of the motivations of the "I", the "Boss") is the **desire to understand**. This is perhaps the main difference between the drive for intellectual knowledge and its elder sister, the drive for love. This desire to understand pre-exists any "method", scientific or otherwise. The latter is a tool, fashioned by desire to be used to

---

<sup>98</sup>(\*) This observation is not contradicted by the fact that it is quite possible, and even probable, that this "awareness" (the passage to the conscious level of something perceived in the unconscious) was facilitated by the existence of the Freudian consensus, of which I had heard without it really making me feel either hot or cold. Knowledge can encourage the emergence of new knowledge, but it's much more common, it seems to me, for it to nip in the bud any hint of emergence - in the same way that ready-made "answers" nip in the bud the emergence of a (good) question. ...

It's remarkable that, while "everyone's heard" a little about the role of the erotic drive in creativity (artistic or scientific, let's say), there was no trace of it in the consensus that prevailed in the circles to which I belonged at one time or another. And yet, there was no shortage of striking facts that could have tipped me off a long time ago. Up until three years ago, periods of intense creativity in my life, and especially periods of inner renewal, were also marked by a powerful influx of erotic energy. Nevertheless, my mathematical activity has never been accompanied by conscious erotic images or associations. But I do remember being somewhat disconcerted, in the '50s, during a work session of the Bourbaki group, by a colleague and friend who mentioned to me, as the most common thing in the world, a peculiarity in his mathematical work: when he had reached the end of a difficult task, he felt an imperious urge to make love (with or without a partner) - and this all the more strongly the more satisfied he was with what he had just done.

its ends: to penetrate the unknown accessible to reason, for the purpose of understanding. Knowledge is born of the desire to know, and therefore of the desire to understand, when it is reason that wants to know. **Method**, as an instrument of desire, is by itself powerless to give birth to knowledge - any more than the forceps of a doctor, or even the expert hands of a midwife, give birth. But they can sometimes usefully assist the birth of the newborn, when the time is ripe and they know how to come at the right moment... .

Many, if not all, high school and university students must feel the rigor of mathematics.

p. 547  
tic, preached to them by sullen masters, as a kind of a priori entirely external to their humble selves, incomprehensible and arbitrary, dictated by a peremptory and impitoyable God to a Euclid promoted to Grand Censor-in-Chief, with the mission of making countless generations of schoolchildren pale at the task of swallowing Culture with a capital C as best they could. I must have been one of the few not to have passed through this stage in my relationship with school mathematics - to have instinctively sensed, from the very first encounter and within the narrow confines of a sixth-grade math book, the original function and meaning of rigor: that it was a flexible and astonishingly effective instrument in the service of an understanding of those things called "mathematics" - things that reason alone can fully know. This "rigor" is also like the soul and nerve of what I called, in the reflections of the day before yesterday, "the rules of the mathematical game", and what earlier I called "the method". Having only glimpsed them, it was as if I had always known them - as if it were my **own** desire that had delicately, lovingly shaped them, like a key that had the power to open up for me an unknown, mysterious world, whose foreboding richness would prove inexhaustible... . And it was my own desire that continued to refine this tool throughout my high school and university years, before any encounter could lead me to suspect that somewhere there were **fellow human beings** - people who, like me, found pleasure in probing the In-known that this key, apparently unknown to all (including my teachers), alone had the power to open up<sup>99</sup> (\*).

#### 18.2.6.4. (d) The rising sea. . .

**Note** 122 (November 8) It's been three days since I started thinking, in principle, about "yin and yang in mathematics", and I have the impression that it's still going on, even though I'm partially absorbed in other occupations and tasks. By dint of preliminaries, I still haven't come to the point I wanted to make from the start: that in my own <sup>□mathematical</sup> work, it's the **yin** note, "feminine", which dominates!

p. 548

I realized this a few weeks ago, on the bangs of the present reflection on yin and yang, and in connection with the "association of ideas aroused by the three-part Funeral Eulogy", which was the starting point for this long digression (see the beginning of the note "Yang buries yin (1) - or the muscle and the gut"). To tell the truth, this association of ideas (to which I'll return later) was more or less based on the intuition that my approach to mathematics was strongly yang-dominant. This intuition was quite natural, since it was my superyang options that had motivated my long-term investment in mathematics. However, this intuition, or more precisely, this idea, was wrong - all it took was

<sup>99</sup>(\*) Still, the little math I'd learned in high school and university might have been enough to make me realize that, in the past at least, there must have been people like me, those in fact who were called "mathematicians". Mr. Soula (one of my professors at university) had told me about Lebesgue, who would have solved the last open problems in mathematics, including measurement theory (which I'd been working on since leaving high school in 1945). But in those years (1945-48), my desire to clarify by my own means the questions I had been asking myself was so exclusive, that it excluded any kind of curiosity about the existence, work or person of mathematicians past or present.

that I take the time to examine it a little and realize that the opposite is true.

For a surprise, it was: a surprise! I didn't mention it "on the spot" in my notes, so as not to cut off the train of thought as I tried to work out how I perceived yin and yang and the philosophy that emerged for me. But here we are at last!

This misconception about the nature of my approach to mathematics must have crept into me, unexamined and as a matter of course, from the time I started paying attention to the yin-yang aspect of things, five or six years ago. It must be a residue of my yang, virile brand image - a residue that has continued to linger there, out of sheer inertia, because I haven't bothered to sweep it up. ...

Perhaps the reader will have the impression that I'm taking him for a ride, given that as recently as three days ago, I explained at length that mathematical work was the most superyang of superyang activities - that in the relationship to mathematics, mathematics was "the woman", and the mathematician as an enterprising lover - and now, all of a sudden, I raise the question of whether, in the case of my humble self, my work or my "approach" is yin or yang, and conclude (as the most natural thing in the world) that it's yin, who'd have thought! If there's any apparent confusion here, it stems from a lack of understanding of this universal fact: that in everything, be it the most yin or the most yang in the world, the dynamics of yin and yang are at play, through the marriage of the two original forces. Thus fire, the most yang of all things and the very symbol of yang, is yin in some of its aspects (this is the "yin in yang")' □ and conversely water, which is the very symbol of yin, is yang in some of its aspects and p. 549 functions (it's the "yang in the yin"). There's no need to develop these two particularly instructive examples here - Surely, the reader intrigued by these observations (which may seem peremptory or sibylline) need only follow the associations of ideas with fire and water, to discover for himself the reality of yin in yang, and yang in yin. And if he's a mathematician, or just familiar with intellectual work (even if he's not a mathematician, or even a scientist), he'll have no trouble discerning the existence of complementary yin and yang modes of approach to any kind of intellectual work, however "yang" it may be in comparison with other, less fragmented types of activity.

A possible starting point would be to go back to the fifteen or so yin-yang couples mentioned at the beginning of the reflection three days ago<sup>100</sup> (\*), when I noted that for each of these couples, it was the predominance of the yang term that took place in intellectual work (especially mathematical work), when we compare such work with other types of activity, such as making love, singing, painting (a picture or a wall, for that matter), gardening and so on. This doesn't alter the fact that, if we stay within a given activity such as doing maths, let's say (all things yang, it's understood), we can distinguish a balance (or sometimes, an imbalance) of either yin or yang traits, varying from one mathematician to another and sometimes, within the same mathematician, from one job to another.

For example, in some works it is the **logical** structure of the theory developed that is emphasized, in others it will be the **intuitive** aspects, there is an imbalance, manifested in the reader or listener by a familiar feeling of **unease** (and sometimes in the author too), when one of these indispensable aspects is grossly neglected, to the "benefit" of the other. (When both are grossly neglected, we throw the book in the garbage can, or leave the room slamming the door!) When each of the two aspects is strongly present, whether explicitly or between the lines, this manifests itself in a very familiar feeling of unease. also familiar with harmony, beauty, balance and satisfaction. So it is, irrespective of

"basic □ tone" that dominates the approach taken, whether that tone is in the "logical", or "intuitive" (or p. 550

---

<sup>100</sup>(\*)See "Le plus macho des arts", note n° 119.

also "structure" or "substance"). There's no need to expand on this instructive example, to describe where the problem lies (i.e., to identify the "malaise" referred to earlier), when one or other of the two aspects is neglected; the reader already knows this from his or her own experience! Similar observations are bound to emerge for most of the yin-yang couples considered three days ago. Perhaps even for all of them, even if some are more delicate than the intuition-logic pair, and will undoubtedly require more in-depth examination to be fully understood.

I now had to try and make this fact a little more explicit, or rather "get it across" - that in my way of doing maths, it's my "feminine" yin traits, more than my "masculine" ones, that are running the show. If the idea here was to take this impression to its logical conclusion, testing it in as many ways as possible, the natural thing to do (which did occur to me yesterday) would be to go through the yin-yang pairs I'm aware of, those that might represent (among others) an aspect or mode of apprehension of intellectual work (there must be about fifty of them, I suppose), and see for each of them which of the two "spouses" of the pair predominates in me. I anticipate that in every case, one of the two will, on examination, prove to be predominant.

So, in the intuition-logic pairing, I notice at first glance that both aspects are strongly present in my mathematical work. This is a sign of balance and harmony, among other signs pointing in the same direction. As befits a yin-yang couple, for me (in my work, I mean), the two spouses are truly inseparable - the logical structure of a theory develops step by step and in conjunction with the deepening of an **understanding of the things it deals with**, i.e., also in conjunction with the development of an ever finer and more complete **intuition of them**. Perhaps in my published works, in keeping with the canons of the mathematician's craft, it is the yang aspect, the "structure" or "logic" or "method" aspect, that is most apparent, most obvious to the reader. Yet I'm well aware that what drives and dominates my work, what is its soul and *raison d'être*, are the mental images that are formed in the course of the work to apprehend the reality of mathematical things.

p. 551 ☐ Certainly, I've never skimmed when it comes to identifying, as meticulously as possible, by means of the language. It is in this continual effort to formulate the unformulated, to clarify what is still vague, that the particular dynamic of mathematical work (and perhaps also of all creative intellectual work) may be found. It is in this continual effort to formulate the unformulated, to specify what is still vague, that perhaps lies the particular dynamic of mathematical work (and perhaps also, of all creative intellectual work) - in a continual dialectic between **the** more or less unformulated **image**, and the **language** that gives it form and, in the process, gives rise to new, more or less blurred images that deepen the previous one, and which in turn call for a formulation to give them form. ... . In fact, it's this perpetual effort to use language to define, as precisely and perfectly as possible, what at first appears as an indefinable and unformed "presentiment", as an informal "feeling", as an image shrouded in mist. ... it's this work that, since my childhood and still today, fascinates me the most in the work of mathematical discovery. But if the "effort" here always seems to be on the "language" side, i.e. on the formulation, structure and logic side, which form the key ingredients of the mathematical **method** ; and if (by force of circumstance) **this is where** the visible aspect of a mathematical **text** (or at least its fruits) is to be found, this doesn't mean that (for me at least) this is not where the soul of mathematical understanding lies, nor the driving force or motivation behind mathematical work. I believe that very few of my works have reversed this relationship, that I have developed a "formalism" by allowing myself to be guided solely, or above all, by its internal logic, by desiderata of coherence, or by other aspects of the formalism itself, rather than by a content, by a substance, manifested in images, intuitions of a "geometric" nature.

trique". In any case, all my life I've been unable to read a mathematical text, no matter how trivial or simplistic, when I can't give it "meaning" in terms of my experience of mathematical things, i.e. when it doesn't arouse in me the mental images, the intuitions that would give it life, just as a living flesh of muscles and organs gives life to a body, which without it would be reduced to a skeleton. This inability sets me apart from most of my mathematician colleagues, and (as I've already mentioned) it's what often made it difficult for me to fit into the collective work of the Bourbaki group, particularly during the joint readings, where I was often left behind for hours on end, while everyone else followed along at ease.

\*      \*

\*

□ I have just followed some associations of ideas about my mathematical work, linked to the "intuition-" couple. p. 552

logical", and to a few neighboring couples who introduced themselves in the wake of this one; the informs  
 - the formed, the undefined - the defined, the informal - the formulated, the vague - the precise, inspiration - method, vision

- coherence. ... It would surely be instructive to review one by one (as I had been thinking of doing) all the possible and imaginable "couples" in relation to intellectual work, and probe for each one in what way and to what extent either of the two spouses is present in my mathematical work, and whether or not one of the two seems to "set the tone", and which one. Over and above a more delicate apprehension of the particular nature of **my** mathematical work, such "piecework" will surely deepen my understanding of the nature of mathematical work in general, and also my apprehension of each of the couples thus reviewed. But such systematic work would obviously take me too far, and would go beyond the reasonable limits of the present reflection. It seems more natural to me to try and find here, and "pass on" if I can, the associations of ideas and images that have convinced me (without having to go any further) that in my mathematical work, it is indeed the "feminine" traits of my being that tend surreptitiously to set the tone, and thus to find a kind of unexpected "revenge" (where one would least have expected it!) for the repression they had to endure in other spheres of my life.

Take, for example, the task of proving a theorem that remains hypothetical (to which, for some, mathematical work would seem to boil down). I see two extreme approaches. One is the **hammer-and-chisel approach**, where the problem at hand is seen as a large, hard, smooth walnut, whose interior needs to be reached, the nourishing flesh protected by the shell. The principle is simple: place the cutting edge of the chisel against the shell, and strike hard. If necessary, repeat the process in several different places, until the shell breaks - and you're happy. This approach is especially tempting when the hull has asperities or protuberances, through which to "take it". In some cases, such "bits" are obvious, in other cases, you have to carefully turn the nut over in all directions, prospecting carefully, before finding a point of attack. The most difficult case is when the shell is perfectly round and uniformly hard. No matter how hard you tap, the chisel's cutting edge slips and barely scratches the surface - you end up getting bored with the task. Sometimes, though, you manage to do it, by dint of muscle and endurance.

□ I could illustrate the second approach, keeping the image of the walnut that needs to be opened. The first p. 553  
 The parable that came to mind earlier is that you dip the nut in an emollient liquid - why not just water? From time to time, you rub it so that it penetrates better, and for the rest, you let time do its work. The shell softens over weeks and months - when the time is ripe, a squeeze of the

just hand it over and the shell opens like a ripe avocado! Or let the nut ripen in the sun and rain, and perhaps also in the winter frosts. When the time is ripe, a delicate sprout emerges from the flesh and pierces the shell, as if playing with itself - or to put it another way, the shell opens up on its own, allowing it to pass through.

The image that came to me a few weeks ago was even different: the unknown thing we're trying to get to know appeared to me as some compact expanse of earth or marl, reluctant to be penetrated. You can go at it with pickaxes or crowbars or even jackhammers: that's the first approach, that of the "chisel" (with or without a hammer). The other is the **sea**. The sea creeps in insensitively and noiselessly, nothing seems to break, nothing moves, the water is so far away you can hardly hear it... . Yet it eventually surrounds the restive substance, which gradually becomes a peninsula, then an island, then an islet, which is eventually submerged in its turn, as if it had finally dissolved into the ocean stretching as far as the eye can see. ...

Readers who are at all familiar with some of my work will have no difficulty in recognizing which of these two modes of approach is "mine" - and I have already had occasion in the first part of *Récoltes et Semailles* to explain myself on this subject, in a somewhat different context<sup>101</sup> (\*). It's the "sea approach", by submersion, absorption, dissolution - the one where, if you're not very attentive, nothing seems to happen at any moment: everything at every moment is so obvious, and above all, so natural, that you'd almost scruple to write it down in black and white, for fear of seeming to combine, instead of tapping a chisel like everyone else... . Yet this is the approach I've instinctively practised since my youth, without ever really having had to learn it.

This was also, in essence, Bourbaki's approach, and my encounter with the Bourbaki group was providential in this respect, by confirming me, by encouraging me to be **giant** in this "style" that was spontaneously mine, and in

p. 554

otherwise I risked finding myself more or less alone of my kind<sup>102</sup> (\*). It's true that this situation (being alone of my kind) had long been familiar to me, and didn't bother me that much. As for whether my instinctive approach to mathematical work was going to be "efficient", i.e. above all (according to the criteria in force, and especially for judging a beginner mathematician) whether I was going to be able to solve "open questions" that nobody had yet been able to answer, I couldn't know in advance, and I didn't worry too much about it. My natural inclination was to ask my own questions, rather than trying to solve those that others had asked themselves. In fact, it's mainly through the discovery of new questions and **notions**, new **points of view** and even new "**worlds**", that my mathematical work has proved fruitful, even more so than through the "solutions" I've been able to provide to questions that have already been asked. This very strong impulse to discover the right questions, rather than the answers, and to discover the right notions and statements, much more than the demonstrations, are also strong "yin" traits in my approach to mathematics<sup>103</sup> (\*\*). That's why I'm particularly sensitive when I see the best of what I've contributed to mathematics being treated casually or with disdain by some of my students, i.e. by the very people who benefited from it in the first place.

In any case, it was only in retrospect that I realized that my natural approach

---

<sup>101</sup>(\*) See "Dream and demonstration", n° 8.

<sup>102</sup>(\*) In this extreme-yin approach, I tended to go further even than most of my friends in Bourbaki were willing to go. This is probably one of the reasons why I ended up leaving the group towards the end of the '50s.

<sup>103</sup>(\*\*) Incidentally, I have the impression that it's no different for any other research work I do, including what I call "meditation".

of mathematics also "worked" when I felt attracted, inspired by a question that others had asked when, in short, it "clicked" and at the same time the question became "mine". If I tried to draw up a more or less exhaustive list of such cases, I suspect it would be quite long.

long. On the face of it, there are four such situations that seem to me to "stand out" for their scope<sup>104</sup> (\*\*\*).

In all four cases, the hypothetical theorem ended up being proved, for the most part, by the "from the sea rising", submerged and dissolved by some more or less vast theory, going far beyond the results it was initially intended to establish. In fact, I've noticed that the ideas, notions, formulas and methods I developed in these situations (and in others too) have long since entered the realm of "well-known" mathematics, which "everyone" knows and uses to their heart's content, regardless of their origin<sup>105</sup> (\*).

p. 555

#### 18.2.6.5. (e) The nine months and the rising sea

**Note** 123 (November 9) There's another point in common with the four cases mentioned yesterday, of open questions that were resolved (or rather, "dissolved") by "the approach of the rising sea". This is the role played by **J.P. Serre** in each of these four cases. It was above all a role of "detonator", to get me "started" on these questions, to use the expressions of a footnote in the Introduction mentioning this role (see "The end of a secret", section 8 of the Introduction). In fact (as I now realize), it appears that Serre played just such a role in the genesis of the main ideas and tasks I developed between 1955 and 1970, i.e. between the time I left functional analysis for geometry, and the time I left the world of mathematics.

I could say, with a slight exaggeration, that between the early fifties and around 1966, in other words for some fifteen years, everything I learned about "geometry" (in a very broad sense, encompassing algebraic or analytic geometry, topology and arithmetic), I learned from Serre' when I didn'tp learnt by myself in my mathematical work. I think it was in 1952, when Serre came to Nancy (where I stayed until 1953), that he began to become a privileged interlocutor for me - and for years, he was even my **only** interlocutor for themes outside functional analysis. I think the first thing he talked to me about was Tor and Ext, which I'd made my own, and yet, look, it's as easy as pie... . ... and the magic of injective and projective resolutions and derived and satellite functors, at a time when the Cartan-Eilenberg "diplodocus" had not yet been published. What attracted me to cohomology at that time were the "A and B theorems" he and Cartan had just developed on Stein's analytic spaces.

. 556

<sup>104</sup>(\*\*\*) The questions I have in mind here are, in chronological order of their solution, the following:

1. Validity of the Riemann-Roch-Hirzebruch formula in any characteristic.
2. Structure of the fundamental "prime to characteristic" group of an algebraic curve over an algebraically closed body of any characteristic.
3. Rationality of *L-functions* of fi ni type schemes over a fi ni body (part of the "Weil conjectures", and an important step towards the proof of these conjectures, completed by Deligne).
4. Semi-stable reduction of abelian varieties over the fraction field of a discrete valuation ring.

<sup>105</sup>(\*) I myself have often practised this carelessness about the origin of the "well-known" I used, except in cases where I knew the origin at first hand, having more or less witnessed the birth, or when I was the father myself. As I have seen many times over the years, and especially in the course of my reflections on the Burial, this elementary delicacy has often been lacking in some of my students or close friends in the mathematical world, even when it has been a question of things they have learned from none other than me, and whose origin they know beyond any possibility of doubt. On this subject, see the reflection in the note "Le Fossoyeur - ou la Congrégation toute entière", n° 97.

or two tête-à-tête with Serre that I sensed all the power, the geometric richness concealed in such simple cohomological statements. At first, they had gone completely over my head, before he told me about them, at a time when I hadn't yet "felt" the geometric substance in the beam cohomology of a space. I was so enchanted that for years I had been intending to work on analytic spaces, as soon as I had completed the work I was still doing on functional analysis, where I was definitely not going to linger! If I didn't really follow through on these intentions, it's because Serre had in the meantime turned to algebraic geometry and written his famous "FAC" foundation article, which made comprehensible and highly seductive what had previously appeared to me to be unbearably boring - so seductive, in fact, that I couldn't resist these charms, and so turned to algebraic geometry, rather than analytic spaces.

If I hadn't held back, I'd have been off, one thing leading to another, making the history of my relationship with Serre, which would also be little more than the history of my mathematical interests, from 1952 to 1970. This is not the place. I would only add that, as is only right and proper, it was from Serre that I was introduced to the four questions mentioned above. Of course, it wasn't a matter of pointing out the precise wording of the question, period. The essential thing was that Serre each time strongly sensed the rich substance behind a statement that, offhand, would probably have neither warmed nor chilled me - and that he managed to "convey" this perception of a rich, tangible, mysterious substance - a perception that is at the same time

**desire** to know this substance, to penetrate it. This is perhaps the most crucial moment of all in a work of discovery, the moment when  $\square$  "it clicks", despite having no idea yet so vague

p. 557

This is the real moment of "conception". This is truly the moment of "conception" - the moment from which gestation work can and does take place, given the right circumstances. ...

If Serre played an important role in my work and in my mathematical output, it seems to me that it was more in the appearance of those crucial moments, when the spark passes and obscure, invisible work begins, than in the technical means, unknown to me, that he sometimes provided me with at the right moment, or in the ideas that I borrowed from him at later stages of my work.

One of the reasons, no doubt, for the special role played by Serre, is my reluctance to keep abreast of mathematical news by reading, or even to learn the ABCs of a particular "well-known" theory by reading the books or dissertations that deal with it. As far as possible, I like to get my information from the living word of people who are "in the know". From the time I first came into contact with a mathematical environment (in 1948) until I left in 1970, I was fortunate never to lack a competent and willing interlocutor to keep me abreast of things that might be of interest to me. This may have created a dependency, but I never felt that way<sup>106</sup> (\*). In fact, the question of "dependence" could hardly arise, as long as my interlocutor and I were equally interested in what he was teaching me. Teaching the eager-to-learn is beneficial for both parties, and an opportunity for the "teacher" to learn, as well as for the one being taught.

The "reason" given earlier does explain the importance of interlocutors in my mathematical past, but not the exceptional role played by Serre, which seems to me to far exceed that of all my other "interlocutors" combined! What's certain is that Serre and I complemented each other perfectly. We had similar interests.

<sup>106</sup>(\*) The first and only exception was in 1981, long after my "departure" from the mathematical world. It was when I turned to Deligne as the ideal interlocutor for my Anabelian reflections, after my "Long walk through Galois theory". At the time, I clearly sensed the intention to take advantage of this unique interlocutor situation, to "turn me on my head" - and I ceased all mathematical relations with him, until today. On this episode, see the note "Two turning points", n° 66.

We had many strong points in common, and I sensed in him the same high standards and rigour that I put into my work. Apart from that, we worked in very different "styles". I have the impression that our approaches of the  $\square$  mathematics and our work complemented each other, without really ever encroaching on each other. The genre

p. 558

The kind of work I was doing (and the way I was doing it) was very different from Serre's kind of work. He might lay the first foundations of a theory in a fifty-page text, or even spend a year writing a medium-sized book elegantly and concisely expounding some subject that inspired him - but certainly not spend the best part of five years of his life, or even ten years or more, developing at length and in volumes a whole new language (which had been quite dispensable until then), to found a new and fertile approach to algebraic geometry, let's say. He introduced a number of fertile new ideas and notions, without letting himself be drawn into "carrying" them through to the end. On more than one occasion, however, these ideas and notions served as a starting point for a large-scale work that suited me perfectly, and for which there would have been no question of Serre himself taking the plunge.

An association comes irresistibly to me here. In the light of the reflections of the last few days, I see my relationship to mathematical work and to my "works" more as "**maternal**" than "paternal". The moment of conception, crucial though it is, represents for me a tiny portion of the "work" during which the thing in gestation, the "child" to come, grows and develops. This work is very much like that of a pregnant woman's pregnancy, which begins when the child is conceived, and continues for nine long months... . The time it takes to bring what was a foetus to term and to **give birth** - that is, to bring a **child** into the world, a living, **complete** child, not just a head or a torso or a baby skeleton or whatever. The mother's role is obviously very different from that of the father (even the best father in the world. . . ), who does little more than cast a seed, then goes off to do other things.

Clearly, Serre's mathematical work, his approach to mathematics, is strongly yang-dominant, "masculine". His approach to a difficulty would rather be that of the chisel and the hammer, very rarely that of the sea that rises and submerges, or that of water that soaks and dissolves. And he seems content to cast a seed, without much concern for where it will fall, or whether it will trigger conception and labor, or even whether the child that might be born of it will be in his likeness or bear his name.

$\square$  An image can help us apprehend an important aspect of a certain reality, but it does not exhaust reality. Reality is always more complex and richer than any image that tries to express it, and so it is with the images that came to me, without having sought them out, to express two different approaches to mathematics - Serre's and mine. Serre sometimes brought to fruition work that needed breathing space, just as I sometimes sowed ideas, some of which germinated and were brought to fruition by others. No more than in my approach to mathematics, I lack "virility" (whereas the background note is "feminine"), any more than Serre lacks "femininity" in his, balancing his "virile" background note.

p. 559

The same cannot be said of a creative approach to an unknown substance, be it mathematical or otherwise: there is no discovery, no knowledge, no renewal, except through the joint and inseparable action of the original yin and yang energies and impulses within a single being. It is in the intimate fusion of the two that lies the **beauty of** a being, or of a work of art - that delicate, elusive quality which signals itself to us through that special feeling of harmony, of satisfaction. This quality is present in all Serre's work that I have known, whether in person or through the texts he has written. I have known few mathematicians where it is so consistently present, and with such force.

### 18.2.6.6. (f) The Yin funeral (yang buries yin (4))

**Note** 124 (November 10) Yesterday's and the day before's reflections are far from exhausting the set of characters strongly marked in my mathematical work, which are of a yin nature. To probe them further, on the lines of the present reflection on yin and yang in mathematics, would also be an excellent opportunity for me to deepen an understanding of the nature of mathematical work in general. This theme of yin and yang in mathematics, which I thought I'd get round to in a day's reflection, and on which I've already spent five consecutive days feeling as if I'd only just begun, has just revealed itself as one of those many seemingly innocuous themes, which become broader and deeper the closer you get to it and the more you enter into it. There's no way I'm going to rush through this juicy theme (or even just "get around to it"), in the middle of a Funeral Ceremony that I've just started.  
don't want to drag this out of proportion!

p. 560

□ I'd just like to point out two more of these "strong characters" (without comment, I promise!).  
marked" in my mathematical work that go in the "yin", feminine direction. One is a predilection for the **general**, rather than the particular (which makes a "pair" or "couple" with it). The other trait seems to me to be even stronger, or to put it better, more essential, more neuralgic, and broader too (in the sense that it **contains** the first). If there is one "quest" that has run through my entire life as a mathematician, from the age of seventeen (fresh out of high school) right up to the present day, an incessant quest that has marked all my work (published or unpublished) since its inception, it is that of **unity**, through the infinite multiplicity of mathematical things and possible approaches to these things. Detecting and discovering this unity beyond the often bewildering richness of diversity (without taking anything away from this richness), recognizing common traits beyond differences and dissimilarities, and going right to the root of analogies and resemblances to discover profound kinship - this has been my passion throughout my life. The very differences, the expression of unlimited and elusive diversity, have come to seem like the infinitely branching branches and twigs of the same vast tree, where each and every branch and twig shows me the way to the trunk that is common to them all. Instinctively and by nature, my path has been that of **water**, which always tends to **descend**, the path towards this trunk, towards these roots. And if I liked to linger along the way, it was rarely at the ridge to explore leaves and delicate twigs, but above all at the large branches, the trunk and the master roots, to get to know their texture and feel through the bark the rising flow of nourishing sap.<sup>107</sup> (\*)

\*       \*

\*

p. 561

□ To tell the truth, I'm still not sure what to make of this newly discovered fact, how to situate it - that in my approach to mathematics, in my way of "doing math", the basic tone with me is strongly yin, "feminine". This is in line with a certain intuition I've already alluded to - that the

---

<sup>107</sup>(\*) I believe I can discern in this quest for unity through diversity, a distinctive trait common to the three passions that have marked my life, including passion for love and meditation. Perhaps even, apart from any passion, it's a **way of** apprehending reality in which I tend to see, pay attention to and give weight to common traits and kinships, rather than differences (without being tempted to overlook the latter). I've noticed that the most common tendency of many is the opposite tendency, the yang tendency, which often goes so far as to ignore or deny deep-rooted kinship. (Superyang tendency, characteristic of our culture. It is often accompanied by a reflex to level out differences, to align everything on the same supposedly "perfect" or "superior" model, for the sake of a false "unity", which is an excessive impoverishment as well as violence). These differences in accent between an interlocutor and myself have often been the cause of dialogues de sourds, in which two parallel monologues are developed that never meet. ...

basic tone of my deepest being, I mean the "child" in me or the "Worker", i.e. that which is creative and beyond conditioning (i.e. beyond the "I", the "Boss") - that this basic tone is also "feminine" rather than masculine. Perhaps I now have everything I need to clarify what this really is, by carefully examining all the signs that point either in one direction or the other<sup>108</sup> (\*), to recognize the significance of each, and what emerges from them as a whole. And if such work doesn't lead to a tangible "yes" or "no", surely it won't have been in vain, in order to get a better grasp of my ignorance, which at the moment is still hazy, unsettled, because I haven't meditated on it. Perhaps I'll do the same, once I've finished my work on Harvest and Sowing, and on the momentum of this one. But then again, this is not the place.

But if I've been led to this reflection on yin and yang, it's been in the course of a reflection in which I've been striving above all to understand certain relationships, between myself and others (among those who were my students, in particular). So it's the possible repercussions of the "new fact" that has just appeared, on my relationship with others and on others' relationship with me, that I'm mainly interested in here. And it's here, too, that I find myself at a loss to "place" or exploit this fact. Perhaps it has something to do with the fact that, apart from me, probably nobody has ever noticed such a thing - not on a conscious level, at least on a formulated level. In any case, I've never received any echoes that I could interpret in this sense, as far as I can remember - any more than I've received any echoes that I could interpret in this sense, as far as I can remember.

that I don't remember any echoes that would give me an image of myself.

"yin," while the character I've camped out since my <sup>infancy</sup> (if not early childhood) has been strongly p. 562  
yang; so much so that even now, this "virile" character seems like a second (?) nature, which continues to dominate my life in many ways.

It's true that the mere fact that a trait in someone (me, in this case) is not perceived on a conscious level doesn't necessarily prevent it from affecting relationships with others, and that this trait is indeed perceived in the mathematical world, among mathematicians who are more or less familiar with my work, and that this perception has "spread" among a much wider mathematical public.

- I have no doubt about it. When I wrote, in "L' Eloge Funèbre (1) - ou les compliments" that "the anonymous pen that has taken care of my eulogy here has gratified me abundantly with what today is delivered to disdain", I wouldn't have known at the time, to identify in a lapidary formula exactly what was "today delivered to disdain" by the mathematical fashion, among the things to which I attach value. But the very next day, through an "association of ideas" that I'll have to come back to<sup>109</sup> (\*), I had sensed (without perhaps having formulated it, and without it yet appearing as clearly as it does now) that "this something" was none other than everything that was recognized (at an often informal level) as being a "yin" or "feminine" way of doing mathematics, "feminine" way of doing mathematics - a way that was tacitly equated with "bombing", "nonsense" (to borrow the compliment paid by my pupil and friend Pierre Deligne, to the text that forms the basis of all his work), "cranking", "ease" and so on.

Certainly, in the Eulogy (delivered by this same friend Pierre), including in the passage where I am quoted in a breath with him<sup>110</sup> (\*\*), compliments were de rigueur! There was no question of nonsense or

<sup>108</sup>(\*) Several of my strongly marked yang traits seem to me to be **acquired** traits, stemming from conditioning, and more precisely, from the superyang brand image dating back to my childhood. These traits include an inordinate investment in action; a strong projection towards the future, i.e. towards the accomplishment of my tasks; a predilection for discovery work that is above all intellectual, and the invasive role of thought; a closed attitude towards anything that doesn't appear to be directly linked to my current tasks, and in particular my inattention to landscapes, seasons and so on. There is, however, one yang trait that seems innate and not acquired, and that's my strong affinity with **fire**, unlike my relationship with water, which is decidedly not "my element". In fact, it seems that my astrological chart is marked by a very strong yang imbalance, with all the signs that enter it being "fire signs", to the exclusion of all water signs.

<sup>109</sup>(\*) See the beginning of the note "Muscle and tripe" (n° 106), where this association is first mentioned.

<sup>110</sup>(\*\*) See note "L'Eloge Funèbre (2) - ou la force et d'auréole", n° 105.

p. 563

of bombast, but rather of "**titanic** aspect", "twenty volumes", "cleared **essential problems**", "greater **natural generality**" (sic), school "**nourished** by the **generosity** with which he communicated his ideas", "theories of **legendary depth**", "renewed **foundations**", "**opened** new applications", notions "so **natural** that it's hard for us to imagine the effort they cost" (not to say that they were "easy" - but that's something I took care to make clear myself<sup>111</sup> (\*\*\*)' □ "great attention to terminology" (not to say "bombing"), "**ancestors** of algebraic K-theory", "topos introduced... .. on a **general** base body", "**analogies suggested** by Grothendieck", "**conjectures**... .. still as unapproachable... .", "as Grothendieck had **dreamed** it". ... .

I've underlined the key words in these quotations - they're all words that denote a yin approach to things. The "perfect fingering" in this burial by "well-dosed compliment" consisted in the systematic use of hyperbole with regard to those qualities which, on the one hand, are "delivered to disdain", and on the other hand, are real and are of great value to me; and this **while** passing a complete and radical eraser stroke on the complementary aspects, which today have the exclusivity of honors, the "virile" aspects, as strongly present however in my work as in anyone else's, with very few exceptions.

In fact, it's these "virile" aspects and values, to the exclusion of the slightest "feminine" note, that are highlighted in the text on Pierre Deligne, both by the choice of a few epithets ("proverbial **difficulty**", "**surprising result**", "makes *l-adic* cohomology a **powerful** tool", "**first step**", "**astonishingly useful**", "**speed**", "**penetration**", "**enlightening and constructive reactions** to each question", "**brilliant discoveries**"), than by the detailed enumeration of tangible results (whereas not a single result of mine is mentioned in my portrait-minute, nor is it suggested that these results may have played a role for those of Deligne).

I'm not sorry I took the trouble to make this quick compilation of epithets - the effect is truly striking! If, at the level of structured knowledge, few people have any notion of yin and yang, we have to believe that in the unconscious of my friend Pierre, as in that which served as his scribe, there is a perception of flawless certainty. Here, it is put to good use for a certain cause: to deliver to scorn he who must be delivered to scorn, and to designate a hero to the admiration of the crowd.

p. 564

In fact, I doubt that these three short texts I've just looked at had very many readers. But whether or not they did seems to me to be an incidental question. As far as I'm concerned, these texts were addressed, not not to hypothetical potential patrons (after all, it's not my friend Pierre's concern to find patrons to finance his institution), but to the "Congrégation toute □ **entière**", which appeared in the reflections at the time. course of the note of the same name (aka "Le Fossoyeur" n° 97). The message they carry is like a shortcut and masterly of innumerable messages in the same vein, from my friend Pierre and others among those who were my friends or students, and others still perhaps, messages captured and approved by this same Congregation. If there is such a thing as a collective unconscious (and I'd be inclined to think there is now), there's no doubt that in the unconscious of this Congregation (aka the "mathematical community"), as in that of the Grand Officiant at my solemn funeral, there's the same flawless perception of what's yin (pissed off!), and what's yang (hats off!).

And all of a sudden, this funeral appears to me in a new, unexpected light, in which my own person has become an accessory, a **symbol of** what must be "handed over to disdain". These are no longer the funerals of a person, nor of a work, nor even of an inadmissible dissidence, but the funerals of the "mathematical feminine" - and even more profoundly, perhaps, in each of the many participants applauding the Eulogy, **the funerals of the disowned woman who lives within himself**.

<sup>111</sup>(\*\*\*) See note "The trap - or ease and exhaustion" n° 99.

### 18.2.6.7. (g) Supermaman or Superpapa

**Note** 125 (November 11) Exceptionally (for once. . . ), I woke up early this morning, after barely four or five hours' sleep. The unexpected outcome of yesterday's reflection immediately set in motion intense work to "place" and assimilate the new fact that had just emerged, just enough time to warm up a hearty soup and have a snack before going to bed at three o'clock last morning. And early in the morning, this same work dragged me out of sleep, then out of bed... ..

If I speak of an "unexpected" outcome and a "new" fact, I must add that from the very beginning of this interminable "digression" on yin and yang, there had been in me a kind of restrained expectation of a "denouement", or at least the expectation of a "junction" that was to take place with a certain procession, which had assembled in a Funeral Ceremony. It might have seemed that I was drifting further and further away from the scene of the funeral, or even that it had been definitively forgotten - and yet no, it had. always there, as if in mute or filigree. I had never really left them. Their silent presence manifested itself in this discreet and constant expectation, this feeling of tension, of suspense, which carried me towards p . 565

that still nebulous point where the "junction" was finally to be made. I could sense the approximate location of this junction point - it was around a certain "association of ideas" (evoked more than once, but still not formulated) which had been the starting point, the initial motivation for this unforeseen journey through yin and yang and through my life. All in all, this journey was to be like another great cycle, returning (more or less. . . ) to its point of departure; or rather, like a turn in a downward spiral, taking me a notch deeper into the thing probed, "to the very heart" (if my premonition wasn't deceiving me) of this Funeral.

But just as I'm getting ready to "land", and at the turn of a final paragraph of a "note" that's still all about "digression" or even "rehashing", here I am, suddenly in the middle of a funeral ceremony and right in the heart of it, a bit like an extraterrestrial who's catapulted himself right in front of the priest in his chasuble and the congregation of the faithful ; or even worse, like a deceased person, believed dead and (almost) already buried, who suddenly lifts the lid (and wreaths and touching epitaphs come tumbling out!) and there he is in person, in his white shroud and sparkling eyes, like a living imp emerging from his box when you least expect it!

Thus, the culmination of yesterday's reflection was at the same time the denouement of that suspense I spoke of, a very particular suspense that is very familiar to me in "sea-spreading" work, be it mathematical or any other. But in the very wake of this relaxation of a long suspense immediately appeared a **perplexity**. I think it's this perplexity above all that has absorbed me ever since, and which, at ungodly hours, has drawn me from bed to the typewriter. That there should be perplexity is hardly surprising - it happens, more or less, every time a situation suddenly appears in a new light, which at first sight would seem to contradict an old vision. The very first thing to do, then, is to carefully probe these contradictions, to examine to what extent they are real, or only apparent, i.e. expressions of an inertia of the mind which is reluctant to recognize the "same" thing under two different lights. This indispensable work is complete, when all the dissonances have been resolved into a new harmony (albeit a provisional one), into a vision that encompasses and brings together previous partial visions, correcting or adjusting them as necessary, and eliminating those that would turn out to be fundamentally wrong. In such a renewed vision, the "old" which gave rise to it, p . 566 i.e. the more fragmentary visions that come together in it, itself acquires a new meaning<sup>112</sup> (\*).

To return to my "perplexity", here it is. The "denouement" or "new day" consisted of an image

<sup>112</sup>(\*) Compare with the reflections in the two sections "L'Enfant et le bon Dieu" and "Erreur et découverte", n° s 1 and 2.

suddenly appeared - that of the burial with great pomp of the "symbol" of the "mathematical feminine", incarnate in my person, and projection at the same time of the "disowned woman" in each of the participants at the funeral; or to put it another way, it's the image of the symbolic burial of a kind of **Super-Mother**, as an expiatory victim in short and in place of the woman-but-rarely-mother who vegetates in the obscure underground of each of the participants who came to applaud at the funeral. This image seems to contradict **another, opposite**, still hazy, one that had gradually formed in the course of the pre-June reflection (culminating in the note "The Gravedigger - or the entire congregation"): that of a **Super-Father** both admired and feared, both attractive and hated, "massacred" by his children, whose mutilated remains are delivered to derision during the "same" funeral. Placed side-by-side (if that were even necessary), these vividly colored images will seem to border on the zany and delirious, and I can easily imagine the scalp dance that these psychoanalytical fantasies are bound to provoke, assuming there are any readers who have had the breath to follow me this far!

I'll leave them to their dance, which will add an exotic note to this unusual funeral, and in the meantime I'll follow up on an association that arose last night, which I believe will reconcile these two supposedly antagonistic, even irreconcilable, images or facets, and even make them love and marry.

## 18.2.7. The reversal of yin and yang

### 18.2.7.1. (a) The reversal (1) - or the vehement wife

**Note** 126 (November 12) I had thought of pursuing in my notes that association mentioned at the end of yesterday's notes, of a nature to "reconcile" and "make love" the two seemingly antagonistic images that had emerged from my funeral. As I was about to start the notes in this direction, I sensed a reluctance, which I wouldn't want to ignore.

The association concerned my mother's relationship with my father, and the meaning of the destruction of the family that had led to the death of my mother.

p. 567 took place in 1933, by my mother's will overcoming my father's acquiescence (reluctant and embarrassed at first, then eager and total). This crucial episode marked a kind of reversal in the couple ☐ **formed by** my mother and father.

My father had been the ostentatiously adulated heroic embodiment of virile values, while my mother (a strong-willed, domineering character if ever there was one) strutted her stuff in the colors of the subjugated and happy woman, over a daily life marked by constant confrontation. Acquiescence to the children's sacrifice marks the moment when the God and Hero **collapses**, followed by a veritable orgy of "triumphant contempt for the woman who, only the day before, had played the role of swooning adulteress, and who now took the place of the fallen hero, emasculated and happy to be so, reduced to the despised role of "woman", from which she herself was relieved at the same moment... .

The little I've said is so schematic, so quintessential I'm afraid, that it's more likely to give rise to innumerable misunderstandings than to help us understand the hidden motives behind a certain burial. However, I feel that this is not the place to expand on what I have just outlined in a few words. To render with a minimum of finesse a complex reality, blurred at will by the two protagonists, would require a new and lengthy digression, of a magnitude that the context does not justify. I don't feel inclined to delve into it at present, and all the less so as this is a situation that involves others than myself, and where my own responsibility (as co-actor) doesn't really seem engaged. I, and my sister, figure not as actors, but as **instruments** in my mother's hands to bring down the ardently admired and envied Hero, in order to take his place and make him an object of derision.

If this scenario, patiently uncovered five years ago<sup>113</sup> (\*), is the most extreme and violent of its kind that I've ever experienced, I've nevertheless had ample opportunity since then to detect very similar scenarios in other couples. The work I did on my parents' lives helped me open my eyes to things that had previously escaped me entirely. I was stunned at the time, and with good reason! Today, I would tend to believe that, apart from the particular violence of the colors, the kind of antagonistic relationship I uncovered in the couple formed by my parents is more or less typical of couple relationships, or at least extremely common. So the reader who, like me, has ended up using his or her faculties to fathom the hidden springs of couple antagonisms, or of female-male antagonism, won't be otherwise surprised (or even shocked) by what little I've said here.

□ If I try to disregard what is peculiar from one case to another, and draw out the common points to the male-female antagonisms I've been able to see up close and where I've understood something, there's this.

p. 568

1. In women, admiration and envy of men, due to the (often overrated) prestige they enjoy as a result of their status (as males, in particular) and the qualities (real or supposed) that justify it.
2. Often there's an element of resentment, even hatred, due to an amalgam (unconscious, as it happens) between the man (lover or husband, for example) and the father. The antagonistic relationship between mother and father is taken up by the daughter, who identifies (more or less completely) with the mother. More direct motives for resentment (towards the father) are often added (his tyrannical attitudes, lack of affection, attention or concern, etc.). Subsequently, these feelings of antagonism (and others), "ready to use", are projected as they are onto the partner (actual or potential), whether or not the latter has "the head for the job".

So when earlier (in 1°) I wrote that women's dispositions (of admiration and envy no- This is only partly true. It seems to me that, more often than not, the **driving force** behind these dispositions **comes from the relationship with the father** (even if the latter is long dead and buried), and that its entry into action depends only to a limited extent on the particular personality of the partner.

3. To compensate for her feelings of inferiority (entirely subjective, needless to say) and veiled antagonism, or even animosity or hatred, there's a fear of exercising power over her partner (even though it's he who, by more or less tacit general consensus, is supposed to hold authority). The woman exercises power by any means at her disposal (the most powerful being her body, and above all, her children,<sup>114</sup> (\*)), and it is almost always hidden. The gratification that accompanies it is therefore mostly unconscious, but no less real and important. The power game often becomes all-consuming, becoming the main content of a woman's life, absorbing almost all her energy, and to which everything else (including the love drive and children) is subordinated, even sacrificed, without hesitation.
4. □ The most extreme case, the most torn, is when admiration and envy towards the male, which it is to dominate while appearing to submit to him, is accompanied by contempt, even disgust and hatred, for what is feminine - for her own condition as a woman. Yet it is only by playing on her "femininity" that she can hope to subdue the man, or at least maneuver him to her will.

p. 569

<sup>113</sup>(\*) On this subject, see the two notes "La surface et la profondeur" and "Eloge de L'écriture", n°s 101 and 102.

<sup>114</sup>(\*) The main common "means", however, is not mentioned here, being of a more subtle nature, difficult to describe in a few words. It consists of a certain all-purpose "tactic", examined in the later section "The claw in the velvet" (notes n°s 137-140) of the reflection on yin and yang.

willingly! So, to satisfy her strongest egotic impulse, that of "making her partner work" (or even subduing him, or breaking him. . . ), she finds herself forced into a role that is hated, felt as contemptible, as unworthy of her. It is in this extreme case of refusal of her own condition and nature, that of a superyang and anti-yin option, that she will seek an illusory escape from the conflict she carries within her, using all her strength to achieve a **role reversal**: herself substituting for the man, the hero and master, once admired and envied and now fallen, reduced himself to the role she had long worn as an abject livery, the despised role from which she would finally be delivered... .

The sketch I've just made is also schematic, capable at best of **evoking** a certain reality for those who have already perceived it for themselves here and there, without perhaps having yet tried to define it as best I could through a summary description like this one. If I wanted to give it some relief, I should at least try to specify the different **levels** (almost all unconscious) on which this set of mutually antagonistic feelings and desires are played out. Moreover, in this tangle of inexorable egotic mechanisms, from which the love drive seems rigorously absent, I'd also have to try and find out whether and to what extent it contributes to the never-ending round-about (like the force of the wind, perhaps, captured by the wings of an ingenious mill to make a heavy millstone turn forever... . ), and to what extent it also happens that the cogs sometimes stop and fall silent, to give free rein to **something else**.

And finally, I've left out entirely what's going on inside him, the "partner" or protagonist, as if he existed only in relation to her, as the **object of** attraction and repulsion, admiration and envy of the woman facing him. This is undoubtedly one of the reasons for this omission: in this merry-go-round of the couple, who play the active role, investing themselves in it wholeheartedly, often finding their true *raison d'être* in it (if not their own).

p. 570 better), while **he** sees nothing but fire, busy as he is elsewhere and □ moreover as naive as any<sup>115</sup> (\*), reacting one after the other without trying to understand, and (what's more) without understanding indeed, not even (it seems to me) on an unconscious level. At least, that's the impression I've always had, ever since I started paying attention to the couple's merry-go-round! But it's also true that I'm much less familiar with the man's role, since I've only been able to observe it up close in the case of my modest self, whereas I've had the opportunity more than once, on the other hand, to get to know the woman's role from the very front.

In any case, even if I were to take great care, over ten pages or a whole volume, to flesh out my rather schematic description, it would still be wasted effort for a reader who has not yet "used his faculties" in this area, and who has never seen or smelled anything of the kind. As for the reader who is a little "in the know", surely the little I've said about it, notwithstanding clumsiness and obscurity, will be enough to put him back in the bath of things he had already perceived for himself, and to arouse in him images and associations no less rich than those that were present in the background, at the time of writing my lapidary description.

It doesn't take much more, it seems to me, to see the "missing link" between antagonism to the "Superpère" (finding its expression in the symbolic burial of the latter), and contempt, rejection of the "feminine", and more profoundly, the denial of "the woman" in oneself (which may find expression in the symbolic "Burial" of a "Supermère", under a plethora of dithyrambic double epithets).

<sup>115</sup>(\*) (November 23) Of course, if the merry-go-round is spinning, it's because (however "naive" he may be) **he's** enjoying it just as much as she is - and she's making it her job to see to it! It seems to me that the two main "hooks" by which she "holds" him (and by which she too is held. . . ) are vanity, and a need for emotional and love security, guaranteed by a stable partner. And then there are the children...

use. . )<sup>116</sup> (\*\*).

### 18.2.7.2. Retrospective (1) or the three parts of a picture

**Note** 127 □(November 13) The time seems ripe now for me to try to trace in a few largep lines a vision both sharper and more nuanced of the Burial, which (as I wrote the day before yesterday) "encompasses and reunites the earlier partial visions, correcting or adjusting them as necessary. . . ". I see three such earlier visions, which we must recognize as partial aspects of a single **everything**.

The first aspect to emerge, the most obvious and also the most simplistic, is the "**reprisal for dissent**" aspect, which was the aspect most emphasized in the note "Le Fossoyeur - ou la Congrégation tout entière" (cf. note 97 p.) - the last note before the illness episode. It's also the note, among those from processions I to X (those before the incident), that seems to me to capture the **collective motivations** most deeply, those of "Le Fossoyeur" alias "La Congrégation (quasiment) tout entière".

The second aspect, which I might call "**massacre** (more than just symbolic) and **burial** (symbolic) of the **Superfather**", doesn't appear. Perhaps this is because this component of the funeral's motivations doesn't really concern "the entire congregation", which was the focus of my attention at the time, but mainly (if not exclusively) "those who were my pupils". It's true that, even leaving aside their undisputed leader, my friend Pierre, they played a leading role in the implementation of the Burial, which would not have been possible without the contribution of

of some, and without the acquiescence of all. (On this subject, see the note on "Silence" (see note no.° 84 p.). It is It is through them, above all, that the "Superpère" aspect seems to me crucial to an understanding of Burial.

The first aspect, the "retaliation" aspect, came to my attention from the time of Yves Lade- gaillerie's setbacks in 1976<sup>117</sup> (\*); since then, I've tended to forget this aspect, but periodically it has come back to my attention, over the following years. It has finally gone beyond the formless stage of being "felt" without more, and by becoming the substance of a clear and nuanced understanding, in the quoted note on the "Gravedigger".

The second aspect'□or "Superpère" aspect, only began to appear in the course of reflection in Ré- coltes et Semailles<sup>118</sup> (\*), and first<sup>119</sup> (\*\*) without any connection with the Burial as such, which I was to discover only in the following months. This aspect gradually emerges from the mists throughout the reflection on the Burial, finally taking striking form with the notes "Le massacre", "La dépouille. . . ", ". . and the body" (87, 88, 89). These notes are dated May 12, 16 and 17, the "Gravedigger" note is dated May 24; the illness episode appears on June 10, and puts an end for over three months to the continuation of the notes, which resume on September 22. At the very least, it's likely that if this episode had not occurred, at a time when I was about to take stock of the whole and draw a final line, my vision of the Burial would have stopped at that which had emerged in the two weeks between May 12 and 24 - a vision in "two parts", each of which remained in its own corner, without the idea ever occurring to me to try to put them together.

Yet there was a vague feeling, like a barely perceptible mist, that the final word was still to come.

<sup>116</sup>(\*\*) (November 23) This was so hasty that a week later, this conclusion and this "missing link" were entirely forgotten! For the "missing step" in arriving at a more convincing "missing link", see yesterday's note "The reversal of yin and yang (2) - or revolt" (n° 132).

<sup>117</sup>(\*) see the two notes "On n'arrête pas le progrès!" and "Cercueil 2: les découpages tronçonnées", n° s 50 and 94.

<sup>118</sup>(\*) (November 29) To tell the truth, this aspect had already been present in the form of an epidermal intuition for a number of years in my relations with Deligne, but without me ever dwelling on it before the Harvest and Sowing reflection.

<sup>119</sup>(\*\*) In the two sections "The Enemy Father (1) (2)", n° s 29, 30.

not really grasped; the feeling of one "groping in the shadows" (the expression must have appeared once or twice in the course of my notes on Burial). The Gravedigger's final note must have had the effect of a light gust of wind in the fog, which can give the illusion that the fog has dissipated, when in fact it has only shifted a tad. Or to put it another way: the aspect taken up in this note appeared there in such clarity and with such relief, that the impression (by no means illusory) of a tangible, penetrating understanding of this aspect, and the feeling of satisfaction that accompanied it (a feeling, that this impression and this feeling created a kind of euphoria, of one who feels ready to reach the goal, and made me more or less forget the other, nonetheless significant, aspect, the "Superpère" aspect, which had remained "on the back burner"!

The third installment appeared just three days ago (five months to the day after the appearance of the unfortunate episode-illness). It's □ the (symbolic) **Funeral and** (very real) **Burial** aspect of the

p. 573

"This **"feminine"** is visualized as a kind of **"Supermom"**, herself embodied in my modest person! This aspect came to light at the end of a long and entirely unforeseen "digression" on yin and yang, in which an effort had finally been made to express intelligibly a certain "association of ideas" stemming from a certain "Funeral Eulogy", which was supposed to close the funeral ceremony. This famous "association" or "intuition" (to which I first alluded at the very beginning of the note "Le muscle et la tripe" (yang enterre yin (1)), ) has still not been made explicit - but everything is ready to go, and I've been promising for a while that I'll get to it!

Along the way, a whole host of facts and intuitions have come to light, some of them new and unexpected for me, and all of them helping me to reconnect with important aspects of my life, and of existence in general. One of these facts - that the "basic tonality" of my mathematical work is "feminine" - seems to contradict one of the intuitions at the root of this association, which is still waiting for its time: the intuition that as a mathematician (as for everything else), I was a very **yang** character; an intuition therefore linked to the "Superpère" aspect of Burial. And this same fact, which seems to contradict this association (from which all the thinking on yin and yang stems!) also brings up in a flash the third aspect that had eluded me until then, the "Supermother" aspect. At the same time (at the end of the endings), the link is made with a "Burial" that seemed to have been forgotten for nearly a hundred pages!

For "rising tide", it's rising tide - let's hope that the end result, I mean this promised "vision" that I'm about to bring out of limbo, will be equal to the means, namely a whole sea of philosophical-Freudian digressions on yin and yang... . The tide has turned (with the

note-coup-d'envoi "Le muscle et la tripe") on October 2, the crucial "new fact" made its appearance in the following days<sup>120</sup> (\*), while □ any day now I'm getting ready to finally put this famous

p. 574

"association" (which appeared five months earlier, on May 12 or 13, after reflection on the note "L' Eloge Funèbre

(1) - or compliments", on the same day as the crucial note "The massacre"). But this fact wasn't "revealed" in the notes until five days ago, on November 8, after three preliminary notes on yin and yang in maths (written over the previous three days). This is the note "The rising sea... ." (122). The very next day, November 10, with the note "Les obsèques du yin (yang enterre yin (4))" (124)), the "Supermère" makes her appearance (but the word is only used in the following day's note, "Supermaman ou Superpapa?" (125)). And so we have the "third part" of L'Enterrement!

It's without any deliberate intention that I've committed myself, on the spur of the moment, to this retrospective of

<sup>120</sup>(\*) I seem to remember that as early as the day after tomorrow, in the note "Innocence (the marriage of yin and yang)" (n° 107), the fact in question had appeared, and was part of the "various signs" referred to in that note (without any further details about them), which "have made me suspect more than once that... .. it is the 'feminine' qualities that dominate in my being... .".

the reflection on Burial, from the perspective of the successive appearance of its three main aspects (as I see things now). Such occasional retrospectives, in the course of a long-term meditation, have each time proved most useful, giving an overall view of the process of reflection, and at the same time a fresh perspective on some of these main "résultats"<sup>121</sup> (\*). Perhaps the most striking thing for the hypothetical reader of this retrospective is that I have makes the detour through such a long digression, rather than get straight to this famous "association" (still to come) and that we don't talk about it anymore, to finally get to the famous "trait final," under the Burial; p. 575 which I was in such a hurry to draw in the note "L'Eloge Funèbre (2)" of September 29, when I was just getting back into the harness of the reflection left in abeyance in June! It was with this in mind, moreover, that I began the following note three days later, "Le muscle et la tripe", which begins with an allusion to this association, without giving any details about it.

If I didn't do it then, and put it off from day to day and week to week for a month and ten days already, it's by no means because of a deliberate intention, which would have appeared at some point. If I try to fathom the cause, I'd say that I must have felt instinctively, without even having to tell myself, that at the point I'd reached then, writing the association in question outright would have made no sense; that it would have been like a mere "statement", purely formal or verbal, while the rich substance covered by words that would have come to me by a pure effect of memorization, would remain ignored, unperceived. If you're a mathematician (or a scientist, if you're not), you're bound to have experienced such a situation many times, and the discomfort it arouses, when confronted with a statement that you can easily see is perfectly precise, and where, moreover, you know the meaning of each of the terms used as best you can, and yet feel that the "meaning" and substance totally escape you. The situation is perhaps even more frequent with non-technical texts, which nevertheless express a tangible substance, strongly perceived by the author; with the difference, however, that it is much rarer for the reader to realize with any clarity that the meaning of what he is reading escapes him. In this case, there was even more - for **myself** too, who for months hadn't been "in the bath" of the Funeral Eulogy and the associations associated with it, and who for years hadn't really "plunged" into the reality of yin and yang (while brushing up against it at every step. . . ).

- Even for **me, anything** I might have written to "say" this association would have been a verbal thing, not really felt or perceived. Resolving to do so, or to put it another way, forcing myself to do so, would have been a purely formal way of discharging a kind of obligation, out of a sense of conscience, "completing" in short, a penum, while taking care to "give good weight", not to lose along the way such an "association" which (as I well remembered!) had been juicy and steaming, and which had long since had time to cool down.

and molder in a corner of memory!

□ If what I remembered were indeed to serve the deepening of an understanding that remained

p. 576

I could not, however, do without these hundred pages of "digressions". They form the most profound part of the whole reflection pursued throughout Récoltes et

<sup>121</sup>(\*) This kind of retrospective seems to me to be very rare in mathematical work, and I've only been practising it myself since the writing of "Pursuing Stacks" (started in spring last year). A common working practice, on the other hand, and one which has a similar effect, from the point of view of a "fresh perspective" on the ideas and results of a mathematical work in progress, is to take up "ab ovo" all the notions and statements of the theory one is developing, in the order that presents itself as the most natural, at the point at which one's understanding is at that moment. Often such work, which may seem purely routine, leads to a substantial deepening of understanding, for example by bringing to light, through the demands of internal coherence of the new ordering, equally "natural" notions, properties, relations etc., which had not been seen previously. Sometimes, too, by revealing the fortuitous or artificial nature of certain hypotheses, or the narrowness of an entire initial context, the work of "restatement" leads to an unsuspected broadening of the initial purpose, giving the theory initially developed a new dimension and scope.

Sowing. I cannot yet predict whether the vision of Burial that I am about to unravel in their wake will leave me with a sense of complete satisfaction, or whether there will remain obscure corners or dissonances, which I may give up trying to illuminate or resolve, at least for the time being, or in Récoltes et Semailles. But in any case, just as in my mathematical work, I know that each of these hundred pages, like each of the six hundred (give or take a few) of the text of Récoltes et Semailles now being written, has its own unique place and message and function, and that I could not have done without any of them (whether or not there are readers to follow me this far!). While the goal was far away (if not totally forgotten. . . ), each of these pages brought me its own harvest, which it alone could bring me.

### 18.2.7.3. Retrospective (2) or the knot

**Note** 127 (November 17) I've just gone through four rather difficult days, with a lot of turmoil around me. There could be no question of continuing in the same vein, and my work on the notes has been limited to a little housekeeping: rereading the part of the text to be given over to typesetting, and correcting the part that has been done. Between the "first draft" of the text for each note, reread before starting on the next note, and the final net text, ready for duplication, I make at least three careful readings, making adjustments of expression during the first two at least. I'm going to get to know the text of Récoltes et Semailles pretty well! But above all, I'm doing what's necessary to make sure that the text that will be entrusted to me for duplication will be the best I have to offer, including in its form. With the exception of one of the Funeral notes, for all the sections and notes of Récoltes et Semailles that I've written and reread, the last reading left me with a feeling of complete satisfaction. I felt that each time I had managed to say what I had to say as clearly and as nuanced as I was capable of doing, without hiding anything that was clear, understood, known to me at the time of writing, nor anything that remained obscure, blurred, misunderstood or even entirely mysterious, unknown... .

p. 577

□ The only exception is the note "The half and the whole - or the crack" of October 17, from which the "thread"

of the meditation split into two, on the two themes I've called (subtitled in the rest of the notes "the key to yin and yang") "Our Mother Death" and "Refusal and Acceptance"<sup>122</sup> (\*). This is the last part of this note, the two or three pages where I speak of division within the person as the ultimate root of division and conflict in the couple, in the family and in human society. This is an intuition that first appeared to me in the early years after my "departure" from the world of science, and which has developed, confirmed and deepened over the years, right up to the present day. It has become so "self-evident" to me (without my ever having bothered to examine it carefully and in all its facets), that it has crept into my thinking somewhat as a matter of course, without any effort to present it in such a way as to make this "self-evidence" even slightly apparent. But if reading these pages leaves me with an impression of vagueness and dissatisfaction, it's surely not simply a question of clumsy "presentation". Rather, I feel I've jumped in with both feet over a substantial reflection on this complex theme, a reflection for which I feel I have all the elements in hand to make it, but which isn't done for all that! In the note of October 25th ("Paradise Lost" (116)), which is directly linked to the note of the 17th (to develop the theme of "Refusal and Acceptance" from there), I first try as best I can to "make up for" the gaps I had noticed in the "Refusal and Acceptance" note.

<sup>122</sup>(\*) The need to group the notes that make up the "digression" on yin and yang under subheadings was felt only a few days ago. This also led me to readjust the names I'd given to these notes, which are now quoted in some places under names that are a little different from their original names (but with the right number, nonetheless). At the same time, the name of this set of notes, "The key to yin and yang", also appeared.

earlier note - but without saying much more than simply this: that as for a possible "voyage of discovery into conflict", "that's not the direction I want to go in right now", too bad, that's for another time!

\*       \*

\*

□ In the previous note of four days ago, I had surveyed three aspects, or "strands", of the p. 578 table. Burial, that have emerged so far. Afterwards, I remembered that at two points already during the reflection on Burial, I had felt, and written, that I was touching the "knot" of the conflict. It was in the notes "Le noeud" and "L' Eloge Funèbre (2) - ou la force et l'auréole" (, ). These notes echoed reflections (seemingly "quite general") in an early section of Récoltes et Semailles,

"Infallibility (of others) and contempt (of self)" (section n° 4). It's **self-contempt**, ignorance of one's own It is also the source of **contempt for others**, of the eternal reflex-compensation of "proving" one's worth by placing oneself above others, using (for example) the derisory power to demean or crush, or simply to cause pain or harm.

As I wrote this note, I certainly had no shortage of examples. The one most vivid in my mind at the time was Pierre Deligne, whom I'd seen use his power to discourage and even humiliate in ways that often seemed inexplicable. It was only two months after writing this note that I began to discover "L'Enterrement in all its splendor", as witnessed by the notes of April 19 ("Souvenir d'un rêve - ou la naissance des motifs", and "L'Enterrement - ou le Nouveau père" (51) (52)). Gradually, too, I discovered my friend Pierre's role as Grand Officiant at my funeral and burial. Most of the pre-June notes on the funeral (Cortèges I to X) focus on him. It's also the one about which I have incomparably richer and more personal material than for any of the other numerous participants. So, on the two occasions when I had the feeling of "touching the heart of the conflict", it was he again, the only one with whom regular contact has been maintained to this very day, who was at the center of my attention.

#### 18.2.7.4. (d) Parents - or the heart of the conflict

**Note 128** ( November 18) Twelve hours of sleep last night - I needed it, after several rather short nights! I feel that I've regained some of the energy that was beginning to fray a little - I'm more energized than yesterday, to pick up the famous "thread" where I left off.

□ In the two moments I was talking about yesterday there was a kind of "flash" in me so clear and strong, that the idea p. 579 that it wasn't something purely subjective, the product (let's say) of a simple, deliberate intention to apply some psychological "theory" that was close to my heart - that it was, in short, the "butterfly" providentially caught in his net by the butterfly hunter<sup>123</sup> (\*)! To doubt such signs, whether in meditation or maths or elsewhere, would simply be to abdicate my power to know and discover. I'm lucky enough to know what that power is, and if there's one thing I have every confidence in, it's in him.

I could see in this "flash", in what it taught me, a fourth "part" of the picture of

---

<sup>123</sup>(\*) For this image, see the note "L'enfant et la mer - ou foi et doute" n° 103.

l'Enterrement, which would be added to the other three (reviewed in the November 13 note). But right away I see it as intimately linked to the two aspects "Superpère" and "Supermère" - and this obvious link goes far beyond the person of my friend. This misunderstanding of the "power to know and create" within us, which I mentioned again yesterday, is nothing other than a misunderstanding of our fundamental unity, the fruit of the marriage in our being of "yin" and "yang", "feminine" and "masculine" qualities, energies and forces. For what is "man" in us, on its own, does not make us capable of knowing or creating, any more than what is "woman" in us, on its own, gives us this power. It is not a factitious and derisory **half** of our being that has the power to know and create, but it is the **whole**, the **totality of** our being, that has this power. It has it, not as the outcome of a quest, a long journey, a becoming, which we would go through in a state of temporary powerlessness that would gradually amass "power" along the way; but this power is ours by nature, we have received it as a free gift, from the day we were born<sup>124</sup> (\*\*).

p. 580 And this "self-contempt", or "lack of self-knowledge", is nothing other than the **refusal** of this gift, the refusal of this fundamental unity, and of the power that is its inseparable companion. Or rather, it is like an inseparable shadow of this refusal, it is the **knowledge of an impotence**<sup>125</sup> (\*), introduced by this refusal; a shy, blurred, unassumed knowledge, which takes great care to stop at the known (which is very poorly known. . . ), afraid as it is to plunge deeper, to become aware of the hidden unknown power, and blocked by this deliberate, cultivated powerlessness.

The most common form this denial of our unity takes, in our superyang society, is the burial day after day, hour after hour of the "yin", the "feminine" in us. This is precisely what the "supermother part" was all about, aka "Funeral and burial of the feminine" and, more specifically and **above all**, of the feminine within **ourselves**.

But I also feel that there is a direct and profound link between self-contempt and the "Superpère component", aka "massacre and burial of the father". It's this strongly presaged link that I'd now like to try and identify. To put it another way, there must be a direct and profound link between the division within us and our antagonism to the father.

p. 581 It goes without saying that this "antagonism" finds occasion to express itself as much in relation to the bio-logical father, as in relation to the person who took his place in childhood, or in relation to any other person who, at one time or another and for one reason or another, takes the place of a more or less symbolic "spare father", onto whom the original antagonistic drives are projected. My aim, then, is to identify the root cause of these antagonistic drives and attitudes, so common that we might sometimes be tempted to regard them as universal; a cause that goes deeper than a simple set of concrete grievances, often all the admittedly tangible grievances one might have against the author of one's days. More than once, I've found that these grievances are often more in the nature of a plausible and welcome rationalization, to an antagonism whose real root, the cause of its vehemence and tenacity, lies elsewhere.

I could formulate the intuition I'm trying to pin down in another way, in the form in which it spontaneously presents itself to me: it's that I have the intimate conviction that in the one who is "**one**", undivided, in the one who accepts himself in the totality of his being - in him, the conflict with the father, or with the mother, is resolved. He is **autonomous**, "**free**" from either parent. The umbilical cord that continues to link us to our parents,

<sup>124</sup>(\*\*) And probably even long before we were born. ...

<sup>125</sup>(\*) As I explain a line further on, this knowledge is "blurred", in its essential content it remains unconscious. Often, however, a small piece of it emerges (like the tip of an iceberg whose base remains carefully submerged... ), in a sort of **profession of faith of impotence**, which more than once has left me speechless. They are made in the tone of a peremptory and unanswerable **statement**, behind which one senses a kind of vehement, fierce closure - as if this impotence, which is thus claimed as an intangible and sacred "fact", were the most precious asset, which one would not relinquish at any price. . .

long after childhood and adolescence (and more often than not, throughout adulthood and into death) - this link is broken. The moorings are broken, which until recently held us back from truly setting out on **our own journey** to discover our Mother World<sup>126</sup> (\*).

This intimate conviction is not just wishful thinking, it's not the projection of a wish. (renamed "conviction" for the occasion). Its origins lie in my own experience, first and foremost. place in □ what I've seen in my relationship with my own parents. I'm thinking here of the transformation This was marked by the "awakening of the yin" in me, followed by the discovery of meditation in the months that followed, and finally by the "reunion" with my childhood two days after<sup>127</sup> (\*). I realize that this turning point was marked by an immediate **autonomy**, in contrast to an earlier dependence on received and adopted ideas. The most profound of all these dependencies was my dependency on my parents, whose values and options had shaped mine and my own vision of the world, and whose Epinal image of themselves, of the couple they formed and of their relationship with their children I had also taken on board "en bloc" and as it was, without any change whatsoever. Since childhood, I'd been "operating" on this set of values, options and images, which were in no way the fruit of my own life experience and assimilation work, but simply "baggage". Much of this baggage was made up of clichés and self-indulgent illusions, which I had "trusted" from my parents, and which very often in my life replaced a direct and living perception, a creative perception of the things around me.

It's true that this "autonomy" I'm talking about appeared immediately with the discovery of the power of meditation. It was total (I think) in everything I took care to examine. That doesn't mean that many preconceived ideas, particularly and above all those that came to me from my parents, initially remained in place through sheer inertia, because they hadn't yet been examined. There were so many things to look at, there was no question of looking at everything at once! Not to mention the fact that, after a few months of intense work, I allowed myself to be distracted by "life going on" - especially love affairs, as you can imagine<sup>128</sup> (\*\*). During

<sup>126</sup>(\*) It's a strange thing that in French, the notes "le monde", "l'univers" and "le cosmos" are all masculine. The equivalent words in German, "die Welt", "das Ail", "der Kosmos", are of the three genders feminine, neuter (which is often a kind of "super-feminine" in German), and masculine. This seems to me to correspond better to the nature of the things designated by these terms. When we speak of the "cosmos", the connotation (apart from space cells and extraterrestrials, of recent invention) is that of an **order**, governed by laws - ideas which correspond well to the masculine (in which the two languages concur). On the other hand, "the world" and "the universe" suggest the idea of a **whole** of which we and everything else are a **part**; of something, moreover, that it's up to us to **discover**, to **penetrate**, to **know**. In these aspects, which seem essential to me, these two terms designate things that are "yin", "feminine" in nature, and particularly so in relation to us. I'd be hard-pressed to understand why the French language nevertheless assigns them the masculine gender.

In this connection, I'd like to point out another strange (?) "anomaly", this time apparently in German, where "le soleil" and "la lune" are called "die Sonne", "der Mond". Their genders are reversed from those used in French, which would seem to be the most "natural". Thus, the sun is immediately associated with the idea of heat and fire, which are typically yang in nature. Perhaps this "anomaly" is common in Nordic languages, because in cold countries, where the sun's heat is never felt as torrid, burning, but is expected as a blessing, a source of life, the sun is felt (along with the earth) as a kind of nurturing mother, lavishing creatures with the warmth they "feed on" as much as with the nourishment they receive from the earth... ..

<sup>127</sup>(\*) I talk about these crucial episodes in my life in the notes "The reunion (the awakening of yin (1))" and "Acceptance (the awakening of yin (2))", n°s 109 and 110, and in the section "Desire and meditation", n° 36.

<sup>128</sup>(\*\*) My love life in the years following my discovery of meditation in 1976 was more intense, and also more eventful, than at any other time in my life. It surely represented a dispersion, a diversion from the initial impetus of meditation, which was not to be resumed (with its due breadth) until August 1979, with the long-term meditation on my parents' lives. (For this, see the notes "La surface et la profondeur" and "Eloge de l'écriture", n°s 101 and 102.) Yet, with hindsight, I realize that I could not yet "spare" this dispersion - a certain passion, a certain hunger within me had to be consumed, and along the way, I had to continue to learn, through those I loved, what I had learned only imperfectly in my past life. At this point, I had my doubts.

For the next two years or so, my meditations were confined to a few occasional reflections of very limited scope, when I found myself confronted with some acute conflict situation, and urgently felt the need to get to the bottom of it. It was only after August 1979 (almost three years after my discovery of meditation) that I began the "great cleansing" of the preconceived ideas about my parents and myself, which continued to clutter me up and block my view of this fascinating world in which I live. The work on my parents' lives absorbed me for seven months, until March of the following year. I was then on the eve of my fifty-second birthday. It was with this work that the autonomy I spoke of, which in a sense had remained only "potential" for three years, became fully actual, complete and irreversible. It was also through this work, and only through it, that I was able to **love** my parents in the full sense of the word, that is to say: **to accept** what they were, or had been, with all that this had implied (and that I was then beginning to glimpse), and in particular, implied for me, their son.

If I felt the need to do this work (128<sub>1</sub>), and if I was able to do it, it was because three years earlier, I had been able to accept the gift of life received at birth, and denied for forty years - the gift of my unity. Or, to put it another way, it's because I'd been able to **accept my own nature**. It was through accepting and loving myself that I was able to accept and love my parents<sup>129</sup> (\*).

p. 584

I can also say that it was through this work alone that the **conflict with my parents** was "resolved"-a conflict whose existence I hadn't even suspected a few years before, when my parents were □ dead one by one and the other for over twenty years. It's true that the basic note in my attitude towards my parents, since my early childhood, had been one of admiring respect, appreciation, unreserved identification, and after their death, a kind of tacit cult of their person and memory. This is not the kind of relationship we usually refer to as "conflict", suggesting a basic note of antagonism, of enmity. Of course, my parents were happy with the way I made them feel, they thought it was all very well and in the right order - and there can't be many parents who wouldn't like to be in their place, or who don't congratulate themselves when they are! It was only after this work on my parents, and even more so after the work on my childhood that followed, that I was able to realize fully, with full knowledge of the facts, just how **false**, fake, not "**real**" this idyllic relationship I'd had with my parents had been. It could only have survived by stubbornly **erasing** from a touching canvas a host of things that didn't "fit", including painful periods (of acute antagonism, often felt as a **heartbreak**), or chronic "blunders", which recurred in the relationship between my mother and me with the same implacable regularity (even if less frequently) as had once been the case between her and my father. Not to mention things that had entirely escaped my conscious awareness, such as the "big cross" I had drawn over my parents at the age of eight, after two years spent in a foreign environment, with a hasty letter from my mother three or four times a year as any sign of life from either of them... ..

But the profound reason, the **real** reason, why I call my relationship with my parents "conflictual" between the summer of 1933 (when I was five years old) and the winter of 1979/80 (when I was fifty-one), is not that during those forty-six years there were conflicts that pitted me against one or the other or both of them jointly - whether these conflicts were frequent or rare, violent or latent, conscious or unconscious. It's rather that this relationship wasn't **and couldn't** be **assumed** (as it was, I mean, without profound transformation). It could only be lived and seen as I lived it and as I saw it, through the effect of a constant, tenacious **repression** of my faculties of knowledge and understanding; through a **refusal**

---

that meditation on the past alone could have taught me.

<sup>129</sup>(\*) This is in line with the reflections at the end of the note "Acceptance (the awakening of yin (2))", n° 110.

stubbornly of a □ cognition of the true nature of this relationship, or at least, of certain

ess

ential aspectsp

. 585

of this relationship, involving in an essential way each of my parents as much as myself, and the image I maintained of us. To put it another way, the form this relationship had taken was perpetuated by a stubborn, incessant **flight** from a reality that was all too tangible, a reality that was just as stubborn in making itself known to me again and again, without me ever really learning anything from it while my parents were still alive. The episodes, sometimes heart-rending, of clear and undeniable conflict opposing me to one or the other, were only some of the more or less eloquent signs of the "conflictual" nature of the relationship with my parents, i.e. of this repression and evasion taking place **within myself**.

To put it another way, a "conflictual" relationship with others, in the deepest sense of the term, is one that is "divided", one that perpetuates itself equal to itself through a process of repression, of escape from reality, and which conversely helps to perpetuate these processes in itself. The signs of "conflict", of "division" in the relationship, can be as much in the nature of antagonism, as in that of allegiance; it can be a deliberate utterance of criticism or even disdain, as a deliberate utterance of approval or admiration.

And here I am again, without having sought it or planned it, with what might be called my philosophical "dada": that conflict between people is only the "sign" of conflict in each of the protagonists, or again: that the "source" of conflict in society is conflict, the division in the person. (The parents in all this ended up disappearing without a trace!).

This view seems to overlook entirely the more simplistic and by far more common view: that conflict between two people is the result of "interests" or desires in one and the other, which are "objectively" antagonistic, i.e., such that the satisfaction of one can only be achieved at the expense of the other. This is the universally accepted way of seeing things, whether we're talking about conflict between two distinct people, or internal conflict within the same person. So (in the first case) these "desires" are incompatible may be the desire to dominate, to set the tone, to steer the ship.

certainly the most □ current cases, including between parent and child (and just as much, between wife and husband, or between

p. 586

lover and lover). I'm not denying that this way of looking at things is real and useful, at least in some cases. But I see that it only concerns a superficial reality, while a deeper reality escapes it entirely. To give you an example, I'd like to point out that the desire to dominate (or to shine, or in general, to put oneself above others) is rooted precisely in this "self-contempt", in this "lack of self-knowledge" mentioned earlier, which we try to escape by adopting attitudes and behaviour that **blur** and **compensate for** this secret lack of self-esteem. So, beyond the "objective" conflict of antagonistic desires, we see in this case the conflict within the person, as the creator of desires of such a nature that they can only arouse and feed antagonisms to others.

Of course, with these few comments I'm not going to exhaust the delicate and important question of the relationship between the two aspects of conflict, which I'd like to describe as "superficial" and "deep" - and that's probably not the place here. Rather, I feel the need to return to the theme of conflict with the father, or conflict with the parents, from which I was moving away. At one point, I may have given the impression (and even let myself be carried away by it for a few moments!) that conflict with a parent, or with Pierre or Paule, was all the same. But I know it's not! I know that **conflict with the father, conflict with the mother, is at the heart of the conflict within ourselves**.

I spoke earlier, in this sense, of my "intimate conviction" (which I would also call a **knowledge** within me, a thing well understood), that in the one who is not divided within himself, the conflict with the parents is resolved. This knowledge, I said, comes to me above all (I believe) from the experience of conflict resolution in my

p. 587 relationship with my parents<sup>130</sup> (\*). Another way of putting it is that **accepting our parents** (i.e. ending the conflict with our parents) **is part of accepting ourselves**. They are (in relation to us) and our **origins**, and our **conditioning** (or a good part of it, at least). The first of one (our origins) is inseparable from who we are, whatever our path and destiny; the other (our conditioning) is deeply rooted in us, and as such is as much a part of who we are as our origins. To deny the true reality of our mother or father, whether expressed in antagonism or allegiance, is also to deny an essential part of ourselves and of what our life has been, as far back as we can remember. ...

And there's more. It was through our mother and father, before all others, that the conflict in both of them was transmitted to us. (This is what was expressed a few moments ago by the pithy term "our conditionings"!)

This is how they are linked to the conflict in ourselves, more closely than any other people in the world. And the first external projection of this conflict within us, and the oldest and most crucial of all, is the conflict with our mother and father. So it seems to me that the conflict within ourselves, and the conflict with either of our parents, are indissolubly linked - they are like one and the same conflict. Sometimes I've expressed the "intimate conviction" that when the conflict within us is resolved (or at least, when it's resolved at its root, in the "yin versus yang" division), then our conflict with our parents is resolved too; or, to put it another way, that the resolution of the conflict within us passes through that of the conflict with our parents. But I'm convinced that the opposite is also true: that as soon as the conflict with our parents is resolved, the conflict within us is resolved at the same time<sup>131</sup> (\*). This is why I see the relationship with our parents as a **key role** in our spiritual adventure, a unique role that belongs to no one else in our family, whether spouse or child, friend, teacher or pupil.

\*       \*

p. 588 **Note 128**<sub>1</sub> (December 1) <sup>132</sup>(\*) The importance for me of "getting to know my parents" was reiterated vided by a dream, which came to me on October 28, 1978. It was a dream about my father's agony. This agony stretched over days and nights of painful struggle, surrounded by the busy indifference of those around him, while by the tacit consensus of all he was considered "already dead" - "it was like a verdict, which would have made his death effective, cutting short all doubt". When I woke up, I recounted the dream, but during the

---

<sup>130</sup>(\*) See footnote below.

<sup>131</sup>(\*) I can give the impression here of posing as "the one who has resolved the conflict within himself". It's true that I say without reservation that the conflict with my parents has been totally resolved. It's also true that the conflict within myself continues to be felt in many ways, it hasn't disappeared. It's something that's certainly apparent on every page of Harvest and Sowing, and it's something I've had occasion to point out on more than one occasion, in one case or another. It would therefore seem to contradict the assertion commented on in this footnote, "that as soon as the conflict with our parents is resolved, the conflict within us is resolved at the same time". And yet, in a certain sense (the one I had in mind when writing these lines), it is indeed true that "the conflict within me is resolved". At least, something essential in this conflict, at its very root, is well and truly resolved, by this knowledge of my unity, by this acceptance of myself. If the conflict is likened to a tree with strong, deep roots, we can say that when the root is cut or withered, the tree is already dead, whereas through acquired inertia, the trunk and main branches remain in place, just long enough to wither and disintegrate little by little. I can feel this gradual "drying up" of the conflict as the years go by, like a once strong and vivacious hold that is gradually loosening. I see the writing of Récoltes et Semailles as one stage in this process, among many others over the past eight years. Another image to try and describe this same reality is that of a deep calm that gradually spreads out, like the calm of a deep sea, unaffected by the upheavals that shake the surface. I explain this in more detail in the two notes "The reunion (the awakening of yin (1))" and "Acceptance (the awakening of yin (2))", n°s 109, 110.

<sup>132</sup>(\*) This note is a b. de p. to the previous note° 128 "Parents - or the heart of the conflict".

In the three months that followed, I avoided thinking about it at all, to the point where it sank into the penumbra of half-forgetting. In short, I "buried" my father's death, about which this dream had spoken to me, and in this dream (which evoked a crucial aspect of my waking life) I "buried" my living father. There was considerable resistance to the clear and penetrating message of this overwhelmingly beautiful dream. They were resolved at the end of a first night of stubborn meditation on the meaning of the dream, on the following January 31st, followed by four more meditations in the three weeks that followed.

This dream made me realize that my relationship with my father and mother was a frozen, "dead" relationship, cut off from a living reality whose perception was being repressed - just as (in the dream) the perception of agony declared null and void, and the spontaneous action that followed from it, was repressed: to help the one who, painfully and abandoned by all, was struggling to live.

□The first thing to end this isolation in me was to get to know my parents. I

p. 589

I had no idea at the time of the dimensions of the task, but I imagined that "in a few hours" I'd be able to get "to the heart of the matter"! The idea of getting to know myself, particularly through my childhood, didn't occur to me at the time. I felt the need to do so later, as a spontaneous consequence of the journey I was about to embark upon. This journey began only six months later, in August 1979, because of the long digression (though by no means pointless in many respects) that constituted the episode "Eloge de l'Inceste". (For the latter, see note "L' Acte (113).

Along with the dream of October 18, 1976 (which triggered the "reunion"), this dream about my father's agony is one of the two that most strongly influenced the course of my life. The resistance to his message was much stronger, it seems to me. The message of the first was received within hours of awakening, while that of the second was put off for months. It only began to be fulfilled nine months later, with my departure on a voyage of discovery that continues to this day. ...

It's only in the last few days that I've been able to make the connection between the meaning of this dream and the reality of the funeral I'm trying to penetrate in the present reflection. This funeral, in which I appear as the "principal deceased", appeared to me a short while ago as a "return of things" (see the note of the same name),

(73)). This time, I see a "return of things" again, but from an entirely unexpected angle. In L'Enterrement, I appear alternately as "The Father" and "The Mother". The idea had never occurred to me that I'd ever been in the analogous position of a son, "burying" alive (be it symbolically, or by tacit consensus) his father or mother - quite the contrary! And indeed, I had strong reasons to be convinced of the contrary, reasons I first mention at the end of the note "the massacre" (in the context, it's true, of the Father's **massacre**, not his burial). (I come back to this in more detail in the note "Innocence (the marriage of yin and yang)" (107). In writing these last two paragraphs about my early childhood, in the note "The Massacre", I must surely have given the impression (and indeed, been under that impression myself at the time) that my relationship with my father had been free of conflict throughout my life. This is what

might also suggest a superficial look at this relationship. But already in the note commented on here, "Parents - or the heart of the conflict", □where

I do not confine myself to such epidermal impressions, it appears clearly that this is not the case, that this view of things (which was indeed mine until January 31, 1979) was one of the illusions that I was happy to entertain for most of my adult life. This illusion became clear to me the moment I finally took the trouble to examine the meaning of the dream about my father's agony - the most **beautiful** of all the dreams life has given me to date. This dream presents the grip of conflict on my relationship with my father with striking realism - and it also lets me experience the **resolution** of this conflict. The conflict is resolved by a **break** in me with the consensus that my father is dead, a break that suddenly opens the door to **something else** - and by a gesture of love from my father, giving me the chance to live with him.

. 590

meaning that he had heard the cry that my constricted throat was unable to let out towards him. . .

The deep kinship between this dream experience, a striking parable of a frozen relationship with my parents (which suddenly comes back to life. . . ), and the reality of the Burial I've been probing for nearly nine months, is now so obvious to me. It's remarkable that throughout this long period of reflection, and right up until the last few days, the thought of this kinship never crossed my mind. I finally "stumbled upon it" by pure chance, in connection with a footnote in which I intended to point out, for all practical purposes, the role that this time too (in triggering a reflection on my parents) had played a certain **dream**, among so many others over the last eight years that have been like providential beacons on my path. This comment had the effect of putting me back in touch with the experience and substance of this dream, which I'm still a long way from having exhausted. Once this contact had been re-established, it was hardly possible, given the context, for the relationship with Burial not to become apparent.

It's true that this kinship, for the moment, only concerns a certain "knot", whereas in this dream and in the reality it transcribes, there is the knot, and its resolution. This resolution, moreover, which the dream had brought to life for me, the flavor and strength of which I'd known from that night on, it was up to me and no one else to make it a lived reality in my waking life too, in my relationship with my father and mother. I was free to do it, or not to do it - and for months, it was the latter alternative.

p. 591 that was my choice! Today - five years after that resolution - it's surely still the same, in□this sort of symmetrical situation where I'm involved, while I'm the one who acts as Father buried by a consensus-verdict, where I had been the son who devoutly buried his flesh-and-blood father alive! And perhaps this time too, it's by meditating on the meaning of my life - in this case, on the meaning of this burial - that I'll resolve this other knot in which I find myself, and perhaps dissolve yet another part of the weight of my past.

As to whether this meditation will be of any use to anyone other than myself - to such and such a protagonist perhaps of this funeral where I am not the only one to be buried, and where legions of mourners have flocked to the funeral - that need not be my concern; nor whether such and such a knot as I see in others will resolve itself or not. That's his job, I've got enough of my own! But if by any chance it should resolve itself while I'm still alive, I'll surely be one of the first to know\*, and I'll be glad of it... ..

### 18.2.7.5. (e) The Enemy Father (3) - where yang buries yang

**Note** 129 Decidedly, in the preceding pages<sup>133</sup> (\*), I barely touched on the theme of **conflict with parents**, and not even that of conflict with the father, which had been my starting point. The associations of ideas I followed from there seem to have distanced me from it, rather than deepening it. In what I've just said about conflict with parents, the roles of mother and father are interchangeable, just as it makes no difference whether the "we" referred to in these pages refers to a man or a woman. However, in our relationship to parents, mother and father are far from symmetrical, and the role played by each of them depends crucially on whether "we" are boy or girl (now man or woman).

In this case, the conflict with the father (expressed through his symbolic burial, or even his massacre) is of primary interest to me in the case of those I know to have actively participated in my funeral, all of whom are **men**. In the structuring of the ego, then, the father is the one to whom

p. 592 We **identify with**, and **model ourselves** on, in our relationship with others (and more specifically, with women), and in our relationship with ourselves. Rarely does this identifica□tion take place without major "burrs", and the antagonism to the father is one of the traces, a tenacious one if ever there was one. This is not the place to try to go into all the details.

<sup>133</sup>(\*) Those of note no. 128, of which this is an immediate continuation.

Nor do we examine the way they tend to express themselves in the relationship with the father. Indeed, my own experience in this area is so atypical that I'd perhaps be less well placed than anyone else to make such an inventory, even though I don't feel intimately, from my own experience, the ins and outs and the particular "flavour" of any of the main cases<sup>134</sup> (\*). My experience here is mostly indirect, based on what I've observed around me, and first and foremost in my children's relationships with me.

Over and above the particular nature of the "blunders", and the grievances and resentments towards the father that stem from them, there is one common aspect that I have strongly perceived on many occasions, when any deliberate "explanatory" statement was entirely absent. This is that the boy's or man's antagonism towards the father who has served him as a model, and whom he reproduces, whether "positively" or "negatively" (by imitation, or by opposition), whether he likes it and recognizes it or not - this antagonism is nothing other than an aspect, particularly eloquent and crucial, of an antagonism towards **himself**. More precisely, it is the outward sign, through the (more or less clearly expressed) rejection of the father, of the **rejection of a part of himself**; of that, surely, by which (unwittingly, or against certain conscious or unconscious options) he resembles his rejected model - his father.

As a result, I'm back on my feet - I can see the link between "self-contempt" (or "self-denial") and "antagonism to the father" becoming clearer - but I'm back on an unexpected side. I was prepared to find a more or less direct link between this antagonism to the father, and self-denial in the form of the refusal (or "burial") of the feminine in one's own person. Instead, I seem to have falls (as I should have expected, in "good logic") on the rejection of the **masculine**. And yet, I know although this refusal, less obvious and more hidden <sup>in□the</sup> man than the refusal of the feminine in him (of which I have especially p. 593

It's not so rare for a person's ego to be in conflict with his or her own, and it weighs just as heavily on him or her. Often, it is superimposed on the other, so that, however the ego is structured, whether in yin or yang colors, we are sure to be unacceptable to ourselves! Or to put it another way, this rejection of the father, or the rejection of what is "masculine", "virile" in oneself and makes us resemble the father, often goes hand **in hand** with the unreserved adoption (in the absence of a "yin" counterweight, rejected) of a "yang", "macho" value system with a touch of zinc!<sup>135</sup> (\*)

The idea comes to me that this contradiction (truly appalling indeed, once said and written in black and white!) is undoubtedly also the real **nerve** in this merciless **competition**, which is one of the hallmarks of our supermacho society (and this just as much in the upper echelons of science, as anywhere else. . . ). For if "climbing" and "surpassing" are superyang values par excellence, these values would undoubtedly not be internalized with such vehemence, nor would they be put into practice with such brutality (however subdued, when it comes to "high spheres" . . . ) if in the rival in the best position, the latter was not the only one. ) if we didn't also see the formidable shadow of the Father, at once admired, envied and secretly hated - the one who was there before us, and whose very existence, as far back as we can remember, has been **the great challenge** in our lives.

#### 18.2.7.6. (f) The arrow and the wave

**Note** 130 (November 19) I found myself impatient to continue where I left off. It's been a week, in fact (since the note of November 12, "L'épouse véhémence (le renversement du

<sup>134</sup>(\*) Compare with the reflections at the end of the note "The Massacre", n° 87.

<sup>135</sup>(\*) (November 29) At least, this is by far the most frequent case of which I'm aware.

p. 594 yin and yang)" (126), that day after day I have the feeling that I'm on the verge of getting "to the heart of the matter" - of coming to the overall picture of the Burial that I had promised myself, which would bring together the partial "strands" that had been de□gaged in the course of reflection - and a week, too, that the "point" in question found itself postponed from day by day. Each day, as I finish my note (since I have to stop and go to bed, as the hour advances), I feel that I've done a job I couldn't avoid doing, that I've "advanced" a notch - but at the same time I feel that the "point" I'm trying to get at has receded by the same amount! The obvious temptation here is to just keep going until I've got to the crux of the matter. But after the "health incidents" of the last three years, I also know that this is the blunder to avoid.

In fact, I know deep down that I'm right in the thick of it. I'm just gnawing at the bitter end. This impatience to get to the end of a task, this drive towards a "point" or "crux", intensely perceived in front of me - close by, or far away, it doesn't really matter - this attraction of the "goal" to me that throws me forward, like an arrow hurtling towards its target - this aspect that seems to me the most intensely "**yang**" of my person, characterizes my way of being **outside work time**. It's a striking aspect of the "**boss**", of what is conditioned, acquired in me. Nothing in what I knew of my early childhood could have foreshadowed this character, which appeared later in my childhood, and which has so strongly marked my entire adult life to this day.

p. 595 In the workplace itself, this aspect seems to have all but disappeared. I have the impression that the little that remains here and there is no more and no less than the sign of the boss's occasional interference, discreet it must be said, in the course of the work (where, to tell the truth, he has nothing to do!). The work itself, at the whim of the Worker who, through my hands, works at his own pace, follows a completely different rhythm. Impatient ardour is replaced by peaceful, stubborn calm. There is no longer an arrow hurrying towards a target, but a wave that stretches out far and wide, moving who knows where, wherever the moving force that drives it takes it - a wave followed by another wave, followed by yet another... . There is no hesitation in this movement, in every place and at every moment it has its own direction that carries it, or draws it forward. In each moment there is a progression, one cannot say towards what, there is a "work" accomplished in a movement that ignores effort.

- and there is no goal. The very idea of a "goal" here seems strangely preposterous - where on earth would we want to place it?! The goal has disappeared, and so has□the arrow. If there is an arrow, it's not a vibrating one that shoots out

in the heart of a target to come and plant themselves in it - but in **each** place of this moving mass of waves following one another there is an unequivocal movement and force, there is a direction in a progression, as precise and sharp as an arrow, invisible and yet imperious that would mark this direction, this force, this movement.

So, it seems to me that in my work, I'm as "yin", as "sea and motion", as one can be. This has been true, I believe, of all the work of discovery in my life, of all the work I've thrown myself into with passion, and above all, of my mathematical and meditative work. And now that I've unexpectedly described how I feel about this work in a sudden, compelling image, it seems to me that this image also describes the **movement of my life**, from the day of my reunion with myself, and perhaps even before, from the moment of my "salutary uprooting" from a cosy<sup>136</sup> (\*) fold. At the very least, it describes the "how" of my life on a deeper level, that of the "calm" I spoke of (just a few hours ago) in one of the footnotes to yesterday's note - a calm that is unaffected by the agitation that takes place on the surface. In this deep calm, there is movement and progress, but there is no goal - the goal has disappeared.

And I also remember now that it was this same image that came to me in March, when I

---

<sup>136</sup>(\*) See note of the same name, n° 42.

speaks of the manifestations of my two passions, meditation and mathematics, as "the up-and-down motion of waves following one another, like the breaths of a vast and peaceful respiration... . "<sup>137</sup> (\*\*). Now, eight months on, I believe I recognize in these images the spontaneous movement of my being, in what is most spontaneous, in what is truly original in me - in what comes from the child eager to know, before it is touched by the preoccupation with appearances and the frenzy of becoming... .

#### 18.2.7.7. (g) The mystery of conflict

**Note 131** □ (November 20) Yesterday evening was spent almost entirely rereading the previous day's notes, p. 596 correct them on the way, retype a page that was decidedly too overloaded, write the footnotes (planned the day before) - and already it was midnight! I was anxious to get on with the evening's work, however little it might be, and went back to my typewriter to resume the previous day's interrupted "thread". And then something else came to mind - the image of the arrow and the wave. For a long time, I'd recognized myself in the arrow, whereas the wave seemed to correspond to a temperament quite different from my own. It's one of the surprises that came up in the course of this reflection on yin and yang, that it's this image of the wave that expresses most strikingly, and most accurately, the "basic tone" that prevails in my being, when "the boss" is far away, or at least when he gives way to something else. The image took shape, as if it had been there all ready, just waiting for the words that would finally give it form. They came without haste or hesitation, as I simply tried to **describe**, as faithfully as possible, without glossing over or distorting anything, what still remained a vague feeling.

The description completed, it was around two o'clock in the morning. I reread these two pages that very night, so there was no need to make any alterations. The trickiest part was when I tried to describe this intuition of a continuous infinity of "arrows", closing like a "field" of forces. It was an idea that presented itself forcefully, and which seemed reluctant to let itself be evoked by language. Yet I felt that this was an important aspect of the whole image, the "yang in the yin" aspect. In the wave there's "the arrow", there's a **momentum** that carries it forward, following a movement of its own, which is not that of **an** arrow, but rather that of a whole multiplicity, a **continuous** multiplicity that smoothly restores the wave's movement. And I also knew that in my work I was **also an** "arrow"; but I was doing so in a different mode from the one I'd imagined until now, because I hadn't taken the time to ever look at this work with any kind of attention, to immerse myself in it as if it were someone other than myself, in order to perceive its tonality. If I hadn't done so earlier, in the eight years that it's been happening to me

to meditate on, is undoubtedly that I have remained the unwitting prisoner of an inveterate deliberate intention: that of identifying myself with the □ "boss" in me, rather than with the Worker-child; that is to say also, when I speak of "me", of p. 597

think first and foremost (perhaps even exclusively, very often) of the person I am when it's the "boss" who takes center stage. In a way, these are also the times when I'm not at work.

The necessities and vagaries of teaching (among other things) have nevertheless, since the discovery of meditation, drawn my attention to **certain** features of my work - namely, those features which I felt were universal in nature, that they should be present in **all** creative work, in all work of discovery<sup>138</sup> (\*). But before this reflection on yin and yang, I hadn't yet thought of discerning

<sup>137</sup>(\*\*) See the end of the "My passions" section, n° 35, from which these lines are taken.

<sup>138</sup>(\*) The first written text, I believe, in which I evoke some of these traits, is that of October 1978, "En guise de Programme" (alluded to in the note of November 6, "La belle inconnue" n° 130). After this text, I won't bother to spell out and expand on my observations on this subject in black and white before this year's Harvest and Sowing reflection. Its first eight sections are essentially devoted to this theme, not to mention numerous other comments throughout the course of the year.

in my own work, which makes it different from that of any other. One of these traits, which seems to me the most crucial of all, is finally identified in the November 8 note "La mer qui monte. ... "

(122). The image first evoked in that note, in the typical context of a conjecture to be proved, is taken up again in yesterday's notes, in a different light, outside any particular context. At last, I'll pick up where I left off the day before yesterday. I left<sup>139</sup> (\*\*) with the intention of trying to pinpoint the root cause of antagonism to the father, beyond the specific grievances we may have against him. Following the associations of ideas that came to the fore, I initially strayed from this line of thought, being led above all to speak of conflict with parents, father or mother indifferently. This "conflict" can take the form of allegiance (as was the case with me), as well as that of "conflict" between parents.

p. 598

of antagonism. Since my work on the lives of born parents, this "conflict **with parents**" appears to me to be truly "at the heart of the conflict" within ourselves. Resolving the latter, I'm convinced, is neither more, nor less than resolving the conflict with the parents, i.e.: being free of them, being fully autonomous spiritually, pursuing **one's own** journey... .

Returning once again to antagonism to the father, in man, I've reconnected with an intuition that has occurred to me many times over the last few years: it has occurred to me that the deeper meaning of this antagonism to the father is the rejection of that in us which makes us like the father, of the appearance and **virile** traits of our person. I've made this last part of yesterday's reflection<sup>140</sup> (\*) a separate note, with the name

"The enemy father (3) - or yang buries yang" - thus also suggesting, by this name, the link with the two sections "The enemy father (1), (2)" (n° s 29,30), where this "enemy father" theme appears for the first time.

Thus, the aspect of the Burial discussed at the start of yesterday's reflection, namely the aspect of "self-contempt", or "self-unrecognition" or "self-denial", appears as a kind of hyphen, or better still, a "**hinge**", between the two preceding sections, the "Supermother - or burial of the 'feminine'" section and the "Superfather - or massacre and burial of the father" section. This hinge-like nature becomes apparent as soon as it becomes clear that, in the first of these strands, "the feminine" is, above all else, "the feminine **in us**" (as indeed was perceived as early as the November 10 note "Les obsèques du yin (yang enterre yin (4)", where the "Supermère" strand makes its appearance); and furthermore, that "the father" is, above all, the symbolic substitute for "the masculine in us". Thus, the two aspects in question are perfectly aligned.

p. 599

symmetrical, corresponding to the two obvious "cases de figure" of the "refusal of self" - namely, the refusal of "the woman" (aka Mother) in us, and the refusal of "the man" (aka Father) in us<sup>141</sup> (\*\*). And the theme of conflict at the

parents, which is a kind of conjunction or superposition of the two distinct themes of conflict with the mother, and with the father, also appears as a kind of hinge. Or to put it another way, as seen in yesterday's reflection<sup>142</sup> (\*), this theme appears to be inseparable from that of self-denial, the one and the other being two distinct aspects of the same undivided reality, that of **conflict within ourselves**.

In all this, it would seem that the original aim of "identifying the root **cause** of antagonism to the father" is still unfulfilled. I could say that antagonism to the father is one of the **forms** taken by antagonism to oneself, or self-denial. The initial question therefore seems to split into two. On the one hand, for what "causes" does self-denial take on this particular form in certain cases? Probing it also means

---

of this reflection.

<sup>139</sup>(\*\*) In the note "Parents - or the heart of the conflict", n° 128.

<sup>140</sup>(\*) In fact, this is not the previous day's note, but the day before, which I'm about to follow up on.

<sup>141</sup>(\*\*) I would remind you that it is by no means rare for the two kinds of "symmetrical" refusal to overlap in the same person. Given the devaluation of yin in our society, it must be quite rare, in any case, for yin refusal not to be present in a more or less pronounced form. So I'd be tempted to see in the antagonism to the father a sign (at least presumptive) of a double refusal of yin **and** yang.

<sup>142</sup>(\*) See penultimate footnote.

We'd like to take a closer look at a number of different typical situations that could give rise to such antagonism.

On the other hand, we're back to the even deeper and more crucial question of the "**cause**" of self-denial, i.e. the cause of conflict and division within us. I think I've at least grasped the common **mechanism** by which the generational conflict is transmitted - the rejection of ourselves within us is nothing other than the internalization of the rejection of us by those around us from our earliest years - of the rejection at least of certain aspects and impulses within us, which form an essential part of our original being, of our creative faculties. I touch on this aspect of things (among others) in the "Refusal and acceptance" section of "The key to yin and yang", and more particularly in the first two notes "Paradise lost" and "The cycle" (116), (116').

Having grasped this common "mechanism" of conflict transmission, however, does not mean having understood the **cause** of conflict in ourselves and (through us) in human society. **Why**, from time immemorial in all places (according to the unanimous testimonies that have come down to us through the ages), "Society" does not tolerate

Is it not the case that those who make it up are **whole** beings? That is to say, beings in full □possession of their creative faculties, who do not repress at great cost a part of what they are, considered so shameful (or so fearsome... ) that it is better to ignore that it is, and tacitly rule that it **is not**... .

For me, this is one of the great mysteries of existence, perhaps the greatest mystery of all<sup>143</sup> (\*).

There was a time, just a few years ago, when my attitude towards the universal reality of repression and conflict was one of militant **revolt** - revolt against this "**sword**", which claimed to cut in two what, by its very nature, should be one, **was** one. This was my attitude when I wrote the Eloge five years ago<sup>144</sup> (\*\*). It was through the long-term meditation that followed, on the lives of my parents, that this attitude changed. Through this work, which day after day brought me back into intimate contact with the manifestations of the conflict in my parents, and which patiently led me from the manifestations to their meaning and cause - through this work I finally came to feel the **mystery** of the conflict. The rebellious attitude had disappeared, as if it had never been there. It had been an epidermal reaction, a simple dispersion of energy. A revolt - against whom? Not against a person or a group of people, against the famous "Them... ." ! We're all in the same boat, and we've been here a million or two years... . Revolt against "God"? That's all it would have taken.

□ Deep down, I've known for a long time (I couldn't even say how long, although for a long time p . 601 I pretended to ignore it. ... ), that everything in this world has its good reason for being, and even, if we understand the bottom line, surely everything is **good** as it is. Death and the "beyond" of death (if there is such a thing) is one of these things. It's a mystery, and if there's a "**faith**" in me about it, it doesn't consist in "articles of faith" about the existence (or non-existence) of an afterlife and its particularities, but simply in this simple assurance: that things are perfect as they are, including everything to do with death, and also everything to do with birth, which is just as mysterious. For

<sup>143</sup>(\*) This suggestion is purely subjective, it simply reflects the fact that, of all the "great mysteries of existence", this is the one I feel particularly strongly about, in a way that goes beyond mere intellectual curiosity. It's the only one that arouses in me a **desire** to fathom it, to know it, to know "the last word" (insofar as it can be known, with the limited faculties that are mine). The difference is the same as in mathematics, between the open-ended questions that "I can feel" (into which I could dive straight away), and those that I "understand" in the technical sense of the term, whose scope I perceive (at a **superficial** level), but which "neither warm nor cool me". The Riemann hypothesis is one of the latter (no doubt due to my great ignorance of analytic number theory), and Fermat's theorem was another until a few years ago. It's my "Anabelian" reflections that have changed my attitude towards the latter, while my ignorance of the work it gave rise to is still as great as ever.

<sup>144</sup>(\*\*) This episode is mentioned several times in Récoltes et Semailles, most recently in the note "L'Acte", n° 113.

For a long time, however, I had excluded "conflict" from this list - I saw it as a kind of "burr", an inadmissible bleat, a stubborn and bizarre (even revolting) "kink" in the concert of Creation. All it took was for me to become intimately acquainted with the conflict, instead of wasting my time pretending to fight with it, for my relationship with it to be profoundly transformed.

The mysteries of death and "after death", of birth and "before birth", are not unique to our species. The questions they raise have meaning for all living beings, perhaps even for everything from the electron to the nebula. The mystery of conflict, on the other hand, seems to me to be unique to man, to

p. 602

the human species<sup>145</sup> (\*). It appears to me as **the** great mystery about the particular meaning, the particular destiny of **our species**. The "explanations" that have been given, by ethnologists and the psychologists, those altogether at least that I've heard of, are clearly no more than **rationalizations**, to **justify** the repression suffered and internalized, as indispensable to the smooth running and very existence of society; rather like in a society of one-armed or one-legged people, there will be no shortage of eminent theorists to prove A plus B (without anyone thinking of contradicting) that a society where people have the use of both arms (or both legs) could in no way function<sup>146</sup> (\*). These are all convoluted justifications, attempting to conceal a mystery with explanations that purport to be "scientific". In fact, the question of the origin and meaning of conflict (or repression) in human society remains purely rhetorical, as long as those who pretend to ask it have not gone through an intense and in-depth process of understanding conflict **itself**, and the origins of conflict **within it**. In the absence of such self-knowledge, this question (like questions about the nature of freedom, or love, or creativity) is a modern equivalent of the medieval question about the "sex of angels" - an exercise in style without more, to manage to "fit in" what needs to be fitted in anyway. Strictly speaking, this question is not a "scientific" one, and its examination does not presuppose **maturity**, but simply a certain preliminary knowledge, and a certain level of intellectual power or agility<sup>147</sup> (\*\*).

In this case, it's not a question of trying to guess the mechanisms by which repression is established in human <sup>society</sup>, i.e. to find an **explanation** for the fact of repression. A

p. 603

Even supposing we could come up with a plausible, even convincing scenario, I wouldn't feel much further ahead. It might shed light on a certain interesting aspect of the mystery - the "mechanical" aspect, in short - without penetrating it. No more than the detailed results of paleontology and the

<sup>145</sup>(\*) (December 3) I may be right to object that conflict, in the form of aggression and confrontation between individuals or groups of individuals, exists within species other than our own. When I speak of "conflict" here, I'm thinking of the specific form it takes in human society, and in particular of its profound links with **division** and **repression** within the individual - repression of the major part of his being, and in particular repression of his means of perceiving reality, and of perception itself. The various forms of repression seem to me to be rooted in the one that seems to me to be the most crucial of all, the so-called "sexual" repression, which inculcates shame of one's own body and bodily functions and drives (or at least, of some of these functions and drives). These are mechanisms unknown outside the human species, as far as I know. Perhaps I'm wrong in using the terms "conflict", "division" and "repression" almost as synonyms, or at least as terms that designate different aspects of the same reality. I'll explain a little more about the meaning of the word "conflict" for me in the note "Parents - or the heart of conflict", n° 128.

<sup>146</sup>(\*) Just as in the days of slave societies, for "the best minds" (who were also served by slaves) as for the rest, it was taken for granted that "no society without slaves". Apparently, it wasn't until Plato had the unexpected good fortune to find himself a slave that he began to see things differently.

<sup>147</sup>(\*\*) (December 3) The fact that the question of the meaning of conflict does not fall within the remit of science might give rise to the expectation that answers can be found in myths and religions. "It seems to me, however, that this is not the case. From what I know, it would seem that one of their essential functions, not to say their main function, is to establish a "law" which, for the most part, consists of a "package" of prohibitions through which repression materializes in a particular society. This law, presented as sacred in essence, is not required to justify itself, or to explain its "meaning", let alone the meaning it shares with other laws governing other societies.

molecular biology, nor even Darwin's profound ideas, really penetrate the mystery of the appearance of life and its creative flowering on earth over the past three or four billion years. What interests me in the mystery of conflict is not the mechanical, scientific aspect - an aspect that's as **external to me** as Fermat's famous "theorem". But it's the question of the **meaning** of conflict. This meaning **concerns me** in an immediate and essential way, just as it concerns each and every one of the countless men and women who have torn and killed each other over countless generations, and who have passed on to their children the conflict taken up from their parents.

That there must be a **meaning** to the conflict, and that I can know what that meaning is, is surely part of the "faith" I was talking about earlier. It's obvious to me - and that familiar "sense of mystery", that there's something deep here to fathom, tells me at the same time that this "something" **is** precisely **that meaning**. The "faith" in question overlaps with a faith in my faculties, when they reveal to me, here without the shadow of a doubt, that there is a "meaning" before me to discover.

Perhaps one day, this meaning will become apparent, as if I had always known it! This mystery doesn't seem distant or unapproachable. It presents itself to me as something very close at hand, which it would be up to me to know more intimately. And surely I can already see a way of approaching it, or rather an aspect that already seems to be beckoning me in a friendly way. After all, conflict has much to teach me, and has already taught me a great deal... .

#### 18.2.7.8. (h) The reversal (2) - or the ambiguous revolt

**Note** 132 ( November 22) That makes two notes in a row where I see myself embarking on excursions anything out of program - this time □ I'll be careful to start first with this

p. 604

which, for once, was **expected**. I'd like to look at one of the "typical situations" mentioned (without further clarification) in the previous note, situations likely to give rise to antagonism towards the father, and more profoundly, to a (more or less radical) rejection of virile traits in oneself (which rejection finds its symbolic expression in the rejection of the father). I had remembered the situation in question as early as the November 18 reflection, ending with the note "The enemy father (3) - or yang buries yang". My intention then was to point out, in this "typical situation" at least, a **direct link between rejection of the masculine and rejection of the feminine**.

The case in point closest to me, and on which I had worked at length in addition, was that of my mother. All her life, she had indulged in a barely disguised contempt for everything feminine, she had modelled herself on masculine values to excess, and at the same time her relationship with men had been, since her adolescence, a "viscerally" antagonistic one<sup>148</sup> (\*). I was very fortunate that my mother spoke to me very freely about her life from childhood onwards, and that I had access to detailed autobiographical notes up to the early years of her life with my father, not to mention a voluminous correspondence. In addition to my own experiences with her, this is exceptionally rich material, which I'm far from having exhausted. I've worked with her enough to feel, without a doubt, that the double refusal in her that I've just mentioned - refusal of the feminine and an- tagonism towards men - was rooted in a torn relationship with her father. The latter, an endearing man in many respects, generous, honest and affectionate, had become embittered during a long social decline in post-war Germany (I mean, the Germany of 14-18), of which there were so many. In fact, this downward spiral had begun even earlier, from a well-to-do, carriage-riding man to a

<sup>148</sup>(\*) Unlike his disdain for the feminine, this visceral antagonism, reflected in a vehement and turbulent love life, remained unconscious throughout his life. I only became aware of it during my work from August 1979 to March 1980.

itinerant shoe-shiner. Under the sting of worries and disappointments, his short-tempered temper sometimes turned to family tyranny, for which his wife, in frail health, fai□s mostly to blame. My mother, deeply attached to her father as she was to her mother, was repulsed by these episodes of paternal tyranny, suffered in silence by her mother, who sometimes couldn't take it but never complained. The child was passionately identified with her mother, the victim of paternal arbitrariness, and at the same time the role played by her mother (the role of victim, the passive role - "the role of a woman". . . ) seemed intolerable to her. There was this identification with the mother, expressed in a revolt, a visceral antagonism towards the father, and at the same **time** there was this startle that "I'll never be like her" (who suffers without rebelling), a startle that could only mean at the same time "I'll never be like women".

But even more profoundly, there was also a longing for the power of the father, of the man, to dominate at will. And my mother's life was dominated and devastated by this all-consuming passion to dominate; and above all, to dominate and break **man** - the very man who aroused in her such a surge of raging revolt, the man who by his very nature was supposed to dominate her - just as her father had dominated her mother, suffering, pale and powerless, his power.

I was going to write here that the reflection now "joins" that pursued in the note "The vehement wife (the reversal of yin and yang)", of November 12 (126). As I didn't remember this note very clearly, I've just reread it. Strangely enough, I had forgotten that this note was prompted (like today's) by my mother's "case study". Ten days ago, I had felt reluctant to develop this case at all. If I've come back to it today, overcoming this reluctance (which I'd also forgotten in the meantime!), it's undoubtedly because there was an aspect of the situation that had remained unclear. I'd also forgotten that the starting point for today's note, "the intention to put my finger... on a direct link between the refusal of the masculine and the refusal of the feminine", had already been the initial motivation for the reflection of ten days ago, following naturally on from the question that ended the previous day's note "Supermaman or Superpapa?" (125). In fact, the last sentence of the 12 :

"It doesn't take much to see the 'missing link' between... .", would seem to say that I had then thought I had accomplished my task for the day (of éta□blir such a link). If I had entirely forgotten that I had already updated this link, and even though I had already asked myself this question before the note of four days ago (on which I followed up today's reflection), it's undoubtedly because I hadn't yet been fully convinced by the brilliant conclusion I've just quoted, formulated no more than six days before this note "The enemy father". (3) - or yang buries yang". The situation becomes clearer by quoting the whole sentence:

"It doesn't take much to see the "missing link" appear between antagonism to the Superfather (finding its symbolic expression in the burial of the aforementioned), and contempt, rejection of the "feminine", and more profoundly the denial of "the woman" in oneself (which will perhaps find expression in the symbolic "Burial" of a "Supermother", under a plethora of dithyrambic epithets of double use... .)."

In this conclusion, there was one step missing, which made it hasty: it was the link between "antagonism to the Superfather" and the refusal of the "masculine", a link that only appeared in the reflection with the quoted note of November 18 "The Father the enemy (3) - or yang buries yang". Antagonism to the Father then appeared to me as the symbolic expression of the far more crucial reality of refusing the yang, "masculine" side of oneself. In the "symmetrical" case of the rejection of the feminine, this link between the symbolic expression and its deeper meaning had already been perceived when the "Supermere part" appeared, in the November 10 note "The funeral of yin (yang buries yin (4))" (124). This is how the two "opposing" strands that appeared in the "Supermaman or Superdad?" note of November 11th - the Father's funeral and the Mother's funeral - came to be seen.

before yesterday as symmetrical manifestations of self-denial (or self-contempt), taking the dual form of the **rejection of the masculine and the rejection of the feminine in their own person.**

In my note of the 18th, "The Enemy Father (3) - or yang buries yang", I confined myself to the case of a **male** "subject" - although the most extreme case known to me is that of my mother! In fact, my mother had been entirely forgotten in this reflection, even ten days earlier (if not hidden under the heading "my parents" in the note of November 17).

It's the knowledge I have of my children and their relationship to me, that made me feel four days ago a link between antagonism to the father, and the rejection of the masculine in oneself. In fact, for each of the four

p. 607

(among my five) children whom I've had the opportunity to know fairly closely, I've more than once in recent years sensed, behind attitudes of inveterate antagonism towards me, their father, a rejection of the virile side of their being, and above all, of the **impetus** within them which launches them out to meet the world - and which makes them resemble a father who's been rejected! I'd never asked myself whether this was a general fact; or rather, there was a sort of unspoken presumption in me that it must be so, without my ever feeling the need, before the reflection of four days ago, to formulate the thing clearly, let alone examine it with any care. To tell the truth, this kind of "general" question was not at all one of those I asked myself in meditation, whose purpose had been more down-to-earth: to understand myself, above all through my relationships with others - and thereby also, to some extent, to understand "others", i.e. those with whom I came into relationship.

Of course, in my reflection of four days ago, when I suggested that there must be this link, that antagonism to the father was the expression of a deeper conflict, namely the rejection of "the man" within oneself, it was still a simple presumption, suggested by my very limited experience. This link seems to me at least plausible, and more particularly in men, but I don't claim to "see" this link in general. I don't have this "intimate conviction" about it, which I so often choose as my very sure guide. In my mother's case, for example, I can see that antagonism to the father was the source of an occult and virulent antagonism to virile traits **in a man**, but by no means to such traits in a woman, quite the contrary. It's true that the mere fact of fully valuing virile traits, and cultivating them to excess in oneself, may not necessarily mean that one fully accepts the yang side of one's being; that would, after all, **also** mean accepting the "yin within the yang" that is spontaneously found in any yang "dominant" trait, which of course was not the case with my mother.

But this is taking a rather dialectical turn, which doesn't inspire me with confidence! I prefer to refer instead to my direct perception of my mother, as refined by my reflection on her life and that of my father. I don't remember ever having the feeling  
un refus chez elle de quelque chose, **en** **she** that is fundamentally "virile". On the other hand, I strongly perceived

p. 608

in her, this contradiction, or rather, this **heartbreak**, of one who cultivates within herself (like so many **weapons**), and who cherishes more than her life, the very traits that, in man, arouse in her such vehemence, and whose life has been crumbled (and prematurely consumed) by the fever of constantly meeting and confronting, and reducing to mercy in others, the **same** force on which she has staked her all, and which devastates her own life, as it devastates the lives of all those dear to her.

## 18.2.8. Masters and Servant

### 18.2.8.1. (a) Velvet paw - or smiles

**Note** 133 (November 24) The cases mentioned in the previous note of the day before yesterday are not, to my knowledge, the only ones to confirm this presentiment that a superyang imbalance in the father (whether or not this imbalance takes despotic forms), is reflected in the children by a rejection of yang, which in turn can express itself in many different ways. In boys, in the cases I'm aware of and which are on my mind at the time of writing, this rejection takes the form of a (more or less complete) repression of the virile side of himself - and this rejection will surely follow him throughout his life (unless profoundly renewed, which is certainly rare). My mother's case shows me that it's not always the same with a daughter - unless my mother also had a certain rejection of the virile side of her being, expressed in a more subtle way that I've never been aware of until now<sup>149</sup> (\*). What is striking in her case, however, is the opposite extreme effect - that of an overdevelopment of virile traits in her (in addition to an aversion to everything feminine). I know of other cases in the same vein, in **men** (my mother's father, for example) - that of a **revolt** against the father, expressed by the development of a strongly virile personality, able to confront the father "on equal terms". As I haven't had the opportunity to experience such a case up close, I'm inclined to believe that it must be rarer. But it doesn't really matter.

□ If there's one common thread running through all the cases I've come across from near and far, it would be this: a The father's superyang imbalance is reflected in the child's **imbalance**, which may be in the yin direction (perhaps the most common case), or in the yang direction<sup>150</sup> (\*). In every case I can think of (though I wouldn't dream of systematically listing all the cases I've come across), this imbalance is accompanied by **an antagonistic relationship with the father**. I have the impression that it is also accompanied by a visceral antagonistic attitude towards **male** third persons, in whom yang traits are strongly marked, at least when these are not balanced by complementary yin traits - that is, towards men in whom a superyang imbalance prevails, reminiscent of that of the father.

A superyang imbalance of this kind (like the opposite imbalance) is bound to arouse **unease** in anyone, as I've already seen<sup>151</sup> (\*\*). But this uneasiness doesn't necessarily translate into an automatic antagonistic attitude - it's not uncommon, for example, for it to be resolved (or at least to disappear from the field of consciousness) by an attitude of submission, more or less unconditional admiration, or allegiance.

The association comes to me here that it was these tones that were surely the most common, in relations to my person (haloed by prestige), within the mathematical world - at least among those colleagues (or students) who (as I wrote elsewhere) "did not feel protected by a comparable renown", or (I'll add here) those in whom a certain inner balance, a certain spontaneous knowledge of their own

force, did not exclude such cantilevers. But it is undoubtedly in the nature of such a relationship of "allegiance" that it conceals a hidden antagonism, which <sup>se□manifests</sup> itself (openly, or in a way that still remains occult)

<sup>149</sup>(\*) A related situation is that of a mother with a domineering, invasive temperament, a sign of superyang imbalance. In both cases, which I know first-hand, this resulted in the daughter's repression of her "virile" traits.

<sup>150</sup>(\*) When I speak here of "imbalance in yin direction", this does not mean a (perhaps excessive, one-sided) development of yin traits, but rather a **repression** of yang traits, which is not at all the same thing. In the opposite case, described as "imbalance in yang direction", it does mean an "excessive development" of yang traits, which often goes hand in hand with a more or less thorough repression of certain yin traits.

<sup>151</sup>(\*\*) In the note "Le Superpère (yang enterre yin (2))", n° 108.

when the right opportunity arises...

I've just followed a few associations, which pick up on and complete my thoughts of the day before yesterday (in the previous note "The reversal of yin and yang (2) - or revolt"), and by the same token, those of the note of November 18, "The enemy father (3) - or yang buries yang". They make me realize that the relationship between a certain state of yin or yang imbalance in one of the parents (in this case, a yang imbalance in the father), and the repercussions it has on the child, is by no means univocal, as I hastily suggested. Undoubtedly, the form in which parental imbalance, in this case of the father, is transmitted must depend on many other factors, both the family environment (and more particularly, the mother's person and attitude), and the child's birth temperament<sup>152</sup> (\*).

But to tell the truth, that wasn't the direction I had in mind when I started thinking about this earlier. Rather, I was thinking of pursuing a completely different association of ideas, which has been present since the reflection of November 12, when the dynamic of **the reversal of** yin and yang roles was introduced into the reflection for the first time (in the note of the same name, "- or the vehement wife", (126)). Perhaps the reader will have made the connection on his or her own - in any case, when I raised this question on November 12, then the day before yesterday on November 22, somewhere in the back of my mind, as if in mute tones, was the thought of two other occasions when "reversal" had already been mentioned, in the course of this reflection on Burial. The first was in the note of the same name in Cortège V, "Mon ami Pierre" (note (68') of April 28). The second occurrence is in a footnote, in the reflection of September 30, part of the note "L' Eloge Funèbre (2) - ou l'auréole et la force". There's even a third such occasion, but between the lines, at the beginning of the reflection due the day after tomorrow, which opened the reflection "The key to yin and yang".

(This is the note "Muscle and tripe (yang buries yin (!))" (106), from October 30.) □ This is the content of p. 611.

the famous "association d'idées, suscitée par l'Eloge Funèbre en trois volets", to which it alludes

- the very one that set me off that very day, to start the digression on wine and yang that I've been pursuing for almost two months. Now might be the perfect time to let the cat out of the bag, since I've been talking about it, not to mention thinking about it since the day after May 12, after the note "L' Eloge Funèbre (1) - ou les compliments", more than six months ago.

What these three situations have in common is that they involve a "reversal" of roles between my friend and ex-student Pierre, and myself. In both cases, which I mentioned a moment ago, I appear as my ex-student's "collaborator" (if not outright pupil!). The first time, it's as if I'd contributed (in a messy, admittedly, but sometimes interesting way) to the development of the "powerful tool" of *l-adic* cohomology by my brilliant predecessor and friend. The second time, when we are quoted in a breath (for having "linked topology, algebraic geometry and number theory by 'interdisciplinary' means ... ."), the same reversal of reality is cleverly suggested by a typographical "oversight", as if by the greatest of coincidences<sup>153</sup> (\*). The meaning of this reversal becomes even more tendentious than a simple question of precedence (in this case, within an institution that Dieudonné and I were the only ones to "start" at the scientific level, but which I had left a long time ago), when we pay attention to the choice of eulogistic epithets ("theories of legendary depth" for one, "brilliant discoveries" for the other, who is also entitled to the underline, along with everyone else except me). This meaning was "strikingly" clarified in the reflection "Les

<sup>152</sup>(\*) In this way, I can see that each of my mother's three brothers (all younger than her) developed in a very different way from my mother (who was a bit of a swan in a brood of ducks), and from the other brothers too.

<sup>153</sup>As I realized earlier in the note "The Massacre" (n° 87), chance often makes things right, as long as the typographers and movers get involved!

obsequies of yin (yang buries yin (4)) ((124), November 10), in which reflection on yin and yang suddenly "landed" in the midst of a funeral ceremony: to one the accumulation of epithets (dithyrambic at times) yin and superyin, to the other yang and superyang. ...

p. 612

That's what struck me the day after the note □ "Les compliments" of May 12, even before that. to have had the opportunity to explain it in as much detail as I did two weeks ago. According to the way I felt at the time (which I'll have to revisit here), there was a real **reversal of** reality, or more precisely, a "reversal", taken to a caricatural extreme, of a basic reality which I felt to be nuanced and balanced. I saw myself as a person with a strong "yang" or even superyang dominant, at least in my most apparent, most obvious traits, and particularly those that are obvious to others<sup>154</sup> (\*). On the other hand, I sensed in my friend Pierre a basic yin temperament, much more balanced than mine had been in the days when we saw each other often and he was my pupil.

In fact, I believe that this apprehension of reality was essentially correct. If I have sometimes, in recent years, and most recently<sup>155</sup> (\*\*), sensed an original "yin" background note in myself, it seems to me that I was the first and only one to feel it - that it was above all through my yang or "virile" traits, often quite invasive, that I was constantly apprehended by others<sup>156</sup> (\*\*\*), both on a conscious and unconscious level - at least as far as personal relationships were concerned. These relationships (apart from romantic ones) mainly, if not exclusively, involve the "boss" in us, the conditioned. The new fact that emerged in the course of thinking about yin and yang - that **in my work**, my approach to things is predominantly yin, "feminine" - doesn't really contradict what I already knew. He nuanced it, correcting me on a point where I had tacitly put everything "in the same bag". And all things considered, it seems to me that the sudden and strong impression I'd had of a cartoonish "reversal" of a reality, or more precisely, of an **intention** of such a deliberate reversal - that this "intuition" was also essentially correct, albeit sketchy. It's the reality imperfectly grasped by this intuition that I'd now like to delve into more closely.

#### 18.2.8.2. (b) Brothers and spouses - or double signature

□

p. 613

**Note 134** (November 25) I'd first have to try and get a closer grasp of this impression, for me that the "base note" in my friend Pierre is a **yin** note. As I see it, this is true both at the level of the "I", as I've seen it expressed in his relationship with me and others, and in his work, i.e. at the level of the drive for knowledge, the creative faculties within him.

As for the first aspect, he and I were obviously of **complementary** temperaments, with the added nuance that the excessive, "superyang" aspect of mine seemed to disconcert him somewhat at times. It was above all, I think, this constant forward projection towards the accomplishment of my tasks, this **isolation** from everything that wasn't related to them, that aroused in him a kind of incredulous astonishment, in which I sensed a nuance of affectionate regret - the same regret I'd felt many times in my mother, when she saw me so cut off from the beauty of things around me<sup>157</sup> (\*).

<sup>154</sup>(\*) Even more so in the years "before I left" than now.

<sup>155</sup>(\*\*) In the note "The arrow and the wave" (n° 130, November 19).

<sup>156</sup>(\*\*\*) And for myself too.

<sup>157</sup>(\*) My mother, like my father, retained right up to the end of her life a capacity for communion with nature, as well as a keen sense of observation of everything around her, both of which I still lack today. This was perhaps the only "yin" aspect of her being that she didn't repress, that was able to blossom freely. On the other hand,

Strictly speaking, it wasn't a feeling of unease, a sign of rejection of a certain reality. At least, I don't recall a single instance of him feeling uneasy with me, or having the impression of an attitude or movement of rejection, of distancing, or even of a clash between us. And I have no doubt that this was in no way a deliberate "diplomatic" gesture on his part, of one who had decided to let nothing show. On the contrary, he sometimes expressed the "astonishment" to which I alluded, without any trace of embarrassment or irritation. Clearly, the basic tone in our relationship, and one that has never wavered to this day<sup>158</sup> (\*\*), was one of affectionate sympathy, which never crossed no shadows.

□ This remains for me a strange fact, and one that nothing I believe could have made anyone suspect, before p. 614 the episode of my departure from the IHES (and even then, at the level of what "passes" directly in a tête à tête, let's say) the fact that from the very first years after our meeting there was a deep, essential ambiguity in his relationship to my person, through the presence of a hidden antagonism, a desire at least to distance himself from my person, and that of ousting. The latter manifested itself in a particularly brutal way (which left me stunned at the time), though infinitely subdued in manner, during the episode of my departure from the IHES (mentioned in the section "Eviction" (63)). My friend had just been co-opted as the fifth "permanent" member of IHES, thanks in no small part to my heartfelt efforts in this direction. In the "explanation" that took place between us (perhaps there were several, I couldn't say), he never lost that perfect, smiling naturalness, with all the aspects of benevolent kindness, that made him so endearing. He then explained to me, without my detecting the slightest hint of hesitation or embarrassment, and even less of antagonism or enmity, or secret satisfaction, that he had from those early years made the decision to devote his life and all his energy to mathematical work; that this dedication to mathematics, which was his for better or for worse, had to come before anything else; that the reason why I expected the support of my colleagues and, in particular, of himself (to request the withdrawal of funds from the Ministry of the Armed Forces) seemed to him to be entirely unrelated to mathematics; that he regretted, of course, that this was a prohibitive circumstance for me, and that, given life "axioms" different from his own, I was about to leave the IHES for a cause which, from his point of view, seemed inconsequential; but that, to his great regret, he could not associate himself, any more than my other colleagues, with a request which was foreign to him, and the outcome of which was entirely indifferent to him (134 ).<sub>1</sub>

In essence, I have given the "manifest", explicit content of my friend's speech, as I remember it, without any effort to try and restore a style of expression, or the atmosphere of an interview, of which I have retained no particularity beyond what I have said here.

The episode takes place at a time when I hadn't yet the slightest suspicion that, behind the overt content quite anodyne (and sometimes strangely absurd) speech, often expresses itself in □ sourdine, and quite clearly, p. 615 a completely different message. This one was surely perceived on an unconscious level, but fiercely rejected, repressed from the conscious field. It's in this note, however, written over fourteen years later, that I take the trouble for the first time to subject this episode to conscious attention, and clearly formulate its long-rejected meaning.

Here I followed one of the threads, probably the strongest, of the associations that came my way. I made it

---

as for "projection towards a goal", which is one of the dominant traits of my "self", it's also perhaps the only aspect of my person through which I've managed to be even more yang than my mother!

<sup>158</sup>(\*\*) (November 26) Although the basic tone has remained one of sympathy and attraction, since I left, over the years and more and more, this relationship has become more and more *strained*, sclerotic, drained of what gave it quality of life. I feel as if I'm standing in front of a "shell" that's so perfectly watertight, that nothing gets through either way. See "Two turning points" and "The tomb", n°s 66, 71.

However, I realize in retrospect that this is not the case. Without doubt, the image of a person and their temperament that emerges spontaneously from the description of concrete situations in which they find themselves involved, is more vivid and convincing than an enumeration of "traits" that are supposed to define them. Rather than launch into this, I'd prefer to note yet another association, and engage in -another digression, by comparing the relationship examined here with that between Serre and myself. In terms of the relationship between our persons, the impression that prevails for me is by no means that of a "**complementarity**" as with Pierre, but rather that of an **affinity** between two temperaments, each strongly "yang" to the other. More than once, in the eighteen years of close mathematical communication, this affinity has manifested itself in occasional frictions, expressing itself in passing chills, none of which have lasted long. As I remember it, these episodes were caused by casual impatience on Serre's part, which didn't sit well with my own susceptibility. Sometimes Serre was annoyed by my stubborn pursuit of an idea against all odds, when it seemed important to me. I'd bring it up at every opportunity, without worrying whether it would "pass" or not, strengthened as I was by the conviction (which was rarely mistaken) that I had "**the** right" point of view. I don't know why Serre had developed an aversion to my cohomological "big fuss" - perhaps he was simply allergic, like André Weil, to all "big fuss". On the other hand, when I began to develop "my" cohomological yoga, in the second half of the fifties, Serre was practically my only occasional interlocutor.

p. 616

so it wasn't looking good! I  $\square$  crois that he only consented to take a cautious interest in these works, and only began to realize they were getting somewhere, with the development of staggered cohomology from 1963 onwards, followed the same year by my sketch of a demonstration ("in four spoonfuls") of the rationality of  $L$  functions<sup>159</sup> (\*).

It seems to me that the relationship between Serre and me was typical of a yang-yang affinity, unlike the relationship with Deligne, which was a yin-yang complementarity. In terms of mathematical work and approach, however, the situation was reversed. As I said in a previous note ("Les neuf mois et les cinq minutes", (123)), I feel that Serre's approach and my own are **complementary**, in the sense of yang-yin complementarity. It was this very complementarity that gave rise to occasional friction, due to the strongly yang temperaments of both him and me.

The relationship between Deligne's and my approaches to mathematics was quite different, to be sure. I can say, without reservation, that it was with Deligne, more than with anyone else, that I had the experience of a perfect **affinity** in our ways of seeing and approaching the mathematical questions that interested us both. This experience has been renewed every time there has been a mathematical dialogue between us. It's clear to me that this is by no means a coincidence - due, for example, to the influence I exerted on him during the decisive years of his apprenticeship. This affinity didn't develop over a long period of familiarity - on the contrary, it was present right from the start.

our first contacts, which was the force at work in creating, almost overnight, a bond of such strength, rooted in our shared passion. It's about a deep affinity between two approaches  $\square$  de

p. 617

<sup>159</sup>(\*) Another point of friction I remember, probably even more episodic, was my insistence on linking the theory of quotient transition in algebraic groups and formal schemes (still poorly understood in the 1950s) to questions of the "effectiveness" of flat equivalence relations, or even (later) to quotient transition in the context of fpqc bundles. These views, first taken up by Gabriel and Manin, are now commonplace just about everywhere in algebraic geometry and even elsewhere. It seems to me that Serre's reluctance dissipated, as soon as I took the trouble (as no one else seemed willing to do) to prove in black and white the first effectivity theorem, for flat and finite equivalence relations.

mathematics, pre-existing at the time of our meeting, and which express (I'm convinced) an important aspect of the original temperament in both of us - a yin "basic tone" in the apprehension and discovery of things<sup>160</sup> (\*).

There's no question of "demonstrating" such an intimate conviction, any more than I'd dream of wanting to "demonstrate" that the basic tone in my own mathematical work (let's say) is yin, "feminine". At the very most, it's sometimes possible for such things to "pass on" a feeling from one person to another, and trigger in others an awareness of something to which they had not previously paid attention; something that had escaped their conscious attention, yet was already "registered" somewhere, in diffuse form. The situation is surely blurred, as it so often is, by the efforts made by the person concerned to mold himself according to the values in honor, the yang, "masculine" values. Whereas I can see that his mathematical work and the (considerable) influence he exerted are profoundly "masculine".

marked by his ambiguous relationship with me, I doubt, however, that the efforts in question to erase

a basic temperament akin to mine, recused - that these efforts were crowned with success. Certainly the

p. 618

The same rigorous attitudes that didn't apply to him before my "departure" have long since prevented him (at least in writings intended for publication) from examining things that are too far beneath him, or things that are now anathema. Yet it seems to me that in what he publishes, he has not been able to refrain from following the style of approach that is spontaneously his own. At least, that's the impression I got as I leafed through the few parsimonious offprints he was still kind enough to send me from beyond the grave, after my "death" fifteen years ago.

But of course, my understanding of Deligne's mathematical approach goes back to the years before my "death", between 1965 and 1969. For five years, we were both strongly connected to the same things, and mathematical communication was uninterrupted (except for a year he spent in Belgium), and more intense than that I had with any other mathematician, including mime (it seems to me) Serre. More than once, I've had occasion to evoke those years<sup>161</sup> (\*), of intense creativity for both of them. In my friend's case, they were marked by an impressive start, which didn't surprise me because it seemed so obvious! It was a time when his very sure sense of substance, of what is tangible behind the most abstract appearances, or in the most "general nonsense" formulations, was not yet obscured by complacency, nor by the burial syndrome that later appeared. He then made numerous contributions to those themes (extreme-yin, I might say) that later consensus (with his unreserved blessing) had long since excluded from the ranks of "mathematics".

---

<sup>160</sup>(\*) (November 26) The reflections of the present note, in continuity with those of the notes "The rising sea" and "The nine months and five minutes" (n°s 122, 123), seem to suggest for any person the presence of a "double signature", or a **double** "basic tone": one (undoubtedly the most apparent) concerns the "boss", i.e. the structure of the "ego" and the mechanisms that govern it; the other concerns the "Worker", aka the "child", i.e. also the drive for knowledge, discovery of the world, creation (including, of course, the drive for love). (It's true, it's the most common thing in the world to take the boss for the worker and vice versa, in other words, to take bladders for lanterns - but that's another story... ) So for me, this basic double tone is yang(boss)-yin(child), for Serre it's yang-yang, for Deligne it's yin-yin (without my having any feelings of doubt or hesitation about it). Against the background of sympathetic relations with one and the other, it's this "distribution" of "signs" (or "tones") which means that, in terms of relations between people, my relationship with Serre is one of affinity and my relationship with Deligne is one of complementarity.

approaches to mathematics.

Of the four possible "distributions", only the yin-yang double tone remains. Given the disfavor of yin in our macho society, a disfavor that will tend to play especially on the first tone (the "boss tone"), I presume that the yin-yang double-tone must be less frequent than yang-yang. Yet I know at least one notorious mathematician who seems to fit this signature. Of course, the second tone, or "original tone", is trickier to pin down, as it will often be "blurred" by outside influences, by the desire to be and do "like everyone else".

<sup>161</sup>(\*) See in particular the notes "L'enfant", "L'enterrement", "L'éviction", "L'investiture", "Le noeud" (in Cortège V, Mon ami Pierre), and the note "L'héritier" (in Cortège IX, Mes élèves).

p. 619 serious"<sup>162</sup> (\*\*): topos formalism, cohomological "big stuff"... . I review and edit pins these contributions, with obvious pleasure, in the introduction to SGA 4<sup>163</sup> (\*). Other such contributions (among even more "muscular" ones, which immediately placed him among the "big stars") can be found in my 1968/69 double report, referred to in the note "The investiture"<sup>164</sup> (\*\*).

**Note** 134<sub>1</sub> (November 26)<sup>165</sup> (\*\*\*) Typical detail: these military funds, about which nobody wanted to lift a finger, as long as there was talk that they would be the cause of my departure, were suppressed the very year of my departure to general indifference! You never know, in case it upsets a distinguished guest who's a bit fussy about the matter... . The funds in question represented only a small part of IHES resources (5%, if I remember correctly). Without having to consult each other, my four colleagues at IHES (not counting the director) were unanimous in seizing the opportunity to get rid of me (almost at the same time, in fact, as the director himself). And I thought I was indispensable, and loved!

(December 6) The two physicists at IHES, Michel and Ruelle, were unhappy that the "Physics" section at IHES was somewhat of a poor relation, next to the mathematics section, represented by Thom, Deligne and myself (including two Fields medals!). This imbalance had just been exacerbated by Deligne's co-optation (which, incidentally, had been done with the unreserved agreement of Michel and Ruelle, unanimously in of the IHES Scientific Council, with the exception of Thom). There had been consultation between physicists and mathematicians at the IHES, to put pressure on the director, Léon Motchane, to re-establish fairness.  
p. 620 balance between the two sections, as far as possible. I assume, however, that my physicist colleagues must not have been unhappy to see this imbalance effectively offset, and much sooner than they would have hoped, with the sudden prospect of my departure.

As for Thom, he was incensed that Deligne had been co-opted against his formal opposition. He had described Deligne's contributions, all unpublished, which I mentioned in my glowing "investiture" report, and which obviously went over his head, as mere "exercises"! What shocked him about Deligne's accession to "permanent" status at IHES, on an equal footing with himself, was that the young Deligne - he was 25 at the time - wasn't already covered in honors. According to Thom, such a position should come only as "the crowning achievement of a career". It was a far cry, less than ten years later, from the heroic years when I welcomed a still unknown Hironaka into my makeshift premises... . In any case, Thom's bitterness was such that (according to what he told me himself) he was thinking of leaving the IHES, to return to his professorship in Strasbourg, which he had been careful (more cautious than I had been, when I left the CNRS for the IHES) to keep. Through my warm sponsorship of Deligne, I had been the first and foremost cause of his frustration, and I presume that Thom must have felt, in his heart of hearts, that I had only got what I had deserved through my impertinence, by

<sup>162</sup>(18.5.4.4\*\*) (November 26) Incidentally, some of this mathematics was exhumed, loudly and without my name being mentioned, at the "Colloque Pervers" in 1981, and the following year with the "memorable volume" LN 900. On this subject, see the notes "L'Iniquité - ou le sens d'un retour", "Thèse à crédit et assurance tous risques", "Souvenir d'un rêve - ou la naissance des motifs", n°s 75, 81, 51.

<sup>163</sup>(\*) (November 26) These comments had been added to a second, completely revised edition of SGA 4 (especially concerning sites and topos). They may give the impression that Deligne had been associated with the birth of the main ideas and results that constitute the "powerful tool" of étale and *l-adic* cohomology. So I've added my voice to that of Deligne and my other cohomology students, sharing (ten years later) the remains of a deceased master!

<sup>164</sup>(\*\*) This double report is reproduced in volume 1 of *Réflexions Mathématiques*.

<sup>165</sup>(\*\*\*) This sub-note to the previous note ("Brothers and spouses - or the double signature" n° 134) is taken from a footnote to that note. (See reference at the end of the third paragraph of this note).

seeing himself forced to leave the IHES just a few months after having introduced my brilliant "protégé"!

As for the director, at a time when he found himself cornered by the unanimous desire of the permanent staff to leave, he then (according to a tried and tested tactic he wielded to perfection) played the "divide and rule" game, using the question of the military funds as a convenient means of distraction, and at the same time getting rid of the most troublesome of his permanent staff. (A masterly reversal of fortune, since the secrecy he had maintained around the presence of these funds seemed to me to be an additional and compelling reason to force him to leave!

and his departure from the IHES closely followed mine - from someone who, like him, had been part of the IHES from its precarious and heroic early years, and who' <sup>□</sup> with him and according to p. 621 its own resources, had ensured its credibility and durability.

### 18.2.8.3. (c) Yin the Servant, and the new masters

**Note 135** (November 26) Among the many affinities between Deligne and myself, in the years before my departure, was the pleasure he took, as I did, in developing (when the need arose) what I call "gros fourbis". Most, if not all, of my energy as a mathematician was devoted to such tasks. If it were a question of building a house, doing "big jobs" would mean : not just making a tantalizing sketch of the house, or even two or three from different angles, or even detailed plans, with dimensions and all; but bringing and cutting the stones that are to be used to build it, one by one; assemble them into walls, lay the beams, rafters and tiles or lozes; fit doors and windows, washbasins, sinks, drains and gutters; and install (if you're really going to live in it yourself) right down to the curtains on the windows and the drawings on the walls. It can be a large house, or a one-room cottage - but the spirit of the work is the same. And as long as you live in it, no matter how thoroughly you've done everything, you soon realize that the work is never finished, that there's always something new to come - at least when the "grosse fourbis" - sorry, the house - is vast.

Most of my energy as a mathematician, between 1955 and 1970, was devoted to starting up and developing à brin de zinc four **big** "gros fourbis" - without, of course, having reached the end of any of them, see above. These are, in chronological order, the cohomological tool, schemas, topos, motifs<sup>166</sup> (\*). These four master themes are, moreover, intimately connected one <sup>□</sup> to the other, as would be distinct buildings p. 622 all part of the same farm or hamlet, all working towards the same goal. And each of these "big edifices" led me, without any intention on my part, to develop other "big edifices" that were already much smaller - a bit like building a large house, or even a whole hamlet, which leads you to install a lime kiln, a carpentry and joinery workshop, and so on. A few examples,

---

<sup>166</sup>(\*) The "cohomological tool" didn't wait for me to exist. I'm referring here to a certain personal approach, which led in particular to the "mastery of étale cohomology" (which seems to me the main technical and conceptual ingredient in the demonstration of Weil's conjectures, completed by Deligne). Twenty years later, in "A la Poursuite des Champs", I'm pursuing this line of research in the direction of "non-commutative" (or "homotopic") cohomology. For the "commutative cohomology" direction, I give some details about this approach in the beginning of the note "My orphans" (n° 46). The four "big fourbis" referred to here correspond essentially to the five "key notions" in the note quoted, except that the "cohomological tool" corresponds to **two** such notions or ideas (namely, derived categories, and the "six operations" formalism).

Interestingly, the only one of the four "big fourbis" (or main research themes) named in my Eulogy (see notes n° 104 and 105) are topos. As chance would have it, this is also the one of the three buried by my cohomology students, the one that had not yet been exhumed under the paternities of rechanges, at the time of the Funeral Eulogy. (The latter takes place in 1983, the derived categories are exhumed in 1981 at the Colloque Pervers, and the motifs in 1982 in the "memorable volume" LN 900).

every year, the need was felt once again to augment the arsenal of categorical notions and constructs with two or three (small) additional "big eats". People who've come ten or twenty years later, who've found everything ready-made and are comfortably settled in (and even others who basically know what they're dealing with), shrug their shoulders condescendingly at so much unreadable "nonsense" (Deligne dixit) and eh-four hair-splitting ("Spitzfindigkeiten", as an illustrious German correspondent called them, albeit well-disposed towards me<sup>167</sup> (\*)). These are people who have no idea what it's like to build a house on level ground, and who will probably never build one, content to play landlord in those that others have built for them, with both hands and with all their heart.

p. 623 □ I was a bit brisk just now, seeming to put my friend Pierre in the bag of those who "have no idea of what it's like to build a house...". Not only did he see me at work, but it was with pleasure that he built houses of his own, as if he'd never done anything else in the twenty years he'd been in the world. Incidentally, this story of "big forks" and house-building and all that (in case the reader hasn't already noticed. . . ) is yet another aspect, or another image, to capture something I had previously tried to grasp as best I could with the image of "the rising sea", then with that of a train of waves following one another<sup>168</sup> (\*). This is the "yin mode", or "feminine" mode, of apprehending reality, and the corresponding approach to immersing oneself in it and extracting an image that renders this reality with suppleness and fidelity. So here I am, taking a detour via my own person, to return to my initial purpose - that of "conveying" this strong perception within me of a kinship, an essential affinity between Deligne's approach to mathematics and my own. But in this aspect of Deligne's work, which I've just tried to define with the help of an image, there was a complete "blurring", it seems to me, after my departure-death in 1970 - I believe that the "big fourbis" are totally absent from his "after" publications. Certainly, he could not reasonably have used this trait in his disowned master, to debunk the latter, while tolerating the same trait flourishing in himself, in accordance with his own nature.

It's true that if it's not a question of following an inner need, the expression of an elementary impulse, but simply of increasing one's prestige through the accumulation of **results** that "make a mark", my friend really had no interest in continuing to embarrass himself with (more or less) "big stuff". Even in my day, and outside the Bourbaki group (itself involved in a sizeable "gros fourbis"! ), it was already a rather frowned-upon thing to do. This is hardly surprising, given that the "superyang" blinkers, in our society and in the world around us, have become the norm.

p. 624 in the consensus of the scientific world, didn't start yesterday. Perhaps this was the main reason why the houses I took pleasure in building remained uninhabited for <sup>long</sup>□years, except for by the bricklayer himself (who was also the architect, carpenter etc.). And to this day, even the part of my work that has long since become common heritage (and even where there is still no other reference available than my writings), remains surrounded (at least for those who are not part of the "beau monde" and who make no point of looking down on it) by an almost awe-inspiring halo, as if entering it would require almost superhuman faculties. It's true that it's often long, and it couldn't be otherwise, given that everything is well and truly done, by hand and in detail, from start to finish, with even

<sup>167</sup>(\*) My correspondent kindly assured me, just to please me, that he was well aware that my work was "largely free of such defects" ("weitgehend frei von diesen Übeln"). For him, these were the "tares" into which one could not fail to fall (like the "Spitzfindigkeiten" of categorists of all stripes), if one were to develop a theory (as I suggested with regard to motifs) on foundations that would still remain conjectural. Here we find the visceral rejection of the "mathematical dream" discussed in the section "The forbidden dream" and in the following three sections (sections 5 to 8). It's yet another aspect of an automatic repression of any "yin", "feminine" approach to mathematics.

<sup>168</sup>(\*) See the two notes "The rising sea" and "The arrow and the wave", n°s 122, 130.

at every turn of the chapter, explanations of where we're going<sup>169</sup> (\*). It didn't seem to me that my students, when they were working with me, had much trouble getting into the swing of things. But that was at a time when "tangible results" had already won over the mathematical establishment, and my students worked with the confidence of playing a "safe" card. I have the impression that, since then, more and more people have taken pleasure in accrediting the "unreadable" version<sup>170</sup> (\*\*), in accordance with a fashion that is even more tyrannical today than it was in my day.

But even setting aside the desiderata of fashion, when it comes to calculating profitability and "returns", we're bound to be careful to avoid "big stuff" like the plague. Developing "big stuff" and making it available to everyone is a **service** to a scientific community that often accepts it.

reluctantly. I've never been too bothered by this understandable reticence; I've always been a bit

knew that I had "the right stuff", and that sooner or later, people wouldn't be able to stop coming.

p. 625

But even as they come, the "returns" in terms of "credit" can only be modest. If I were to draw up a numerical balance sheet, not of the notions, questions and ideas I introduced and developed in the fifteen years from 1955 to 1970, and which have either become part of the common, anonymous heritage, or are buried without music (waiting to be exhumed with great fanfare), but of what might be called "great theorems", I doubt I'd find even ten. Perhaps the total time directly devoted to their demonstration is of the order of a few weeks, or a few months at the most. There wasn't one until 1957 (Riemann-Roch-Grothendieck theorem) - and yet I know I hadn't wasted my time in the three years before that. In fact, none of the "great theorems" would have been demonstrated by now (although this was by no means my main concern), if I hadn't stubbornly followed a passion for understanding within myself for these fifteen years, trusting the approach it dictated, whether or not it was "profitable" (in terms of such and such desiderata), or whether or not it was well regarded in the wider world. Each time, this approach consisted of starting with a strong intuition, or a handful of such intuitions, and taking them as a solid, foolproof thread that pulled me into the unknown; and in doing so, to change the image, I couldn't help but gradually, with the unknown in the process of making itself known, like rough stones that you "know" by cutting them, build houses, some very large, some not so large, and all fit to be lived in - houses where every nook and cranny is destined to become a welcoming and familiar place for more than one person. Doors and windows are plumb and open and close without cracking or creaking, the roof doesn't leak and the chimney doesn't pull. It doesn't have to be Notre Dame de Paris, and there's no "great theorem" hidden in everyone's breadbox - these are simply houses that had to be built, and that I built to be lived in. I found my joy in making them, beautiful and spacious, knowing full well that the work I was doing, alone or in company, had to be done, and that at each moment it was as good as I could make it.

It's this spirit, too, that I found in the Bourbaki group in the 1950s, and which made me feel at ease, "at home", notwithstanding the differences in background and culture, and the difficulties.

that I mentioned earlier. In those days at least, it was a  $\square$  esprit de **service**, still, that

p. 626

<sup>169</sup>(\*) It's only over the years, I think, that I've come to realize the need to include such explanations, often purely heuristic, to try as far as possible to communicate to the reader a sense of "direction" and purpose, strongly present in me at the time of writing. Today, this seems far more essential than meticulous writing of key demonstrations, which the reader will be happy to reconstitute or even construct from scratch, as soon as he senses where we're going, and that "where" attracts him... ..

<sup>170</sup>(\*\*) This is obvious only to Deligne, who repeated it to me during his recent visit. This was SGA 4 (more than half of which develops the language of topos with extreme meticulousness), declared "unreadable" by my friend, as justification for his brilliant "SGA 4 operation<sup>1</sup>".

I found there. Service to a **task**, and beyond the task, service to other men, eager like us to understand things small and great, and to understand them thoroughly and to the end. This "service" did not take the form of austere duty or asceticism. It arose spontaneously and joyfully from an inner need, expressing something in common that linked these very different men.

And it's this same spirit that I recognize in the Cartan seminar, where so many French mathematicians got their start, and later (in the 1960s) in my own seminar (which goes by the acronym SGA, "Séminaire de Géométrie Algébrique du Bois Marie"). One of the differences between the two seminars was that mine were strongly focused on the development of the "big fourbis" mentioned earlier (i.e. "**my**" fourbis), for which there were never too many hands, whereas Cartan's themes from one year to the next were more eclectic. What seems more important to me is what the two seminars had in common, and above all, what seems to me to have been their essential function, their **raison d'être**. To tell the truth, I can see two of them. One of the functions of these seminars, close to Bourbaki's purpose, was to prepare and make available to everyone easily accessible texts (I mean, essentially complete), developing in a detailed way important themes that are difficult to access<sup>171</sup> (\*). The other function of these seminars was to provide a **place** where motivated young researchers - even if they weren't geniuses - could learn the trade of mathematician on topical issues, in contact with eminent and benevolent men. Learning the trade - in other words, getting down to work, and in the process, finding an opportunity to make a name for themselves.

It would seem that my departure in 1970 marked the end, in France at least, of the "major seminars".

- **sustainable** places where, year after year, some of the great themes of contemporary mathematics are being worked on - and places that are also **benevolent** and inspiring, for ☐all those who come to put their minds to it.

p. 627

hand. I don't know if they exist anywhere else in the world (Moscow, perhaps, under the impetus of I.M. Gelfand?). What is certain is that such places are decidedly contrary to the zeitgeist, just like the "big fourbis", written out in black and white, meticulously, for **all** to see.

It's no coincidence that hardly anyone writes careful and (for the time being) ex-hausive essays on topics that have been ripe for discussion for ten or even twenty years, and which are clearly crucial, but which in the meantime are only accessible to a handful of people "in the know". Those who are part of the mathematical "big world", unless they are also part of the "handful" in question, will have no difficulty whatsoever in being brought up to speed by one of them, who will be only too happy to oblige. As for the rest of us, what the hell! Back in the sixties, I saw a lot of books clamoring to be written. I'd have written them myself, but I couldn't do everything at once. To my knowledge, none of these books has yet been written<sup>172</sup> (\*). However, I know more than one person (even if only among ex-students) who was in the know enough and had the feeling and the knack, to be able to write without difficulty such a book as was needed (and still is). And from the little I've seen of some of their later work, I don't get the impression that it's the abundance and difficulty of their more personal work that's made them so successful.

<sup>171</sup>(\*) "Difficult to access", either because these themes remained imperfectly understood, or because they were known only to a handful of insiders, and the scattered publications dealing with them gave an inadequate picture.

<sup>172</sup>(\*) (November 28) I should make an exception here for theses written at my instigation. The spirit that animated me and which I believe communicated itself to my students, at least during the time they worked with me, was that which animated me for my own work; that is to say, in colorful terms, "to build the houses" that were visibly needed, even if I was often the only one to feel the need for this or that particular "house". I have the impression that, as a general rule (with one exception), this feeling was eventually communicated to the student, making him or her "hook" on a particular subject, and subsequently identify strongly with it. With the exception of Verdier, who didn't deign to make available to everyone the foundation work agreed between us and which is still waiting to be written, the thesis work of all the students who did their state doctorate thesis with me has become what you might call "standard references". They are houses fit to live in, and none of them duplicates any other. ...

would have prevented him ("I'm sorry, but I really don't have the time!") from providing this service to the famous "mathematical community". For more than one, too, it's a safe bet that it would have made him even more notorious, like author of a book read and quoted (even if not everything he expounds necessarily □ from him - but the "how" p. 628 is by no means a negligible quantity. ... ), than by the more or less thick bundle of its separate prints.

Clearly, it's not a simple "lack of time" that's preventing some of us, with impressive unanimity, from making accessible to all what remains the privilege of a few - or even from having (if only here and there, let's say, the time to write a book) an **attitude of "service"**. At this point, I'm irresistibly reminded of the SGA 5 seminar in 1965/66, which, for eleven years, had been ignored for personal gain by the very people who had benefited from it in the first place, my friend Pierre and my other cohomology students! It's true that there was a body to share, and therefore a special motivation in this case. But I'm also thinking of other cases, where the service rendered made up for obvious shortcomings, and was brushed aside by the people in place<sup>173</sup> (\*). People will say that these are still rather special cases, that it was my person who was targeted, when it was obvious that it was I who had inspired the work in question. And yet, I can sense a "zeitgeist" in all of this that transcends any individual case.

The aspect of the "zeitgeist" that I'm trying to pin down here, as best I can, is the **discrediting of an attitude of service** - a discrediting that I perceive through a host of converging signs, and which for me is a patent fact. Everyone is free to deny it, just as they are free to examine it for themselves and see for themselves. My purpose here is not to "prove" it to a reluctant reader, but to try to grasp its meaning.

From the point of view of this reflection, the first meaning is obvious. The attitude of service is typically a "yin", "feminine" attitude, and it's not surprising that it's one of the many that find themselves devalued. The nuance, which I've seen many times, is that such an attitude was just the right one. good for those who couldn't afford a "master" attitude - that work done in this spirit

□ was **subaltern** drudgery, good for the pedestrian among those who coach big ideas and p. 629 brilliant discoveries".

However, I also know that there's more to it than that - because otherwise, why should we prevent at all costs a "pedestrian" of good will (when by chance there are any) from quietly doing in his corner the dirty work that is his by right, finally providing solid references where previously we had to be content with saying (when we deigned to say something. . . ) "we know that. . . " or "we can demonstrate that... .", or more rarely and more honestly "we'll admit that... . " ? !

I was first confronted with this troubling question eight years ago, when Yves Ladegaillerie was trying to "fit in" his thesis<sup>174</sup> (\*). It was, I confess, at a time when my interest in both mathematics and the world of mathematicians was at its most marginal. I was a little bewildered, but I didn't try to unravel the meaning of this mystery. With a few variations, my attitude hardly changed in the years that followed, until last February, when I continued to reflect on the subject in Récoltes et Semailles. And yet, by dint of picking up on signs, and even if I didn't mean to, I couldn't help but gradually pick up on their meaning, or rather, meanings. I can see two of them. One has to do with me - the burial syndrome, which I haven't quite got round to yet. The other has nothing to do with any particular person. It's about an **attitude of exclusivity in the possession and control of scientific "information"**, an attitude that prevails within the scientific community.

<sup>173</sup>(\*) I'm thinking here, of course, of Yves Ladegaillerie's work, and that of Olivier Leroy, mentioned in four previous notes and sections ("On n'arrête pas le Progrès", "Cercueil 2 - ou les découpes tronçonnées", "La note - ou la nouvelle éthique", "Cercueil 4 - ou les topos sans fleurs ni couronnes", notes n°s 50, 94, section 33, note n° 96).

<sup>174</sup>(\*) On this subject, see the two notes °s 50 and 94, cited in the previous footnote.

of the scientific "establishment", making it a kind of ruling caste by divine right, within the so-called scientific "community"<sup>175</sup> (\*\*).

p. 630

This is a theme I've already touched on (barely, barely) in the note □ "Deontological consensus - and information control", and a little also in "Le "snobisme des jeunes", ou les défenseurs de la pureté" (25), (27)). I suspect that this is a **new development** in the scientific world, which has come to take hold at a snail's pace over the past two or three decades. I don't think I was among those who propagated and welcomed this unwritten "new ethic" of double standards<sup>176</sup> (\*). If I have any co-responsibility for its advent, it's rather that I didn't see it coming<sup>177</sup> (\*\*). Before these last few years, I had no idea that the all-round information I had enjoyed freely, practically since my first contacts with the scientific world in 1948, had over the years become, I'm not sure when or how, a far-reaching **privilege** shared with a handful of friends - a **class privilege**, to use an overused term, which here seems to express a very tangible reality.

But my aim is not to make a "class analysis" of the mathematical world, and the "relations of force" and the "means of power" in this world - no more than to paint a "picture of manners". It's time to return to □ a more limited purpose - that of understanding, in its essential springs in the main protagonists, the "news" of my early funeral!

p. 631

#### 18.2.8.4. (d) Yin the Servant (2), and the generosity

**Note** 136 (November 28) The previous two notes were essentially digressions around the theme of the yin-yin affinity between Deligne and myself, in terms of mathematical work and approach to mathematics. I don't know whether they helped to "get across" my perception of this affinity and its nature, which for me is beyond doubt.

I've written elsewhere that "in my work, I'm as "yin", as "sea and motion", as one can be". On reflection, I'd say that's not literally true - that one "can be" even more so, because (as I see it) Deligne is even more so than I am. Or at least, the "yang in the yin" seems more pronounced in me than in him. What's fiery in me, takes on a more measured air in him. Where I boldly launch myself forward, more often than not he will remain cautious, and often well-founded, in his expectations. As long as I have the beginnings of an idea, a "tip" I can get my hands on, I don't hesitate to throw myself into a mathematical quagmire that I feel is substantial, without bothering to take a closer look at the initial idea ("ihr auf den zahn fühlen", as they say in German. . . ), or to predict the outcome of the melee. Sometimes the idea just doesn't make sense, for some obvious reason that escapes me because I'm so keen to "jump into the fray". Eventually I realize it - sometimes I feel like an idiot, and yet I've rarely regretted taking the plunge. That's how I make contact with an unknown substance - by rubbing up against it, whether "advisedly" or not.

<sup>175</sup>(\*\*) (December 6) Lust for domination is a **superyang** imbalance, and by far the most common form of such an imbalance. It corresponds to an obliteration of the yin term, "feminine" in the yin-yang couple "Master-servant", or "that which dominates (or masters) - that which serves", neighboring the couple "mastery - service".

<sup>176</sup>(\*\*) I don't know if there are many among the elders or colleagues of my generation, or even among younger colleagues and friends, who have seen it. I doubt if there is a single one of "those who welcomed me fraternally, into this world that became mine", to whom Récoltes et Semailles is dedicated - apart perhaps from Chevalley. That's certainly one of the things I'd have liked to talk about with him - but he's no longer here to tell me. ...

<sup>177</sup>(\*\*) I don't know if there are many among the elders or colleagues of my generation, or even among younger colleagues and friends, who have seen it. I doubt if there is a single one of "those who welcomed me fraternally, into this world that became mine", to whom Récoltes et Semailles is dedicated - apart perhaps from Chevalley. That's certainly one of the things I'd have liked to talk about with him - but he's no longer here to tell me. ...

My friend, on the other hand, first probes and examines - and then launches out, when he feels sure, if not of the point of arrival, which would be asking too much, but at any rate that there's somewhere to land, and that he won't come back empty-handed. I've never had the impression in his work of any kind of **dispersion of energy**, as I often had - but rather that with him, **all the strokes work**. From this point of view, his style of work carried

the mark of **maturity**, whereas mine was more the mark of **youth**, sometimes muddled by the sheer force of it. to be feisty. When we first met, however, I was approaching forty, p. 632

when he was twenty years old. And more than once, I sensed in him a kind of smiling indulgence towards me, the kind of indulgence a benevolent adult would have towards an affectionate child, when he saw me still embarking on some (small) "big job", without ever doubting anything... ..

The aspects I'm evoking here are no doubt difficult to detect in published works "au net", which present a final, or at least advanced, stage of reflection. I'm no less exacting in my work than he was, and I hardly ever entrusted notes to a typist or printer until they had reached a stage where they satisfied my need for complete clarity. On the other hand, in the style of writing I follow in "Réflexions Mathématiques" (and particularly in "A la Poursuite des Champs"), the original approach to the work is apparent on every page. Readers will notice many "misses". They are all small in scale - usually spotted the next day or two, if not the very same day, and rectified in the pages that follow. (That this should be so surprised me - it's one of the signs of the extraordinary "ease" of my mathematical work, which I've mentioned elsewhere<sup>178</sup> (\*).). One of the reasons for the "little misses" is, of course, my lack of familiarity with a subject I hadn't touched for seven or eight years - and these absent-mindednesses become rarer as the work progresses, as the contact gradually lost is re-established. Nevertheless, this way of taking at face value, without hesitation, what a rather nebulous memory gave me of things I knew more or less well at the time, illustrates well this "go-getter" aspect, and sometimes scrambling, which constitutes (among others) the "yang in the yin" aspect of my mathematical (or non-mathematical) work. I'm convinced that an equally spontaneous text from Deligne's pen would be much closer to what is commonly considered "publishable" - indeed, publishable by his own exacting standards.

□ If I insist here on the character of "maturity", of "yin very yin" in the working style and approach of p. 633 I don't mean to suggest that my friend's work is in any way unbalanced, that it lacks or is lacking in "yang" or "virile" qualities. If this were so, his work would not, like Serre's or mine, bear the delicate, unmistakable mark of **beauty on** every page. But this is not the place, any more than I did in the case of Serre or mine, to follow the delicate harmony of yin and yang, of "feminine" and "masculine", in his published work, which is known to me, and in what is known to me of his work through the personal contact I've had with him for nearly two decades.

Nor should we think that my observation of a balance between yin and yang is some kind of truism, that it applies immediately to every man who, in one capacity or another, is considered a "great mathematician". This perception of beauty that I just mentioned is not equally present, nor to the same degree, in the work of all mathematicians who leave a lasting imprint on the mathematics of their time. Among these, I know of two who, like Deligne, appear to me to be predominantly yin in both their work and their personality, and whose work has never failed to impress me.

---

<sup>178</sup>(\*) See note "The trap - or ease and exhaustion", n° 99. It seems to me that this "ease" is even greater now than it was before I "left". This seems to me to be linked to a maturation that has taken place in me over the past fifteen years, and which is felt in my mathematical work as elsewhere.

The yin imbalance is so extreme in one of these colleagues that he seems entirely unable to even formulate the slightest definition or statement clearly and correctly. The yin imbalance is so extreme in one of these colleagues that he seems entirely incapable of formulating even the slightest definition or statement clearly and correctly (let alone an idea. . . ) - even though he has a deep intuition for many things, and has introduced a number of important and fruitful ideas. In each case, these ideas have taken shape through the work of others. It's clear that he has a rare repression of "yang" traits and forces, both in his work and in his way of being. This repression takes on the proportions of true powerlessness, even in his work, where he would be incapable of completing anything by himself.

p. 634 means. He compensates for this impotence of being with an attitude of megalomania, internalizing at the same time the defects he delights in cultivating in himself, as if it were **thanks to them** that he could ☐conceive ideas that

(in his eyes) make him **the** great scientist of the millennium. ... <sup>179</sup>(\*)

I sense a repression in the opposite direction in my friend Pierre, evacuating certain "yin" traits and leading him (more or less successfully) to model himself on a superyang image. Admittedly, this repression is a long way from the opposite extreme I've just described. It does not go so far as to erase from the reader or interlocutor the feeling of beauty, of satisfaction without any aftertaste of unease, which are the signs of a true understanding, giving at every moment their fair share to both clarity and shadow, to mystery. In other words, the "superyang" brand image chosen by my friend should hardly encroach on his work itself, at times of work I mean, when the presence of the "boss" should be as often effaced as it is (I think) with Serre, or with me<sup>180</sup> (\*\*).

On the other hand, it seems to me that the role of the boss becomes important, even invasive, when it comes to choosing work **themes**. There's this fixed idea of standing out from my person, and by the same token, the refusal to follow certain inclinations of his own nature which are too strongly associated in him with the image of the disowned master. So, while he may, like anyone else of great means, be able to demonstrate difficult theorems (or even "proverbially difficult" ones), and even to introduce beautiful ideas and develop them, he would never dream of naively "rethinking", in his own way and even if only in broad outline, an entire science (such as topology, which could really use it.... ) - or even to create a new science from scratch, to "unearth new worlds" (as I wrote elsewhere) (136<sub>1</sub> ). And yet, if there's anyone I have no doubt he has what it takes, it's him. If there's anything he's lacked until now

p. 635 to do this is **generosity** - true generosity, which is at the same time a calm assurance, which makes us follow the impulse of our own nature wherever it carries us, without us ☐soucier or encouragement, nor "returns".

But there's also the simple joy of "building houses", big or small, for others to live in, without necessarily having to be on the scale of a "whole science" or a "new world" - the joy of lugging stones and beams around like the first bricklayer or carpenter who comes along, without fear of being mistaken for this or looking like that - or of bringing within everyone's reach what (according to some) should remain the preserve of the very few. It's an attitude of service, a certain humility, another expression of the same generosity mentioned earlier, of the same fidelity to one's own nature. My friend has exchanged it for an attitude of self-importance ("me - to do such a job!") and a caste attitude<sup>181</sup> (\*), in terms of choice.

<sup>179</sup>(\*) I'm talking about attitudes and ways of being that I'd seen before I left, when I had the opportunity to meet this prestigious colleague on a familiar basis. It's not impossible that something has changed since then (although that would be a rare occurrence. . . ).

<sup>180</sup>(\*\*) I revise this hasty impression at the end of sub-note no. ° 136<sub>1</sub> (dated December 4) to this note.

<sup>181</sup>(\*) This "class" attitude, in my friend and in the "great mathematical world", appears in my thoughts first in the two notes (from March) "Deontological consensus - and control of information" and "Youth snobbery - or the defenders of purity" (n°s 25, 27), and it reappears in last week's note "Yin The servant, and the new

acceptable" work themes.

Finally, there is a third attitude or force by which "the boss" weighs in on my friend's choice of work themes, the substance he gives himself to probe, a force that sets him imperative barriers. It's the "master's funeral" syndrome, or **gravedigger's syndrome**. It's not just a question of refraining from naming the one who must remain ignored. It's also a matter of burying the work itself, or more precisely, of "**cutting**" it off cleanly, as if with a **chainsaw**, in one's own work as in that of others, at the level of each of the master branches sprouting from a vigorous trunk<sup>182</sup> (\*\*). As I reminded you the day before yesterday (in the previous note, "Yin the Servant, and the new masters"), among the four major themes that I identified and developed during my period as a "surveyor" between 1955 and 1970, only one was "taken" and used in broad daylight by my brilliant pupil and <sup>succ</sup>cessor, the other three have been "truncated" - muted, p. 636 it goes without saying. One of the themes was partially exhumed in 1981, and another the following year - as if stunted shoots had sprouted from the scarred stumps of severed main branches, surrounded by brightly-colored garlands and neon lights, just to give the impression...

**Note** 136<sub>1</sub> (December 4)<sup>183</sup> (\*) My own approach has constantly led me to "rethink" from top to bottom everything that stands in my way as a mathematician, whether it's the most insignificant thing, or whether it's on the scale of "an entire science". It's true that, having only two arms like everyone else, I haven't always been able to go so far in carrying out a program of work to remake "an entire science from top to bottom", as I did in the case of algebraic geometry, starting from a few very simple key ideas around the notion of the schema. Even in this case, where I invested a large part of my mathematical energy for twelve years in a row, I was far from "completing" the planned program - for that, I would have needed twelve more years! (And no one after I left bothered to carry on with the task, which must have seemed (wrongly) thankless... .)

Other cases in which I have rethought a science, but certainly without going that far, include **holographic algebra** (both commutative and non-commutative - the latter, incidentally, did not yet exist when I first started thinking about it in 1955), and **topology**, with the introduction of the notion of **topos**, which is still waiting for its time to become the daily bread of the geometric topologist, along with the various notions of "topos".

of "spaces" and "varieties" commonly used today<sup>184</sup> (\*\*). No doubt certain important parts of current topology will hardly be touched <sup>by</sup> the systematic development of the p. 637 point.

toposic viewpoint in topology. So this point of view seems to me to be the crucial element in the "creation from scratch of a new science" - a science that achieves a synthesis (entirely unexpected when I arrived in the 1950s) of algebraic geometry, topology and arithmetic<sup>185</sup> (\*). Over and above the construction of the new algebraic geometry, and through the "mastery of stale cohomology" (and that of the l-adic cohomology that follows from it), it was the elaboration of a master builder of this new science still in the making, and the development of solid technical foundations, that was in my eyes my main contribution to the mathematics of my time. The "yoga of **patterns**", which remains

---

masters", n° 135.

<sup>182</sup>(\*\*) I was first confronted with the reality of "the chainsaw" on May 19, during the reflection in the double note "Les héritiers... .", " . . and the chainsaw" (n° s 91, 92), then in the four coffin notes that follow (and which, with "Le Fossoyeur", form the "Fourgon Funèbre" or Cortège X de l'Enterrement), on May 21 and 22 (notes n° 93-96).

<sup>183</sup>(\*) This sub-note to the preceding note ("Yin the servant (2) - or generosity", n° 136), is taken from a footnote to this one. (See footnote in third paragraph before end of footnote).

<sup>184</sup>(\*\*) Compare with some of the comments in the second part of the March note "My orphans" (n° 46), and in his sub-notes n° s 46<sub>5</sub> to 46<sub>7</sub>.

<sup>185</sup>(\*) See previous footnote. (March 11, 1985) The term "entirely unexpected" is no doubt excessive, for the prescience of such a synthesis is already to be found in Weil's conjectures, which acted as a powerful source of inspiration.

still conjectural, seems to me to be the soul, or at least the neuralgic part among all, of this new science, so vast that until today I hadn't even thought of giving it a name. We could call it, perhaps, **arithmetic geometry**, suggesting by this name the image of a "geometry" that we would develop "above the absolute base" Spec  $\mathbb{Z}$ , and which admits "specializations" both in the traditional "algebraic geometries" of the various characteristics, and in "transcendental" geometric notions (above the basic bodies  $\mathbb{R}$ ,  $\mathbb{C}$  or  $\mathbb{Q}_l \dots$ ), via the notions of analytic or rigid-analytic "varieties" (or better, **multiplicities**), and their variants.

I see yet another "new science" that I had glimpsed as early as the 1960s, originating in my reflections on homological algebra begun in 1955. It's a vast synthesis of ideas coming from homological algebra (as it developed in contact with the needs of geometry

algebra, or better said, "arithmetic geometry"), homotopic algebra, the topos version of "general topology", and finally the theory (in limbo since the sixties) of (non-strict)  $\infty$ -categories, or, as I prefer to say now,  $\infty$ -fields. I had expected, as something going that this synthesis was going to be taken in hand by some of my cohomology students, in the same way that I would-

p. 638 mencer par Verdier  $\square$  d dont la fameuse thèse<sup>186</sup> (\*) était censé justement aller dans ce sens. It seemed to me that the

The development of a satisfactory common language, with all the desired generality and flexibility, was to be a matter of a few years' work, surely exciting, by a small nucleus of motivated researchers. After a few very fragmentary beginnings in this direction by some of my cohomology students, my departure in 1970 signaled an immediate abandonment of this work program, among many others close to my heart. That's why I came back to some of my ideas, in a 1975 correspondence with Larry Breen, in the hope of reviving a vision of things that I felt were "in the way", and that "everyone" took care to carefully circumvent, whenever confronted with them. In my letters to Larry Breen (reproduced in chap. I of "A la Poursuite des Champs"), I proposed to call by the name **topological algebra** this science still in gestation, which for a decade or two I alone had been glimpsing<sup>187</sup> (\*\*). Finally, in February 1973, with "A la Poursuite des Champs" (The Pursuit of Fields), I set to work, wearily and despairingly, to see someone other than myself tackle a task that had been burning to be undertaken for twenty years.

Clearly, there's no common ground between the "arithmetic geometry" mentioned earlier, and topological algebra, one of whose main roles, in my view, is that of "logistical support" in the development of this new geometry. For this new geometry to reach the stage of full maturity attested (let's say) by a mastery of the notion of pattern, comparable to the mastery we have of stale cohomology, we must no doubt expect several generations of geometers to have tackled it, more

dynamic and bolder than those I've seen at work; not to mention a comparable mastery of **Anabelian  $\square$  algebraic geometry**, which appears to me (along with the motifs) as one of the two neuralgic" parts of arithmetic geometry, now discernible<sup>188</sup> (\*).

p. 639 <sup>186</sup>(\*) On this subject, see the note "Credit thesis and comprehensive insurance", n° 81.

<sup>187</sup>(\*\*) With the exception, at most, of Deligne, to whom I had thought I had communicated a vision, which he hastened to bury with the rest in the wake of my departure. I allude several times in Récoltes et Semailles to this part, the earliest of all, of my overall program to lay the foundations of a kind of "all-round geometry" - notably in "Le Rêveur" (section n° 6) and in the notes "Mes orphelins", "L'instinct et la mode - ou la loi du plus fort", "Le compère" (n° s 46, 48, 63").

<sup>188</sup>(\*) (For some key ideas in Anabelian algebraic geometry, see Esquisse d'un Programme, par. 2 and 3).

By "neuralgic", I mean here a part of this "arithmetic" geometry that brings it intuitions, conductive threads and problems that are entirely new in relation to the "acquis" of the sixties (this "acquis" essentially consisting of a framework and a language, and a homological and homotopic formalism common to the three disciplines encompassed by the "arithmetic" geometry).

Finally, there's a fourth direction of thought, pursued in my past as a mathematician, moving in the direction of a "top-to-bottom" renewal of an existing discipline. This is the "moderate topology" approach to topology, on which I expand somewhat in the "Outline of a Program" (par. 5 and 6). Here, as so often since the distant years of high school, I seem to be alone in sensing the richness and urgency of the work to be done on the foundations, the need for which here seems more obvious than ever. I have the distinct feeling that the development of the moderate topology point of view, in the spirit evoked in *Esquisse d'un programme*, would represent for topology a renewal of scope comparable to that which the schema point of view has brought to algebraic geometry, and this, without requiring energy investments of comparable dimensions. What's more, I believe that such a moderate topology will eventually prove to be a valuable tool in the development of arithmetic geometry, in particular for formulating and proving "comparison theorems" between the "profinite" homotopic structure associated with a stratified scheme of finite type over the field of complexes (or more generally, to a stratified schematic manifold of finite type over this body), and the corresponding "discrete" homotopic structure, defined by transcendental means, and moduli of suitable hypotheses (equisingularity in particular). This question only makes sense in terms of a precise "unscrewing theory" for stratified structures, which in the context of "transcendental" topology seems to me to require the introduction of "moderate" context.

\*       \*

\*

□ To return to the person of my friend Pierre Deligne, he had ample opportunity, during the years 1965-1970 of close mathematical contact with me, to become thoroughly familiar with this set of geometrical ideas and visions, which I have just reviewed in broad strokes. (With the exception of the ideas of moderate topology, which began to germinate and intrigue me only from the early '70s onwards, as I recall). His role vis-à-vis this vast program was twofold, and in two opposite directions. On the one hand On the other hand, drawing on the ready-made tool of *l-adic* cohomology, and on the ideas (which had remained hidden) of pattern theory, he made remarkable contributions to the development of the arithmetic geometry program. The most important of these are undoubtedly the start of a theory of mixed Hodge coefficients, and above all his work on Weil conjectures and their *l-adic* generalization. On the other hand, apart from the **tools** and ideas that he directly needed for his work (and whose origin he systematically endeavored to make people forget), he did his utmost to thwart the natural development of everything else: this is the "chainsaw effect", of which I had ample occasion to speak in the course of my reflection on Burial, including (allusively) in the preceding note (n° 136). This chainsaw effect has been partially blurred by partial exhumations (in 1981 and 1982), "like stunted shoots that have sprouted... "under the sudden pressure of immediate needs. (These occasional exhumations have just been mentioned again at the end of the previous note). He also did his utmost to constantly give the impression (without ever making it clear...) that the paternity of the ideas, notions, techniques and results he used, and whose origin he was careful to conceal, was his own, when he wasn't generously attributing it to some other of my former students or collaborators.

All in all, after this quick retrospective of what has been so tenaciously truncated and buried by

---

arithmetic geometry). Perhaps a third such "neuralgic part", intimately linked to the motives, should be added to the previous two, namely the Langlands-style theory of **automorphic forms**. If I have refrained from mentioning it, it is because of my regrettable ignorance of the theory of automorphic functions. (I don't know whether the opportunity will present itself to remedy this ignorance... )

my friend, I return to the impression that prevailed in the previous note, where I suggested that the interference of the "boss", of egotistical greed in his work, was essentially limited to the choice of work **themes**. After all, the gravedigger's gravedigger's gravedigger's gravedigger's gravedigger's gravedigger's gravedigger's gravedigger is apparent in his work, with very few exceptions

p. 641

And I realize that these "opportunities" are countless! **This gravedigger syndrome** (intimately linked, I'm sure, to the emphasis on superyang values) seems to me □avoir

had a truly "invasive" effect on his work and his oeuvre, in no way comparable to that of his pro-yang options; and this effect is by no means limited to the mere choice of themes, which the "boss" would make available to the "worker-child", only to withdraw on tiptoe. On the contrary, it seems to me that the "boss" hardly detaches himself from the "worker" at all during the work, so worried is he that the latter might forget the imperative instructions; in other words, that the work itself is often invaded by **inner dispositions** entirely foreign to the nature of the work of discovery, which is thrust into the unknown. This is something that was strongly felt many times during the reflection on Burial, and which I tended to lose sight of during my long reflection on yin and yang.

## 18.2.9. The claw in the velvet

### 18.2.9.1. (a) Velvet paw - or smiles

**Note** 137 (December 7) It's been over a week since I've continued with the notes, apart from some housekeeping work (including sub-notes to two of the previous notes). I had to have three teeth pulled (that's what it's like to be approaching sixty. . . ), a necessary but brutal intrusion, which has meant that I've been operating at a slightly reduced speed lately. I took advantage of the situation to fall back on some overdue correspondence. Now everything seems to be back to normal...

In the four preceding notes (from November 24 to 28), I tried above all to identify more closely the relationships of affinity or complementarity between temperament and mathematical approach in Deligne and myself, in order to situate this "reversal" of yin and yang roles, which I thought I had perceived in my friend's presentation of himself and me, at least at the level of their "mathematical" personalities. Along the way, other aspects of reality came to light, concerning my friend or myself, and beyond our personalities, aspects of the world of mathematicians or, quite simply, of the world of men. In the end, it seemed to me that it was the attitude of service, and the signs of the disappearance of such an attitude in the scientific world, that was the most striking new thing to come out of this stage of reflection, as I'm trying to suggest by the name "Maîtres et Serviteur" (Masters and Servants) that I've given it.

p. 642

□To get back to the original point of "situating" a certain reversal, I now feel as if I've closely enough the real situation concerning my friend and me, to follow it up. The first thing to note is that this initial intuition of a reversal of yin and yang roles, which came to me the day after the May 12 reflection "L'Eloge Funèbre (1) - ou les compliments", was indeed correct. It had already become clear, as early as the November 10th reflection in the note "Les obsèques du yin

(yang buries yin (4))" (n° 124), that my friend endeavors to give a supervirile image of himself, and superfeminine me. The question raised in the November 24 note "Le renversement (3) - ou yin enterre yang" (n° 133), was whether this presentation actually constitutes a "reversal" of reality. The "new fact" in the note "The rising sea... ." (n° 122) was that, just as in my friend's work, the tonality my basic approach to mathematics was yin, "feminine", could at times make me doubt it.

The reflection of the last three notes, however, dispelled this doubt. It was already clear from the outset that I had always been perceived by Deligne (as by my other students and ex-students), on a conscious level at least, as very strongly (too strongly perhaps. . . ) virile<sup>189</sup> (\*). But it also became clear that, in the mathematical relationship between Deligne and myself, and against the background of a strong yin-yin affinity, there was also a yin-yang **complementarity** at play (which could be called "secondary", as opposed to this affinity playing the "primary" role), in which it's really me who plays the "yang", virile role, through a "yang in the yin" component that's much more pronounced in me than it is in him.

The deliberate intention I have observed in Deligne, and which seems to me to be eagerly echoed from many quarters<sup>190</sup> (\*\*), seems to me to be ☐ a **deliberate intention to reverse roles**, and more specifically, **yin-yang roles**<sup>191</sup> (\*). It seems to me that this is another important aspect of Burial, adding to the four already reviewed earlier (in the notes of November 13 and 17 "Rétrospective (1), (2)", n°s 127, 127'). It is these five aspects, all of which are undoubtedly intimately linked, that we now need to assemble into a coherent overall picture of l'Enterrement.

To be convincing, such a painting would also need to bring together, in a common perspective, **three successive "planes"**. In the foreground, there is the lone Deligne, Grand Officier à mes Obsèques, non-pupil and non-heir of the master, declared deceased and having no place to be or to have been. . . Apart from the deceased himself (who is, however, only a deceased, a tacit extra), this is clearly **the** central figure in the funeral ceremony. He is closely followed, in the background, by "the bustling group of my ex-students, carrying shovels and ropes" (to quote from memory the enumeration of the Cortèges, in "L'Ordonnement des Obsèques"). Finally, in the third shot, there's the (almost) entire congregation, who have come to celebrate my funeral (and those of the four co-deceased, standing tall in their "solidly screwed oak coffins"), and to lend a hand at the burial.

☐ Between these three planes seems to reign a perfect harmony, a "**Unanimous Accord**," like those we see. The same atmosphere reigns at any other funeral celebrated in the proper manner, between the priest filled with pious compunction, the family of the deceased displaying the tunes of the occasion, and the bulk of the audience, intoning where it should be intoned, and remaining silent where it should be silent, without ever, ever making a mistake.

To continue with this last image, I now see myself placed in the situation (less comfortable than that of the dear departed, decidedly out of the loop. . . ) of one who, faced with such a touching ensemble, would impertinently propose to try to guess the true thoughts and motivations that animate and agitate the one and the other, priest, family and common people of the faithful, behind the airs of solemnity or contrition sedants

<sup>189</sup>(\*) Besides, current values being what they are, I doubt that any scientific prestige can be carried by an image (generally accepted and received) that is not necessarily a "yang" or even superyang image. It's only at an unconscious level, it seems to me, that the "feminine" nature of my approach to mathematics has been perceived both by my friend and ex-student, and by the mathematical public in general (those, at least, who have had any contact with the kind of thing I've been working on).

<sup>190</sup>(\*\*) I'm thinking here of the "puffs of insidious disdain and discreet derision" mentioned in the Introduction (see Intr. 10, "An act of respect"). I shouldn't be surprised, when I see some of the most prestigious of my students setting the tone themselves. The thing that seems common to me in the many "puffs" that have reached me over the years is precisely an affection for condescension towards the strongly "yin" traits in my approach to mathematics and in my work. On this subject, see also the comments in the footnote of June 23, in note no.° 96 "Cercueil 4 - ou les topos sans fleurs ni couronnes".

<sup>191</sup>(\*) The first time this deliberate reversal of roles appears in my thinking, it's the reversal of roles in the master-student relationship, as I'm presented as my student's "collaborator", taking on the role of the **true** founder and master of *l-*adic** cohomology. (See the two notes on this subject, "Le renversement" and "L'Eloge Funèbre (1) - ou les compliments", n°s 68', 104.) It's interesting to note that in the "master-student" "couple", it's indeed the master who plays the yang role (as the giver, or speaker), "active", and the student the yin role (as the receiver, or listener), "passive". Here again, the brilliant reversal effected by my ex-student can be seen as a yin-yang role reversal, in the same direction (yin-yang becoming yang-yin) as that which constitutes the main message of my Funeral Eulogy, a message that appeared in the note "The funeral of yin (yang buries yin (4))".

for the occasion.

The reflection has been going on for some time now, with the main unspoken thread being to prepare what is necessary to apprehend the closest of these three "planes" of the painting - that of the priest in chasuble, sorry, of my friend Pierre Deligne I mean. It is on this plane that I would now like to turn my attention.

Let me say at the outset that one of the aspects (or "strands") of the picture that featured prominently in the note "Le Fos- soyeur - ou la Congrégation toute entière" (n° 97), namely the "reprisals for dissent" strand, seems to me to play only the most effete of roles with my friend, if it even comes into play at all. I've never had

p. 645 At the time, I had the impression that my friend Pierre felt in the least "implicated" by my "dissidence". On the contrary, it was a great opportunity - one he would probably never have dared to dream of - to elegantly rid himself of the presence of a master who was a little too present, in this institution where, at the age of twenty-five, he had just achieved one of the most envied (or at least, the most enviable) positions in the mathematical world. The fact that this dissidence became more pronounced in the months and years that followed, was experienced, it seems to me (perhaps not on a conscious level, but it doesn't really matter), as an even greater godsend, which gave him free rein, without any hint of resistance coming from anyone (as in he gradually came to realize over the years), an impressive "legacy"<sup>192</sup> (\*). He wouldn't have pretended to complain, even inwardly or unknowingly, about this inescapable boon.

pereated! And it seems to me that the same observation must be valid, all things considered, for most of my students "before" (my departure), and in any case, each of my five cohomologist students. If any of them, whether inwardly or more or less clearly expressed<sup>193</sup> (\*), have hinted at a feeling of dissatisfaction, of frustration with my dissidence, I tend to believe that this is in the nature of a **rationalization** of a grave-digging attitude towards his providentially departed master, rather than a **cause** (albeit one of many) of it. What strengthens me in this conviction, as much for my cohomology students "in general", as for their undisputed leader Deligne, is that the forerunner signs of the Burial that was about to occur (if the right opportunity appeared - and, oh unexpected miracle, it did!), are that these signs appeared in the first place. - these signs were already apparent before I left in 1970, and in any case after the famous SGA 5 seminar of 1965/66, destined for the massacre I know. It's no coincidence, surely, that with such a perfect set-up, all five<sup>194</sup> (\*\*) lost interest in the fate of this seminar where they learned their trade, and at the same time, some beautiful mathematics that they were almost the only ones, for twelve years, to have the privilege of knowing and using. I've gone into enough detail on this subject in the course of discussing the fate of SGA 5, to make it worthwhile to say more here. I will only point out, as far as Deligne is concerned, that in three of the four articles he wrote before I left in 1970, the intention to hide, or at least to conceal and minimize as far as possible the influence of my ideas, is clearly apparent, without having waited

<sup>192</sup>(\*) See, on the subject of this "inheritance", the note "The heir" (n° 90) and the sub-note (n° 136.)) of the note "Yin the Servant (2) - or generosity" (n° 136).

<sup>193</sup>(\*) The only one of my ex-students to have expressed a sentiment in these tones (with a certain reproving nuance to boot) was Verdier, about a year ago. Back in the days of *Survivre et Vivre*, however, he seemed to sympathize with my dissent. There was even an episode of cordial collaboration with his wife Yvonne, on the occasion (if I remember correctly) of the organization of a traveling exhibition on the initiative of Robert Jaulin (of whom Yvonne had been a student), which I joined as a survivor...

<sup>194</sup>(\*\*) (December 12) I should, however, single out J.P. Jouanolou, who ended up writing three consecutive seminar papers, developing notions and techniques that he would need directly and immediately for his own thesis work.

my "dissent".

\*       \*

\*

□What, then, is the root and particular nature of this attitude of antagonism, of avid competitorp to supplant, to erase, in my friend towards me - an attitude that coexisted with an affectionate and trusting sympathy, and a communion at the mathematical level, from the very first years of our meeting? I I'm even convinced that it must have been present in the background from the moment we met, and probably even before; and also, that it arose much more from the role I was to play for him, than from any particularity in me - if not all the "particularities" that made it possible for me to play this role for him. It's also the role he's been trying to erase for the last twenty years, surely it implied, without any attempt on either side, and by force of circumstance, a "parernal" aspect. And there's no doubt in my mind that it was around this aspect that the conflict arose - a conflict that already existed in him, long before he ever heard my name or even (doubtless) the name of our common teacher, mathematics.

. 646

This conviction, to tell the truth, is not the fruit of reflection, and even less would I pretend to "demonstrate" it. Rather, it came to me over the years, after I'd left - I can't really say when or how myself; little by little, I think, by dint of signs large and small, none of which I dwelt on, even for a moment, but all of which, together, ended up leaving the trace of a knowledge, diffuse and imperfect to be sure, but a knowledge nonetheless, that was there one day... . I could undoubtedly, through painstaking work uncovering half-buried memories and probing them one by one, deepen and materialize this knowledge that remains somewhat imponderable; and it is quite possible (and even probable) that such work would hold many surprises in store for me. Yet I don't feel motivated to do it. This is probably because (rightly or wrongly) it seems to me that this is not really my job, but my friend's - that what I'm probing here concerns him much more than it concerns me. As far as I'm concerned, this intuition or "knowledge" or "conviction" that I've just formulated is enough for my present desire to understand, and I rely on it without reservation.

As so often in my life, I am confronted here with a relationship□of antagonism to the father, where I figure surrogate father, "adopted" father (much more so, it seems to me, than "adoptive" father<sup>195</sup> (\*)). This, plus my friend's deliberate reversal of yin-yang roles, is immediately associated in my mind with the situation evoked in the note "Le renversement (2) - ou la révolte ambiguë" (n° 132) - a situation of which my mother's relationship with her father is for me the most extreme prototype. Yet the differences between the situation in question, and that of my friend Pierre's relationship with me, are immediately obvious. In his relationship with me, I never perceived the slightest hint of "revolt", or even antagonism in the form of virulence, aggression, showing claws or teeth, even in a smile. Of course, there was no lack of smiles on either side, but on his part, they were either smiles of

p. 647

<sup>195</sup>(\*) (December 12) As I write these lines, I'm aware of the need for caution when asserting the "non-symmetry" of roles, especially as these are played out on an unconscious level. I presume that at this level, and apart from the mathematical communication itself, I must at some point have entered into the "paternal" role, all prepared by the context. But this role was clearly not of comparable weight, in my life and in my relationship with my friend, to that of my mathematical passion; it remained episodic, and there should be no trace of it after my "departure" from the mathematical scene in 1970. On the other hand, my ex-student's attachment to me, for better and (above all) for laughs, continued to manifest itself over the next fifteen years, both in his work and in the way he maintained, against all odds, an ongoing personal relationship with me.

sympathy (as I felt them), or sometimes innocent surprise, and sometimes almost pain, when he could see (and I ended up feeling the nuance of intimate satisfaction) that certain blows, delivered with a velvet paw, had hit the mark where it was intended.

To put it another way, this antagonism, whether expressed towards myself or towards third parties (when it was a question of reaching out through them to the deceased master, yet still very much present in him. . . ), has always, and without a single exception, taken the extreme-yin form: that which delights (and excels) in reaching out and wounding, even eliminating or crushing, with all the appearances of the most exquisite delicacy. While his deliberate choices for his brand image as a mathematician are superyang (as mine undoubtedly have been, albeit without any more success than his), it seems to me that on the relational level, the basic tone (towards me at least, and those he considers to be related to me) is decidedly and across the board superyin. (I would make one reservation on this subject, however, an important one, on which he I'll have to come back).

p. 648

□ Another "eye-popping" difference between Pierre's relationship to me, and that of the "ambiguous revolt": From what little I know of his family, I understand that Pierre's father is a mild-mannered, modest man, hardly the "profile" that would provoke a reaction of revolt, later transferred to a surrogate father.

### 18.2.9.2. (b) The reversal (4) - or the conjugal circus

**Note** 138 (December 8) As I finished the reflection last night, I had the somewhat painful impression of one who understands less and less. Before going to bed, I stayed for a while following the associations generated by last night's reflection. I thought I saw a few points of light appear, which I think will serve as luminaries in today's reflection.

Perhaps the most important of these associations relates to the "velvet paw" aspect of my friend, who likes to scratch (and sometimes deeply and mercilessly) with the most innocent airs in the world, and "with all the appearance of the most exquisite delicacy". This image, which came up in the course of a comparison (with a situation of "revolt" mentioned earlier) that had been shipwrecked, immediately struck me as rich in meaning, as an essential aspect of the "antagonism" I had set out to explore. And in retrospect, the image of "innocent smile and velvet paw" - the quintessence of an experience of almost twenty years - seems to me **the** "sensitive point" in yesterday's reflection, **the** unexpected "point of light" as I groped in the dark. If this impression of groping and darkness prevailed beyond that, it's because, too caught up in the ideas I'd had in my head the moment before and which I had to pursue or place, I hadn't been able to pay attention to the delicate "tilt" that had taken place in me, as soon as the image appeared. And in the half-hour that followed, as I pursued a few associations related to this image and one or two other moments of the past reflection, my attention became scattered once again. It's only now, with a day's hindsight, that I can see the thread of my interrupted reflection coming into focus, a perspective that had escaped me only a short while ago, as I reread yesterday's notes.

If I take care to follow the strongest association of all and the one most intimately linked to my lived experience, discarding for the moment others more □ "structured", more "intellectual", it comes this. I see myself back

p. 649

suddenly, as if in a single impression that would sum them all up, to this multitude of particular cases (experienced either as a co-actor, or as a close witness) of the **conjugal circus** - the circus of the woman-man couple. The circus of the couple, married or not, with or without children, young or old or young-old or the opposite, in the doldrums pulling the devil by the tail or in ease driving a carriage, it's all the same the circus of the couple doesn't change for all that. Suddenly, I'm back at it again, with one aspect of this circus that struck me

of all things (it took me a long time, it has to be said, before I saw anything but fire in it). . ): it's the very particular, very "innocent mine", "I said nothing and did nothing", "velvet paw" tactic played by the woman, in a certain game where it's always she who leads with perfect dexterity, and where it's always he who follows (and often, cashes in) without realizing anything. I've seen very few couples that didn't work to this tune, with infinite variations it's understood, left to the improvisation skills of each of them, not to mention their particular temperaments and other circumstances. I had the opportunity just today to see a particularly dazzling demonstration of this, which I won't go into here.

It's a somewhat colorful and nuanced description of these circus games, at least in the broad outlines, or even just the evocation of the tones (velvet paw, precisely, on the "her" side) in which which was largely absent from the November 12 reflection I've just reviewed, in the note "Le renversement (1) - ou l'épouse veéhémente" (n° 126). Clearly, I was pursuing this reflection against the grain of a reluctance, so much so that it ended up taking on the appearance of an austere "forces and motivations" - I was definitely not in good form that day! It was also the first time, in "The key to yin and yang", that the "reversal of yin and yang" was mentioned. The extreme case that had obsessed me My mother's was then, and still is as recently as yesterday (see note of November 22, "Le renversement (2) - ou la révolte ambiguë", n° 132). However, in my "four-point analysis essay", I took care to identify the first of these three "points" in such a way as to apply to all of them.

to the vast majority (if not all) of couples I've come to know even remotely closely, without the necessary predominance (albeit in occluded form) of the vehement tone of (ambiguous) "revolt". This p. 650

However, there's another thing in common that I missed that day. It only began to dawn on me last night, during that well-spent half-hour when I let my thoughts wander in the wake of the "in shape" reflection. This important common thing, which I had previously only perceived in the extreme case of "vehement wife", is the subtle play of **yin-yang role reversal**.

I'm not sure whether I should write that this game is the "spring" of the power game I alluded to earlier, or that it's **identical** to the latter. Surely, what for her (and often for him too) constitutes the quintessence of the masculine role, of the role devolved to the man, is the **possession of power** - a possession often fictitious, admittedly, but which in any case draws an element of reality from the social consensus. Perhaps I've tended to underestimate the strength of this element of reality, the strength of the **symbol of** the man as representing **authority** in relation to the woman - and in particular, its strength as a driving force in the woman's motivations. I suspect that for her, "being a man", or "being the man", means above all else, **exercising power**. The "reversal of roles", at the level of egotistical motivations<sup>196</sup> (\*), is probably no more, no less, than **the exercise of power by the woman over the man**.

Given the existing consensus, this exercise of women's power can scarcely take place in any other way than covertly.

It does not consist in ordering, nor in ☐faire pretending to decide (with the expectation that the decision will be followed), p. 651

but to **keep things running** - and, above all, to keep things moving, without ever seeming to do so. That's the famous marital merry-go-round, spinning and spinning! Tactics to keep it moving,

<sup>196</sup>(\*) The reversal of yin-yang roles in the erotic drive and in the game of love has been discussed elsewhere (see note on "Acceptance (the awakening of yin (2))"). The erotic impulse is by its very nature foreign to the games of the ego, and in particular to the games of power, even though the ego is eager to make it an instrument to serve its own ends, and skilful at doing so (within certain narrow limits at least, and by distorting and mutilating the original impulse). If there is a relationship between the two types of yin-yang "reversal", i.e. between, on the one hand, the free play of the two impulses yin and yang in the lover **and** in the lover, and on the other, the obsessive play of an incessant and insidious demonstration of power by one of the spouses over the other, it seems to me that this relationship can hardly be other than this: that each of the two types, at every moment, excludes the other.

passed on wordlessly from mother to daughter, from woman or girl to girl, from generation to generation, is the **"velvet paw" tactic** mentioned yesterday at the bend in the road. If you pay close attention, you'll recognize it in an infinite variety of guises, from the extreme-yang case of the vehement wife, embodied for me by my mother, to the extreme-yin case of the dolent (even overwhelmed) wife, which I saw embodied by another close relative.

It seems to me that there are very few women who don't practice this age-old tactic, and master it thoroughly<sup>197</sup> (\*). It's a daily practice, especially in the conjugal circus, but not limited to it. It seems to me that it's rarely practised between women (perhaps simply because it's harder to "get" a woman than a man). On the other hand, for some women, this tactic becomes second nature, in their relationship with **all** men, or at least those who are perceived by them as having a markedly virile character.

If I'm talking about "tactics" here, it's only an accessory aspect, the "tactical" aspect, of a more important reality: that of an inveterate inner attitude, towards "men" in general, or at least towards those, father, lover or husband in particular, who in her life play a privileged role as a **man**, invested (by social consensus, or by her own choice) with **authority**. This attitude is by no means always in the nature of a thirst for domination (as in the case of the "vehement wife") - at the very least, it's an attitude that's in the nature of a thirst for domination (as in the case of the "vehement wife").

p. 652 At least not in the sense in which the word "domination" is usually understood. It's more a case of a craving, which sometimes becomes all-consuming, **to constantly exert an** action  $\square$  sur l'autre, to "keep it moving" (implied: in

movement around her own person... ). To achieve this, all means are often good. One of these means of exerting action, and thus power, is to **hurt**, and sometimes to hurt as deeply as possible, to knock out outright, and at the limit, to destroy, physically or psychically, if only the occasion is propitious; and this, always, without seeming to touch, with "all the appearances of the most exquisite delicacy". On more than one occasion, I myself have been "sent packing"! Often too, caught off-guard as a co-actor or witness, I've had my breath taken away by the apparent gratuitousness of the act that wounds or destroys, with an innocent smile or an absent air, but always looking as if nothing has happened, seizing with an infallible instinct the moment and the place to touch the other where he or she can be most deeply affected - whether this "other" is the father or the lover, the husband or the child, or a mere acquaintance or even a stranger (provided only that the opportunity is there to strike and to reach...). . . ).

### 18.2.9.3. (c) Ingenious violence - or passation

**Note** 139 (December 9) This is the extreme, yet by no means rare, case of **violence for violence's sake**, of **gratuitousness** in violence and malice. This kind of violence, whether it strikes a stranger or the person closest to us and supposedly loved, is not characteristic of either men or women; it is neither "yin" nor "yang". But the disconcerting and insidious **form** in which I encounter it here, under the mask of an air of distracted absence or even ingenuous gentleness - this form, which has come to be quite familiar to me, seems to me to be peculiar above all to women. This is no doubt linked to the "patriarchal" social consensus, which invests men with authority and power over women<sup>198</sup> (\*). This form is

<sup>197</sup>(\*) It's also true that there are very few men who don't "walk the walk" when this tactic is applied to them. For most of my life, I've walked without a hitch. That only really began to change with the appearance of meditation in my life, at the age of forty-eight (it's never too late to do the right thing). Even today, I sometimes get caught up in it (not often, admittedly, and never for very long...).

<sup>198</sup>(\*) This consensus, moreover, and the authority of the man in his relationship to the woman, have been greatly eroded over the last few generations, and more and more so these days. I'd be the last to complain! It doesn't seem, however, that this superficial change in laws and mores has changed much in the deeper workings and "style" of relations between the sexes, and in particular in the visceral and carefully concealed antagonism between women and men. This is undoubtedly due to

its own means of satisfying a will to power which, in order to be forced (by the force of things) to follow paths other than those open to man, is no less imperious, no less devouring within her - quite the contrary! It would seem that not being able to unfold in the light of day, being condemned in advance to an occult existence, only serves to exacerbate and further proliferate this craving within her, to the point, in many cases, of truly "devouring" her life and that of her loved ones.

p. 653

Fortunately, this craving does not always reach the level of gratuitous, all-out violence, and the registers in which it is deployed are not all in tones of violence. While tones of discreet derision are more often than not the rule, giving vent to a veiled antagonism or secret enmity, simply mischievous tones of indulgent affection, a little mischievous on the edges, are not excluded. And while it's true that the tried-and-tested tactic of the "velvet paw" is a woman's privilege and weapon of choice, this privilege is by no means exclusive. Many times I've

could, and very closely, see this weapon wielded by men<sup>199</sup> (\*), with equally perfect mastery<sup>200</sup> (\*\*). Remarkably, in all these cases, the man who had appropriated this woman's

wea  
. 654

pon wasp

someone who tended to repress certain virile sides of his being, and (by the same token, no doubt) to mold himself according to the **maternal model**.

This same tactic is frequently observed, and is virtually the rule, in the power games played by children, girls and boys alike, vis-à-vis their parents, or other adults in their stead. This immediately gives rise to an association with the situation of writers or journalists in countries (past or present) where direct or indirect censorship is rife, making direct, unvarnished public expression of one's true ideas and feelings impossible or risky. The main difference between this last case and the previous ones is that, in this case, recourse to indirect, veiled and sometimes symbolic expression of one's true feelings is no longer the work of the unconscious, but of conscious thought. The reason for this, surely, is that there is then a sufficiently widespread consensus in favour of unorthodox ideas and feelings (which need to be "passed on" without appearing to be so), so that the person concerned no longer feels obliged to hide them from himself, for fear of appearing as a hideous misrepresentation in his own eyes. Only in extreme cases of ferocious political or religious terror (such as existed in the Middle Ages, or in the Soviet Union and its satellite countries in Stalin's time) are unorthodox desires forced (by some, at least) to plunge an even deeper notch, evading the gaze of the Internal Censor, as well as that of the censorship instituted in mores and police apparatus.

All these examples seem to suggest that the "velvet paw" style (or "I said nothing, thought nothing, wanted nothing") appears, more or less automatically, in any situation that is even remotely sustainable, where

---

The fact that this attitude of antagonism, and its means of expression through a certain power play (or reversal of power), is much more the result of the **transmission of an "inheritance"** from generation to generation, than of "objective" conditions within the family.

<sup>199</sup>(\*) I note, however, that in the cases known to me, when there is apparently "gratuitous" violence (by which I mean unprovoked) towards a close person or friend, it is always a person towards whom the person concerned harbors (albeit unwittingly) a long-standing grudge or animosity, materializing in concrete grievances (even if these remain informal more often than not). The only exception to this is my friend Pierre Deligne, in his relationship with me and those he assimilates to my person, as belonging to my "sphere of influence". This is an attitude of antagonism and violence (muffled, admittedly!) with no "personal" cause, by which I mean no cause in grievances (real or imaginary) that he harbors against those he's trying to reach. On the other hand, this is a behaviour that many women display, and not only (as in this case) towards close friends, acquaintances or even strangers, but also towards those closest to them, such as their lover or husband (of course, and as a matter of priority), or their brother or even their own child.

<sup>200</sup>(\*\*) It would seem, moreover, that this tactic, implemented by the unconscious, always inherits from it that "tact" and almost infallible sureness, so rarely present in fully conscious action. I don't think I've ever seen this tactic used without mastery.

a balance of power to our disadvantage makes it impossible, or at least dangerous, for us to express candidly, directly, our feelings, desires, ideas, intentions - and, more particularly, feelings of animosity or enmity towards those who are perceived as exerting a constraint on us (and no-tamment, la contrainte justement qui prétendait empêcher nous d'exprimer nos sentiments véritables)<sup>201</sup> (\*).

p. 655 This is not the only <sup>□</sup>case in which the style in question appears, and the inner dispositions that it recover. Very often, this "balance of power" is more or less fictitious, corresponding much less to an "objective" reality, taking into account the real dispositions (or means of power) of those perceived as "oppressors", than to the **idea** (conscious or unconscious) that we have of them. This idea is rarely the fruit of a careful and intelligent examination of a given reality, but is almost always part of the "package" of conditioning of all kinds that we receive at a young age, taking into account certain fundamental choices that have been made in us since that early period. Thus, whether in a girl or a boy, the choice (unconscious, of course) to identify with **the mother** implies the adoption of a whole set of attitudes and behaviours (such as those expressed by the "velvet paw" style), and at the same time the ideas (unconscious most of the time, but it doesn't matter) that underlie them (such as ideas about a certain balance of power, and the antagonistic reflexes that accompany these ideas). In the opposite case of identification **with the father**, but when the father himself has integrated into his person certain typically "feminine" traits (or which are such in our society, at least), it's conceivable that the effect could be quite analogous to that in the first case.

The point I'm getting at here is that in our society today, and in the circles I've been part of at least, it seems to me that this style ("velvet paw"), and this "feminine" inner attitude I'm examining here, are only to a very limited extent the spontaneous individual reaction to relationships of that it's an objective force, instituted by society or by the particular circumstances surrounding our childhood (or even, our <sup>age</sup> <sup>□</sup>adult at a given moment); that it's rather an "**inheritance**" taken from one or other of our parents

p. 656 (if not both at once?), who himself had taken it over from one of his own parents. Clearly, this type of inheritance tends to follow the **maternal** line, being transmitted primarily from mother to daughter. But on more than one occasion, I've seen mother-to-boy transmission up close. There's nothing to suggest that it can't also be transmitted, exceptionally, from father to son, or even from father to daughter.

#### 18.2.9.4. (d) The slave and the puppet - or the valves

**Note 140** (December 10) I'd like to return to some associations around the theme of gratuitous **violence**. This was the theme with which yesterday's reflection began, and from which I drew back, in order to return to an examination of the "feminine" (or "velvet paw") style in power games, and as a means of expressing a disposition of antagonism towards others (and above all, towards men perceived as strongly virile or as being, in any capacity whatsoever, in a position of authority, prestige or power). As I reminded you yesterday, (seemingly) gratuitous violence, violence "for its own sake", is no more than a form of violence.

<sup>201</sup>(\*) As I was writing these lines, the thought occurred to me that the situation I've just described is precisely the one we were confronted with in the early years of our childhood - all of us, without exception. A large part of our unconscious (the part we might call "the oubliettes", generally perceived at the unconscious level as a sort of "garbage pit"), is nothing other than the response of our child psyche to this pressure from the environment, which forces us (it's practically a question of survival) to bury away from our own eyes, as a sign of disavowal, everything in us that falls under social censorship. This censorship is soon internalized in an inner Censor, whose sullen presence guarantees the permanence of this premature burial. Yet, despite the Censor, unorthodox impulses, knowledge and feelings, duly buried, manage to express themselves, sometimes with exacerbated and fearsome efficiency, in indirect, often symbolic, yet perfectly concrete ways. The "velvet paw" section is a particularly "striking" - and often disconcerting - example... ..

for both men and women. Everyone has had the opportunity to be confronted by it suddenly, at the turn of the road, whether in the guise of the "most exquisite delicacy", or in the form of a boot or a burst of machine-gun fire in the belly. The latter style, the "yang" style, is certainly rarer these days, in so-called "peaceful" times, and in civilized countries like ours. For most of us, well-bred and more or less well-placed people in a country of affluence, this violence that-says-well-its-name is not part of everyday life, as is the case with the other, muffled violence with its ingenuous airs. And yet, all you have to do is peruse the "news" column of any major daily newspaper, or listen to the news at<sup>202</sup> (\*), to realize that gratuitous violence "lasts", even here, still roams the streets. It doesn't always go so far as to slit the throat par-dessus le marché, the anonymous little old lady

p. 657

you've taken it upon yourself to break into. But when young people in search of adventure "borrow" a car left carelessly open in front of the house, it's rare that they don't leave it in a ditch ten or twenty kilometers away, having first carefully ransacked it. Even in the peaceful countryside where I have the good fortune to live without worrying too much about anything, the smallest farmhouse or cottage doesn't remain unoccupied for long, before it's already been looted from top to bottom (that's for utility) and, what's more, copiously vandalized (that's for pleasure). In all these cases, the gratuitousness of the violence is particularly striking, given that the person struck is a stranger, often someone we've never seen before and never will.

This is what we might call "**anonymous**" violence. Since time immemorial, no doubt, wars have been collective orgies of such violence - times when the opportunity to kill for free is king, and when the life of a vague individual is worth zero before the pleasure of pulling a trigger and testing one's power to make a nameless, bland figure slump before one... .

If there's one thing in the world, as far back as I can remember, that has left me bewildered and speechless every time, it's seeing myself confronted once again with violence beyond comprehension, violence that strikes and destroys for the sheer pleasure of striking and destroying. If there's one thing in the world that imbues us with this indelible sense of "evil", it's not death or the suffering the body can endure, but it's this thing. And when such violence (whether it's harsh or gentle, whether it seems "big" or "small") comes at you unexpectedly from one of your loved ones, it's bound to hit hard and deep, to bring out (or resurface. . . ) a nameless anguish. The root of this anguish goes deep down, when it finds the soft, fresh soil of childhood, or even infancy, in which to take root. This anguish, "the best-kept secret in the world" in my life as a child and as an adult, appeared in me at the hands of my mother, in my sixth year.

It was at the age of 51, during the month of March 1980, that I uncovered the episode of the implantation of anguish in my life. Anxiety's hold over me had been defused beforehand, to a large extent in my life. sure at least' with the appearance of meditation in my life (in 1976), gradually taking a place in it growing. A third decisive turning point in my relationship with anguish came in July and August 1982, during a careful examination of the mechanism of anguish in my everyday life. The anguish-creating situations, from childhood to middle age, were those which, in unknown depths of my being, made me re-experience "that which is beyond comprehension". These were also the times, to be precise, when I saw myself confronted once again with the familiar signs of violence, seemingly inexplicable, elusive, irreducible... . The sudden eruption of this violence suddenly brings back a wave of distraught anguish, which is immediately controlled and repressed. This visceral reaction remained identical to itself.

p. 658

<sup>202</sup>(\*) These are things, it's true, that I stopped doing a long time ago, contenting myself with occasional information through intermediaries.

<sup>203</sup> (\*). If anything has changed over the last few years, it's the emergence of a way of **thinking** in the wake of anguish, one that makes comprehensible, and often obvious, what had appeared under the threatening mask of "that which is beyond comprehension", of the delirious ; and above all, in the last two years, by the appearance of a **look at myself**, a look of interest and concern for this anguish itself, which a reflex movement of peremptory force would have me hide from myself. Or, to put it another way, my relationship with anguish has become, especially over the last two years, no longer one of visceral refusal, or of taming wild beasts or gravediggers, but rather and increasingly, one of attentive and affectionate **welcome to** the message it brings me about myself - about my present, my past and its action in my present. This, it seems to me, is the last step I've taken so far, towards an increasingly complete inner **autonomy in** relation to others, that is to say, above all else: in relation to my family and friends<sup>204</sup> (\*\*).

p. 659 □ It seems to me that it's the violence-that-doesn't-say-its-name, the "feminine"-style violence, that is most powerful source of anxiety, far more so than the more spectacular violence of a punch in the face. Those who play with muffled violence - and thereby also play with the secret valves that release nameless, faceless waves of anguish in others - hold in their hands a weapon more formidable than any authority or simple power of coercion. And to manipulate these floodgates of anguish at will and at whim, with an air of innocence, represents a **power that is** undoubtedly more incisive and more formidable - even if it remains hidden - than any de facto or de principle power instituted by social consensus. This is woman's "just revenge" on man, in a society where man claims (or has claimed) to dominate her; and this is also the price "he" pays for his illusory supremacy (present or past). If she is a **slave** (and in our country, she is less and less so), he is a **puppet** in her hands, or very nearly so (and he is as much a puppet today as he ever was).

For some years now, whenever I'm confronted with a situation of gratuitous violence (be it directed at myself or others, be it brutal or insidious), the association with **self-contempt** - or rather, I **see** this self-contempt - comes to me with unstoppable force.

even in one who affects, openly or inwardly, to despise others. I have no doubt that this is □ not a simple push-button mechanism in me, a "philosophical" or "psychological" dada that I

p. 660 I'd be quite happy to take the occasional step out, perhaps as a way of exorcising the anguish I was talking about with a convincing formula, by casually sticking a boilerplate label on a threatening stranger. It's simply a **knowledge of** an essential, profound and (once seen) obvious relationship.

<sup>203</sup> (\*) (December 14) It would be more accurate to say that this reaction remained "more or less the same" **right up to the time of** my meditation in July and August 1982. While the "provocations" that caught me off guard have been numerous since then, the "visceral reaction" in question has only appeared once, a year ago. It was the occasion for a short meditation, lasting a few hours, which completely clarified the situation. As soon as a confused inner situation is confronted with simplicity and acceptance, the anguish that accompanies it and brings us the message of our confusion, disappears without a trace, except that of knowledge and renewed calm.

<sup>204</sup> (\*\*) This "last step" has already been discussed at the end of "L'acception" (n° 110), in the somewhat different light of a "final step".

liberation from the need for **approval** or **confirmation**, which "is really the hook, discreet and ironclad, by which conflict can 'hang' in us, and by which we are. . . dependent on others. . . by which, in short, it "holds" us, and (in a minor way) manoeuvres us as it pleases... ". (This passage could well have been written on this very day - but I swear I didn't copy it!)

I can't say whether there are still other such "steps" ahead of me, which will give me the hindsight to see my current autonomy as still relative, and not complete (as I would tend, however, perhaps a little naively, to believe. . . ).

The emergence and blossoming of a relaxed, attentive relationship with anxiety represents a **liberation** in our relationship with others. In fact (as the following paragraph states), it is the possibility for others to "turn the floodgates of anguish" in us as they please (by alternating between gratification and rejection, in a measured and deftly administered manner), that represents their principal means of power over us.

This knowledge doesn't "evacuate" anything, it simply allows me to **situate** an unknown. It is in no way a sentinel, placed there to block the path of anguish, or to expel it from the square. This is not the nature of knowledge, as I understand it. Knowledge is part of an inner **calm**, and helps to ground it. It is a restlessness within us, on the other hand, that constantly pushes us to want to block the way to "intruders", lest they upset a "calm" of composition. The calm I'm talking about doesn't fear intruders, it welcomes them. And the surface agitation created by the new encounter with anguish does not disturb this calm, but rather contributes to it.

## 18.2.10. Violence - or games and the sting

### 18.2.10.1. (a) The violence of just

**Note** 141 (December 13) With my "joke" in the previous note, about the "slave" and the "puppet", I'm sure I've found another way to displease everyone, and (if I'm read. . . ) to be called every name in the book! Unless the hypothetical reader applauds contentedly, who knows, convinced that the image is well sent and applies to the whole world, except to himself (or herself); and except perhaps again, at most, to the sarcastic author. By this supposition, moreover, he would be giving my modest person a credit that in no way belongs to him. At the very most, I'd venture to admit that in the last few years (and especially since a certain meditation on anguish in July and August 1982), I've begun to get out of, or even be out of, the famous "circus" - the conjugal circus, of course, but also the others that resemble it.

like brothers. In the first part of *Récoltes et Semailles*, there's even a section in this vein, called "Fini le manège!" (No. ° 41, last March). It wasn't about the conjugal circus, but about a certain mathematical circus, into which I had more than enough time to turn.

a good part of my life, like everyone else. But it's also true that a few weeks after this section □au nom prometteur, on April 29, appears a note "Un pied dans le manège (n° 72), whose name p . 661

would seem to herald a different tune! The difference with before, perhaps, is that if it happens to me again here and there to turn in some merry-go-round (and I hardly see any more than the mathematical merry-go-round which continues to attract me. . . ), it's myself (or at least someone within me) and no one else who pulls the threads that keep me going round and round, and these have ceased to be invisible to me.

Having made these reservations, I can say that for most of my adult life (and more precisely, until I discovered meditation), I "walked" on the quarter-turn (like everyone else, again), both in the conjugal carousel (it spun merrily for no less than twenty years!), and in the others. I don't regret it, because the knowledge I have of carousels of all kinds I owe first and foremost to the ones I've been on myself. If I've been on them for so long, it's because the student was slow to learn - and also, surely, because in more ways than one I found bait. In the end, I suppose, they lost their strength and charm. ...

It seems to me that in all these carousels, I was always the one who "walked", and never the one who "made walk". Or to put it another way, I don't think I've ever had the slightest propensity for the famous "velvet paw" style - I've sometimes played hard with my claws, but never, I think, with claws drowned in velvety down. This is one trait, among many others, that attests to the fact that at the level of the structure of the ego, of the "boss", of that in me which is conditioned, the basic tone is strongly "masculine", without any ambiguity whatsoever. The yin, "feminine" tones, on the other hand, dominate at the level of the "child", the original in me, i.e. also in the drive for knowledge and in the creative faculties.

I'd like to say a few more words about the "gratuitous violence" in my life. In the previous

note (from three days ago), I evoke it in the light of the one who finds himself the target of this violence, or at least the one who is confronted with it in others (even as a mere witness), when I write :

"If there's one thing in the world, as far back as I can remember, that each time has left me bewildered and speechless, it has been to see myself confronted once again with that violence that passes understanding, the violence that strikes and destroys for the sheer pleasure of striking and destroying... . "

p. 662 □ These lines, and those that follow them, correspond well to reality, to the reality of my own experience in all I'm sure this is also the case for countless men and women who, like me, have been confronted with this kind of violence. They could give the impression that the person who wrote them is himself a complete stranger to such violence, that all his life he has been free of such delusions. But this is not the case. I recall four relationships in my life, three of which took place in my childhood or adolescence (between the ages of eight and sixteen), marked by an enmity based on no specific personal grievance, and expressed in the form of systematic and merciless mockery, or in roufflés and other brutalities. On the first occasion, the victim, a classmate (still in Germany), was the whipping boy of the whole class. The situation dragged on for years, I seem to remember. The next two cases took place during the war, when I stayed (just out of a French concentration camp) in a Secours Suisse children's home in Le Chambon sur Lignon, "la Guespy", between 1942 and 1944. This time, the "horrors" were one of my classmates (whose parents, like mine, had to be interned as German Jews), and one of our two supervisors, both of whom spoke German like me. They were both a bit of a pushover for a sometimes ruthless group of young boys and girls of which I was a member - but I think I gave them a harder time than anyone else in the whole gang. Living together under the same roof, and as refugees with a precarious status, under the constant threat of the Gestapo rounding up Jews, could have aroused in me feelings of solidarity and respect, but it didn't happen.

In all three cases, the person I took as a target of malice was of a gentle, rather shy, non-combative nature, which I then classified as "soft" or "cowardly", and which therefore formed part of the traits that were supposed to make him or her a less-than-stellar character. In an age devastated by the breath of violence and contempt for the individual, and myself filled with aversion to war or concentration camp violence, and everything that goes with them, I nevertheless felt entirely justified in the contempt and violence I inflicted on others, for the simple "reason" that I had taken pleasure in classifying them as "unsympathetic" (and other adjectives to match. . . ), after which everything (or almost everything) became permissible, not to mention the fact that I had to be careful not to get too close to them. not to say, highly commendable. I used to pride myself on being "logical" and fair-minded,

p. 663 □ I didn't see then that my behavior, and its justification by an antipathy (which I wouldn't have I'd certainly thought to probe their true nature), were exactly the same as those of the good-natured German of the thirties vis-a-vis "dirty Jews" (things I'd seen up close in my childhood); and that it was these too that made possible the unprecedented outburst of violence that was then sweeping the world. Of course, I pretended (following in my parents' footsteps) to distance myself from this violence as if it were some strange aberration (sometimes even "beyond comprehension"). I was full of haughty condescension towards all those, soldiers or civilians, who in one way or another consented to be active or passive cogs in the heroic mass graves and accompanying abominations. And at the same time, at my modest level and within my own limited sphere of action, I was doing what everyone else was doing... ..

If I try to discern the cause of such a strange blindness in the service of a deliberate purpose of contempt and violence, it comes down to this. The violence I myself had had to endure during my childhood since the age of five, without ever having been designated as such to my attention as a child, had ended up in my mind's eye.

by creating a state of chronic tension, unconscious and carefully controlled by a strong will. This tension, or accumulation of aggression with no particular target, created the need for a release of aggression. This "need", however, was not bodily in nature - there was no shortage of opportunities to let off steam through appropriate bodily activity in any of these cases - but **psychic**. Surely there must have been some accumulated resentment, mostly unconscious of course, and not materialized in palpable grievances towards a particular person (one of my parents, let's say, or one of the people who took their place), on whom I could then have transferred feelings of resentment, and given them concrete, perhaps violent, expression. There must have been a "vacant" violence in me, a diffuse, wandering violence, looking for a target on which to vent. It often seems to be animals (insects, toads, dogs or cats, even oxen or horses. . . ) that bear the brunt of such wandering violence, in search of a victim. This was not the case for me; I don't remember ever having martyred an animal, big or small, in my life. Apparently, I needed a scapegoat closer to home, a **person**! When you're looking for one, it's always easy to find one.

□ I have no doubt that what I have just written describes a certain aspect of reality. Yet I feel that this description still remains on the surface of things, only identifying a certain "mechanistic" aspect, without really going any further into the unconscious experience. For the moment, in place of this experience, there is a kind of great "blank", a void. This is not the time or place to go beyond that, to probe further into what this "white" covers, what dissolves in this "void". Is it this famous "self-contempt", which was so peremptorily asserted in the note three days ago, and which suddenly, now that it's **me**, seems to have vanished without a trace? Now or never, at last, would be the time to get to the bottom of it, to elucidate this tenacious and ambiguous "vagueness" that continues to mark my knowledge of myself, just as the "vagueness" that once surrounded the role and very existence of anguish in my life. It seemed to me that anguish was the "best-kept secret" of my entire life. Is there another, even better-kept secret, one that I've barely touched on here and there, on two or three occasions, since I've been meditating? I feel like I've got everything I need to get to the bottom of it - including this sudden surge of familiar interest, which tells me that the time is ripe to get started! However, I have a feeling that I'm not going to do so here, in this meditation that is in some way "public", or at least intended for publication. This one, among many others, will at least have had the virtue of unexpectedly bringing to maturity a question that has suddenly become very close, recognized at last as crucial to an understanding of myself, whereas previously it had seemed like one question among a hundred, on a long waiting list whose end I may never see... .

It's not out of the question that I'll still have the opportunity to meet one or other of the three men (two of whom are about my age) who were once the innocent targets of my own violence and aggression; or if not, at least that I'll have the chance to write to one of them. It will be good for me to be able to make amends, and to do so with full knowledge of the facts. Perhaps it will be good for him too. Strangely enough, though, I don't get the impression that any of the three of them ever really held a grudge against me, or that my violence had triggered in him any personal animosity towards me in particular. a kind of calamity, from which there could be no escape, and which my own person has was perceived more as one among extras in this calamity, than as □ a ruthless tormentor (that I was) and hated. Of course, I may be wrong, and I may never know - just as I may be lucky enough to be confronted one day with this karma, which I sowed in blindness.

I think there must have been a maturing in me in the years following the "Guespy" episode, with no "Guespy".

p. 664

p. 665

And yet, as far as I can remember, there was no reflection whatsoever on the subject. Still, there were effective reflexes in me afterwards, which would have prevented me from ever again associating myself with acts of collective violence by an entire group against one of its members. I don't think it ever happened again in my adult life, nor that I was ever tempted to play such a role again, which I must have sensed to be false and spineless under its cheerful, "sporty" exterior. But even after the war, life was full of situations full of veiled violence and anguish, perpetuating the deep tensions that had marked my childhood and adolescence. This is the context of a fourth relationship, marked by occasional movements of animosity and violence that I can call "gratuitous" - not founded or provoked by concrete grievances, nor even (I believe) by acts that could pass for "provocative". It concerns my relationship with one of my sons. I know that I was no less attached to him, and that I "loved" him no less than my other children. But at some unconscious level, I must have rejected certain aspects of him, precisely those that made him softer and more vulnerable, and harder to apprehend, than his brothers and sister. Decidedly, he didn't "fit in" at all, even less than my other children, with the beautiful superyang images I would have liked to find in my children - and all the more so, as certain very harsh circumstances that had surrounded his first two years and left a deep impression on him, made it more difficult for him to form trusting relationships with his parents. During the time he lived with me under the same roof, right up to his tenth year, I sometimes subjected him to humiliating punishments, imposed in a thunderous voice. These were things that had faded entirely into oblivion, as had a certain atmosphere that had come to permeate the family air - a few dialogues with his sister and two brothers, two or three years ago.

p. 666 years, which very conveniently brought back so□soit little of these things in my memory. Perhaps the day The time will come when he, too, will be ready to talk about it with me - he who, perhaps, among my children, has borne the brunt of a family atmosphere charged with hushed anguish and unassumed tensions; or at the very least, the one who has most "coped" at the hands of his father, while each of them has had his ample share of the parental "package". At the very least, I know - and I'm glad to know it - that what's preventing any of my children from having a simple, trusting relationship with me, their father, and from talking together about a heavy past and probing it, is not some fear they've kept from me, and which they've tried hard to hide.

But then again, this is not the place in these notes to delve further into a complex situation, which involves six or seven other people as much as myself. What I wanted to do, above all, was to make an unvarnished observation of the occasional appearance, here and there in my life and in my own actions, of the same apparently gratuitous violence, which so often "left me bewildered and speechless", when I encountered it in others. This observation is not made with any particular "intention", nor is it meant to "explain" or "excuse" gratuitous violence in anyone, any more than it is meant to explain or excuse mine. It's not impossible - indeed, it's probable - that, with further reflection, the two violences - that in others and that in me - will end up shedding light on each other. It's the kind of thing that eventually comes on its own, out of the blue, without being sought out. If I've made this observation, it's simply because it was in the way, and (on pain of ceasing to be true) I couldn't not make it here.

### 18.2.10.2. (b) Mechanics and freedom

**Note** 142 (December 14) Last night's reflection was a timely reminder of something we all tend to forget, and especially (in this case) of something **I** tend to forget: that I'm not "better" than anyone else, that I'm cut from the same cloth as everyone else.

like so many of my friends whom I'm about to put in the hot seat, the focus of uncompromising attention. ...

Yesterday, I gave a sort of description of the appearance of (seemingly) "gratuitous" violence, such as the discharge of tension and aggression □ accumulated on some scapegoat who, for one reason or another another, finds herself in charge. This "mechanistic" and superficial description, surely "well known", can lend credence to an equally "mechanistic" **attitude** towards this violence, in oneself or in others. It is then seen as a kind of inescapable inevitability, rooted in the very structure of the psyche - alas, what can we do about it! Such an attitude, under a "rational" or "scientific" guise, seems to me to be nothing other than the rationalization of an **abdication**: an abdication before the presence of a creative **freedom** in ourselves and in others, which opens up the option for each of us **to assume** the situations in which we find ourselves, instead of passively following the slope lines of ready-made mechanisms, ready to take us over at any moment. While it's true that we rarely make use of this "freedom" option, the very **presence** of this option and of the creative possibilities within us, whether we choose to make use of it or not, changes the nature of things completely. It is in **this way**, and in no other, that situations involving relations between people, or between a person and himself or the world around him, have a dimension that is absent when, instead of people, we're dealing with (say) computers, however sophisticated they may be. This is also where the privilege of **responsibility** for our actions and the motivations behind them comes into play for each and every one of us. This responsibility is in no way removed by the fact that we often resort to the convenience of hiding our own motivations. p. 667

To return to the case in point as an illustration, if I was able to play the great soul while making use of my power to torment a comrade who had done me no harm, it's because behind a surface "good faith", I had chosen an attitude of crass, phenomenal bad faith, which was just as obvious at the time as it is now, forty years later. It was indeed a **choice**, which nothing forced me to make, and which amounted to turning a blind eye to the tensions and aggression that had built up inside me (while, of course, claiming to have nice "non-violent" ideas), and "sneaking" (sic) them out onto the scapegoats at hand. Violence of this kind - which is to say, almost all violence and violence against abominations raging in the world of men - can only take place, and their secret function can only be fulfilled, on **condition** that it remains rigorously secret precisely (while □ even as it croaksp . 668

We're encouraged to do this by the air we've always been surrounded by, while we've always seen those around us eager to endorse our subterfuges, no matter how crude. It's true that we've always been encouraged to do this by the air that surrounds us, while we've always seen those around us eager to endorse by consensus subterfuge, however crude, in the service of fictions that had their assent. And my own subterfuge, in the cases I have mentioned, did indeed have the assent or tacit encouragement of those around me, without which I could not have maintained it and continued my game.

Assuming a situation, on the other hand, is no more and no less than approaching it **in good faith**, in the full sense of the word, i.e. without taking advantage of the facility offered to us to conceal the obvious ins and outs of the situation through crude subterfuge. It also means, quite simply, making use of our healthy faculties of perception and judgement, without taking care to conceal them for the needs of one cause or another. It may seem strange, but it's also simple and obvious - when we approach a situation with such an "innocent" attitude, it is immediately and profoundly transformed, however confused and knotted it may have seemed. Or, to put it another way, if it was indeed "knotted" and hadn't moved a muscle for a long time, it's because we ourselves were preventing it from evolving, from "flowing" according to its own nature; that we were obstructing its spontaneous movement, following in the footsteps of the "innocent".

This is the concordant example of all those who have surrounded us since our earliest childhood. It's enough to **stop** stiffening, to **stop** obstructing, for things that seemed frozen to start moving again, for what was stuck to become unstuck, and for the hard accumulated tensions to finally free themselves and resolve themselves in a new and ample movement, finally reappearing.

This "ease" or "convenience" we have, with everyone's encouragement, of "taking bladders for lanterns", and thereby blocking what is made to sink, is in fact nothing "comfortable"! We're paying an exorbitant price for the cushy inner immobility we've been allowed to enjoy - the price of inner tension,

p. 669

and the enormous investment of energy required to maintain both this tension and the fiction of bladders = lanterns. That said, everyone does as they please, at any given moment - that's our privilege. And at any moment, because of what we

What we do, we sow, for ourselves and for others. And the harvest of what we **sow** begins right now.

### 18.2.10.3. (c) Greed - or the wrong business

**Note** 143 Perhaps it's time to return to the "foreground" of the Funeral, i.e. the ins and outs of the role played by the Grand Officiant at my funeral, my friend Pierre. I had already returned to it a week ago, in the note "Patte de velours - ou les sourires" (n° 137, December 7), only to move away from it.

again with this digression (on five consecutive notes) on "la griffe" and "le velours". I feel that this This "digression", like many others that preceded it, was not in vain.

If I've been led to this conclusion, it's precisely because the most striking apparent trait, perhaps, in the way my friend has taken on his role, is the persistence, without any hint of rupture at any time, of the purest "velvet paw" style, in the service of a flawless antagonism that never says its name<sup>205</sup> (\*). Another salient fact is that, behind the pleasant, well-tempered appearances of a knowing smile and friendly airs, my friend often expressed an unequivocal, and seemingly gratuitous, intention to **harm** or **injure**, **either** myself or those he considered "mine" (in terms of mathematical work). I have gone into enough detail on concrete facts in this sense in the first part of Burial, for it to be worth returning to them here. What we're talking about here is malevolence (strictly circumscribed within the realm of scientific activity, it would seem), "**violence**" in the strongest sense of the word, even though it remains rigorously concealed - the claw always drowned in exquisite downy silks. And this violence, this malevolence, has all the appearance of the most disconcertingly **gratuitous** - it

It would seem that they are exercised for the sole pleasure of harming and injuring,

p. 670

□As <sup>with</sup> any situation, it seems so unbelievable that often we hesitate to believe the testimony of our healthy faculties<sup>206</sup> (\*). Denying this testimony, as is common practice, is one of the innumerable ways of not taking on a situation, and thereby perpetuating it, so it's surely preferable to put the matter down, to look around it, perhaps in search of aspects that may have escaped us and which provide an approach to it, enabling us to integrate it into our experience. It seems to me that very few of us have ever been in such a state of causeless malevolence - and to be willing to remember this is already a possible step **towards approaching** a factual situation, which common reflexes would rather encourage us to evacuate straight away. It's also a good idea to

<sup>205</sup>(\*) As I've already had occasion to point out elsewhere, the fact that antagonism, or deliberate rejection or derision, "never says its name" is in no way peculiar to my friend Pierre, but (as far as I'm aware) applies to all participants in the Funeral, without exception. And so, in this "Yin funeral" of derision, the underlying note in each of the participants (and as befits such a funereal occasion) is itself - yin!

For the "occult" nature of the Burial, see also the note "The Gravedigger - or the entire Congregation", n° 97.

<sup>206</sup>(\*) On this subject, see the note "The Emperor of China's robe", n° 77'.

probe further, to see if there might not be some hidden grievance that is the cause and springboard of violence that seemed to have no cause - just as it's good, if need be, to recognize bogus "grievances" for what they are, of the kind (for example) that I myself have practiced, knowing that so-and-so is an awful character who deserves no mercy, etc.

But in this particular case, no matter how hard I probe, I can't see anything that remotely resembles a **grievance** that my friend might (rightly or wrongly) harbor against me, or against any of those he has chosen as targets of malice. He himself has never hinted at anything remotely resembling this; not to mention the fact that, when probed by me on more than one occasion about some of his actions which had left me speechless, he never admitted that there was the slightest hint of enmity in him towards anyone. I ended up sensing a secret gratification in him, during my occasional encounters, when he would serve me his good reasons, all objective, with his very own air of innocent, slightly amused surprise... . In short, I entered into a game that he played as he pleased, and with an intimate satisfaction that took me a long time to perceive. (And yet he was far from the first person to make me squirm in this way!) Still, better late than never, I finally got off that merry-go-round<sup>207</sup> (\*\*)!

If, on the other hand, I probe myself, reviewing my relationship to my □ami since our meeting a Nearly twenty years later (in 1965), I can't find a trace of anything that might have been the cause of any grievance against me. In the conventional, superficial sense of things, I can say that during all this time, and more particularly in the first five years of close contact, I "did him nothing but good".

p. 671

But this observation immediately reminds me of another, less superficial one - that of a **complacency** in me towards him, which emerged in the course of reflection in the notes "Being apart" and "Ambiguity" (n° s 67' and 63"). Clearly, this complacency was by no means "a good thing" for him - and also, that the my brilliant young pupil and friend's attitude towards me developed in close symbiosis with my own attitude, and more specifically, with this complacency. It's not impossible, even, that this complacency, at some unconscious level, was (not only perceived, which is obvious anyway, but also) felt by my friend as a "grievance", as a scenario perhaps too well known and replayed over and over again, in his youth as a child who was a bit of a prodigy around the edges, and which was served up to him (albeit discreetly) once again. Perhaps he'd naively believed that, once he'd set foot in the mathematical "big wide world", everything would be different from what he'd known - and then no, it was still the same tobacco! (And by his own deliberate choice, today it's still the same tobacco, and even bigger, which is more... .)

I'll probably never know exactly what's going on here. Besides, it's not my job to find out, assuming I have the antennae to do it on my own. If there was a "grievance", it was, at most, an "auxiliary" grievance, helping to set "something" in motion - a certain **game**, driven by a force of quite another magnitude; a force whose presence I've long felt, but whose nature remains enigmatic to me. Before leaving this "foreground" of the Burial painting, I'd like to at least try to surmise the nature of that force.

Clearly, there's a **greed** to supplant, oust and erase, as well as a greed to **appropriate** the fruits of others' labors and love affairs with lady mathematics. Yet it's clear to me that it's **not** a simple "bulimia" for prestige, admiration, honors, or even power, which is the mainspring of his role in the Burial. How often, in the course of my reflection on this □rôle, have I been It's hard to believe that his **obsession with** burying was actually burying himself! Thanks to his exceptional gifts and an equally exceptional situation, he had been blessed with everything he needed to

p. 672

<sup>207</sup>(\*\*) This was in 1981 - the "second turning point" referred to in the note "Two turning points", n° 66.

to far surpass his master, and to leave a profound imprint on the entire mathematical world of his time. All he had to do was let the child in him play to his heart's content, without bothering him with instructions, barriers here and forbidden directions there - simply taking care of what was necessary, strictly stewardship. In doing so, and without having to push, pull or elbow, the "boss" in him, no more or less greedy than in anyone else, would certainly not have lacked all imaginable marks of prestige, admiration, honors, and power to boot, not even knowing what to do with them, whereas it's the dullard who gives it his all, leaving the boss little leisure to play the boss... .

Decidedly, in simply "utilitarian" terms, it was a bloody bad deal to get embroiled in a Funeral that had been sticking to him for fifteen years or more, and was going to stick to him for the rest of his life, if the cumbersome deceased hadn't suddenly decided to disrupt the ceremony, by lifting the lid of his coffin, when (as expected) it was least expected! (All bets are off as to how this unfortunate incident will affect Pierre's future bets... .) Or to put it another way, my friend had the makings (by his intellectual means, at least), and the credentials, to be a mathematical Peter the Great, and chose instead to play the little Peter. Sounds like a bad deal indeed, at least if the goal was indeed, first and foremost, that of vanity.

#### 18.2.10.4. (d) Both knowledge or fear of knowledge

p. 673

**Note** 144 (December 15) Towards the end of last night's reflection, I felt the slight uneasiness of someone who, with a peremptory air, serves up a reasoning of impeccable logic, while dismissing the diffuse feeling that there is nevertheless something wrong. This "something" became apparent, moreover, as soon as I was stopped writing. One vague way of putting it is this: the "logic" of the unconscious, the one that presides over our most crucial choices, is by no means that of <sup>conscious</sup>□<sup>ordinary</sup> reasoning, and even less that of orthodox" reasoning. In this case, the perception I have of the "assets" of the young man Deligne in the second half of the sixties (let's say), and the weight I give them (which goes in the same direction, at least, as the weight any reasonably well-informed mathematician would give them) - this perception and this weight (which I would like to call "objective") are unrelated to the dispositions and feelings of the interested party himself; with those, in particular, concerning his own abilities, which certainly form the key asset among all those at his disposal.

I have the impression, however, that on a conscious level at least, and with all the modesty that modesty demanded, my friend had integrated and made his own the flattering echoes that had surely been coming back to him for a long time about his unusual gifts. But there's no doubt in my mind that at a deeper level, where the great choices that dominate a life are made without words, this "objective" version of things became (and still remains today) a **dead letter**. In its place, there is an insidious **doubt**, which no "proof" of value (or of superiority over others. . .) will ever uproot - a doubt all the more tenacious because it remains forever unformulated. I've seen it in my friend, as I've seen it in others less brilliantly gifted, and it's the same. This doubt is the stubborn messenger of an **intimate conviction**, which also remains unspoken, even more deeply buried than this doubt itself: an intimate conviction of powerlessness, fundamental and irremediable. This too is the "self-contempt" of which I spoke at the very beginning of Récoltes et Semailles, in the context of a reflection that remained "general"<sup>208</sup> (\*). It reappeared, again in an impersonal context and under a different guise, a month or two ago, as a "feeling of cracking"<sup>209</sup> (\*\*) - this diffuse feeling of "cracking".

<sup>208</sup>(\*) See "Infallibility (of others) and contempt (of self)", n° 4.

<sup>209</sup>(\*\*) See note "La moitié et le tout - ou la fêlure" (n° 112), October 17.

which I had first noticed in myself, the day after I discovered meditation. And several times during the reflection on Burial, there was a sudden and acute perception of this "intimate conviction of powerlessness" in my friend, throwing new light on a situation that seemed to defy common sense... .<sup>210</sup>(\*\*\*).

□ I know that this intimate conviction, in my friend or in any other, is itself like **the shadow of a knowledge** - the knowledge of a "crack" that actually exists, of a "mutilation" suffered, and sanctioned and maintained to this very day by its own acquiescence. The shadow does not, however, restore the knowledge from which it springs, beneficial in itself like all knowledge - it is rather like a deformed, gigantic caricature of it, a scarecrow version. What deforms knowledge and makes it unrecognizable is **fear** - the fear of making contact with knowledge itself, of letting it rise from the depths where it has always been repressed, and of assuming the humble reality of which it is the faithful reflection.

p. 674

To make contact with this dreaded knowledge, to become aware with a fully conscious gaze of this reality known in its deepest layers, and shunned - this is what it really means: to make full contact with that in us (whether we call it "the force", or "the child"), "believed lost and dead for a long life". For it is this strength and nothing else, the strength of childhood, that enables us to take on the knowledge of that in us which is cracked, mutilated, paralysed. Assuming this knowledge also means reconnecting with that **other knowledge**, which predates our mutilation and is even more essential than it: the original knowledge of the presence of this "force" that lies within us, a force that is neither muscle nor brain, and which contains both.

Strangely enough, this lost knowledge of the presence within us of this "force", this **creative power**, as an obvious, indestructible part of our true nature - this knowledge is rediscovered through the discovery and humble acceptance of a **state of powerlessness**, resolved by this very acceptance. The knowledge of a state of powerlessness covers and conceals the even more deeply-rooted knowledge of our creative force. The latter is like the key that opens us to the former, both indissociable in truth, like the front and back of the **same** knowledge<sup>211</sup> (\*), both objects of the **same** fear.

□ When I speak of "the force" buried in each of us, this is by no means an abstract thing and vague, with the verbal subtlety of a "philosopher", or a psychologist with a touch of philosophy about him. It's this strength that allows you to "do math" (or "make love". . . ) like a child breathes - that is, without prudently obliging yourself not to leave the wake left by your predecessors, and to repeat with application the gestures and recipes (or the clichés. . . ) that were theirs. ) that were theirs; and it's also one that gives you the courage and humility, in your own home as well as in that of others, to call a spade a spade and not take bladders for lanterns, even if in doing so you go against the most established consensus, or the most inveterate and well-honed mechanisms within yourself.(\*)

p. 675

212

<sup>210</sup>(\*\*\*) On this subject, see the note "Le renversement (3) - ou yin enterre yang", where (among other things) certain such "sensitive moments" of reflection are evoked.

<sup>211</sup>(\*) In this image, of course, the "**right side**" is the knowledge of powerlessness, of inauthenticity, of the "crack", while the "**left side**", even more hidden, is the knowledge of our undivided nature and creative power. I've found again and again over the years that it's the "flip side", the more deeply buried knowledge of the two, that is the object of the greatest fear, and the most vehement denial. It's not so much the familiar, anodyne state of being a trained and (more or less) "learned" monkey that worries anyone, but rather the innocence of the child who feels things as they are and calls them by their name, and who does and says as he feels, without shame at being different from what's "expected" of him.

<sup>212</sup>(\*) (December 16) The action of the creative force in everyone, the force of renewal (or "child force"), can be recognized by its fruits, both in the works of the hand or mind, and in the facts of everyday life, in our relationship with others and with the beings and things around us. Over and over again, I've noticed that creativity in everyday life is much less of an issue.

The first example I've come across is one that's sure to get the heart racing of any young (or even not-so-young) glory-seeking researcher. Who wouldn't want to be the intrepid pioneer of sciences still in their infancy, and as such feature prominently in every textbook, like Kepler, father of modern astronomy! But when it's a question (as Kepler and others did) of tenaciously spinning one's own yarn in solitude and indifference (if not disdain or hostility), for thirty years or even just one - then suddenly there's nobody left! We don't mind being in the

p. 677 manuals, in good company in short, but one is also **afraid of** being alone, if only for a year or even **seulement** one day. But he who "knows" the presence of the force within him (and to know it he hasn't had

never to speak of it, either to others or to himself. . . ) - he also knows that he's **alone**, and that being alone doesn't worry him. And whether he'll be in the textbooks is the least of his worries - especially when he's working.

As it happens, this same Kepler, in his very work, "went against the best-established consensus" in his science, and established for millennia at that. In his day (when the Inquisition still existed), this was even more inconvenient than it is today, when you have a good chance of losing your job, or not finding one, but without the risk of ending up at the stake. Coming back to Kepler, I don't know what he was like in his everyday life, with regard to the "best-established consensus"; perhaps he kept his nose to the grindstone, like everyone else. What's certain is that today, as in the past, there aren't many people who would deviate even a hair's breadth from this consensus. It's undoubtedly the same old tobacco - the **fear of being alone**, the flip side of a deep-seated need to be alone.

---

We're not just talking about "works" (in the conventional sense, i.e. tangible "products" shaped by the hand or mind, of creativity).

The presence of continuous creativity in a person's life is a sign of continuous "contact", however fragmentary and imperfect, with the creative force within him or her. This is something different from the mere presence of "gifts", and of a continuous investment of energy to take advantage of them, expressed by a more or less important production, also more or less "rated", but which does not have, in itself, a creative virtue, a virtue of renewal.

In my intellectual pursuits, and particularly in my mathematical work, with modest "gifts" (but considerable investment), it seems to me that this "contact" with the force within me, i.e. the tacit and profound knowledge I had of it, was virtually intact. In other words, I was pretty much "functioning" on my full (creative) capacity in this (admittedly very fragmentary) area of my life, with virtually no loss, detour or blockage of energy by the usual "friction effects". One of the most common of these is a certain pusillanimity, which so often renders us deaf to the inner voice telling us what to do, when what it's teaching us is precisely "new", that is, leading us down paths that only we tread. This kind of inhibition, almost absent from my relationship with mathematics (and, it seems to me, more and more so as the years go by), has, on the other hand, existed in other areas of my life just as much as in anyone else's, and particularly in "everyday life".

Returning to the subject of mathematics, I see a kind of reversed relationship in my brilliant ex-student. He has "gifts" that have always amazed and enchanted me, in no way comparable to my own. (It's true that the longer I live, the more I see that this **is** by no means the essential thing, to be innovative in science or elsewhere; see on this subject the reflection in the note "Yin the Servant (2) - or generosity" (n° 136).) His investment in mathematics is considerable, as was mine in the past, and from an early age he benefited from exceptionally favourable conditions for the development of his gifts, and for the conception and elaboration of a body of work commensurate with them. Twenty years on, I'm still waiting for this work, and I'm still not satisfied! Surely there is some "contact" with the creative force within him, attested by the beauty of such things he has made - but this contact is disturbed, tormented. My friend's relationship with his work, and even within his work itself, is one of conflict - work becoming, more and more over the years, an **instrument** in the hands of the "boss" to satisfy **his** cravings, alien to the child's thirst for knowledge and discovery.

I doubt that such a conflictual relationship can be resolved without first being assumed - that is, first and foremost, acknowledged. At least, not once in my life have I seen such a thing happen, without the other. This is what led me to write that the knowledge of our powerlessness was "the key" to regaining full knowledge of our creative power, and thereby also full creative power itself. In my mathematical work, the question has not arisen, because there has been no deep blockage in this work, equivalent to partial impotence, which would have made me "function" on only a small part of my possibilities. On the other hand, the question arose for me as it does for everyone else, at the level of my daily experience, in my relationship to others and to myself, to my body and to my body's impulses. It was at this level that I experienced, over and over again, that the realization of a blockage, a "powerlessness", was indeed the **key** to freeing imprisoned creativity.

universal in man: the need for approval, for confirmation by others (and would there be only **one who** approves and confirms). ... <sup>213</sup>(\*)

#### 18.2.10.5. (e) The secret nerve

**Note 145** But I've strayed from my point again! I had started from the realization that my "reasoning" of last night was off the mark, when I wanted to "get across" this conviction of mine, that my friend's motivation for playing the role I know in my Burial, and in the way I know, was not **greed** (for prestige, admiration, honors, power). It's true, of course, that by trading a child's impulse for a **role**, he'd made "a bad bargain", even from the point of view of "returns", prestige etc. But that proves absolutely nothing. But this proves absolutely nothing. Such "miscalculations" are, moreover, the

almost absolute rule, it seems to me, and by no means the exception, in the choices (at the unconscious level) of our principal investments and options. But even though the reasoning is worthless, I nevertheless p. 678

There's no doubt that what I wanted to convey is the perception of a reality: that it's **not** this very real greed, which has taken a growing and truly devouring part in my friend's life, that it's not this **greed** that constitutes the **nerve** in this role played by my friend, as **the** key figure in the implementation of my funeral.

If I take a closer look at this clear-cut feeling (without any further attempt to "establish" its validity!), I come to the following conclusion: it's this **gratuitousness** in the antagonistic or malevolent act, a gratuitousness that has often left me speechless, that doesn't "fit" at all with the all-purpose "explanation": greed. As far as prestige, admiration and honors were concerned, at least, and even "power" in the ordinary sense of the term, my brilliant ex-student and friend gained nothing, either in the moment or in the longer term, by playing on his former master's "discreet and delicately measured disdain", of which he had the secret; or by using the same disdain (perhaps less delicately dosed) towards a researcher of lesser status than himself, or towards his present or past work, in such a way as to discourage the one whose confidence in his own faculties of judgement was not as firmly anchored as it was in me; or for yet another, who had courageously persevered against the general disdain of which my friend set the tone, by robbing him of the fruits of his perseverance against all and sundry. While it's true that in this last case, as in others, my friend pretended to appropriate the fruits ripened by others in solitude (and sometimes in the disdain of his elders), this "benefit" (in the "Pouce" style<sup>214</sup> (\*)) is so derisory, when one considers **who** the appropriator **is**, that the "explanation" put forward goes up in smoke itself!

As far as I'm concerned, I know for a fact that it's not **this** benefit that's the "nerve" of the company. of such appropriations. On the other hand, I sense in it **the intoxication of a certain power** - a power more delicate, and no doubt more exhilarating, than power in the conventional sense, as a man of science and importance.

commonly exercised by sitting on Committees, Councils, Juries and the like, directing an Institute, or p. 679 research of brilliant young researchers, or talking into the ear of a minister. The "intoxication" of which I speak appeared (for the first time in the reflection) in the note "La Perversité" (n° 76), when I suddenly find myself confronted with "an act of **bravado**, a kind of intoxication in a power so total, that it can afford to even to display (symbolically. . .). . . its true nature of "perverse" spoliation of others".

It was a dazzling act of bravado, ostentatious and yet at the same time **hidden**, informal, slipped in there casually, with even a semblance of an explanation for the strange name "faisceaux".

<sup>213</sup>(\*) Here I'm reiterating, by another means, observations that had already appeared in the sections "The forbidden fruit" and "The solitary adventure" (n° s 46,47), and also, in passing, in the note "Acceptance" (n° 110).

<sup>214</sup>(\*) See the notes "Pouce!" (n° 77) and "Appropriation et mépris" (n° 59) about this style of appropriation in my brilliant friend and former student.

perverse", what could be more natural? We're going to shed some light on this in three words, plus a short list of "things that should have found their place" in our modest but brilliant article. ... <sup>215</sup>(\*).

Once again, I recognize the purest "velvet paw" style, a.k.a. "thumb" style! - and behind the uniformity of a **style** that has become familiar to me in more than one person, I also sense the **common nerve**: this imperious, all-consuming **thirst** to wield power; a **certain power**, and in a certain mode - the power of the cat over the mouse, when he plays his Great Game with that perfect grace (which only the mouse is unable to appreciate to its full value), and with "the most exquisite delicacy" for sure - or the power also of a clever wife over her big dodo of a husband. . .

Based on my friend's case, I've already been led to talk about the "style" in question, and its meaning, in the general context of couples of all kinds. This was the subject of our reflection a week ago, in the note "Le renversement (4) - ou le cirque conjugal" (n° 138, December 8). Here, for the first time, the "nerve" of the "velvet paw" game (a.k.a. "Thumb!") appears with all the clarity it deserves, as in a **game of power**. A game of power, however, of a very particular nature: the fascination of the game for those who play it, its often all-consuming charm, consists precisely in the **occult nature of the power** that is exercised through it, this "neither seen, nor known" character, which makes it possible to play the other (**of him, never with him**).

p. 680

him. . . ), making him go round in circles as he pleases, always leading the dance, where the other baldly follows shot after shot.

□ **coup**, in pathetic response to those little blows delivered by invisible wires that one wields at one's whim and according to one's enjoy...

All I had to do was write down in black and white what I'd felt obscurely for years, without ever having bothered to formulate it clearly - all I had to do was make this short effort to condense into words what had long remained diffuse, so that what only yesterday seemed "enigmatic" to me (namely, the nature of a "certain force" in such and such a friend), suddenly opened up its obvious meaning to me! This "force" in him, or (as I wrote earlier) the "nerve" behind such acts which may seem "inexplicable" (or even "beyond comprehension"), I had already clearly identified in the reflection of December 8. But while the starting point of this crucial reflection was indeed a certain "enigmatic" game played by my brilliant friend, it was **another** experience, richer and more intense than the one associated with his person, that fuelled this reflection; an experience that had been fully assimilated (or very close to it), and which gave me an already-formed knowledge that the more epidermal experience of my sporadic relationship with my friend Pierre could not then have communicated to me.

Of course, in the end, it was this experience that I had to understand, and thereby fully assume; and if I launched into a digression on the "couple's carousel" without any inner reservations, it was because I felt that this carousel had something to tell me about my relationship with my friend. His thoughts continued to linger in the background, like a discreet background note.

However, the two didn't come together completely that day, or in the days that followed. No doubt the moment was not yet fully ripe. For the junction to take place without reserve or effort, with the ease of the obvious, I first had to "clear the ground", by stubbornly and unhurriedly following, one by one, the most compelling associations that demanded my attention. I didn't rush things, and I knew that this was what I had to do - attend to what was calling me insistently, without letting myself be diverted by a "propos" or a "fil" (of reflection), or even by a program to complete.

While I'm weeding and hoeing, the forces of earth and sky are at work. When evening comes, all you have to do is pick up the ripe fruit, which falls into the open hand that welcomes it. ...

## 18.2.10.6. (f) Passion and hunger - or climbing

---

<sup>215</sup>(\*) See note "Le Prestidigitateur" (n° 75").

**Note 146** □ (December 17) It seems to me that with the day before yesterday's reflection, there was a kind of unblockingp

. 681

of an understanding that had remained undecided, a little stunned, in front of a quantity of facts and intuitions piled up before me in a rather amorphous heap - like a puzzle of which I had only succeeded so well in to assemble a few pieces here and there. Now I feel as if I've stumbled across **the** key "piece" of the unknown picture that needs to be reconstituted, around which the others will finally fit together effortlessly. In any case, I have no doubt that I have touched the "nerve" behind the role played by my friend Pierre in the burial of the master and his (more or less) faithful followers, and at the same time, the "nerve" of his relationship with me, the deceased master.

This craving to play with a certain power, discreetly pulling invisible strings with an air of candor - this craving must surely have been present long before I met him, ignored by himself and everyone else. If I didn't see it manifest itself in the first years we knew each other, before the episode of my departure (in 1970), it's undoubtedly because in those years of intense learning and the blossoming of a delicate and powerful thought, my friend's energy was totally absorbed elsewhere. The conditions were ideal, in fact, to serve as a springboard for his exceptional abilities. The episode of my departure, first from the institution of which we were both a part, and then (in the year that followed) from the ma- thematic scene, was a crucial turning point not only in my own spiritual adventure, but surely in his as well. It was this episode that suddenly opened him up to means of power that only the day before he wouldn't have dared to dream of: firstly, the power to "oust" from the scene an ex-master who was taking up a great deal of space there, and from whom he had previously confined himself to discreetly distancing himself<sup>216</sup> (\*); then, when it became clear that the latter was disappearing from the scene, the even more exhilarating power to make a certain School bearing the name of the deceased master vanish without a trace; and, finally, to cut off, in all its main branches (except the one on which he himself was perched), the blossoming of a vast program in the service of a vast Vision, which he himself had long nurtured<sup>217</sup> (\*\*).

The meaning of this great turning point in my friend's life appears to me as a kind of reversal in the mutual relationship of hegemony of the two dominant forces in his person, those which seem to me to take precedence over all others: mathematical passion, and the "craving" for power play ("à patte de velours"). The first of these forces is essentially "pulsional" in nature<sup>218</sup> (\*), the second is egotic, "ac- quised". Before the turning point, it's the drive for knowledge that dominates my friend's life (as far as I know), while the drive for power is more or less dormant, in a state of vacancy. At the end of a vertiginous social ascent in the space of a few years<sup>219</sup> (\*\*), and in a situation that suddenly presented a draconian choice, it was the temptation of power and its secret intoxications that prevailed (with the hand held high, I believe, and without any desire to fight) over the passion for knowledge. The latter does not disappear

<sup>216</sup>(\*) On the subject of this concern to distance oneself, then to evict, see the notes "Eviction" (n° 63) and "Brothers and spouses - or the double signature" (n° 134), as well as the sub-note (n° 134<sub>1</sub>) to the latter, and finally the section "The unfinished harvest" (n° 28).

<sup>217</sup>(\*\*) See, on the subject of the liquidation of a "School" and the "chainsaw" effect, the notes "L'héritier", "Les cohéritiers... ", ". . and la tronçonneuse" (n° 90, 91, 92) and the first four notes of the Cortège "Fourgon Funèbre" (coffins 1 to 4), n° s 93-96. On the subject of the vision that was buried, see the two glimpses (in two different lightings) given in the two notes "My orphans" (n° 46), and the sub-note n° 136<sub>1</sub> to the note "Yin the Servant (2) - or generosity".

Note that in the main text, the expression "et ce faisant. . ." (" . . . to cut short... the blossoming of a vast program. . ") is not adequate. The liquidation of a School was the **first** radical "chainsaw stroke" to "cut clean" a set of master branches, but not the last (as witnessed in particular by the notes-cercueils cited, n° s 93-96).

<sup>218</sup>(\*) The fact that mathematical passion is "pulsional in nature", that it is an expression of the "child" (aka the "worker"), does not prevent it (as is forcefully pointed out in the same paragraph) from also being invested more or less strongly by the "cravings" of the "boss" - and this is part of the common lot (from which I have been no more exempt than anyone else) in the relationship between "the worker" and "the boss".

<sup>219</sup>(\*\*) On this subject, see the note "L'ascension" (no. 63').

not from the stage, but is now a vassal and humble servant of Fringale, an **instrument** in the latter's hands. Passion (aka "the worker") goes about her work under the jealous eye of Fringale, aka "the boss", who never leaves her side. As the worker has good tools (not all of which are forbidden to him), and good hands, even if he's kept short in this way, he continues haphazardly to maintain production and the company's reputation. But it's not as it used to be, of course, when the (sometimes very childish) worker took his

The boss was far away and only came once a season!

p. 683

□ The subsequent evolution seems to me to be more quantitative than qualitative. It's the progressive-  
The boss's **tactics**, following a style that remains uniform, while the boss-worker relationship doesn't change a bit. This type of boss is cautious by temperament, and only likes to venture where he's sure of winning. To do this, he needs to be sure of the ground - or, alternatively, to be sure of the tacit approval of the entire "Congrégation", starting with the smaller group of ex-students of the deceased. The evolution of the personal relationship maintained with the latter, against all odds, is a faithful reflection of the evolution of "local knowledge". There is a gradual **escalation** in the boldness of the game of power and contempt, culminating after twelve years (in 1981) with the prowess of the Colloque Pervers, where all restraint (and even, all caution) are cheerfully thrown overboard in the general euphoria<sup>220</sup> (\*). And so it took twelve years for my friend to convince himself that the ground was so fertile that no caution was called for: any shot wins! The time was ripe, decidedly, to finally bring out the secret weapon, the **motives** - exhumed under an alternative paternity the following year<sup>221</sup> (\*\*).

I don't feel motivated to retrace here the successive steps of this twelve-year climb, even though I have everything in hand to do so. That would be the work of a chronicler, as I did enough of it in the unexpected "investigation" pursued in the first part of L'Enterrement (or "La robe de l'Empereur de Chine"). These "steps" of an escalation seem to me like so many **probing shots**, launched by my friend in the direction of a mute Congregation, with the same answer each time: he could go there! For nearly fifteen years, she has been his silent ally and guarantor, while he has been, without realizing it or caring, her docile instrument<sup>222</sup> (\*\*\*).

### 18.2.10.7. (g) Daddy-cake

p. 684

□ **Note 147** I don't know if this craving in my friend is exercised against others as well as myself, and younger thematians in whom he smells my "scent". I haven't heard anything to that effect. However, it's clear to me that it was through his relationship with me, and thanks to a situation that is certainly unusual in the scientific world, that this propensity in him, which had been living in the shadows, became, overnight, an all-consuming craving. During the episode of my departure, when he explained to me, with all the appearance of seriousness, that he had given his life, totally, to mathematics<sup>223</sup> (\*), he undoubtedly "believed" what he was saying, and I myself, a little stunned though I was, didn't think of questioning his words. And yet, if I'd had a finer ear, or to put it better, if I'd had the maturity to listen and trust a "finer ear", which does exist in me as it does in everyone, I would have known that what he was telling me about himself might have been true the day before, but that it wasn't true that day. It was a noble reason given for a dubious deed, a deed that neither he nor I had the simplicity to face up to, even though its meaning was obvious. It was **something else** than such a passion, which had in those days seized the hearts of both of us.

<sup>220</sup>(\*) On the subject of the "Perversity Colloquium", see Cortège VII "Le Colloque - ou faisceaux de Mebkhout et Perversité", notes n°s 75-80.

<sup>221</sup>(\*\*) On the subject of the exhumation of motifs, see the notes "Souvenir d'un rêve - ou la naissance des motifs", and "L'Enterrement - ou le Nouveau Père", n°s 51,52.

<sup>222</sup>(\*\*\*) See note "Le Fossoyeur - ou la Congrégation toute entière", n° 97.

<sup>223</sup>(\*) On this episode, see the note "Brothers and spouses - or the double signature" (n° 134).

the reins of his life, never to let go until today.

So it was my person, or rather something in my friend's relationship to my person, that (given the right opportunity) triggered this drastic change in the nature of the force dominating his life, and in the direction of his investment in mathematics. This is the moment to remember the famous "strands" or "aspects" of Burial, highlighted in the reflection of the 13th

November (in the note "Rétrospective (1) - ou les trois volets d'un tableau" n° 127), and in the note that follows it ("Rétrospective (2) - ou le nœud du tableau", n° 127'), which had time to get a little lost along the way.

since then. I pretended to remember it, just a little, in my note of ten days ago, "Patte de velours ou les sourires" (n° 137, December 7). In particular, I reconnected with the intuition of the eternal role of "adopted father" that I had to play with my young friend, and which, it seems to me, has remained active and intact.

to this day. On the occasion of this reflection, I would like to reiterate my unreserved conviction, which must have formed and taken shape gradually over the course of at least the last six or seven years (since p. 685 even longer, perhaps): that it was "around this aspect (the paternal aspect in his apprehension of my person) that the conflict arose - a conflict that already existed in him long before he ever heard my name...". (So that's the famous "Superfather" part, while the "Supermother" part is still in limbo, at least for the moment).

In fact, it's barely a page later that the famous "smiles and velvet paw" style makes its first, quick appearance, as an object of attention. In the days that followed, the associated associations seemed at first to distance me from my friend's person, as well as from the occult "paternal" aspect of the role my friend had assigned me in his life. This aspect has not been mentioned again until today - you can't think about everything at once, let alone talk about everything at once! In terms of thinking, however, it seems to me that somewhere, in the indistinct but nonetheless present and active background, the thought of this paternal aspect must have been present, it must have acted as an effective and discreet stimulus to this long digression on a "claw in velvet" style. After all (I'm making this clear to myself now, after the event, but it must already have been there in the form of a diffuse yet peremptory motivation...), the "father" figure is no stranger to this famous style, quite the contrary. In fact, it's fair to say that the very first person in a little girl's life (or boy's, for that matter) to be led gently and smoothly (though not always tenderly) by this style is none other than Dad!

And as long as the innocent kid (or boy) adopts and makes his (or hers) own this style and know-how - which must become second nature almost at the same time as learning to speak, or almost - the very first guinea pig and beneficiary, no doubt, will be that same big daddy! More often than not, when I've seen this game played, it's been accompanied by the hidden anger of a grudge, as well as a deliberate attempt at derision. And of course, in most families, there's no shortage of reasons to hold a grudge against the father, or even those cleverly suggested (or even created out of thin air) by the tender mother.

wife. In my friend, however, I never at any time sensed such a nuance of rancor or spite. When I saw him injure or harm "for pleasure", it was **really** (so I felt) **for pleasure alone** ;

not (I think) the pleasure of the suffering or humiliation itself that he inflicted, but rather the secret intoxication of exercising, at his own pleasure and in that particular style in which he was a master, a **power** - more exhilarating or even more piquant, no doubt, by this ingredient with a "**perverse**", "**forbidden**" connotation (harming, or causing suffering **for pleasure**), and yet which he could indulge in, delicately and casually and apart from that, to the hilt and gogo. . . <sup>224</sup>(\*)

<sup>224</sup>(\*) For a detailed illustration, see the note "La Perversité", n° 76.

### 18.2.10.8. The nerve within the nerve - or the dwarf and the giant

**Note** 148 (December 18) With last night's reflection, I feel that this "foreground" of the Burial painting, centered on the relationship between my friend Pierre and myself, continues to emerge from the mists of misunderstanding and confusion. For some time now, I've been faced with the task of inserting a certain "Superpère" section into this foreground (among others), and although I hadn't really formulated it clearly, this section didn't really seem to want to fit in willingly. If there's one student I've always felt completely "at ease" with, not tense at all and at no time that I can remember, it's him! Admittedly, I have little recollection of our very first encounters, and I can't claim that there wasn't that tension in him then - often barely perceptible, yet very real - which arises when we first approach someone invested (in one capacity or another) with authority or prestige, and towards whom we have a particular expectation. It is at least probable that such a tension must have been present, and that I paid no more attention to it than to any other young researcher I happened to meet. What is certain is that, if there was any tension at first contact, it quickly vanished without a trace. To use the image that appeared last night, he was as comfortable with me as a kid (or ex-kid) is with a sugar daddy he's never had to fear, and who has rarely refused him anything.

I thought about the situation again last night, after stopping to write. It now appears to me that my friend's relation to me was operating on two quite distinct levels, and (it would seem) without communication mutual. One of these levels, which undoubtedly became established in the weeks and months following our meeting, was that of the personal relationship - that of the "sugar daddy", therefore, kind as can be, not impressional at all, himself a bit of a child on the edges, including in his work, to such an extent that there is a nuance, I would almost say, **maternal** towards him, which I have already had occasion to mention once or twice: that of a child, giddy and a little boisterous, and above all as naive as any. It's also true that, in terms of his work, and objectively speaking, he really had no reason to be impressed. Of course, I knew a lot of maths that he didn't (and that he'd learned in a few years, by playing around), and above all, I had an experience of mathematics that he still lacked. But he had a speed of assimilation, and an acuity of vision to quickly recognize himself in muddled and confusing situations, by which he often amazed me, and which I lack. If I myself sometimes impressed colleagues, it was above all due to the uncommon **slaughter** that I have in my work, due above all, I believe, to a certain approach that I have to mathematical work. But there was certainly no reason for my brilliant young friend to be impressed, when his own slaughter, provided he started writing (which he didn't mind at all), was far more effective than mine.

This level of my friend's relationship with me, the "sugar daddy" level, seems to me to include the totality of his conscious image of me, and a good part of his unconscious image too. It's this image, it seems to me, that elicits in response, following paths no doubt established since childhood, a kind of reflex craving, that of the famous "claw in the velvet" game - a game that requires us to be entirely "at ease" with our partner, entirely "sure of him" and thus also sure of ourselves<sup>225</sup> (\*). This is the level of complete assurance, based on an intimate knowledge of a situation, corroborated again and again

<sup>225</sup>(\*) (December 29) This assertion is only apparently contradicted by cases (which do not include my friend) where the "playmaker" seems (at first sight at least) to be impressed, even subjugated by the person he's leading. This is, however, a **pose** for the sake of it, of which the actor himself is the first dupe (on a conscious level, I mean) - which is essential to give this pose a certain air of "truth" that can't be improvised! The most extreme case of this kind of play that I've ever known is that of my mother in relation to my father. On this subject, see the two notes "Le renversement (1) - ou l'épouse véhémence" and "Le renversement (2) - ou la révolte ambiguë", n°s 126, 132.

still by experience, which is interpreted  $\square$  in a fully concordant way by the faculties of perception and appreciation, both conscious and unconscious. The game itself is occult, unconscious to the player himself (I presume so, at least), but the feeling of assurance and the perception of reality that underpins it are in the conscious, rational, "objective" realm.

The other level, on the other hand, is entirely unconscious (at least that's my impression), uncontrolled and uncontrollable, of an irrational nature that seems to defy and make a mockery of any reasoned or reasonable knowledge of "objective" reality (which I've just recalled). At this level, the personal relationship itself, linked to any realistic perception of the Other, disappears. I myself appear as a giant, powerful and secretly envied, and my friend feels like a dwarf, overwhelmed by the conviction of his irremediable insignificance, and consumed at the same time by the insane desire, not to be a giant himself when he is a dwarf by immutable condition, but somehow to **rise to** his level, to **pass himself off** as a giant at the very least, or, more secretly and insidiously still - the insane desire **to be that giant himself**, or at the very least, to **pass himself off as one**. I think I detect yet another nuance in this desire, which is like the echo, in deeper layers, of the desire present in the layers close to the surface, which finds symbolic satisfaction precisely in this "velvet paw" game, and is its nerve and spring: the desire for **role reversal**. In the upper layers, it's the reversal of yin-yang, dominated-dominant, object-subject roles that's at stake. This relationship is not the case here, however, as the giant has no desire to dominate the dwarf - he's content to be a giant, and thus, without knowing or caring, to be a perpetual, burning challenge to the one who feels overwhelmed by his irremediable dwarf condition... . This superb ignorance in which he feels himself held, he feels as a tacit contempt and as an affront. It's this relationship that he's determined to overturn, himself appearing as the giant, and consigning the latter to insignificance - insignificance through **oblivion**, if not insignificance through **derision**, in return for the ignorance and contempt in which he feels himself held.

I said earlier that the two levels, "papa gâteau" and "géant", "would seem to have no mutual communication". On reflection, it seems to me  $\square$  plutôt now that there is indeed communication between the two,

p. 689

if only by this desire for reversal: the desire at one of the two levels now appears as an "echo" of the similar desire already seen at the other. At first glance, it seemed to me that this reversal of roles, at the deeper "dwarf-giant" level, was not a yin-yang reversal of roles. What is true is that this reversal is not of the dominated-dominant type indeed. And yet, on further reflection, there's no doubt that the **values** embodied by the giant are yang and superyang values, while the dwarf appears as the embodiment of yin non-values - in terms, I mean, of my friend's ideological options, not so very different from the options that were still mine in the early years of our relationship<sup>226</sup> (\*).

This statement will become clear, no doubt, once I've established a bridge between the image of "the dwarf and the giant" and reality, or at the very least, explained the origin of this image in the history and prehistory of the relationship between my friend and me. As far as "prehistory" is concerned, it's hardly necessary to point out that a conscious or unconscious image of this kind only comes into being as a result of the deep-seated "self-contempt" I've already mentioned several times in my reflections; or, to put it more accurately, that such an image is nothing other than a tangible, more or less concrete **materialization** of this contempt. Perhaps I could even say that this "secret conviction" is on the lookout for a situation to support it, while at the same time

<sup>226</sup>(\*) This concordance in the choice of "yang" or "superyang" values lasted until I left the company in 1970. In the years that followed, my value system at the conscious level "swung" towards "yin" and "superyin" options - see the note "Yang plays yin - or the role of Master", n° 118.

the scarecrow-image that expresses it. I believe that in everything in the psyche, however deeply buried, there lives a force that prompts it to express itself, often symbolically. This expression may often remain unconscious, but it is no less active, quite the contrary, in the facts and gestures visible in everyday life.

To return, this time, to the **story** of my friend's relationship with me, I'm sure she is too, begins even before we met. He must have heard of me around the time of his first contacts with the world of mathematicians, in Brussels, around 1960 - so four or five years <sup>before</sup> we met, when he was sixteen or seventeen<sup>227</sup> (\*). It's no coincidence that he asked me, and no one else, to teach him mathematics, or at least to teach him what was to become the central theme and tool of his work (namely, algebraic geometry). Before we met, the way I appeared to him (at least as a mathematician) could hardly have been anything other than my own brand image, making me a kind of heroic and prestigious embodiment of the core values of the mathematician world, and this at a time when he himself was a modest student, fresh out of high school. This image he had of me, and which was the very one I liked to portray, was no mere Epinal image, made to make glory-loving high-school students dream. It was based on tangible realities, and he certainly had enough flair to smell them in those years, in contact with mature mathematicians who were well into the game. From 1965 onwards, he was better placed than anyone else to take my measurements himself. I sensed in him a fascination for a vision that was opening up to him, born and matured in me over the past decade, and which continued to unfold and develop before his eyes. There was no doubt in my mind that these visions, which he made his own "as if he'd always known them", would serve him in the full light of day as inspiration and tools to develop even more far-reaching visions and work, within his means. This was not to be - and it is only in the light of this long meditation on a Burial, almost twenty years later, that I can glimpse how the fine, passionate perception of what I had to convey to him, must have served **at the same time** to flesh out and support' by first-hand elements of irrefutable reality, a **scarecrow-image**, aberrant; an image likely to **paralyze**, like the "intimate conviction" of which it is an expression. The very acuity of his perception of a "greatness" and depth in what I was transmitting to him, and which he was the only one to have made his own (and without effort) in its entirety - this acuity and vivacity which were his strength, then turned against him, making the aberrant image even more striking and peremptory.

Three days ago, I thought I'd touched the "nerve" of the role my friend has been playing for nearly fifteen years - and there was no doubt then that I'd just touched a nerve center: this all-consuming **craving** for a certain **game**, a delicate game of power, which was at the same time the symbolic and ephemeral satiation of the desire for a certain role reversal. . . With today's reflection, going down into deeper layers, it seems to me that I'm now touching on the **nerve within the nerve**, the even more secret **sting** that ceaselessly arouses and sustains this craving. For at the level of the "sugar daddy" there is certainly the opportunity and

<sup>227</sup>(\*) (December 29) I found this chronological information in the "Note biographique" (two pages long), by Pierre Deligne, written in 1975 on the occasion of the award of the "Prix Quinquennal" by the (Belgian) "Fonds National de la Recherche Scientifique" (Rue d'Egmont 5, 1050 Brussels). I intend to return to this biographical note in a later post, where I'll talk about Deligne's visit to my home last October. It was during this visit that I learned from him of the existence of this notice, which he was kind enough (at my request) to send me later. It was in this note that I also found the concrete form "the dwarf and the giant" of a certain image in my friend, a diffuse conception of which had gradually emerged in the course of reflection on L'Enterrement. It began to appear in the note "L'enterrement" (n° 61), and became clearer, notably, in the course of the reflection in each of the notes "L'éviction", "Le noeud", "Le renversement", "Le massacre", ". . . and the chainsaw", "L'Eloge Funèbre (2) - ou la force et l'auréole". It is only with the present note that this perception begins to "settle" into a coherent overview of the "foreground" of Burial.

(March 1985) For Deligne's biographical note, see "La profession de foi - ou le vrai dans le faux" (n° 166).

to play this game in complete safety, leading the dance with nonchalant delicacy, and sure to win every time. But no doubt the charm of easy opportunity dulls in the absence of a spur. And as I noticed only yesterday, there's no sting of pent-up grievance, of secret resentment - which is why we call him "cake"! This missing sting, in short, is something I've just touched on, when, in the course of associations, and as if under the dictation of a knowledge that would have been there all ready long ago, I was led to describe this "other level", "uncontrolled and uncontrollable", where a dwarf and a giant live side by side.

And the initial impression of a still confused intuition, that between the two levels there was no mutual communication, suddenly disappears, giving way to an understanding, expressed and aroused at the same time by the double image of the "nerve within the nerve" and the "goad". In terms of "layers", some superficial and others deep, I'd like to use a third image again, saying that these nourish or maintain the movement of the others, that they are the deep foundation, firmly anchored in the structure of the ego. Without this foundation, the surface agitation would quickly dissipate and fade away, giving way at last to something else. ...

## 18.2.11. The other Self- even

### 18.2.11.1. (a) Rancune en sursis - ou le retour des choses (2)

**Note** 149 □ (December 20) Since the reflection of five days ago, and that especially continued in the second p. 692 from that day's notes, "Le nerf secret" (n° 145), I feel that work on the famous "foreground" of the Burial painting has suddenly taken another turn. Before this reflection, I'd felt in the position of a It's a little embarrassing to be faced with a jigsaw puzzle, where you don't seem to understand much at all. Since April, I'd been gathering the pieces one by one, and taking careful inventory. It wasn't that I was short of pieces, no, it was more that I felt I had too many! In any case, there had to be enough to make a picture, partial perhaps, but a picture that would stand up. The last piece of the puzzle I threw on the table was that of "reversal" (of yin and yang), held in reserve from the very beginning of "The key to yin and yang" (as an "association of ideas" to which I promised myself I'd return), and finally bursting out with unforeseen force in "The key to yin and yang".

note "Les obsèques du yin (yang enterre yin (4))", November 10 (n° 124) The thirty-five days that followed, until five days ago, were spent turning over and over the pieces already uncovered, as the most compelling associations demanded my attention<sup>228</sup> (\*). I expected that, in doing so, the pieces would eventually come together, revealing the unknown picture. Nothing of the sort happened. On the contrary, they continued to thumb their noses at each other, as if fragments of ten different newspaper clippings had been thrown in a jumble and I had been left to assemble them! I was beginning to wonder whether I wouldn't be obliged, at the end of the day, to make a final inventory of the pieces, and another of the question marks concerning their assembly, and call it a day. ...

The situation changed five days ago, when, by dint of turning and flipping these famous coins, some palpating them and smelling them, something finally "clicked", when one of them (that of a **craving** behind a certain **style**) was suddenly recognized as "neuralgic". I had the immediate impression of a **qualitative change**, that a **perspective** that had hitherto been lacking was already being organized p. 693

<sup>228</sup>(\*) The "piece" that had been the starting point for all our thinking on yin and yang since the beginning of October only came back to the fore fourteen days later, on November 24, in the note "Le renversement (3) - ou yin enterre yang" (n°

from that particular piece. That's how I put it the following day, taking up my thoughts in the following note ("Passion et fringale - ou l'escalade", n° 146). And my premonition began to be confirmed the very same day, with the appearance of the "**papa-gateau**" piece, which was said to have been called the "neuralgic part" precisely for the purpose of fitting it without burrs!

The "**Superpère**" piece, which had always been there (already inherited from the first part of Récoltes et Semailles, and taken up again in the early days of "La clef du yin et du yang"<sup>229</sup> (\*)), now seems to have been written off, as if it had simply strayed there by accident. Under the fresh impression of the new "cake" piece<sup>230</sup> (\*\*), I tend to forget that this famous Superpère (not "cake" at all, as it happens) did indeed have something to do with the relationship between my friend Pierre and me, even if it didn't take center stage (which was not by a long shot. . . ). I ended up remembering it at the next session, of course - at the very moment, in fact, when I was about to explain to myself why this eternal piece of the puzzle had nothing to do with it! It was, in fact, "just the opposite" of the cake-piece, which had just placed itself with such ease. And then no, on closer inspection, this supposedly foreign piece, whose contours had remained the vaguest, suddenly clarified its shapes, "taking on those of the image-force (conjured up by none other than my friend Pierre himself<sup>231</sup> (\*\*\*)) of the **dwarf and the giant**. At first, when I saw it reappear in such strongly marked features, I expected it to be "uncommunicative" with the double neuralgic piece already in place (made up of daddy-cake, and the imperious urge to "make it work" - a little phone call here, a little phone call there. . . ). And now, on the contrary, it appears as "the nerve within the nerve", as an even more neuralgic piece, fitting together without friction or detachment with the part of the puzzle already in place!

p. 694 This piece, under its former name "Superpère", had already been □ maintes fois frôlée, and even taken in the hand and turned over and over like the others, and even (I remember now) declared to be the centerpiece, the "heart of the picture" and all that; but, perhaps for want of a striking image (provided by the interested party himself), and above all, no doubt, for its absurd, aberrant nature, entirely ludicrous even in terms of the coarse "common sense" of the current and universally accepted consensus, I was embarrassed and ashamed of the damn thing, it burned in my hand: no one (including a certain "myself" who tenaciously continues to live on inside me. . . ) would ever take it seriously! I might as well pack it in and "play" with more manageable pieces!

When I just spoke of "pièce maîtresse", "cœur du tableau" etc., in connection with the play that became "Le nain et le géant", it's the "self-contempt" aspect of course that I'm thinking of, rather than the "Superpère" aspect. For the moment, the latter designation for this piece-aiguillon, or "nerve within a nerve"-is hasty and unjustified. I mean, it doesn't seem, at first sight at least, that this famous faceless giant with oversized hands is anything like a father figure. If he needs a name, it's "Superman" or "Supermale", rather than "Superfather". So all things considered, the latter is still very much on the cards, for the time being at least, as is the "Supermère" piece (or "part"), to which I'll also have to return.

For the moment, the most urgent thing seems to me to be to try and situate the part of the picture already placed, with the "secret nerve" and the even more secret "nerve within a nerve", in terms of a yin-yang dynamic in the person of

---

133).

<sup>229</sup>(\*) See sections on "The enemy father (1) (2)" (n° s 29,30) and the note on "The Superfather (yang buries yin (2))", n° 108.

<sup>230</sup>(\*\*) The term "new" piece may not be entirely justified. But it is a piece, at least, that had previously escaped inventorying, so obvious was it!

<sup>231</sup>(\*\*\*) For further details, see the last footnote of the preceding "The nerve within the nerve - or the dwarf and the giant" (n° 148).

my friend. On this subject, I have three hard facts. Two are expressed by the yin-yin "double signature"<sup>232</sup> (\*): my friend Pierre's basic tone is "yin", both in what we might call the "acquired personality", expressed above all in the tone of his relationships with others, and in the "innate personality" or drive, expressed above all (for an outside observer such as myself, at least) in his spontaneous working style, free from the interference of the "boss". The first fact, concerning the acquired personality, or the "structure of the ego" (or in more graphic terms, "the boss's **head**"), seems to indicate that this structuring took place in childhood, and from the very first years of life, by identification with a "yin" model. This does not exclude

a priori, that this model was the father, if he had himself (as seems to me to be the case) p. 695 an "acquired personality" with a basic yin tonality. But on the other hand, my friend's predisposition to a craving for a kind of power game which, in our country if not everywhere and always, is typically (if not exclusively) "feminine", and more precisely, which is **the** game among all others that the wife is wont to play with the husband - this predisposition makes me suppose that the identification was made with the person of the mother, and that it is from her that he has "inherited" this craving (or a propensity for such a craving), and that it is also from her that he has taken on the appropriate "style" (or "tactic"), that of the "claw in the velvet paw".

It's possible that the father was both a husband-cake and a father-cake, and that my friend had long since had ample opportunity to make him his first "guinea pig", and to get his claws (and velvet!) on him. But it's also possible that the propensity or predisposition in question in my friend remained unused until after his meeting with me, because the first designated target, namely his father, had yang aspects strongly enough marked to **"provoke"** this craving, and at the same time **give rise to** the tried-and-tested tactic of "making strong heads work". To tell the truth, none of the impressions I remember from the first years I knew my friend suggest that he was familiar with this game, or even that he had played it before. In any case, even with the benefit of hindsight, I can't detect any trace of it in his relationship with me, or with others, in his "spoiled brat" manner. So I'd be inclined to think that this propensity in him was still latent, and that it only developed and took the hold I know it has on his life and work, after my "death" in 1970 (when he was twenty-six), and thanks to a particularly tempting conjuncture.

The "third fact" to be recalled here is my friend's choice of a value system in line with generally accepted values, his choice of "virile" (or yang) values. Over the past fifteen years, these values seem to have increasingly turned to "superyang". In his case, there's an obvious contradiction in this choice: while adopting "official" **yang** values, he has nonetheless modeled himself, in most essential traits, after a **yin** model<sup>233</sup> (\*). And it's not just that that this choice of values is purely "bogus", that it's nothing but a false flag, flaunted for reasons of circumstance, and which would have course only in □the peripheral layers of the psyche. The image-force of p.

696

the dwarf and the giant, acting from deeper layers, would lose its meaning, and also the imperious urge to overthrow that it arouses, if the valorization of yang were not also internalized in these layers. There's no doubt that this contradiction must give added impetus to this "intimate conviction" of crackedness, of insidious powerlessness - when (for want, perhaps, of an adequate "model" in his childhood on which to model himself) he knows (in his innermost being) that he is fundamentally **different** from what he **"should be"**!

If my friend, as seems plausible to me, didn't find in his father the traits that, according to the current consensus around him, should **have** been there, and that he could then have made his own, this must have aroused in him

<sup>232</sup>(\*) The idea of a "double signature" is introduced with the note "Brothers and spouses - or the double signature", n° 134.

<sup>233</sup>(\*) This is a kind of contradiction common especially among women, and one from which my own life has been exempt.

a diffuse **resentment**, a resentment that couldn't cling to any concrete grievance against a father whose only fault was that he was too much of a "cakewalk"! This resentment, lacking a "hook" to hang on to, would then have remained "**vacant**", **waiting for** a suitable target - a target who, first of all, was (by context) a father figure, and moreover, whose **aptitude** for this role was obvious, through the undeniable presence, perhaps even excessive, of those traits that were lacking in his "original" father. It's these traits, too, that make the newcomer "father" the ideal **target**, in the kind of "game" that's already all set in motion here, waiting only for the right partner, aka "the spare father", aka (here we go at last!) "the Superfather"!

All of a sudden, I seem to be back on very familiar ground, which I only now recognize. It's a terrain in which I've been a prisoner for twenty years, during the only marriage of my life (the marriage from which three of my five children were born). In the lines of the preceding paragraph, and without any deliberate intention (but rather as one who, cautiously, groped in the shadows to become aware of his surroundings), I have **also** just described in turn the neuralgic forces in the relationship to her father, and then to me, **of the woman who was my wife**. I can't say when or how the knowledge (or rather, the irrefutable intuition) of the silent, obstinate presence of these two forces in her, and of their mutual relationship, came to me. One day I knew, without ever having given it a moment's thought, that the inexorable force dominating my wife's relationship with me, from the very first days of our marriage, was driven by resentment towards me for not having been there for her, like **another real** father, in the days of a distraught childhood... .

□ It's true and I know, certainly, that there was nothing "clueless" about my friend's childhood, and that the personality

p. 697

that he developed and that I've known, from the sixties until now, bears little resemblance to that of my ex-wife. Yet, beyond the obvious dissimilarities, I see in the part of the picture that is emerging from the shadows, a striking similarity with another "picture", which is well known to me. This similarity appears in the nature of the relationship with the father (linked to a temperament of the father where yang traits are deficient), and in the repercussion of this on a relationship of adulthood which, in both of them, dominated his life, as the focus of the forces of conflict in both<sup>234</sup> (\*).

For a moment, I was about to overlook a third "similarity", which is not without consequence in my own life: in both the relationships in question, the **protagonist** was **none other than myself**. And what, in both cases, designated me for the role of "Superpère" that I was called upon to play, was (in addition to immaturity) that which since my childhood had been dearer to me perhaps than anything else in the world - that in which I had also invested myself most inordinately: a "build" that was more virile than nature... .

So once again, in a different and more penetrating light than eight months ago, I find myself with the feeling of a "return of things"<sup>235</sup> (\*\*) - with, today as in the past, a nuance of incredulous astonishment (it seems too "right" to be true!). And also, this time again but in more restrained tones than the sudden burst of laughter of yesteryear, there's the perception of a comic, adding to these inexorable "returns" the gentler note of humor.

<sup>234</sup>(\*) (February 19, 1985) There is a striking kinship between my friend Pierre's relationship with me, and (since the early days of their marriage) that of my former wife. Moreover, this kinship extends beyond the relationship to my person alone, in the sense that both have developed a propensity to make certain beings, to whom bonds of affection bind me (my children in particular in one case, pupils in the other), **instruments** for reaching me through them.

<sup>235</sup>(\*\*) See the note "Le retour des choses - ou un pied dans le plat", n° 73.

### 18.2.11.2. (b) Innocence and conflict - or the stumbling block

**Note** 150 ( December 22) Yesterday again, I didn't find the time to work on my notes, except for the careful rereading and correction of the previous day's notes. Over the last few days, my energy has been diverted by tasks of □correspondence and the like, and I'm gnawing at the bit (this is nothing new!) of myself p. 698

to find myself face to face with myself, to push forward the reflection I had begun. The writing is decidedly slower in this third part of *Récoltes et Semailles*, centred on the present reflection, "The key to yin and yang", where the dynamics of yin and yang are the constant thread for penetrating further into the meaning of Burial. If I didn't take the precaution of setting the alarm clock, to allow for an interruption in the work after about three hours (just to stretch the body, or to warn me that the clock is ticking and it's time to stop), the whole night would pass like an instant! The three hours have gone by each time, and I feel as if I've barely started (or restarted), with two or three unfortunate pages I've just typed, if not just one or two, just long enough to get round to some seemingly innocuous association I thought I'd step over in the process... ..

There's an impression of extreme slowness in progress, counted in pages per hour or per day - and the natural reaction to this impression, with a hot substance right in front of my nose pulling me forward, would be to double and triple my efforts, as I used to do until just a few years ago. But I know that this is the trap to avoid - the trap of this extraordinary "ease" in the work of discovery<sup>236</sup> (\*), when it's enough just to "push" forward, to be sure of moving forward indeed, slowly perhaps but surely ; like a man holding the ploughshare of good, hardened steel, pulled by a pair of powerful, impassive oxen, and slowly and surely making his way, furrow after furrow, through dense, sometimes rough earth, yet at the same time supple and docile to the shiny ploughshare that delicately and unhurriedly opens it up, penetrates it and turns it over in wide, brown, steaming swathes, bringing intense, teeming subterranean life out into the open. The pace may be slow, but the field is vast, and each furrow dug seems to barely make a dent in the expanse that remains uncultivated. Yet at the end of the day, furrow after furrow, the field is ploughed, and the ploughman returns happy: for him, the day has not passed in vain. His toil and his love were his seed, and his joy at work, and his contentment at the end of each furrow and at the end of a long day, are his harvest and his reward.

\*       \*

\*

□With the reflection of the day before yesterday, and perhaps for the first time in the writing of *Harvest and Sowing*, p. 699

I feel as if I've stepped onto the uncertain terrain of that which is not yet directly perceived or felt, and which remains (and perhaps will remain) **hypothetical**. Lacking eyes that know how to see in what seems to me darkness and night, I groped my way along a hesitant path, with no assurance that it was "the right one". When the path forked, I didn't flip a coin to see which way I'd go; I relied on my intuition and common sense to point me in the most plausible direction to continue, though I had no idea where it would lead. The path I was following, or tracing out for myself, seemed to "stick" to the facts I knew, and that was a good sign. But it wasn't out of the question, especially where these facts were tenuous, that another, quite different path would not have "stuck" just as well, on condition perhaps that I delved a little deeper into this or that raw fact... . Then, at the bend in the road and to my own surprise, I found myself

---

<sup>236</sup>(\*) See note "The trap - or ease and exhaustion", n° 99.

suddenly found myself back on "very familiar ground", which I had long and painstakingly traversed, and which I had come to know and leave behind. A situation which, only moments before, had seemed obscure, shrouded in the uncertain mists of "without doubt" and "perhaps", was suddenly illuminated by the light of another situation which, for its part, was understood. As I wondered about the distant origins, in myself and in the other, of the conflict in the relationship between this friend and me, they seemed to be revealed by a deep similarity, suddenly glimpsed, between this relationship and another, which had weighed on my life with a completely different weight, for twenty long years.

The appearance of this similarity was so powerful, I confess, that this feeling of hesitation, uncertainty and trial and error vanished immediately, to be replaced by a feeling of assurance and conviction. When, at the end of the reflection, I speak of the feeling ("of incredulous astonishment") that it "fell too right to be true", this feeling was the response to another, in the background, which said that "it fell too right **not to be true**! And this feeling, surely hasty and unjustified in the present state of the facts at my disposal, has not been readjusted in the meantime; it is still present as a background note, whether I like it or not. Surely, without the help of certain experiences that I've come to understand and accept, and above all the long experience of my married life, the thought could hardly have occurred to me of this "vacant grudge" (of a grudge "on probation", in short); and this very thought was also the "detour in the road" that, in the space of a few moments, brought me once again onto the "very familiar ground" of my married experience.

p. 700 ☐ One could say, certainly, that an unconscious deliberate purpose will have brought me to a place already designated in advance,

which perhaps teaches something about me and this deliberate intention, and nothing about motivations in others. Just as it is possible that an assumed experience will have enabled me to apprehend a reality in others, which would otherwise have remained entirely enigmatic, for lack of my own sensitive "antennae" (and for lack of tangible facts concerning my friend's childhood, and the personalities of each of his parents).

It seems to me that I'm very close to completing my rough sketch (à bâtons rompus!) of the "foreground of the picture" (of the Burial.) To assemble the last pieces of the puzzle that remain in my hand, I'll use as necessary the elements of apprehension (however hypothetical they may be) that appeared in the reflection of the previous note. This will also be a way of testing their coherence with all the other facts known to me.

The day before yesterday's reflection, the "Superpère" piece of the puzzle clarified its shape and contours. I had first identified it, somewhat hastily, with the piece "The Dwarf and the Giant", where the giant nevertheless appears more as a kind of "Superman" in overwhelming format, and not as the "father", or a "Superpère". But this last piece ended up appearing again in the same reflection, this time as the target of a "resentment in abeyance", a resentment in search of a target, as if the aforementioned "Superpère" had been **called** by this very resentment and had appeared in response to this call, in fulfillment of a diffuse expectation. If that's the case, it's fair to say that if the Superpère (borrowing my build and features, which were apparently tailor-made for the occasion) hadn't appeared in my friend's life, he'd have had to be invented! That's what it's all about, with nothing more hypothetical for me, in the case of the woman whose husband I was - and whose target I was, moreover, "expected to be during a young life...".

Thus, the Superpère appears as the "face side" of that "faceless giant with oversized hands" from the play "Le nain et le géant". "The dwarf" must see him mostly from behind, the giant, no doubt doing his famous "demonstrations of strength" (referred to in the October 5 note "Le Superpère" (no.° 108)). So here we have the "Superpère" piece at last, fitting in with the "giant" side of the "Le nain et le géant" piece.

As for the "dwarf" aspect of this one, its outline has also been made clearer by the reflections of the day before yesterday, which join here those of the note of October 17 "La moitié et le tout - ou la fêlure" (n° 112). Again, as

so -often, the endless rejection of "yin", "feminine" traits, in favor of "yang", "masculine" traits'□ which makes p . 701 my friend finds himself "fundamentally different from what he '**should**' be", even though he has modeled himself on a predominantly "yin" model.

It's important to emphasize here that at no time in the past did I think, nor did I want to suggest, that my friend's person was marked by a predominantly yin **imbalance**, i.e. by a deficiency, a "void" on the side of the yang, virile traits in his acquired personality. Let me remind you that the main impression I got of him, at least during the first years I knew him, was that of a **balance**, a harmony, which made him so endearing to me and to all those, it seemed to me, who knew him at the time. This impression is very closely associated with another, which I've mentioned elsewhere<sup>237</sup> (\*) - that he seemed to have retained something of the freshness and innocence of a child, in his approach to things (mathematics in particular) and also, it seemed to me, to people. This balance, and this "freshness" or "innocence", are not subject to the slightest doubt in my mind - they're **facts**, and there's no question of trying to disguise them. They were expressed in my friend by a delicate sensitivity, and, when the occasion presented itself, by the nuanced and unambiguous expression of what was perceived and seen. There was a firmness, as there was a gentleness. The gentleness has faded over the years, leaving only the empty, muffled shell of a vanished gentleness - and the firmness has become closed and hard, behind a façade of precious, borrowed half-tones. A delicate yin-yang balance was transformed over the years (probably without anyone noticing) into the eternal yang imbalance - the same one, but in a different style, that had dominated my own life since childhood. That was his choice, and those choices can change - there's no such thing as a foregone conclusion! The fact remains that I've never known my friend to have gone through a period of yin imbalance, or to have been sluggish, careless or inconsistent, and I don't think he ever was.

All this makes it at least likely that the person who served as his childhood "role model", and who surely had strongly marked yin traits, was not lacking in yang traits to balance them out. If (as I'm inclined to believe) this person was his mother, then I presume she had fairly strong yang traits (in contrast to such traits, which are probably less pronounced in the father) to appear as□ "the best choice", as a "masculine" role model for a boy; and at the same time p . 702 time, to encourage the blossoming of a harmonious temperament.

At this point, all would seem to be well in the best of all possible worlds, in a close-knit family (perhaps) untroubled by any misunderstandings. All would be for the best, were it not for one tiny stumbling block, in the form of a mute and seemingly innocuous consensus: a boy is supposed to look like his father, not his mother...

### 18.2.11.3. (c) Providential circumstance - or Apotheosis

**Note** 151 (December 23) It seems to me that to finish assembling the "puzzle" of the foreground of the Burial painting, I only have to place one last piece. This is the one I called "la Su- permère", in the note "Supermaman ou Superpapa?" of November 11 (n° 125). This "Super" appellation had been inspired, first and foremost, by the "portrait" painted of me, with superlatives, in my Eloge Funèbre<sup>238</sup> (\*). A symmetrical reflex must also have been at play, since there's a

<sup>237</sup>(\*) On this subject, see the note "L'enfant" (n° 60), in Cortège V "Mon ami Pierre".

<sup>238</sup>(\*) See notes "L'Eloge Funèbre (1) (2)" (n° s 104,105), and "Les obsèques du yin (yang enterre yin (4))" (n° 124).

already had "Superpère" in the air, in more ways than one! On reflection, however, the name I gave to the image that had just appeared wasn't quite right. What was evoked by this superyin image had no maternal connotations whatsoever. If it was in symmetrical relation with another image, it was that of "Superman", with muscles of steel and an IBM software brain, rather than that of "Superfather". In this case, it would be "Superwoman" or "Supernana", with heavy tits up to her navel and beyond (not to say, up to her knees. . .), and asses to match, to make Hercules dream - as for the brain, let's not talk about it. ... a bit in those tones. The inadequacy of the language, too, must have forced my hand a little, given that there's no ready-made "female" counterpart to the famous "Superman" (itself a recent invention, incidentally, a modern version of a Hercules decidedly out of his depth). I'll go for "Supernana" anyway, for want of anything better. ...

It has to be said that I've been dragging this misnamed piece around for almost a month and a half, without really doing anything with it, other than recalling it here and there for memory's sake, as a promise that it would be taken care of,

□

p. 703

but later. In the end, she wasn't going to inspire me all that much, and it might well be because of that. name that didn't really fit. After all, of all the friends, (ex-)students and other colleagues I've had in the mathematical world up to the present day, I'd be hard-pressed to find a single one with whom I've played even the slightest bit of a "maternal" role, or for whom I've had the impression that they assigned such a role to me. Even those with whom I played a more "yin", receptive role, rather than the predominantly "yang" role of one who teaches, communicates and transmits, must be very rare - as far as I can see (after the years 1952, 53, when I did my thesis), only Serre, and even then. . . . If I try to remember what my current, not to say permanent, arrangements were in relation to other mathematicians, it was above all that I always had brand-new "carpets" to "place" (to use the image that was current in my time), not counting the "carpets" (also of my own making) that were less new but which (to my mind) hadn't really been used, so to speak. To put it another way, in my relationship with my fellow mathematicians, and even though we hardly ever talked about anything but maths (I must have been even worse at it than any of my colleagues and friends!), the yang predominance (or rather, the superyang imbalance) in my acquired temperament was back in full force, as in any other relationship. Perhaps even more so, given my inordinate investment in mathematics, an investment of an egotistical nature (needless to say) and motivated precisely by my long-standing superyang options!

It's these obvious aspects, manifested at every step in my relations with other mathematicians, that must have obliterated, to my colleagues as well as to myself, this **other** fact, in the opposite direction: that my style in mathematical work, and my approach to mathematics, are strongly predominantly **yin**, "feminine". It's this particularity, it seems to me, apparently rather exceptional in the scientific world, which also makes this style so **recognizable**, so **different** from that of any other mathematician. That this style is indeed "unlike any other" has come back to me through countless echoes, ever since I started publishing maths, and at least since my thesis work (in 1953). Moreover, this style has not failed to arouse resistance, which I'd like to call "visceral" - I mean, which didn't seem to me (nor do they seem to me today).

be justified by "reasons" that might be called "objective" or "rational". This reminds me that my thesis work (in which I introduced, among other things, nuclear□spaces), which I had submitted to *Memoirs of* the American Mathematical Society, had been rejected by the first referee, a well-known mathematician who had worked in the same field, and who had considered my work to be more or less muddy. It was thanks to Dieudonné's energetic intervention that my thesis was published, despite the unfavorable opinion.

p. 704

of the referred. I learned a few years ago that it is one of the hundred most cited articles in the mathematical literature<sup>239</sup> (\*) over the past two or three decades. I assume that if we have another twenty or thirty years of mathematics ahead of us, the same will apply to SGA 4, as (among other things) a basic reference for the topos point of view in geometrical topology; which SGA 4 has been classified as "unreadable" (among other qualifiers of the same water<sup>240</sup> (\*\*)) by my brilliant friend and ex-student Pierre Deligne. I know (as he knows himself) that this is one of the mathematical texts to which I have devoted the most time and the most extreme care, rewriting and having rewritten from top to bottom, in particular, everything concerning sites and topos and categorical "prerequisites". The reason for this exceptional care was that I felt that this was a real cornerstone for the development of "arithmetic geometry", the foundations of which I had been laying for decades<sup>241</sup> (\*\*\*). I also know that when I did this work, I had long had (without wishing to flatter myself) the master's touch for writing maths in a way that was both **clear**, where the main ideas were constantly put forward like an omnipresent thread, and **convenient to find** one's way around for reference purposes<sup>242</sup> (\*\*\*\*). While I may have been wrong to write (and have written) a detailed reference work forty or fifty years ahead of my time, the fact that times that were ripe (in the sixties) suddenly ceased to be so is not, it seems to me, my fault!

□ These latest associations with Deligne take me back to the period after my departure, when echoes in the same sense came back to me more than once "like puffs of insidious disdain and discreet derision". This nuance of **derision** was absent in the signs of "visceral resistance" to my working style, to which I alluded earlier, taking place before my departure. I don't detect any hostile or malicious intent towards me. I had occasion to evoke such signs even within Bourbaki<sup>243</sup> (\*), at least (if my memory is correct) until around 1957, when my work on the Riemann-Roch-Hirzebruch-Grothendieck formula dispelled any doubts that might have remained about my "solidity" as a mathematician. I don't recall perceiving any resistance to my style of work between 1957 and 1970 (the year of my "departure"), except occasionally at Serre<sup>244</sup> (\*\*), but never with a hint of enmity - it was more an epidermal reaction of annoyance. On the other hand, I had the impression that my friends sometimes felt overwhelmed, because I was moving too fast and they didn't want to spend their time just keeping up to date with my complete works as I sent them my paving stones, or told them (by letter or in person) what I was concocting.

I think I've understood the nature of the "visceral resistance" to my style I alluded to earlier. Its cause seems to me to be independent of the burial that took place later (where this resistance ended up playing an important role). This resistance is nothing other than a ("visceral") **reaction** to a "**feminine**" **style of approach** to a science (mathematics, in this case). Such a reaction is commonplace and "in the nature of things", in a scientific world which, as much and more than any other partial microcosm in today's society, is steeped in **virile values**, and feelings, attitudes, reactions (of apprehension, fear, fear, fear, fear, fear, fear, fear, fear, fear, fear, fear, fear, fear, fear!)

---

<sup>239</sup>(\*) perhaps my memory is failing me here, and these are the hundred (or twenty?) most cited articles in functional analysis.

<sup>240</sup>(\*\*) See "The clean slate", n° 67.

<sup>241</sup>(\*\*) which is surely another reason why Deligne is so keen to discredit this text, that he sometimes even forgets his preferred half-tone style, and doesn't mince his words when debunking it! On this subject, see "La table rase", already cited in the previous footnote.

<sup>242</sup>(\*\*\*\*) In 1965, when he had just arrived at my SGA 5 seminar, Deligne familiarized himself with the part of SGA 4 that had already been written on the net, and wrote some of the presentations himself (using my handwritten notes as a starting point). This same Deligne learned from me the art of writing a mathematical text, and in particular the art of clearly presenting a dense and complex substance.

<sup>243</sup>(\*) See note (unnamed) no. ° 5, in the first part of *Récoltes et Semailles*.

<sup>244</sup>(\*\*) On this subject, see the note "Brothers and spouses - or the double signature", n° 134.

and rejection) that go with these values. The reaction of resistance to my particular style of work, the embodiment of a creative approach with a "feminine" underpinning, simply stems from the common conditioning of the scientist in the world of today and of recent decades - the scientific world, at any rate, as I've always known it.

p. 706

Like any other reaction resulting from conditioning, there is nothing "rational" about it, and in the one where it manifests itself, there's considerable resistance to even thinking about examining its meaning. It's strongly felt to be **its own justification** - a bit like the aversion to "faggot" in most good-natured circles, or that to "metèque", which is also very local. And yet, in my case, I didn't sense in this reaction a hint of (conscious or unconscious) enmity towards me, but rather an attitude of **reserve**, of unfavorable prejudice, **towards my work alone**. Only when it became clear that I was doing things with my style (or in spite of my style, never mind!) that people hadn't been able to do before (and that they couldn't really do anything else either, after the fact) - only then were these reservations relinquished, as if with regret perhaps... . In any case, if in some people these reserves remained in tacit, unconscious form, I was too locked up in my work and my tasks to perceive them.

To tell the truth, it seems unlikely to me that such a "visceral reaction" could magically disappear, simply because Mr. so-and-so has demonstrated theorems that we hadn't been able to demonstrate before. At the level at which deliberate statements of acceptance and rejection are made and unmade, one thing and the other ("such and such a way of working should not be allowed", and "Mr. so-and-so has demonstrated such and such theorems") are really unrelated!

You might say that it's only natural that things changed after I withdrew from the mathematical scene - once I was no longer there, in short, to "cut a rug" for those who would pretend to be picky about my style, but couldn't do the same with their own. This "explanation" is flawed, however, because it doesn't take into account the nuance of derision, of hushed malice, which didn't exist before. Nor is there anything in what I know of that would lead me to suppose that between 1957 and 1970 I had the time to make myself so disagreeable to the entire congregation of my fellow members that a grudge or revenge motive might have come into play after my departure. With many friends in the world I was leaving, I had maintained warm, sometimes affectionate relations, and (as I have said elsewhere) I cannot recall a single relationship of enmity with a fellow mathematician from before 1970.

p. 707

There was, however, a **subsequent** grievance against me on the part of the Congregation, the cause of a kind of collective "rancor", and in any case, a collective act of "reprisal", which, though it remained unspoken, was nonetheless

of "unfailing efficiency". I probed this "reprisals for dissent" aspect in the May 24 note, "The Gravedigger - or the whole Congregation" (n° 97). In this note, I left out a certain tone in these reprisals, with regard to myself and those who had the imprudence to claim to be me.

the tone of derision, which goes beyond the simple "end of refusal". And every time I felt this "puff", **it was a certain style that was the designated target**. To put it another way, it's the particularity that distinguishes this style from any other, its "yin" or "feminine" nature, that has been the providential circumstance, eagerly seized upon by the collective unconscious to wash away the affront of dissent, adding to the reprisal of **exclusion** the extra dimension of **derision** - derision that is supposed to designate, through a certain style, the irrefutable signs of **impotence**.

And now that the word "impotence" has finally named a certain unspoken fact, it becomes apparent how this same "providential circumstance", added to that of my "death", becomes the opportunity to

for my friend and ex-student and ex-heir Pierre Deligne, to make **this** role **reversal** tangible, credible and **raw**, this insane and seemingly hopeless desire of the man who feels like a "**dwarf**" in front of a "**giant**"! "Perched on the shoulders of a giant" (to use the very words that appear as the final word in his curriculum vitae<sup>245</sup> (\*)), from now on he will be the "giant" for all to see, and he will point out to the derision of the entire Congregation, like a "dwarf", a great braggart and a great vacuum-breaker, this giant of pure junk - but yes! - and yet he had been (and remains in spite of everything... ) "a perpetual and burning challenge for those who feel overwhelmed by the irremediable condition of a dwarf... .".

This spectacular reversal in the distribution of the roles "dwarf" and "giant", between himself and the Other (the One who is felt to be a **challenge**, and who must be supplanted at all costs) this reversal is also at the same time **the reversal in the roles "feminine" and "masculine"**. It is indeed as an incarnation (pletho- of the **feminine** (never clearly named and yet ardently repudiated), than that of the feminine (never clearly named and yet ardently repudiated), than that of the feminine (never clearly named and yet ardently repudiated).

who was (and remains despite everything. . . ) a giant, is designated to the □foule (and above all to the Prestidigitateur himself. . . ) p. 708

as a pitiful dwarf and an object of derision; and it's also as a heroic and exemplary embodiment of **virility** that the one who was a dwarf (and who, despite everything and deep down, "knows" that he is and remains one, by immutable condition. . . ) finds himself a giant with hands of steel, acclaimed by the same crowd that has come out to boo the Other.

This reversal, however symbolic it may be, is visibly out of all proportion to the "private" reversal operated by virtue of a tried-and-tested tactic (known as the "velvet paw") in the restricted and inconsequential circle of "between four eyes"; a gentle little merry-go-round where he feels he holds the strings that "make the Other walk" and turn... . The dwarf making the giant walk, all right, but still and irremediably a dwarf! Whereas the apotheosis of the dwarf who finds himself giant and even higher perched, and who designates to the derision of all the very one on whom he is perched - this apotheosis takes place in the middle of a public square, before a large and jubilant crowd, who have come to acclaim the Eulogy of a deceased and buried "dwarf", as the "highlight" of a superb and delectable Funeral Ceremony.

#### 18.2.11.4. (d) Disavowal (1) - or reminder

**Note** 152 (December 24) With yesterday's reflection, I feel I've just about finished "assembling" this first plan of the Burial picture, at least as well as I feel able to do so with the "pieces" of the puzzle I now have. It goes without saying that in this second part of my reflection on the Burial (the third part of Récoltes et Semailles), my aim has been, no longer to gather material facts (I have gathered enough of these in the "investigation" part, in Cortèges I to X), but to arrive at an understanding of the **inner workings** of the Burial, through the secret **motivations** (most often unconscious, no doubt) in each of the many protagonists<sup>246</sup> (\*). These motivations derive, first and foremost, from the nature of the interested party's relationship with my modest person (as the "deceased"); or, more precisely perhaps, with what I represent for him/her for one reason or another, linked or not to my departure from the mathematical scene and the circumstances surrounding it.

□The "foreground" consists, apart from myself, in the one of all who played at my funeral the role of the "priest in chasuble", or of the "Grand Officiant aux Obsèques". He is also, among those who were friends or students in the mathematical world before my departure, the one with whom I was most closely linked,

p. 709

<sup>245</sup>(\*) On this subject, see the last footnote in "The nerve within the nerve - or the dwarf and the giant", n° 148.

<sup>246</sup>(\*) (December 31) This "statement", taken literally and given the number of its "many protagonists" (and would there be

only ten!), would of course be entirely out of reach. Apart from my friend Pierre, the best I can do is to get a general idea, by identifying "motivations" and "intentions" as best I can in a "collective unconscious", which at best only approximates those of a particular "protagonist".

by mathematical affinities of exceptional strength; and the only one, too, who continued a personal relationship with me after I left, a relationship that continues to this day. For all these reasons, I have a wealth of "data" about him that is unmatched by anything else known to me among the participants in the funeral. Finally, of all the mathematicians I've known<sup>247</sup> (\*), he is undoubtedly also the one, by far, whose role in his life he assigned to me weighed the heaviest - much heavier, visibly, than that commonly assigned to his teacher, even in the practice of an art to which one would have devoted oneself body and soul (as I myself had devoted myself to it). I've come to realize this over the last ten years or so, and that the role he assigned me also spilled over into his mathematical passion (and into what ended up taking its place). This perception in me, which had remained diffuse for all those years, became considerably clearer and fleshed out in the course of my reflection on L'Enterrement, and right up to yesterday.

It seems to me that with yesterday's reflection, along with this first plane of the picture centered on the relationship between my friend Pierre and myself, the "third plane" has finally been put in place and assembled, consisting of "the whole Congregation", rushing in jubilant to participate in the Funeral and Burial with their eager acquiescence. As I wrote yesterday, what was still missing from the image that had emerged in the course of the reflection of the note (of May 24) "The Gravedigger - or the whole Congregation", was the nuance of **derision** put into the exclusion of the one treated as deceased and as a "stranger", an "outsider". The meaning of this derision, made clear as early as the note (November 10) "Les obsèques du yin (yang enterre yin (4))", was recalled and put into perspective yesterday: it's derision of what is felt (on an informal level) to be "feminine", and which is therefore the object of a "visceral" reaction of rejection, by equating (equally informal) the "feminine" with "impotence" - man alone, in his triumphant virility, being supposed to be the bearer of "power", of creative force. I've also emphasized the entirely refractory nature of the "feminine".

We can't deny common sense and reason to such visceral assimilations, the result of conditioning, when the ideas and images it arouses are felt with such force of conviction and evidence, that they're as their own justification.

p. 710

There is one aspect, however, which appeared in a sudden flash with the final word in the note "Les obsèques du yin", which has not yet been taken up. Here are the lines that end the reflection in that note:

"These are no longer the funerals of a person, nor those of a work, nor even those of an inadmissible dissidence, but the funerals of the 'mathematical feminine' - and even more profoundly, perhaps, in each of the many participants applauding the Funeral Eulogy, **the funerals of the disowned woman who lives within himself.**"

It even seems to me, now that I think about it, that this aspect was more or less overlooked in the case of my friend Pierre himself, about whom I have no shortage of first-hand facts! If this aspect was even remotely present, and perhaps felt by an attentive reader, it must have been between the lines rather, when attention was mostly absorbed by the various angles of the "reversal of yin and yang" aspect - (an aspect which, at first glance at least, seems specific to the person and particular role of my friend in the Burial). This omission reminds me that I'll have to talk again (in a few days 2) about my friend's last visit, from October 10 to 22 (reported in the note of October 21, with a promise to come back to it "in a few days". . . ). This will be the most propitious moment, it seems to me, to examine one last (?) angle of the "reversal" - with the reversal of the original yin-yang balance **in the very person of** my friend. This is yet another **burial** of certain original yin traits in him, under the iron rule of yang traits that appeared later and took possession of the place. I find myself here, in a new and more

<sup>247</sup>(\*) And even among all the people I've known, with only two exceptions.

deep, in the face of this startling realization that had already occurred to me more than once<sup>248</sup> (\*): that in believing he was burying the man who had been his master (and who still remained a friend), it was none other than **himself** that he was actually burying with his own hands!

So if I return once again to the "third plane" or "background plane", to this "Congregation" alias "mathematical community", the few lines quoted earlier would suggest that what I felt so strongly in the case of my friend Pierre, could well also be true for "each of the many participants applauding the Funeral Eulogy". It is this aspect, it seems to me, that I still need to examine somewhat, p. 711 before I felt fully satisfied and (provisionally?) considered the "background shot" (as well as the foreground) of the painting of my funeral to be complete.

(December 25) Yesterday, on the pretext that it was Christmas Eve, I treated myself to a real "high", staying on top of my notes until just after 3 a.m. (for once!). It's true that the whole day had been scattered with other tasks, and (having reread the previous day's notes) there were only a few hours of the night left, if I wanted to continue the same day. As is often the case, in the end I didn't even manage to tackle anything I had in mind when I sat down in front of the white paper! Instead, I took stock of where I was in the "picture" of the Burial, and highlighted an aspect, in both the "foreground" and the "background", that was still unclear: that of the "**burial of the disowned woman**" who lives in each of the participants in my funeral.

Clearly, in this quotation, the expression "burial" is used as an image to designate an act of **disavowal** and **repression** (or "repression", to use a received terminology). In order to disavow and repress something (in this case, something that "lives" within oneself), one must first make sure that this "something" is indeed present, "alive" (even if miserably). We're talking here about the "woman" in every being, whether male or female, i.e. the "side" of the person that is made up of traits, qualities, impulses or forces of a "feminine" or "yin" nature. This simple, essential fact - that in every being, woman or man, lives **both** "the woman" **and** "the man" - is an extraordinary fact that is still generally ignored today. I myself only learned it eight years ago, when I was in my forty-seventh year<sup>249</sup> (\*).

Of course, "psychoanalysts" have "known" about it and talked about it for a long time now. There are certainly plenty of books about it, and everyone has heard a little about it, just as I had. In fact, "everyone" is quite willing to admit that there must be some truth to it, as long as it's people with recognized expertise who say so, and there are books written about it, and everything. Yet to have heard of it and be "all ready to admit... ", and even having read a book or even p. 712 ten on this subject, or even (I'd venture to say) to have written one, or even several, does not in itself imply that you "know" the thing; at least, not in a stronger and, above all, less useless sense, than that of a simple memorization of ready-made formulas, like "Freud (or Jung, or Lao-tzu. . . ) said that. . . ". Such formulas constitute a certain cultural baggage, a kind of calling card for a "cultured" person, "in the know" about this or that, or even sometimes (with diplomas to match) an expert in this or that, and as such they can even be admitted to have a certain "usefulness"; what's certain is that everyone is very attached to it, to the baggage they've accumulated left and right, at school and in books, in "interesting conversations" etc., and which they carry around with them, and which they carry with them through thick and thin, like a bulky, flashy trophy, for the rest of their lives. When I irreverently implied earlier that this precious baggage was "useless", I meant: useless for something that, in any case, nobody

---

<sup>248</sup>(\*) This "observation" appears for the first time in the reflection in the note "L'Enterrement" (n° 61).

<sup>249</sup>(\*) On this subject, see the note "Acceptance (the awakening of yin (2))", n° 110.

and is even shunned like the plague by everyone, namely, learning about oneself. Or to put it another way: that this baggage is useless if you want to **take charge of your life**, that is, if you want to digest and assimilate the substance of your own experience, and thereby mature and renew yourself... .

If I were to sum up in a few words the essential content of my long reflection on yin and yang, it would be by "recalling" this "simple and essential fact", which I have just recalled. If there's a reader who's followed me this far, and if he hasn't yet sensed, in terms of his own experience, this fact : that there is "woman" in him, even though he is a man, and that there is "man" in him, even though he is a woman - it's because, in making this vain effort to "follow" me, he would have wasted his time overloading a baggage, no doubt already heavy, with yet another weight, labelled "Harvest and Sowing". And if he were a man, and even if he weren't one of the participants in this funeral, of which he would have had no knowledge or suspicion before reading me, it's a safe bet that he too, day after day and without his own knowledge, "buries a disowned woman who lives inside himself" (just as I myself had done in the past and for most of my life).

p. 713 There are a thousand and one ways for a man to "bury" the woman who lives inside him, as also for a woman to "bury" the man who lives inside her<sup>250</sup> (\*), that is-□à-directly : to disown and repress him. One of the most

The most common way of "burying" something that is alive in oneself is through attitudes or acts of rejection of that same thing, when it is apparent in others. This rejection is none other than the "visceral reaction" I mentioned yesterday in a case in point. What gives the reaction of rejection its strength ("visceral") is **not** really (as I seemed to imply yesterday) because the thing rejected in another person simply goes against a set of "values" that would have our full and undivided support. Those who know themselves to be "strong" are not offended by the sight of "weakness". On the contrary, the strength of the reaction comes from the fact that this thing, observed in others and "out of place", **calls us into question ourselves**. It's like an insidious **reminder**, immediately rejected, of something concerning us, which deep down **we know**, even though we'd like to hide it from ourselves and from others; a reminder which then takes on the tones of a silent and fearsome challenge. In such a context, a benevolent attitude of tolerance towards the apparent "flaw" in others would appear to us as a perilous admission of connivance, to be avoided at all costs. On the other hand, by rejecting them, we unequivocally disassociate ourselves from the other person, in short, we give convincing proof (first and foremost, to the inner Censor within ourselves) that we ourselves are free of reproach, that we are and remain conformist and "good-natured". At the same time as **an act of unconditional obedience** to certain value **norms**, distinguishing what is honorable from what is inadmissible, the reaction of rejection is at the same time a **symbolic act of burial**, whereby the thing in ourselves "that doesn't belong" is eagerly "classified" as something that **"isn't"**. **Not in us, anyway!**

In this picture, the infinitely variable form that rejection takes seems to me to be of no consequence. It can be outraged rejection, with all the signs of indignation or disgust, or it can be rejection through irony or "delicately dosed" disdain. It can be expressed in clear, unequivocal words, or it can be merely suggested, with allusive or double-entendre words, or even without words, with the right smile (or lack of smile. . . ), placed where it's most appropriate. Rejection can be fully conscious, or it can be confined to the penumbra of what is barely visible to the eye, or take refuge in the complete shadow where the eye never penetrates.

p. 714 The intensity of the rejection reaction, too, is infinitely variable'□ depending on whether the "questioning" in question

<sup>250</sup>(\*) The same goes for a man who "buries the man living inside him", or for a woman who "buries the woman living inside her", attitudes that are far from as rare as one might think.

is felt to be relatively harmless, or indeed frightening. The ones that provoke perhaps the strongest reactions are those that directly concern **sex**. This extreme susceptibility has diminished somewhat over the last few generations. I have noticed, however, that things as universal in nature as the so-called "homosexual" and "onanistic" (or, to put it more kindly, "narcissistic") aspects of the amorous impulse are as strongly rejected today as they were in the past. This is the case, at least, if one is confronted with it, not in an "interesting conversation" about Roman mores or depth psychology, but in everyday life. Even between the eyes, it's rare for us to talk about the manifestations, in our own person, of these aspects of the sex drive (generally experienced as rather embarrassing "burrs", to say the least).

In the case in point, the rejection I experienced before I left the mathematical scene was certainly not as strong as the one I've just described. It's true that the object of this rejection, namely, "feminine" ways of being and doing things when we're supposed to be "among men", does have a "sexual" connotation, in a broader sense of the term than that linked to the mere evocation of actions and gestures revolving around "the buttocks" and the rest. I have no doubt that this connotation was generally felt, at an unconscious level<sup>251</sup> (\*). It was, however, discreet and indirect enough to exclude any brutal reactions, going beyond a simple "reserve" with regard to my "seriousness", my "solidity" as a mathematician. What's more, the fact that my "cross" was a purely intellectual activity made it seem relatively harmless, far removed (what would you expect? . . .) from any disturbing, scabrous association of a man-woman belly-dancing up her skirt! Nevertheless, after my first contacts with the mathematical world (in 1948), it took almost another ten years for the reservations my style aroused, even within a benevolent microcosm, to finally disappear - from my sight, at least. The situation changed again after my departure, however, as an atmosphere of benevolence, friendship and respect for me was suddenly altered (without my realizing it for the next six years) by what was felt by this same microcosm to be "dissidence", and disavowal.

\*       \*

\*

□ I'm not sure, to tell the truth, if this change of mood was really as "sudden" as I've just to say. Or to put it another way, I don't have enough facts to give me any idea of **how the** change I was suddenly confronted with after I left in 1970, in 1976<sup>252</sup> (\*). It's true that all that time I'd had little contact with the world I'd left, which might have given me a sense of its "temperature" and evolution. What is clear to me is that in this evolution, the attitude of the group of all those who had been my students, and of their uncontested leader Pierre Deligne, played a decisive role. The Burial could only have taken place, and the atmosphere that gave rise to it, thanks to a "unanimous agreement"<sup>253</sup> (\*\*) and without fail, encompassing the "three planes" of this Burial: "L'héritier" (aka Grand Officiant aux

p. 715

<sup>251</sup>(\*) On this subject, see the note "Les obsèques du yin (yang enterre yin (4))", n° 124.

<sup>252</sup>(\*) It was, I recall, during my unsuccessful efforts to get Yves Ladegaillerie's thesis published. This episode is mentioned in the two notes "On n'arrête pas le Progrès" and "Cercueil 2 - ou les découpes tronçonnées", n°s 50, 94.

<sup>253</sup>(\*\*) For the first appearance in our reflections of this observation of "unanimous agreement", see the note of the same name (capitalized!), n° 74.

Obsèques), the group of "cohéritiers" or "proches", formed by the eleven other "élèves d'avant", and finally "la Congrégation" (perhaps not "toute entière" - we'll have to come back to that. . . ). How this perfect harmony came about remains unknown to me, and perhaps will remain so. At present, I don't feel prompted to probe it, and I doubt that anyone else will do it for me (quite the contrary!).

This reminds me that, when writing the previous note "The providential circumstance - or the apotheosis", the question had occurred to me as to **which** of the two, "The Congregation" or "the priest in the chasuble", ultimately represented **the** master force at work in the Burial, of which the other would have been the "instrument", as it were<sup>254</sup> (\*\*\*)). I didn't dwell on it then, not being sure even if the question made sense - it had

p. 716 It's a bit like the famous chicken-and-egg question! What is certain is that neither of them (the "priest", nor the "Congregation") could do without the other's help in implementing the Funeral.

Another question, however, which seems to me to have a clearer meaning, is which of the two was more heavily involved in this work. It's true that "the Congregation" is not a person, and it's improper to speak of "his" investment in a task. But it's also true that for me, this personified entity takes on a concrete form, through ten or twenty **people** I've known well, with each of whom, for a decade or two or more, I've been in close, friendly relations. So when I speak of the "investment" of the Congregation, I'm thinking in concrete terms of the "sum" of the investments of all those former friends who were involved in my funeral. Thus clarified, it seems to me that the question is no longer rhetorical.

The answer that comes to me, without a hint of hesitation or doubt, is that there is **no common ground** between the investment of the "heir" and that of the Congregation - any more, in fact, than there is in an ordinary funeral. This is all the more true when the inheritance is important to the heir (while no-one in the Congregation has anything to gain for himself), and when the ties (of attraction or conflict) that bind him to the deceased are strong and play a vital role in his life. If there is any doubt in such a situation, it can only stem from the presence of "co-heirs" among those close to the deceased. (We're talking here about the "second plan", rather than the "background" formed by the bulk of the Congregation). In my case, the only one of these "close relations" and co-heirs whose part in my funeral could be of comparable weight to that taken by the principal heir Pierre Deligne, seems to me to be Jean-Louis Verdier, playing the role of Second Officiant aux Obsèques. This appellation is not gratuitous, as on more than one occasion during the funeral, I saw both of them officiate in perfect harmony! But as I've already written elsewhere, apart from some of J.L. Verdier's public acts, I know very little about him since we lost touch; too little, no doubt, to be able to form even the slightest idea of the ins and outs of his relationship with me, or with his prestigious "protector" and friend.

p. 717 **Note 153** (December 26) In yesterday's reflection, I tried to clarify this intuition, which appeared "in flash" on November 10, that in "each of the many <sup>participants</sup>" at my funeral, it represented the burial-the "disowned woman who lives within himself". When I have spoken and spoken again here of "each" of the participants, it's a rather exaggerated expression, which it's perhaps best not to take entirely literally. At the very least, I'm convinced that this intuition is right for everyone.

<sup>254</sup>(\*\*\*) I recall that in the May reflection, in the note "Le Fossoyeur - ou la Congrégation toute entière", I had realized that my friend had been an **"instrument"** of a **collective will** of flawless coherence". The lines that follow do not really contradict this intuition, but rather complement it, leaving open the possibility of a certain symmetry in the relationship between the "Congregation" and "the priest in the chasuble".

of those (and I'm sure there are many) in whom this "visceral reaction of rejection" to my particular style of mathematics has taken place, a reaction that has been the focus of my attention over the past three days.

On the other hand, it's clear that such a reaction is **not** present in my friend Pierre, or at least, that there was no trace of it, quite the contrary, in the five years preceding my departure. It was the deep **kinship** between my style of approach to mathematics and his own that gave rise to such perfect communication during those years, and was also the cause of that uncommon affinity between us mathematically, an affinity that he and many others must have felt, as I myself did. It was this kinship, too, that was surely the cause of the **fascination** that my mathematician persona and my work exerted on him, not only in those years (when it was expressed "positively"), but also in the years that followed and right up to the present day (when it has been expressed mostly "negatively", but just as eloquently<sup>255</sup> (\*)). I have no doubt that if there had been in him the slightest reservation, the slightest unease about my style of working and approach to mathematical things, in those early years, I wouldn't have failed to sense it.

It's true that from those years onwards, my friend did his utmost to erase from the outside world the role I had played for him, if only as the person who had taught and passed on something important to him, and from whom he had drawn important ideas for his work - and a fortiori, to erase this relationship of affinity, even fascination. After my departure, there was a gradual escalation in the disavowal of my person, not only through silence, but also through the affectation of disdain towards my style of working, and vis-à-vis many of the ideas and notions I had introduced. The first trace of such an affection that is  $\square$  connue to me was in 1977, on the occasion of "operation SGA 4"<sup>1256</sup> (\*). p. 718 I haven't tried to follow the progression of this climb step by step, and I don't feel inspired to do so (as I said yesterday, on a related matter).

This disavowal of a style of approach closely related to his own, and of a body of work from which his own emerged, is akin to a **disavowal of himself**. When I first thought about this disavowal of my style and my work (while I'm still mostly under the impression of the five years of close mathematical contact before I left in 1970), I was inclined to play it down, to give it only a kind of **tactical** significance, as a particularly tempting **means** of supplanting and satisfying antagonistic impulses, by seizing the windfall of a certain "providential circumstance". This is indeed the tone of the note from il three days ago, "La circonstance providentielle - ou l'apothéose" (N° 151). And what I just remembered, Knowing that in the years before my departure there was no trace of rejection of her own style or of mine, also points in this direction, and not in the direction of the situation examined yesterday: that of a disavowal of "the woman who lives within oneself" (if only, among other things, through a certain approach to mathematics), a disavowal that would have **pre-existed the implementation of L'Enterrement**.

This does not prevent the person who chooses such means from **paying for them**, whether he likes it or not. To be operational, this "affectation of disdain" for a certain style had to be played out, not only in relation to others, but also and above all, **in relation to oneself**. But one cannot disavow, before others and oneself, a "style" that is also profoundly one's own, **while practicing it** as if nothing had happened. This "tactical disavowal" of others, by the logic of things, involves a disavowal, a **repression of** a part of oneself - in this case, by the repression of the style of approach to mathematics that is one's own, by virtue of one's "own" culture.

<sup>255</sup>(\*) Or at least, this fascination must have been, at the outset, the force in the "positive sense" (that **of identification** with the one who is felt to be similar) among the two forces at play in the establishment of this ambiguous, conflicting relationship of identification with my person.

<sup>256</sup>(\*) On this subject, see "Two turning points" and "The clean slate", n°s 66, 67.

nature of the creative force within him.

p. 719 This observation is not the result of a direct perception of a fact. It is the result of a short reflection, making use of known facts and drawing common-sense "conclusions" from them. I've learned to be careful with such conclusions (and especially, outside mathematics!), and not to rely on them. only if they are confirmed after the fact by other facts. But I remember here, very opportunely, that I had been led, in terms of what is known to me of Deligne's work, to note that there is no trace in this work of certain inclinations (of a "yin" nature) in my friend, which were nonetheless quite apparent in the years before my departure, and which I also recognized in myself. I wrote about this in some detail in my notes of a month ago (November 26 and 28) "Yin the Servant and the new masters", and "Yin the Servant (2) - or generosity"<sup>257</sup> (\*). Perhaps the most important of these things is a certain humility, which allows us to see (and describe, without fear of looking foolish) simple, silly things to which no one has ever deigned to pay attention. The best things I've brought to mathematics myself<sup>258</sup> (\*\*) are just such things. Most of my work, and that of my most brilliant pupil, would never have been written if I had disavowed this inclination of my nature, which was not to everyone's liking. ... This propensity (or "inclination") is intimately linked to another, without which its effect would remain extremely limited. It's an attitude of humility again, and of "service": when it's a question of getting to know and describing with delicacy and under all its facets this new thing scorned by all, of not finding one's time too precious to devote ten pages to it if necessary (instead of being content with two lines: here's the thing - you can do what you like with it!), or even ten thousand; to spend a whole day on it (for a man who has plenty of other things to worry about. . . ), or a whole life, if need be.

When I spoke of "new worlds" to be discovered, in a somewhat haughty tone perhaps, I was talking about nothing other than **this**: seeing and receiving what seems infinitesimal, and carrying and nurturing it for nine months or nine years, the time it takes, in solitude if need be, to see a vigorous, living thing develop and blossom, made itself to engender and conceive.

If this propensity, which could be called "maternal", is today the object of derision, it is to the "benefit" of attitudes felt to be "virile", which tolerate only one possible type of approach to mathematics: that of "muscle", to the exclusion of "guts". Real math", also known as "hard math".

p. 720 (or "**hard** maths"), as opposed to the (unappetizing) "**soft** maths", □c'est les démonstrations en dix ou cinquante pages serrées, de théorèmes-au-concours (of proverbial difficulty, or it's no game at all!), making use of all the "well-known" theories, notions and facts available on the left and right. As for the "wood", it's just there, that's what it's there for! And as for those who have patiently cleared the land\*, who have sown, planted, smoked and pruned throughout the seasons and over the years, to make these spacious, slender-trunked forests grow and spread out, so much in their place (where the bush was thick and impenetrable) that you'd think they'd been there since the creation of the world (as a backdrop, no doubt, and as a reserve of "all wood" . ...) - these people, who are only good for producing fluffy articles (or even fluffy books or series of fluffy books, if they find publishers foolish enough to print them), and unreadable to boot, are "soft math" retards, not to say "flabby" - but no matter how virile we may be, we're no less polite...

With this beautiful flight of fancy, I suddenly feel like I'm back at the starting point of this long meditation on the

<sup>257</sup>(\*) These are notes n° s 135, 136. The sub-note to the second cited note (n° 136 ) should also be added.

<sup>258</sup>(\*\*) See sub-note no. ° 136 cited in the previous footnote.

yin and yang - to the very first note of early October, "Le muscle et la tripe (yang enterre yin (1))" (n° 106). It's the same burial again, at parade pace and to the sound of a bugle, of what is "feminine", buried by the male disdain of Bras-de-Fer aka Cerveau d' Acier aka Superman. This burial doesn't just take place in the small mathematical microcosm, that's for sure, and its scope goes beyond any specific case, which can however be used to smell it a little closer. And that smell is one of the main lessons I've learned from Burial, in which I appear to be dead before my time.

When I narrow the focus of my attention even further, to focus on the particular role played by my friend Pierre, I see in Burial yet another meaning. Once again, I see a **reversal**. As I said yesterday, without thinking I'd come back to it so soon, it's no longer a reversal in a **relationship** (real or fictitious) that links him to another, but a reversal that takes place **in his very person**. He is not sought after for his own merits (as the object, perhaps, of a "foolish desire". . . ), and he is no longer limited to being purely symbolic (while, at the end of a magnificent sleight of hand, the one who felt "dwarfed" does not cease to feel just as dwarfed, as if he hadn't just been "dwarfed").

convinced himself that he had become a "giant". . . ). It's a reversal, I wouldn't say irreversible, but at least perfectly **real**. It starts from a state of harmonious balance of creative□ "feminine" and "masculine" impulses, p . 721 with a predominantly feminine note. The result is a state of war and repression, where **attitudes** and **poses** (egotistical, like all attitudes and poses), flying the "virile" flag, obstinately repress the **creative force**, derided and symbolically "buried", in the form of a grotesque, flabby effigy, with the features of the "Superfemale".

In less nuanced terms, but more vivid and striking perhaps: a "**feminine**" being, slender and vigorous, supple and **alive**, has been metamorphosed, by a permanent trick of prestidigitation, into a "**virile**" being, indomitable- sand, stiff and **dead**.

#### 18.2.11.5. (f) Staging - or "the second nature

**Note** 154 (January 1, 1985) Five days have passed, taken up by various occupations. The end of the year was the perfect opportunity to write letters that had been outstanding for weeks or months, not to mention a few cards of good wishes, in response to those received around Christmas. We also had to build compost heaps with manure that had already been brought in two or three months ago, and plant waste from the garden and the landfill, or brought in from the municipal dump, to have good compost ready for the garden in early spring. As the site is on a slope, an additional terrace had to be built next to the one already provided for the "day-to-day" composting of household waste.

With all this going on, I've hardly found time to work on my notes, except for housekeeping work. I have reread with great care, still making a few alterations here and there, the entire reflection since the "Masters and Servants" section (i.e. since the November 24 note "The reversal (3) - or yin buries yang").

(n° 133)), adding the footnotes already provided for the last fortnight's notes. He The main aim was to have a manuscript ready for typing, but quite apart from any practical issues, this re-reading was useful in regaining an overview of the thinking that had taken place over the past four or five weeks. As is also the case in long-term mathematical reflection, while the particular "moment" of reflection in which I find myself on a day-to-day basis is placed under the strongly focused beam of intense attention, the "thread" of reflection and the sinuous line it has followed in the weeks, or even in the years, that have passed since I first wrote this book, is still visible.

the months gone by, tends to get lost along the way, to drown and dissolve in the vagueness of a penumbra. I cannot say whether this is a general fact in any long □term research work, or whether it is related p . 722 to this systematic mechanism of "burying the past" in my life, to which I've already had occasion to refer.

allusion<sup>259</sup> (\*). In any case, as the days and weeks, even months, of long reflection go by, I lose touch with the earlier stages of my work, resulting in a growing sense of unease. This discomfort is eventually resolved by a more or less thorough retrospection of the work that has just been done, which re-establishes the contact that had gradually been loosened. I've found that these retrospective "halts" play an important role in my work. Each time, I leave with a fresh wind in my sails, relieved of the "malaise" that had signalled a gradual loss of an overall perception of **continuity in the time of** the work I'm pursuing. In my mathematical work, it's not uncommon, not to say the rule, for such a step backwards to lead me to rethink the work already done from top to bottom, and to see in a new perspective both the work done and the work still to be done<sup>260</sup> (\*\*). But whether it's a mathematical task or a meditation on my life, the "malaise" I'm talking about is always the sign of a still imperfect understanding, not only (and for good reason) of the work still to be done, but also of what has been done in the course of the work that has already been done. This imperfection is by no means reduced to a faulty memorization of each of the various stages of reflection, and of their chronological order (aspects that are relatively incidental in the case of mathematical reflection, where the object of attention is a mathematical situation, itself foreign to the psychic particularities of the person examining it, and to the events of that examination). It seems to me to be more a sign of a lack of **unity**, of insufficient **integration** of all the partial understandings that have emerged as a result of the mathematical process.

p. 723 successive stages of reflection. These partial understandings also remain imperfect, even hypothetical, as long as they are not integrated into an overall vision□, where they become clearer. mutually. To use the image of a **jigsaw puzzle** again, investigating an unknown substance is akin to putting together a jigsaw puzzle whose pieces are not given in advance, but have to be discovered in the course of the work. What's more, each piece uncovered appears at first only in a vague and approximate form, even grossly distorted in relation to the "correct", as yet unknown, form. The "local" work of reflection consists in identifying the pieces one by one, and trying as best we can to guess the contours of each one, guided above all by assumptions of internal coherence within the piece examined, or between it and other, presumed neighbouring pieces. But each of these pieces only reveals its true nature and its precise, final form, once they are assembled in the as yet unknown overall picture from which they originate. The "uneasiness" I was talking about is that which, in the presence of a multiplicity of perfectly well-spotted pieces, presented in a more or less shapeless heap, signals to me that it's time to finally assemble them - or also, if (more or less partial) assembly has already taken place, that it's still too fragmentary, or that it's out of kilter and needs to be completely reworked. To find **the** right assembly, the chronological order in which I came across the pieces of the puzzle is no doubt often incidental. But taking the pieces in hand one by one (and in that order, while we're at it), in the attitude of someone who knows they have to fit together and who is waiting for each one to be placed in its proper place, is undoubtedly an essential step in the work, to finally see them fit together. The "final word" in the previous note (from six days ago) tried to capture in words a certain strong impression in me - that of a **metamorphosis** that had taken place in my friend Pierre over the years, in the fifteen years since I left the mathematical scene. I'd seen signs of it here and there over the years, which sometimes left me flabbergasted, but not at any point.

<sup>259</sup>(\*) This mechanism was set in motion at the moment of the "changeover" that took place in my childhood, which I place in the summer of 1936 (when I was in my ninth year). This crucial episode in the structuring of the ego is alluded to in the note "Le Suprême (yang enterre-yin (2))" (n° 108), and in the sub-note n° 108<sub>1</sub>.

<sup>260</sup>(\*\*) For similar thoughts on the role of occasional "retrospectives" in long-term work, see also the second part of the note "Rétrospective (1) - or the three sides of a picture" (n° 127), and in particular the footnote referring to it.

At the time (as far as I can remember), I stopped by to get a **general** idea of what was going on. It has to be said that, while I sensed a certain "wind", and a particular role my friend was playing in it (with the burial of motifs in particular, which I was dimly aware of(\*)), I was very far from suspect the large-scale burial of myself and my entire body of work that my

<sup>261</sup> □ami was deftly orchestrating. It was the gradual discovery of this burial during of the past year, which was finally enough of a **shock** to shake an inertia in me, and to motivate me to finally "put down" on a situation that had seemed drowned in the mists of a distant past. So it was also in a very different frame of mind from the somewhat "routine" frame of mind that had been mine during our past encounters, in a frame of bemused attention, that I received my friend during his recent visit in October. It was during this visit that this impression appeared, or rather, this sudden perception of something that had surely been present for a long time, and which I had until then been happy to ignore: the perception of this "metamorphosis" - the very one I came back to by a different route in the reflection of the previous note. If I have rediscovered this impression, this time through what I know of my friend's mathematical work, it is surely not by the greatest of coincidences, but guided by what direct contact with him has taught me over the last two months. The force of evidence of this impression of a metamorphosis, culminating in a "virile, indemoluble, stiff and **dead** being", could certainly not come as the result of a reflection comparing and assembling facts (or partial impressions of another nature), but only through immediate experience, which remained unspoken. And this experience remains unspoken to this very moment<sup>262</sup> (\*).

p. 724

In the previous note, I wrote that this "reversal" (in the very person of my friend), or this "me- tamorphosis" (to use the expression that appeared in □le "mot de la fin" ), was not "sought for its own merits", adding in parentheses: "as the object, perhaps, of a 'foolish desire'. . . " (of this desire for reversal, therefore, mentioned in the note "The nerve within the nerve - or the dwarf and the giant"). Yet, on re-reading the notes the next day, I wasn't so sure, or whether my deliberate pro- posal of **opposing** these two "reversals" I'd discerned in Burial was really well-founded. After all, in this image of the dwarf and the giant, the "giant" embodies (as I've pointed out more than once) "virile" values, and the "dwarf" is overwhelmed by "female" de-values. And even though this image **is located** outside my friend's person, plastered as it is on his relationship with another person (me in this case), this doesn't prevent it from having no "objective" existence outside his person, but rather from being the **projection** onto the outside (onto his relationship with so-and-so) of a conflicting reality played out in **none other than himself**. To put it another way, this image of the dwarf and the giant appears as a symbolic staging of the **real conflict** at play in deeper layers than those in which the image lives, which is none other than the never-ending **conflict between the yin and yang "sides" of his person**.

. 725

<sup>261</sup>(\*) (February 30) For echoes of this feeling, which remained in an informal and diffuse state (until the discovery of "l'enterrement dans toute sa splendeur" from April 19 last year), I point in particular to the occasional allusions, in the first part of Récoltes et Semailles (written in February and March last year), to the fate of the notion of **motif**, notably in Introduction, 4 ("A journey in pursuit of obvious things") and in the section "Le Rêveur" (n° 6). The formulation of this sentiment becomes considerably clearer in the final pages of the final section of this first part, "The Weight of a Past" (n° 50), starting with the passage "I might consider the 'Letter to . . . ' " (read: Daniel Quillen), which represents a sudden turning point in our thinking. The first "notes" to emerge from this final stage of today's reflection, and above all the double note "My orphans" and "Refusal of an inheritance - or the price of a contradiction" (n° s 50,51), written at the end of March, take stock of what was previously felt to be a diffuse state, concerning the fate of my mathematical work and a certain "wind" of fashion towards it and myself.

For a description of a particular form this "diffuse feeling" had taken in relation to the motifs, see the note "Le tombeau" (n° 71) and the following one, "Un pied dans le manège" (n° 72).

<sup>262</sup>(\*) (February 30, 1985) It's still unspoken at this very moment, even though I've just given an account of my friend's visit, in the note "Le devoir accompli - ou l'instant de vérité", n° 163.

Such an **externalization** of an inner conflict, which must remain rigorously concealed, is one of the few all-purpose procedures used by the unconscious to "evacuate" the original real conflict as far as possible, substituting another that seems more "acceptable", or at least less disturbing. In this case, the chosen image-paratone remains itself unconscious (I presume so, at least); and even, I'd tend to believe, it remains confined to relatively deep layers of the unconscious, yet closer to the surface than the knowledge of the real conflict. (The latter, moreover, is none other than the "place" of this "double-sided knowledge" referred to in the note "The two kinds of knowledge".

- or the fear of knowing", n° 144.)

This suggests that the "insane desire" recalled in parenthesis in the previous note, that "**to be that giant himself**, or at least to **pass for him**", - that this desire is merely the "externalized" **transposition**, in terms of the lightning rod-image of the dwarf and the giant, of the desire for a "metamorphosis" in himself; a metamorphosis if not real, at least apparent - that or a predominance in his being felt as unacceptable, the predominance of "yin" tones (felt to be "soft" and contemptible), would find itself

p. 726

□ "reversed", metamorphosed into a predominance of "yang" or "virile" tones (felt as "heroic", and as the only ones worthy of envy). Far from being in any way opposed in their intimate nature, these two desires now appear to me as inseparable, one being like the shadow, the **symbolic** and tangible **expression of** the other. As for the "metamorphosis" I came to perceive during my friend's visit (better late than never!), it now appears as the symbolic and tangible expression of the other.), it now appears as the **realization** or fulfillment of this "insane" and imperious desire; fulfillment, not through the intervention of a providential grace, but as the long-term effect of the "boss's" stubborn determination to "rectify the situation", to **remodel** himself according to borrowed traits, and to impose these same traits on the worker-child (who, as you can imagine, is never consulted for this kind of typically "boss" operation).

In the previous note, I emphasized the **reality** of this "reversal" (or "metamorphosis"). I can now see more clearly the nature and limits of this "reality". It's the reality of a **pose**, striving to mold itself according to a model, felt as the ideal to be attained. The choice of model, i.e. the type of pose adopted, undoubtedly predates our meeting. But it seems to me that the energy invested and dispersed in this pose was minimal at the time of our meeting, and in the years that followed. There was, I believe, a sudden and drastic change in the dimensions taken by this investment, by the extraordinary "occasion" created by my departure; the departure first, from my institution (where overnight my friend had to appear to himself as having surreptitiously **substituted himself for his "rival"**), and shortly afterwards, my departure from the mathematical scene. A second, even more important aspect of reality is that, by virtue of an inordinate investment, this pose ended up becoming "**second nature**". And that's exactly what this "second nature" is, as I perceived it during our recent meeting. It's burdened with an immense inertia - just as it had been for myself. In my case, this hasn't prevented a renewal from taking place, and the fact that it has taken place in me doesn't detract from the inertia in my friend, which stands in the way of a renewal in himself.

This "new" reality that has gradually taken root in him has not "resolved" the conflict within him, any more than the occupation of a country by a neighboring country "resolves" a conflict. Rather, the conflict within my friend is "frozen".

p. 727

in a certain "balance of power", and chances are it will remain so until □ the end of its days. You could say that the structure of the ego, i.e. the mechanisms of behavior, have indeed changed, sometimes dramatically. Such changes, however, imposed by the will of the "boss", change nothing of the original nature of the worker-child's creative forces. They're simply like shackles imposed on the worker, who has to manage as best he can to work anyway, under the watchful eye of the "boss".

suspicious of the "boss", when the latter doesn't take the tools out of his hands, to show the worker what he has to do!

But that doesn't stop the business from running and making money, and the boss, by and large, is happy. There's a nasty atmosphere, sure, but like most bosses, he's thick-skinned and doesn't let it get to him, as long as the returns stay good.

#### 18.2.11.6. (g)Another self - or identification and conflict

**Note** 155 ( January 2) It's been over a week, since the December 24 note "Le désaveu (1) - ou le rappel" (n° 152), that I've had the impression of being just about finished with the foreground of the Burial painting. And then no - three times in a row already, I've had to come back to one point or another that doesn't seem to be right.

just three words to add, no doubt, to put a final point on a final point.

i. And each time, this "last point" kept me busy for an entire evening, when it turned out that what had seemed "not quite clear" had even remained rather obscure, and that it was by no means a luxury to return to it and find its own light. I suspect it will be no different again today, as I propose to return to a (final?) point, touched on in passing in the note "Disavowal (2)".

- or metamorphosis" (n° 153). This is one of the aspects of a relationship in which I play the role of "father". adopted" the aspect of my friend's ("ambiguous") **identification** with me. This aspect is mentioned in three or four lines, in a footnote to the note quoted. There was no further mention of it that evening, but the very next day, rereading the previous day's notes, I felt I had to come back to it. When I started thinking about it again last night, I thought I'd follow up on it, but in the end it was another of the "last points" left open since the previous reflection, which kept me busy late into the night.

On the many occasions in the course of Harvesting and Sowing when I've been led to note, in relation to such and such a friend or pupil, an aspect of adoptive or ☐adopted father, this was each time on the occasion of the appearance of

p. 728

conflictual features of this relationship. So, without any deliberate intention, it was the **conflictual** aspects of such a relationship with a "paternal" connotation that were at the center of my attention and were highlighted. I was well aware that in such a relationship, there is always a more or less strong component of **identification with the father**, with the only reservation that this identification can sometimes take a "negative" form, through identification with the "negative" (or opposite) image of a repudiated father<sup>263</sup> (\*). This knowledge remained in the background, without intervening in a visible way in the reflection, while nevertheless contributing its share to a diffuse apprehension and to the formation of a still blurred, unformed image of this or that relationship. I'm only going to say this once,

I believe, and in general terms, in the sense of identification, at the end of the section "The enemy father (1)" (n° 29):

" . . . it was the reproduction of the same archetypal conflict with the father: the Father both admired and feared, loved and hated - the Man to be confronted, defeated, supplanted, perhaps humiliated . . . but also the One we secretly wish we were, stripping him of a strength to make it our own - another Self, feared, hated and shunned. . . "

It hardly needs saying that in these lines, written on the occasion of a "retrospective on my past as a mathematician", if there was a precise case in point that guided my pen as I wrote, it was that of the relationship with my occult "heir" and ex-student-who-doesn't-say-his-name, Pierre Deligne - at a time, however, when I had no suspicion, on a conscious level at least, of the Big Show Burial orchestrated

## 2. A walk through a work or the Child and Mother

<sup>263</sup>(\*) This was notably the case in the relationship to me of three of my sons, who were by no means "adopted", let alone "adopters". . . .

by him! In reproducing these lines, written over nine months ago, I was struck by the extent to which they seem to prefigure and "call forth" (as it were) the image of the dwarf and the giant, which seems to have been formed and materialized for the sole purpose of giving tangible form to the intuition that has just been expressed. However, I have no doubt that it is not in me, the chronicler-researcher, that the image has been formed, but in my friend himself.

here it is<sup>264</sup> (\*\*)!

p. 729

□ Conflicting identification is clearly seen in the words "The one you secretly want too being" and, even more strongly and unequivocally: "another Self". In the image of the dwarf and the giant, as it came to my attention on December 18 (in the note "Le nerf dans le nerf - ou le nain et le géant", n° 148), it's a question of the "insane desire **to be that giant himself**, or at least, to **pass for him**", lines that seem to come in response to the "Celui qui secrètement on voudrait être" quoted just now. But this time I'll stop here (every day has its time!), one step short of the "another Self" that came nine months earlier as a matter of course! It's true that this time, while it's a question of "working on parts", in a very specific case, it's a question of being far more careful and circumspect than in a context where we're pretending (as if nothing had happened!) to make an assertion of a general nature, which wouldn't concern anyone in particular... .

But when you think about it, it's true that it's a very small step indeed, for the unconscious hungry for **symbolic** satisfaction, which it can buy with mental images of its own making, between the "insane desire" (and obviously of considerable strength) to be this or that, and **the act of identification** with the very thing one wants to be. For identification, however unconscious, to be even remotely credible, and for the satisfactions it brings to be savoured with a minimum sense of security, it must undoubtedly be backed by certain "objective" characteristics of resemblance to the person (in this case) with whom one identifies. I presume that, in the case of my friend's relationship with me, the first "objective characteristic" likely to foster a feeling of resemblance, and an act of identification, was the strong affinity between his approach and mine to our common subject, mathematics. This would be the force "in the positive sense", "that of identification with the one who is felt to be **similar**", mentioned in passing in the footnote quoted at the start of today's reflection.

However, as I've already pointed out several times in the course of reflecting on the relationship between my friend and me, from the very first years of this relationship, he didn't fail to perceive aspects of "superyang" imbalance in the character I'd been playing since childhood, which had long since become my "second nature". I can't say whether, at the level of conscious perception, my friend was able to distinguish clearly between these two entirely distinct aspects of my person. □

p. 730

to doubt it). In any case, the superyang aspect of the "boss" in my company must have aroused in him two quite distinct types of reaction. One, the only one I perceived until the last few months, and the only one conscious in him (I presume), expressed itself occasionally in a slightly pained attitude of regret, which I've had occasion to evoke, an attitude that never left the friendly or affectionate tones. On closer inspection, the other reaction itself appears "ambiguous", made up of two apparently opposing components. One was "positive", in the sense of an unreserved **valorization of** my person as the embodiment of heroic, "larger-than-life" "values"; generally accepted values, to be sure, which one assimilates in one's early years like the air one breathes, but for which one's immediate childhood environment had probably not provided any inspiring "model". This component-la, like the feeling of **affinity** (of an altogether different nature) mentioned earlier, went hand in hand with a sense of identity.

<sup>264</sup>(\*\*) On this subject, see the final footnote to "The nerve within the nerve - or the dwarf and the giant", n° 148.

the sense of **identification** with myself, without any element of antagonism. On the other hand, this antagonistic element is part of the other component, or rather, the other side (or "**reverse**") of this identification I've just described, and it remains more enigmatic for me. This is surely where the "paternal" role my friend has assigned me, by virtue of my conformity to a certain ideal "profile" supposed to embody such values, plays a crucial role. In groping my way, using the few tenuous elements at my disposal, to fathom the root cause of the strongly antagonistic content of this identification with an "adopted father" (with very "Superpère" features!), I came across (two weeks ago) a plausible, but still hypothetical, "scenario" in the December 30 note "Rancune en sursis - ou le retour des choses (2)".

This is not the place to revisit this scenario. It seems more interesting to revisit the image of "the dwarf and the giant" (which had just appeared in the note of the day before), from the point of view of this conflicting identification of my friend with myself. It then becomes clear that the two protagonists in the image, the dwarf and the giant, are none **other than himself**, or rather, **two distinct aspects of himself**. "The dwarf" represents what my friend feels to be **the original**, "unchanging" **aspect** of his being, rooted in his childhood as far back as he can remember, and no doubt even further... . It's also what is felt as the banal, insignificant, not to say derisory aspect of his person. It's **the aspect that's been disowned**, and therefore also felt as "irremediable", as "overpowering", as the "**pole**" of a person's identity.

**shameful** and contemptible of his being. "The Giant", on the other hand, represents **the vertiginous ideal** we despair of ever attaining' □ **to which** we can, at best, hope to resemble in the slightest, even if it means giving the lie to p. 731

to himself and to others, by every means at his disposal. One of these means has been to supplant the One who appears as the prestigious and envied embodiment of this ideal, and to "prove" his superiority over the Rival by every conceivable means. As for the Giant himself, he now appears as distinct from the Rival and Father, and is **the pinnacle, the ideal, heroic pole of the self**. The supreme gratification of the "boss" is anything that feeds the illusion that you **are** indeed this ideal pole, this projection of a spirit eager to enlarge itself. But the very craving for this gratification reveals an anxiety, "a deeply buried doubt" - it tells us that the person concerned "is not fooled, deep down inside, by these factitious signs of importance, of 'value'... . ."<sup>265</sup> (\*).

At a more superficial level of the psyche, these "factitious signs"<sup>266</sup> (\*\*) are, however, part of those "objective (more or less) characteristics" mentioned earlier, which are supposed to "lend credibility" to an act of identification with an ideal model (whether this remains in the impersonal form of a faceless "Giant" who lives within oneself, or takes on the familiar face of the enemy Father, the Rival).

#### 18.2.11.7. (h) The enemy brother - or the transfer (2)

**Note 156** (January 3) Yesterday afternoon, taking advantage of a little free time while waiting for friends to come by, I leafed through C G Jung's autobiography, which a friend had just brought me by chance. I was hooked by what little I had read. It was the first time I'd held a text by Jung in my hands, and until then I'd had only the vaguest idea of him - a dissident pupil of Freud, who had managed (according to scattered echoes that had come back to me) to reintroduce the shifting chiaroscuro of mystery into the straight alleys of the Master. That was about as far as it went. Now I had the impression of a living person like you and me, who doesn't waste his time bringing it back, and above all: one who will right to the real questions, <sup>those □ which</sup> he feels essential from his own lights, and who is not content p. 732

<sup>265</sup>(\*) Quotations in quotation marks are taken from "Infallibility (of others) and contempt (of self)", n° 4.

<sup>266</sup>(\*\*) These signs may be "factitious", but they often end up forming a "second nature" of unyielding solidity, "indémolissable" (to use the expression of the endnote in "Le désaveu (2) - ou la métamor-

(when the adventurous question is as old as the world) ready-made answers from learned people.

The "biography" aspect (intended for publication) was of course of particular interest to me, since the notes I'm currently writing are indeed somewhat akin to a biography, and in a spirit very close to Jung's: the external event remaining constantly subordinate to the inner adventure, of which it is both a revelation, and the occasional stimulus. It struck me that Jung didn't write an autobiography (or, more accurately, contribute to one) until he was 83, and, more importantly, that at no earlier point in his life did he take the trouble to examine his own childhood in depth. It would seem to me that for Freud's students, it must have been self-evident that one of the first things, if not the very first thing, to familiarize themselves with the ways of the unconscious, would have been to explore those ways in their own person! There's no doubt in my mind that a so-called "knowledge" of the unconscious that is limited to what is learned in a university curriculum (even if taught by a prestigious master like Freud himself), and to the analysis of a certain number of "clinical cases", remains a non-integrated knowledge, a fragmented, "dead" knowledge - a knowledge that by itself does not provide, or even promote, an understanding of oneself, or of others, or of the world.

But it's also true that self-exploration is an undertaking which, by its very nature, cannot be the subject of an institutionalized "program" - any more than the restoration, at its very root, of a disturbed psychic equilibrium (in a "patient", let's say) can be the fruit of the intervention of an "ogue" of any kind, confined to implementing boilerplate techniques. Disturbed equilibrium" is by no means confined to the socially unacceptable stage of a nervous breakdown or neurosis, but can be found in virtually everyone (to a **greater** rather than lesser degree). Psychologists themselves (or ethnologists, sociologists and other "ogues"), of all persuasions, are no exception! And a genuine restoration of disturbed equilibrium is by no means in the nature of a simple "medical act" performed on a third party. It is **an act of the person himself** and of no one else - **an act of love**, which he is free to do or not to do. It is not the result of the inexorable unfolding of psychic mechanisms (with or without the intervention of an expert in psychic mechanics), but an act in the full sense of the word, a **creation**, a **re-birth**.

p. 733 □ Before I finish writing the peremptory sentence above, about "so-called 'knowledge'" of the unconscious", I realized how the context can make her seem overconfident. Without knowing anything about Jung's work (which we've just been discussing), I seem to be dismissing him and his "so-called" knowledge of the unconscious - given that he apparently hadn't bothered (until he was 83) to explore the soil in which his own unconscious had grown. I assume, however, that when you read his biography, it will become clear that, without having devoted himself to such "exploration", Jung must have had **other** ways of making contact with his own unconscious (ways which themselves no doubt remained unconscious for a long time), so surely the premises of the offending assertion don't apply to him.

Something else of a completely different order caught my eye as I leafed through the glossary. Under the term "quater- nité" (NB this is the French edition), Jung insists on the "totalizing" character of the number four. Until about ten years ago, I was very resistant to the idea of a philosophical or "mystical" use of numbers - any speculation or discourse in this direction seemed to me nonsense, childish, "Hokus- pokus" (as we say in German, for fourpenny magic tricks). The little I've learned about the Yi-King (or "Book of Transformations") has made me less peremptory. Yesterday I made the connection between the "cosmic" character attributed to the number four, and the spontaneous grouping that had taken place, when writing "The key to yin and yang", in "packets" generally of four or eight notes, united under a common title. The

---

phose", n° 153)!

The first group is reduced to a single note; this is true, but (as I had noted with satisfaction on completing the sixth group, "La mathématique yin et yang", which has seven notes instead of eight) if we combine it with a later group, into which this isolated note seems to fit most naturally, we still find a package of eight notes ( $7+1 = 8$ ), so again a multiple of four. This pattern has continued to the present day, the last group to be completed being Group 10 "Violence - or Games and the Sting" (156<sub>1</sub>). It has to be said that, from group 7 onwards ("The reversal of yin and yang"), I let myself be guided by this "pattern" which had just emerged without my looking for it, and without seeking or assuming any "meaning" other than that of a certain mathematical "regularity" in the form, felt to be harmonious.

This reminds me of the only other text I've written on a theme that could be described as "cosmic", focused again on the dynamics of yin and yang in human life and in the creative act<sup>267</sup> (\*). This text p. 734 grouped together, apparently without initial deliberation and certainly without effort at any point, in a rigorous numerical order. I'd forgotten what it was, but looking at it now (you're either curious or you're not!), it turns out to be seven "stanzas" of four "stanzas" each. So, once again, they were grouped by four. It's true that the number of stanzas is seven, which is not a multiple of four - so according to the Jungian criterion, the character of totality would not be satisfied for the work as a whole<sup>268</sup> (\*\*), but only for each of the seven "stanzas" that make it up. But I've still got enough to get away with, given that the famous "poetic work" was also provided with a providential "epilogue" (not to mention an interminable prologue, which I had the good sense to leave out), so we've still got  $7+1 = 8$ , we're saved!

It's time to return to yesterday's reflection where I left off. I had tried to understand the image of the dwarf and the giant in my friend, in terms of his identification with me. It appeared that "the dwarf" and "the giant" represent (or "**stage**", to use the expression in the note preceding yesterday's) the two extreme "**poles**" in my friend's person (I mean: what the "boss" has **instituted** as "extreme poles"): one "shameful, despicable pole", and another "ideal, heroic pole". To tell you the truth, with a difference of emphasis or lighting, I agree with the interpretation I found the day before for the same image-force of the dwarf and the giant, in the note of the day before yesterday "La mise en scène - ou la "seconde nature"" (n° 154). It was then a question of of the "staging" of the conflict instituted by the boss, the ego, between the two "sides" yin and yang of being. This formulation of the original conflict, in terms of the two "sides", would correspond to an undistorted knowledge of this conflict - and I'm convinced that this knowledge must indeed exist, in deep (but by no means inaccessible) layers of the psyche. The formulation in terms of two "extreme poles", yesterday, represents a **distorted view** of the conflict - distorted by a deliberate statement by the boss, valorizing one of the "sides" to make it an ideal, heroic "pole", and devaluing the other to make it a pole again, p. 735 extreme opposite to the previous one, a shameful, contemptible pole. I presume that this intermediate image lives in shallower, intermediate layers, perhaps partially cohabiting with the externalized image, the "staging" of the dwarf and the giant, even closer to the conscious surface, and partially encroaching on the superficial layers<sup>269</sup> (\*). In these layers, the idyllic image of "daddy" reigns.

<sup>267</sup>(\*) This is the "In Praise of Incest", discussed in note n° 43 (referring to the section "The Guru-not-Guru - or the three-legged horse", n° 45), and especially in the note "The Act" (n° 113), pp. 507 - 509. See also the beginning of the note "The dynamics of things (yin-yang harmony)", n° 111.

<sup>268</sup>(\*\*) The projected work (under the provocative name "Eloge de l'Inceste") was in fact to comprise three parts (L'Innocence, le Conflit (or la Chute), La Délivrance (or l'Enfance retrouvée)), of which only the first was completed. That's what we're talking about here.

<sup>269</sup>(\*) This presumption regarding the image of the dwarf and the giant stems, of course, from the very explicit expression of this image, in the final word of Pierre Deligne's biographical note written by himself (alluded to in the last footnote to the note "Le nerf dans le nerf - ou le nain et le géant", n° 148).

cake" a little soft around the edges, from a respectful and considerate son, with visible velvet and an invisible velvet claw. ...

Compared to the day before yesterday's reflection, yesterday's seems to me to have nuanced it, and thus to have sharpened its contours somewhat, without yet bringing anything essentially new to it. It's true that when I stopped the reflection because of the prohibitive hour, I didn't feel that I'd reached the end of the path I'd embarked upon, that of "ambiguous identification". In retrospect, I realized that, no doubt as a result of my inveterate habit of "seeing myself as a yang", it seemed to go without saying that any identification with myself could only concern my yang traits. In this case, in the stage image of the dwarf and the giant, it was the **giant** that I had recognized myself in, in a distorted but still clearly recognizable form. If, however, I am insistently presented as "**the dwarf**"<sup>270</sup> (\*\*) by the effect of the "reversal" syndrome in my friend, this assimilation (with obviously malicious intent) was immediately rejected by me, by a reflex of universal naturalness and great strength: to be confronted with a desire for derision, targeting traits (yin, in this case) that are perfectly real in me, while passing over in silence the complementary traits that are just as real (which, for their part, benefit from a valorizing consensus) - such a situation elicits in me the never-ending reaction, if not to deny the incriminated traits entirely, at least to tacitly minimize them, by putting forward, as if to **oppose** them, the unjustly retracted traits.

With this "visceral" reaction, I'm well and truly entering the round of conflict, just as I'm supposed to! It alerts me to that eternal □ "hook" where I'm taken for a ride. My

p. 736

I also find my own vision of reality distorted, in response to a provocative distortion. So it was in vain that I wrote yesterday, from the tip of my lips (or the keys of my typewriter), that

"the first "objective character" likely to foster a feeling of resemblance and an act of identification, was the strong affinity between his approach and mine to our common teacher, mathematics".

In writing it, I was forgetting that this "strong affinity" consisted of a **yin, feminine** approach to the discovery and knowledge of things - that this was precisely the aspect by which, as "similar" to him, I too appeared as a **dwarf**, just like him: it was the secret, vulnerable, shameful side that he reserved for himself to bring into play, when the right moment appeared, to supplant and "overthrow". This "providential circumstance"<sup>271</sup> (\*), the yin predominance in my drive for knowledge, was **not** only a **weapon in the hands** of a dubious friend - it was also, and first and foremost, a kind of "objective foundation" for his identification with me; not, this time, as identification with the **father**, but as identification with an **older brother**, not to say an "older sister".

When I use the term "objective" here, it's to express that this time it's a question of an "identification" rooted, not in one of the fictions of the "boss" wanting (or fearing. . . ) to be this or that, but in a profound, tangible, indubitable **reality** - that of a **kinship** between the original nature of one and the other. In any case, surely this kinship could not fail to be perceived by him as by me, and I have no doubt that at some deep level, the **meaning of** this kinship was also perceived. At the very least, I presume, without being totally convinced, that this perception must have served as material for his identification with me. This identification would have taken place on **two** distinct **levels**: on the one hand, the "ideal" level, in which I figure as the embodiment of **values** of which he would like himself to be a

<sup>270</sup>(\*\*) This "dwarf" himself-mime being no other than a metaphor for the "Meganana" with the features of a "false" giant, with flabby and ramomo forms. ... (Feb. 85)

<sup>271</sup>(\*) See note of the same name, n° 151.

exemplary incarnation (even if only in appearance, as the model appears out of reach, and is supposed to actually realize the ideal); on the other hand, the "real" level, where identification is established through of a **de facto kinship** correctly perceived, but a kinship in common traits deemed redhibitoires, pitiful<sup>272</sup> (\*).

p. 737

This is a good time to remind myself that at the time of our meeting, and for more than ten years afterwards, I had the same repression of my "feminine" traits that I've come to see in my friend. Looking back, it seems to me that, at the time of our meeting, this repression already existed to some degree in my friend, but that it remained mostly latent, and in any case, was much less strong than it was in me. As I've pointed out on more than one occasion, my person had long been marked by a superyang imbalance, whereas his gave off an impression of harmonious balance. Since then, he and I have **evolved in opposite directions**: my friend from a state of yin-yang balance to a strong yang imbalance, and I from a strong yang imbalance to a state of (relative) yin-yang balance.

The idea that immediately arises is that my friend, perhaps by virtue of this double identification with me, has followed (some thirty years later!) the evolution, in the sense of a deterioration of an original balance, that I myself had followed since the age of eight. It's possible that a moderate over-valuation of "virile" values to the detriment of "feminine" values was transformed, through contact with me or with the environment I was part of, into an over-valuation with a touch of zinc. But as I've pointed out elsewhere, the "nerve" (or "living force") in the Burial orchestrated by him, and the nerve also in his own metamorphosis (which is also the burial of the child in him by the boss's care. . . ) - this nerve can scarcely lie in the mere adoption of this or that other, more or less extreme (or even demented!) value system. And the same applies to the "nerve" in my identification with myself, and the disproportionate role this identification has played in my friend's life. There's no doubt that one and the same "force" is at work, and that its roots reach far back into his childhood<sup>273</sup> (\*\*).

p. 738

Another strange idea comes to me here. It seems that the heaviest burden that I have carried for forty years of my life, this repression of the "feminine" in me by the "masculine", which was also akin to that of the child in me by "the Big Boss" - that this burden was **"taken up"** by my friend, at precisely the moment when it might have seemed that he himself was free of a similar burden. It was around the time when my value system shifted in a yin direction, a development that foreshadowed the moment of my reunion with the child some fifteen years later, when I suddenly felt relieved of an immense weight<sup>274</sup> (\*). The immediate association here is with the Hindu idea of **karma**. It's clear to me that over the last eight years, I've lightened a substantial part of the karma I've been carrying around with me since childhood. I would have thought (and still tend to think) that this lightening has not been "at the expense" of anyone, that it is beneficial not only for me, but "for the whole world". I can even say that I **know** very well that this is so, even if it turns out that someone else chose (or even had to choose) to take it over. It's also true that I don't consider this karma I've lightened as an "evil". It was for me the nourishing substance of a **maturation** that was ahead of me.

<sup>272</sup>(\*) These two "levels" thus correspond to two distinct "archetypes", and here in opposition to each other, in the identification with my person: that of the father (aka "the giant"), and that of the Brother, or even, that of the Sister (aka "the dwarf"). The latter is also found in the image of the "cake-daddy" - suggested by the father in the flesh "as he is", alas! and not "as he should be". . .

<sup>273</sup>(\*\*) For a more precise intuition along these lines, see especially the note "Rancune en sursis - ou le retour des choses (2)", n° 149.

<sup>274</sup>(\*) This "shift" in value system is discussed in the note "Yang plays the yin - or the role of Master" (n° 118), and the "reunion" in the note of the same name (n° 109).

me. I know that it is good for me and for everyone that I have eaten and been nourished by it, that knowledge has been formed in the nourishing womb of ignorance<sup>275</sup> (\*\*). It seemed to me that this substance or karma, once transformed into knowledge, left no residue, that it disappeared. To tell the truth, I don't know what the Hindu or Buddhist tradition teaches on this subject - if for them there is a law of "karma conversation" (similar to that of the conservation of matter), which would be unaffected by the vital creative processes of ingestion, digestion and assimilation.

For the sake of propriety, I've just omitted **excretion** from these "vital processes". Yet excretion (along with the death of the entire organism) is a key process in the recycling of what has been absorbed, returning to the infinite cycle of transformation of "dead" organic matter into living organic matter, whereby life is eternally reborn from death<sup>276</sup> (\*\*\*)).

p. 739 **Note** 156<sub>1</sub> □(February 30) This "pattern" eventually broke with the ultimate group 12, which, alas!

n°

p. 740

**six** notes, bringing the total number of notes making up "The key to yin and yang" to 62. I had anticipated that there would be **eight** notes in this "Conflicts and Discovery" group, which would have been in keeping with the criterion of totality, and would have brought the total number of component notes to  $64 = 8 \times 8 = 4 \times 4 \times 4$ , which is also the number of hexagrams in the I Ching! I was sorry that my expectations were not fulfilled, but I didn't want to "cheat" and include in "The key to yin and yang" the Jeux notes devoted to Pierre Deligne's visit to my home, whose natural place seems to me to be in the continuation of "The Funeral Ceremony", **after** "The key...".

However, I remain dissatisfied with this group n° 12, the only one of the twelve parts. of "La clef. . "which doesn't leave me with an impression of **unity** of inspiration and purpose. This lack of unity seems to me to be due, not to the theme of "Conflict and Discovery" itself, but to the irruption of extraneous (and at times disturbing) events in the course of reflection.

(March 7) Last night, as I reread the thoughts of January 14, which I had grouped together in a note (n° 162) called "conviction et connaissance - ou la passation"<sup>277</sup> (\*), I felt dissatisfied with this name. On the one hand, the "main" title and the subtitle didn't seem, "at a glance", to fit together - in fact, they correspond, one to a first and the other to a third "movement" in the reflection, which by themselves are apparently unrelated: description of the process of the blossoming of knowledge (in the form of a sudden **convic- tion**), and evocation of the endless chain and "passing on" of karma, from one generation to the next, and from one person to the next. What's more, the most intimately personal content, the "neuralgic" content for my own person, which was the substance of the "second movement" of the reflection (and had in fact been the "passerelle", leading from the first movement to the third) - this crucial content did not appear in the chosen name. (There's no doubt in my mind that this surreptitious concealment is not at all the ef-

fect of pure chance. ... ) Since all three themes seemed important in their own right, and I couldn't think of any "appropriate" name or double-name that would evoke all three, I ended up com□prendre

that the best thing would be to split the note into three, with a suggestive name for each one separately: "Conviction and knowledge", "The hottest iron - or turning", "The endless chain - or passing (2)" (n° s 162, 162', 162").

<sup>275</sup>(\*\*) For thoughts along the same lines, see the end of the note "Le cycle" (n° 116'), and in particular the last paragraph.

<sup>276</sup>(\*\*\*) On the cycle of life and death, see also the note "The Act", n° 113.

<sup>277</sup>(\*) This was also the last note in "The key to yin and yang".

.....It was afterwards that I suddenly realized that this operation, dictated (so to speak) by the very substance of the reflection, had at the same time resolved the "aesthetic" dissatisfaction that I had been dragging on for almost two months, while this twelfth and last part of "The key to yin and yang" (which I had called "Conflict and discovery") stubbornly refused to let itself be completed (naturally, that is) in a sequence of eight notes, and only wanted to include the six that were already written. And I received my reward for not giving in to the easy temptation to "cheat" and "stick" two notes at the end of "La clef", "on the spur of the moment" and who se place was elsewhere! This last part of "The Key" (which will eventually be called "The Enigma of Evil - or Conflict and Discovery"), at the same time, takes on a beautiful symmetrical structure, with two packets (of three notes each) on the central theme, clustering around the two "digression-notes" on Fujii Guruji and on my monk friends.

## 18.2.12. Conflict and discovery - or the enigma of Evil

### 18.2.12.1. (a) Without hate or mercy

**Note** 157 (January 4) In yesterday's and the day before's reflections, I tried above all to get in touch with the reality of my friend's identification with me, and in so doing, to discern its scope and implications. It's a job I'm still doing as one groping around in the half-light, not to say, in the dark of night. Or perhaps I should say that my eyes remain closed, and my eyelids opaque to a light that I remain unable to perceive. In any case, I have no recollection of having "felt" or "seen" this identification at any time during my relationship with my friend, any more than I have "felt" or "seen" his antagonistic attitude towards me. Yet I **know**, without any possibility of doubt, from a rich body of concordant facts, that this identification with me, and this antagonism which is like a shadow of it, are **realities**.

- just as someone born blind "knows" the sun, daylight, colors, light and dark, exist, even though he has never seen them. He knows it, without having **knowledge of** these things. Or if he does have a very diffuse knowledge of them, through a more refined tactile sense perhaps (or through a "memory"

which is rooted not in his life alone, but in those of countless generations ☐ of sighted beings that preceded it), this knowledge remains indirect and fallible, like that of a warm, sonorous voice coming to us through a distant, uncertain echo.

p. 741

The work we've done over the last two days has again been like a stopgap, like a substitute for an immediate perception that's lacking. This is more or less the case in all "meditative" work, as I understand it. The work constantly **pushes** against the current of **inertia** - the inertia of leaden eyelids! Certainly, in moments when the eyes are fully open and awake, there's no need for meditation or work: all you have to do is look, and see. As these moments are rare, rather than sit back and wait for them, I prefer to take the lead, without worrying that the work is clumsy and "slow". It may be slow, and sometimes even slower than usual - but that doesn't mean it's ever stagnant or going round in circles. When there is work - real work, I mean, driven by a real desire - then there is progress: something is done, takes shape, is transformed, imperceptibly at one moment, visibly at another... . And sometimes, at the end of a clumsy, stubborn progression through a formless, contourless penumbra, continuing for hours or days, even months or perhaps years, the miracle happens: the blind man **sees**! And what is seen is not a fleeting vision that disappears as if it had never been, leaving only the faint trace of a memory. It's a **knowledge** born of these obscure labors, a new knowledge, as intimately ours as the taste of the things we love.

I wrote in the day before yesterday's reflection that if there was a case in point whose thought had "guided my pen" nine months ago, as I wrote the final lines of the note "The Enemy Father (1)" (which I had just quoted), it was that of my friend Pierre in his relationship to me. Yet other "cases in point" even closer to me must have been present in my mind at the time, in the background of my reflection. When I talk about it

of "a father both admired and feared, loved and hated" and then of "another Self, feared, hated and shunned. . . ", the terms "feared", "hated", "hated", and probably even the term "fled", do **not** apply to friend Pierre's relationship to me. Neither by direct perception, fleeting and slight though it may be, nor by cross-checking with the facts known to me, have I ever had the slightest indication of **fear**.

p. 742

that my friend would have had of me, or of a hatred or only of an **animosity** that he would have nourished against me. The opposite ☐ is true, as I've had occasion to point out on more than one occasion. And it's this It's precisely this circumstance that has made the seemingly gratuitous, unflinching antagonism that has manifested itself in crescendo over the past fifteen years so disconcerting, under the guise of "thumb!", aka "velvet paw"<sup>278</sup> (\*), finally reaching the pitch of quiet impudence, sure (provided certain forms are respected) of total impunity. . .

This disconcerting, enigmatic progression is immediately associated with the equally "disconcerting" and "enigmatic" (and these are euphemisms, to be sure!) progression in the deterioration that followed, also over a period of some fifteen years, in the couple's relationship with my former wife, and by the same token, in the family we had founded. In the absence of any sign of chronic hatred or animosity towards me on the part of my wife, it took me ten years of inexorable deterioration in the relationship (while most of my energy was taken up by mathematics, playing the role of the famous pile of sand for the ostrich... . ), before finally acknowledging the presence, in the one I continued to love, of a tenacious, mysterious and implacable will to destroy, working against me through those who were dear to me. That was in 1967, five years before I left home, and ten years before the resolution of a conflict that I felt was the heaviest burden of my life. With the hindsight afforded by a long-accepted relationship, I can only note what continues to remain a mystery to me: an insatiable will to destroy, and at the same time an **absence of hatred**, or only animosity, towards those, adults or children, who are mercilessly struck down, whenever the occasion arises.

It's the same mystery, all things considered, as the one I'm now confronted with in my friend's relationship with me, with the difference that this "tenacious will to destroy... exerted against me through those who are dear to me" was rigorously confined to the world of mathematicians, and that its instruments and hostages were not my children "in the flesh", but those who symbolically took their place: the students and assimilated who, if anything, "bore my name". In both cases, not only do I detect no hatred or animosity, but there are also feelings of sympathy, and often even affection, towards me that cannot be doubted.

☐ These aren't the only situations in which I've been confronted with a desire to injure, even even a desire to destroy (in the strongest sense of the word<sup>279</sup> (\*)), without any trace of hatred or animosity. The one that most strongly marked my life was in 1933, in my sixth year, with my mother as the protagonist - the year in which the **family** we formed, my parents, my sister and I, was destroyed forever<sup>280</sup> (\*\*).

p. 743

The various situations of this kind that I've experienced up close, from a desire to destroy, or a desire to hurt as deeply as one can, without my detecting any trace of animosity, seem to

<sup>278</sup>(\*) See the two notes "Pouce!" and "Patte de velours - ou les sourires" (n° s77, 137), as well as the notes that follow the latter, forming the "La griffe dans le velours" part of "La clef du yin et du yang".

<sup>279</sup>(\*) By "strongest sense", I mean here a will, not to cause suffering for the sake of suffering, or to destroy some limited thing dear to the other, but the will to psychically (if not physically) destroy the other; the will (when possible) to implant an indelible and devastating despair in the face of "that which is beyond comprehension". Behind the brilliant and affable exterior of "Colloque Pervers", I seemed to find this extreme dimension in two of the most brilliant of its actors... ..

<sup>280</sup>(\*\*) For more on this episode, see "Le Superpère", note no. ° 108.

very different from one another. I doubt I could find a common "explanation" for them, or at least a common trait in the protagonists' distant antecedents, which would suggest a deep causal link<sup>281</sup> (\*\*\*). Perhaps more important than an explanation, and in any case more important than an explanation, is the **realization that** such a thing exists: **the will to destroy in the absence of hatred**. This brings me back to the theme of "gratuitous violence", touched on earlier in a different way<sup>282</sup> (\*\*\*\*). Here, we're talking about gratuitous (and sometimes destructive) violence **against a loved one** or a person considered to be a threat.

"friend". The mere **existence**, in everyday life, of such violence (which rarely says its

□nom), is an important **fact** in everyone's life - one of the important facts of human life. Observing this p. 744

In fact, by going against the inveterate mechanisms that constantly push us to try and hide it, is the first step towards assuming it. No theory, no reasoning, no "approach" can save us from taking this step.

I don't know if I'll ever **understand** this fact, but it seems to me that to understand it is also to "understand conflict". What is clear to me is that such understanding cannot come from "theory", any more than from "experience" (by virtue of experience alone). It is not some "sum total" of an accumulation (of "knowledge", or "experience"), just as it is not of the order of the intellect alone, nor even of the order of the "intelligence" alone<sup>283</sup> (\*). I'm not sure I know anyone, even by name, in whom such an understanding lives. But it seems to me that anyone who, after a hundred and a thousand evasions in the face of an irrefutable reality with a thousand faces, has finally come to the simple **realization** of this fact, humbly, without bitterness or revolt, without resignation or indignation - as the realization of a formidable **mystery perhaps**, the meaning of which escapes him, but the extent and depth of which he senses; a mystery which intrigues or challenges him, without frightening or worrying him any more - that person has not lived in vain.

### 18.2.12.2. (b) Understanding and renewal

**Note 158** (January 5) Although it wasn't premeditated, the final accents of yesterday's reflection were very much in the vein, again, of a Funeral Eulogy - but this time delivered (or sung) by the deceased himself. One is never so well served as by oneself!

Yesterday I was confronted once again with one of the most perplexing aspects of the "mystery of conflict": that of the will to destruction without hatred or apparent motive, exercised in the shadows, obstinately and relentlessly, against a loved one, or such loved ones or friends. Sometimes, such a will gets out of control, leading to an all-out destructive frenzy in which anything vulnerable becomes a welcome target. It's like an irrepressible bulimia for "action" in reverse, whose repetitive nature (like that of clown games), and consummate mastery in the art of pulling the strings,

can have a most comical effect, when the observer (or even the one who has just paid the price) is

gifted with a sense of humor' □ and that the "Actor-Marionettist has only modest powers over others. La p. 745  
situation is more serious, it is of consequence, when there are children among those who bear the brunt of the

<sup>281</sup>(\*\*\*) Yet a deep-seated, virulent self-contempt is surely common to all these situations. Perhaps such virulence (when it is not resolved by an act of grace, by a profound inner transformation, i.e. as long as it is not "assumed") must find an outlet and express itself through destructive acts, through a will to destroy, which turns against its own person when it does not seek and find its target in others. In many a person, and even in close relationships, I have witnessed the simultaneous action of a will to destroy, directed both against oneself and against some external target, chosen from among those close to us (mother, father, spouse or child. . . ). (February 1985) See also the reflection in "The cause of causeless violence" (n° 159), three days after the present note, which obviously prepared it.

<sup>282</sup>(\*\*\*\*) See the note "La violence ingénue", n° 139.

<sup>283</sup>(\*) (March 5) In any case, I know that such an understanding will only come to me through an understanding of this violence. **in myself.**

circus games, even if these are only "bloody" in the figurative sense; and also when those possessed by a thirst for destruction find themselves invested with considerable, even discretionary powers over some of their fellow human beings. History records the names of some despots possessed by such a madness of indiscriminate destruction, turning their fiefdoms into vast mass graves. We think of Ivan the Terrible, or Stalin, or a certain Chinese emperor (whose name and millennium I've forgotten) who was finally slaughtered by his own cornered subjects, armed with sticks and stakes<sup>284</sup> (\*). There's no doubt that there have been similar cases in our own country, perhaps on a smaller scale, and about which "History" has been more discreet... ..

When I wrote yesterday, without any false modesty, that I didn't understand the "fact" I'd just observed, that of the thirst for destruction in the absence of hatred, this in no way meant that I had no ideas on the subject, quite the contrary. On the contrary, I have more than just "ideas", I have some very strong intuitions. They were born and bred in the soil of my life, rich in the conflicts that sometimes seemed to devastate it, like endless storms raging across a still landscape.

p. 746 of winter' □ ruthlessly <sup>ripping out</sup> what needs to be ripped out<sup>285</sup> (\*). But all is belly for the sleeping earth waiting in silence. When spring returns, in the hollows of the great dead trunks lying there inert, there is intense life, and in the following spring (if not the very same year) we can already see grasses and flowers blooming there.

These "strong intuitions" all concern, I believe, the "**ingredients**" of conflict. I've spoken a little, and spoken again, about some of them, first and foremost "**self-contempt**", and its links with the repression of certain aspects and essential forces of our original being, such as the yin or yang "sides", one of which is often denied. I've also often had occasion to talk about **vanity**, which is like a calling card, the most universal of all signs, and the most apparent, of the presence of conflict within us, and which appears to me as the "**front**" of the same medal, the "back" of which is self-contempt. There is **contempt for others**, an outward projection of self-contempt, for which it is at the same time a cover, or better said, a diversion and an exorcism. Basically, contempt for others is nothing more than deliberate ignorance of their existence as sentient beings who share in this world in the same way as ourselves. Gratuitous violence cannot

<sup>284</sup>(\*) This emperor, fearing a popular uprising, had forbidden the people to use any metal objects (such as knives, forks, etc.) that could be used as weapons, with the exception of one knife per village, attached by a strong chain in a public place.

What all three of these characters had in common was that, in addition to their thirst for destruction, they were also possessed by **fear**: fear of being murdered, and beyond that, no doubt, fear of their own inevitable **death** - as they sowed death all around them. This coincidence is surely not fortuitous. I also note that Stalin (the only one of the three about whom I've had any detailed information whatsoever) began his political career as a great master precisely in the art of pulling the wool over people's eyes, of manipulating them by playing on their vanity and greed. His first acquired style was, it seems, that of the "velvet paw", until it became unnecessary for him to bother hiding his claws.

If I haven't included my (ex-) compatriot Hitler among the examples cited, it's not because I have any particular sympathy for him, but because I don't detect in him the mania for "**all-out**" destruction mentioned. The targets of scorn, then destruction, were those designated as "the others", "foreigners": first of all "the Jews" (and the Communists and other "Judeo-Bolsheviks" dear to Nazi jargon), then "Asians" and other non-Arian metatics. The good, non-Jewish German was all very well under Hitler, at least until the first major Allied air raids, when the war really started to go badly for them.

<sup>285</sup>(\*) No sooner had this image been jotted down in the rush of the pen than it occurred to me that it was only partially adequate - it would almost have an aftertaste of "cliché"! As I reflect for a moment on this aftertaste, I rediscover the old deliberate intention within me to "see my life as yang": movement, arrows and storms... .

Without even taking the time to pose, but sensing that the image wasn't right (and yet, that's what had come to me, nothing to do!), I "corrected" it in the text by going on to the "sleeping earth waiting in silence" - and voilà, yin! It was the chord that "resolves" a "false chord" (or "dissonance"). In many ways, a more accurate image than that of the storm, "tearing away what must be torn away", and in more yin tones precisely, would be that of the worm gnawing away "what must be gnawed away" - and which finally collapses - but all goes belly-up for the earth that waits in silence, and when spring returns... . (continued without change!).

to germinate and proliferate on the terrain of such contempt. There's the **fear of knowing**, the fear of reality, a fear whose nerve center, this "Black Point", the epicenter of a vortex of anguish ready to be unleashed at the slightest alarm, is the fear of knowing ourselves: the fear of becoming aware of our own poses and subterfuges, however crude; and the fear also of becoming aware of the creative force within us that day after day we reject and bury, through these same poses and subterfuges.

In my life, fear appeared at the age of six, when there was still (it seems to me) nothing to fear. vanity. This must have only appeared later, at the moment (I presume) of the "changeover" that took place around the age of huit<sup>286</sup> (\*). And it was fear, too, that disappeared first and without trace, as soon as apparition of a curiosity that's both benevolent and irreverent, certainly intrigued but in no way impressed by the abracadabra and macabre spectacles of the "Point Noir" genre. The mechanisms of vanity, on the other hand, have remained in place with no apparent change in the eight years since the fear of knowing disappeared. It's only the hold these mechanisms have on my life that has changed, as they are defused by the presence of an awakening curiosity that doesn't let itself be fooled!

I have in my hands a whole range of conflict ingredients - which I know at first hand, without a shadow of a doubt, are indeed essential ingredients. And for years now, I've also had everything I need to "assemble" these ingredients, carefully explaining, in the light of what I've observed in myself and others, their links of contiguity and dependence. It's a job that will take a few days or a few weeks, not even months, I presume, and will surely be very instructive and useful. If I haven't taken the trouble to do it yet, giving priority to other, more directly personal directions, it's probably because I was well aware that it's not from such an "assembly" of ingredients, in general terms from which my person is absent (if only as one "example" among others), that an "understanding of conflict" could come to me ; nor does the mere fact of placing side by side, "assembling" or even mixing a certain number of simple bodies, "ingredients" in the composition of a compound body, reconstitute the latter. For "reconstitution" to take place, a "chemical reaction" must first take place - something bringing the ingredients into contact and into play in a far more intimate way, and by forces of an altogether different order, than simple "assembling" or mixing could do.

The same is true for an understanding of the things of life. Intelligence alone can, at a pinch, spot the ingredients of something like "conflict", and it can in any case, in the presence of ingredients already known and with the help of facts about them (known first or second hand), put them together in a plausible, even "correct" way. This kind of work can be useful in recognizing a conflict situation from time to time, and in identifying a more or less precise "etiology" - but that's not the whole story.

an "understanding of conflict". I will say, however, that I have moved one step closer to such an understanding, the day when my **relationship to conflict** will have been transformed, When I say "my relationship to conflict", I mean p. 748 in the first place, of course, the conflict within myself, and (from there) the conflict that occasionally pits me against this or that person; and lastly, the conflict I see acting in people close or less close to me in my everyday life, which often expresses itself in conflicts pitting one of them against another.

Over the past eight years, there has been such a progression towards an understanding of conflict, which also means: a transformation, or rather, successive transformations, in my relationship to conflict. I've already mentioned two or three episodes<sup>287</sup> (\*). Perhaps a full understanding of conflict is equivalent to a full acceptance of its existence, wherever and however it arises.

<sup>286</sup>(\*) On this "tipping point", see the note "Le Suprême" (n° 108).

<sup>287</sup>(\*) On this subject, see in particular the two notes "Acceptance (the awakening of yin (2))" and "The slave and the puppet - or the floodgates", n° 110, 140.

manifesto<sup>288</sup> (\*\*). I'm obviously a long way from that! And perhaps a full understanding of conflict also means total resolution of the conflict within oneself. I'm even further from that!

But there's one more thing I think I know, and that's the nature of the force that, from a combination of ingredients, suddenly gives rise to an **understanding** that renews the person. It is precisely this force that is not "of the order of intelligence". I doubt that any intellectual work, the reading of books let's say, no matter how learned, profound or sublime, will in any way stimulate its appearance. When it does emerge, it's only in silence and in contact with that which is most intimately personal to us and our lives; something, therefore, that no book and no person, be it Christ or Buddha, can ever reveal to us.

When I say "that which is most intimately personal", I don't mean that these are things we can't talk about, either to ourselves or to others - and sometimes it's good to talk about them. But even when spoken through the voices of angels and prophets, what is **said** is not the thing itself. This thing-already known, but buried perhaps, whose contact can suddenly give rise to a new knowledge-is **known** neither to angels nor prophets, nor even to the closest and most beloved of beings, but to the most intimate of beings. from **you** alone.

p. 749 □To return to conflict, and "destruction without hatred", which seems to me the hardest "core" of the conflict, the most resistant to understanding, that is, to **acceptance**. I also think I know, in the next step before me to enter further into it, what **is** that "most intimately personal" thing I'll first need to get in touch with again; the thing that would play the role, in this case, of that famous "Black Point" so tenaciously evaded! It's the experience of situations of "gratuitous violence", of contempt for others (and of "destruction without hatred" too, perhaps), in which **I** was the actor - the one who did the violence, the one who found it worthwhile to despise. It's by coming into contact with this reality, or never, that I'll be able to get to the bottom of this famous "self-contempt", and finally **see**, beyond all "no doubt" and all "maybe", if this is indeed the deep root of evil, and not just in "everyone but me"!

### 18.2.12.3. (c) The cause of causeless violence

**Note** 159 (January 7) The reflection in the previous two notes revolved around the mystery of the existence of this strange thing: a will to destroy (or a will to hurt, or humiliate, or harm), in the absence of any hatred or animosity. The impetus for this reflection came from my friend Pierre's relationship with me, which immediately led to an association with my ex-wife's relationship with me. More than once during the reflection on Burial, I was led to realize, or to remember, that in these two cases as in others, it was certain traits in myself, the "super-viril" traits that I had cultivated in myself since the age of eight, that served as stimulators and "attractors" for such antagonistic impulses. If I'm not mistaken, this was first mentioned in the October 5 note "Le Superpère (yang enterre yin (2))" (n° 108). This link is taken up again in the following note of October 9 "Les retrouvailles (le réveil du yin (1))" (n° 109).

In this note, I return to the moment when, for the first time in my life, I perceived this link. It was October 18, 1976, the very day of my reunion with the child in me, and in the final lines of the notes that bear witness to this most important day of my adult life. In these lines (reproduced in the

---

<sup>288</sup>(\*\*) The meaning of such "full acceptance" can give rise to innumerable misunderstandings. It is quite different from connivance. It does not exclude **refusal**, clearly and unequivocally - it contains it. On this subject, see the reflection in the note "Spouses - or the enigma of "Evil"" (n° 117).

note quoted), I speak of the "secret hatred and resentment" of three women I had loved, including the one who at the time was still my wife (although I had not lived with her for five years). With Looking back, it seems to me that in each of the three cases I had in mind, this impression of □ "secret hatred" p. 750 did not, strictly speaking, correspond to reality - by which I mean any direct perception I might have had at any time<sup>289</sup> (\*) of such hatred. What I had perceived, and what I had had ample opportunity to experience, was a will to destroy, or a will to cause pain, or to injure, both lasting and apparently inexplicable, gratuitous - something I had **interpreted** as a sign of hatred, "secret", because never expressed. In fact, I think that for two of the women in question, it was in these quoted lines, for the first time since I had □ known them, that I made the observation that appeared to me p. 751 as a "secret hatred". At this point in my life, it was impossible not to make the confusion I've just mentioned. This confusion in no way detracts from the importance of making this observation, involving myself in it just as crucially as these women to whom I was closely linked.

As for the "resentment" referred to in one breath with "secret hatred", I sensed from the outset that if a "certain force" superyang within me had drawn the resentment of each of these three women to my person, it was for grievances for which I was in no way responsible - for wounds and damage suffered "long before they knew of my existence, in the distraught days of a childhood deprived of love". This perception, which had decanted over the years as the fruit of an intense experience, surely had the effect of an invisible guide for my reflection of last December 20, in the note "Rancune en sursis - ou le retour des choses (2)" (n° 149), where the intuition appears that this same process of **displacement** of an initial resentment, or a "rancune en état de vacance", could well have taken place in my friend Pierre, around the time of our meeting or perhaps even earlier. The facts known to me make this intuition at least plausible.

There is, however, an important difference with the case of my ex-wife, and with the other two cases discussed in the post-reunion meditation. I don't have the impression that

---

<sup>289</sup>(\*) (March 6) After writing these lines, I remembered that in the course of my married life, there were two episodes, the first lasting a few days, the second a few minutes, when I felt assailed as if by two beams of hatred, shooting from the eyes of my then wife.

The first time, in the fifth year of our marriage (1962), my wife suffered what is euphemistically called a "nervous breakdown". This episode had a profound effect on the couple's life and the family atmosphere. It is also the moment in my life, of all those I have conscious memories of, that was experienced as the most atrocious, and that marked me most deeply (as it was supposed to).

Unless we have an exceptionally stable inner foundation (which, due to lack of maturity, I was far from having at the time), the hatred we are the target of, and even more so when it comes from loved ones close to us, has a devastating effect on our psyche, when it arouses in us a similar and destructive hatred of ourselves. It would seem that something in us must, at all costs, find a "meaning" for "what passes understanding", even if this "meaning" is an outright condemnation and rejection of ourselves by ourselves: since we are hated (and even though the "reason" for this hatred escapes us completely...), it's because we are hateable... .

If I was so affected by this episode, which remained like a sword of Damocles hanging over my life for the next six or seven years, it was surely because it resonated violently with a traumatic childhood experience. This had disappeared from my conscious memory, but it was all the more active whenever I was suddenly confronted with inexplicable malice or hatred - all as sudden and inexplicable as the will to destroy that had assailed me at the age of five, coming then from the person of all people who, as far back as I could remember, had been the peaceful and secure center of the Universe.

It's one of the most important things I've learned in my life about the malevolence or hatred I'm sometimes the target of, that I'm in no way the real and immediate **cause** of it (even if certain aspects of myself, which I neither disavow nor reject, contribute to attracting it to me). For years, however, this knowledge remained too epidermal to defuse this deep-rooted mechanism, which comes into play when I'm confronted with apparently "causeless" malice or violence. To defuse it, I first had to go back to its roots and retrace the steps of those forgotten days and nights, heavy with anguish, when my mother suddenly, mysteriously and inexplicably, became a hostile and fearsome stranger... ..

my friend's childhood was in any way "distraught" or "deprived of love". This difference seems to me to manifest itself in the tone of my friend's antagonism towards me, which at no time reached that pitch of **vehemence** with which I was so familiar in the other three relationships. Equally, in my friend's relationship with me, the appearance of signs of antagonism was at first extremely discreet and sporadic, and even after my departure in 1970, it took another eight years before this antagonism expressed itself directly and unmistakably against my person<sup>290</sup>. This seems to correspond to the existence of an initial "resentment" which remained diffuse, imponderable, without the presence of a hard "core" corresponding to the feeling (even if hidden from the conscious gaze) of an outrage or a wrong suffered, felt as irreparable perhaps. ...

p. 752 □ In evoking, in the penultimate note, the will to destroy, or that to injure or harm, in the **absence of hatred and animosity**, the thought came to me (with some insistence) of an apparent contradiction, which I thought I'd come back to straight away. This is it. In the two cases that were the focus of my attention, involving my pupil (and mathematical "heir apparent") and my wife, there had indeed been an unconscious "grudge" that they had transferred onto me. The very idea of a "grudge" or "resentment" seems linked to that of an "animosity" or "enmity": one would be tempted to say that a grudge (or resentment) is one of the possible ways (and one of the most common) of feeding an animosity. And this assertion is certainly justified, in the case of what we might call a "direct" grudge, a "real" grudge, motivated by a **grievance** (real or imaginary) towards the person concerned, for a **wrong** or **damage** that that person has allegedly inflicted on us. But in the cases I'm dealing with, it's not such a grudge we're talking about, but an indirect grudge, "**by proxy**" so to speak, transferred from an initial potential target, inadequate for one reason or another<sup>291</sup> (\*), to an "**adoption target**" or replacement, which appears to "fit" the needs of the cause. The remarkable thing, is that such "misplaced resentment" (it's a case of saying it!), which acts as **the** stubborn force at work behind attitudes, behaviors and acts of such a nature that they □ **would be said to be** driven by hatred or "causeless" animosity - that such a "grudge" is **nonetheless devoid of any feeling of hatred or animosity!** Indeed, it's the combination of these **two** aspects of "gratuitous violence" in the strongest sense of the term (the one I'm examining here) that makes it so disconcerting, as something truly "beyond comprehension"<sup>292</sup> (\*): the complete absence of any rational, tangible "cause" for this violence, both in the person who bears the brunt of it (without having provoked it by attitudes, behaviors or acts that are hurtful or prejudicial to the other), and in the person who carries it out (without being driven by any "cause").

p. 753

<sup>290</sup>See "Two turning points", n° 66.

<sup>291</sup>(\*) There are many such "reasons", which often mean that the person who (voluntarily or not) has caused damage or inflicted The most common, perhaps, especially when it comes to the mother or father, or someone considered beyond the reach of rank or social position, is the barrier of fear of violating a taboo. Perhaps the most common, especially when it's the mother or father, or someone considered out of bounds by rank or social position, is the fear of violating a long-standing, internalized taboo of authority. These are very strong barriers (in my case, they have tended to disappear over the last fifteen years or so, and increasingly so. . .). In the opposite direction, it can happen that the person in question is "not up to the task" of assuaging a grudge commensurate with the wrongs suffered - that he or she appears too insignificant, too evasive or pusillanimous perhaps, to be up to the role that would otherwise be rightfully his or her.

However, I can also imagine that in certain cases, the wrong suffered is too imponderable, too subtle (and even "non-existent", to say the least, according to the prevailing consensus, long internalized by the person concerned), to give rise to anything other than a diffuse resentment, unable to "condense" and take shape and strength in a relationship itself in soft tones, with no apparent angles. In fact, this is no doubt a simple variant of the previous case, which has emerged in the course of reflection.

with the note "Rancune en sursis - ou le retour des choses (2)" (n° 149).

<sup>292</sup>(\*) On the subject of this violence "beyond comprehension" ("unfassbar" in German), see the note "The slave and the puppet - or the floodgates" (n° 140). When I speak here of gratuitous violence "in the strongest sense of the term", without immediately qualifying it as anything other than "beyond comprehension", the precise meaning I have in mind is identified in the following explanation, by clarifying the "two aspects" that combine in it.

feelings of hatred or animosity that he might harbor, "rightly or wrongly", against his target).

Perhaps the question of the presence or absence of hatred or animosity, in the cases I'm dealing with (where we find ourselves confronted with violence that appears "gratuitous", as if unprovoked), is relatively incidental here, surely, as was the case for me, in the experience of the person who suffers this violence, and from the moment the violence suffered becomes conscious, there must appear an impression of "secret hatred" or "animosity" on the part of the person inflicting it. However, this impression is in no way the result of a perception (which would have suddenly appeared, as if by a wave of a magic wand), but rather that of a cookie-cutter **assimilation**: violence = hatred (or animosity)<sup>293</sup> (\*\*).

One thing that seems much more important to me, however, is to note not only **the existence** of something as seemingly aberrant, as demented, as contrary to the most inveterate "common sense" reflexes, as "grudge by proxy", displaced from its "original <sup>target</sup>□ (or targets) to p. 754 a "replacement target" (a target of pure convenience, almost!); but to note, **moreover**, that this is one **of the most common mechanisms**, encountered at every street corner, whether in one's own person (the last one you'd think of going after. . . ), or in that of one's family and friends. I even have the impression that this mechanism is **universal in nature**, that it's part of the basic mechanisms of the human psyche, that it's one of those few all-purpose mechanisms that make up the **syndrome of flight** from reality: the refusal to take cognizance of it, and the fear of assuming it.

More to the point, today I feel as if I've put my finger on the **mainspring common to all situations of "gratuitous violence"**, without exception. This impression emerged, with the force of a sudden conviction, when I began to examine (three paragraphs above) an "apparent contradiction". I then had the feeling that a whole host of fragmentary and heterogeneous impressions stored up over the course of my life, revolving around the "sensitive point" among them all of this violence "that surpasses understanding", were suddenly coming into order, suddenly acquiring a perspective that they still lacked - a perspective that appeared there unexpectedly, at the end of a thought, just as I was about to place a very last dot on a very last i. ...

#### 18.2.12.4. (d) Nichidatsu Fujii Guruji - or the sun and its planets

**Note** 160 (January 8) For the past week, there's been an unusual cold snap - temperatures of -15 and below, and when the wind blows from "Mont Ventoux" (the name says it all!), it must be even colder. It seems that this wave is sweeping the world (according to someone who listens to the news), and that in the south of France it hasn't happened since the famous winter and spring of 1956. When I was growing up in Germany, I experienced cold like that, but there was snow to protect the earth, and put a gentle tone in the air and on things. With this snow-free cold, the earth's surface is frozen like a block of ice. In just a few days, the garden has been raked - I don't know if there will be anything left in the spring from what we sowed and planted. The remaining leaves of leeks, celery, chard, lamb's lettuce, beet and chard are like sheets of ice, frozen vegetables. We hurry to harvest as much as we can

day by day, to eat it as we went along, before it thawed and everything went on the compost. And <sup>yesterday</sup>□the water supply had frozen in the kitchen, luckily there was still running water downstairs in the old p. 755

<sup>293</sup>(\*\*) (March 6) In some cases, however, there may well be a perception of a hatred that is actually present, even though it has in no way been provoked (see today's footnote on this subject). It's a hatred which, except in exceptional circumstances, remains confined to deep layers of the unconscious, and which moreover remains there in a state of "vacancy", without a designated target, even though it is the secret force driving acts of violence (most often in insidious form) which, in turn, do indeed and with unfailing constancy aim at the same chosen target. ...

garage, less exposed to the cold. Today a friend came over with a portable gas flashlight, and managed to get the water going again. I'll have to leave a trickle of water running so it doesn't refreeze so dry. Luckily I've got a good wood-burning stove in the dining room, where I've moved my work. I warm myself with vine stumps, which I break with an axe every day, a good grape crate full overboard in the cold weather. When the wind's been blowing all afternoon, it's enough to give you a cold sore, just standing there for a quarter of an hour, twenty minutes, breaking wood in the wind. Not to mention the fact that the car outside won't start - I've heard that cars don't stand the extreme cold very well, antifreeze or no antifreeze. The same complaisant friend got it running again earlier today, but will it still work tomorrow to proofread the typing of the secretary I gave the job to? In short, all it takes is a cold snap in winter, or a heat wave in summer, or a good little illness at any time, to remind us of some of the realities of life that we tend to forget when everything's humming along just fine...

Over the last three months, my work rhythm has gradually shifted towards the night hours. I work until around two or three in the morning, and sleep until around eleven or twelve. With the weather the way it is, if I listened to myself once in bed, I'd stay up for my easy twelve hours - and conversely, once at work, I'd never go to bed again! Right now, I'm trying to keep a reasonable balance. I don't worry too much about time shifts, as long as I get a good night's sleep, and don't lie in bed for hours on end with my thinking machine still running. Even now, when there's hardly any work to be done in the garden, there's still enough to keep me busy every day, including the firewood, and a little gymnastics here and there. I have the impression of a satisfying balance in my life, where: the work of discovery doesn't seem to devour everything else, but without being on the small side. Since I went back to work on September 22, I must be spending an average of five to six hours a day on it. It's modest, but the "output" seems hardly less than before. The "slaughter" (around a hundred pages a month) is about the same, give or take, as writing the first two parts of *Récoltes et Semailles*. But from a qualitative point of view, there's no doubt in my mind that this third part is the most profound, the one that has taught me the most about myself and others.

□Na mu myo ho ren ge kyo!

p. 756

Just as I was finishing this short retrospective on the rigors of winter and the evolution of my life balance, I received a phone call from one of my Buddhist monk friends from the Nihonzan Myohoji group, announcing the death of their revered "preceptor"<sup>294</sup> (\*), Nichidatsu Fujii, better known as Fujii Guruji, or "Osshosama" to those close to him. My friend in Paris has just received the news in a phone call from Tokyo, and I assume that Fujii Guruji has died today<sup>295</sup> (\*\*). He had just turned one hundred on August 6, physically weakened but in excellent mental condition.

By a strange coincidence, August 6 is the anniversary of two other important events, one of historical significance, the other of a personal nature for me. It's the anniversary of the atomic bombing of Hiroshima (August 6, 1945) - which the Japanese commemorate as "Hiroshima day". (That's why

<sup>294</sup>(\*) "Preceptor" is more or less equivalent to "teacher", meaning "master" or "teacher". Nihonzan Myohoji is the phonetic transcription of the group's Japanese name, which translates as "Japanese Mission". This is a "missionary" Buddhist group, with a primarily pacifist vocation. See below for further details.

<sup>295</sup>(\*\*) As it turned out, he had only been dead for a few hours. The news spread fast!

Fujii Guruji's birthday festivities were held towards the end of July, to keep the days around August 6 available for pacifist and anti-atomic demonstrations). On the other hand, my father was born on August 6, 1890, six years to the day after Fujii Guruji's birth.

After the death of Claude Chevalley, Nichidatsu Fujii's is the second death of a person who played a significant role in my life, and it occurred during the writing of *Récoltes et Semailles*. In view of this passing (which doesn't really come as a surprise), I'm particularly pleased that just last year, there was a warm exchange of letters with him. I had been invited to attend the ceremony for the old Master's hundredth birthday, which was to be held with exceptional pomp in Tokyo (a small book of testimonials about him had even been hastily edited, to be presented to him for the occasion). This had been an opportunity for me to write (as I do almost every year), a few words of early congratulations, apologizing for not being able to attend the ceremony on July 30, as I myself was still more or less bedridden at the time of writing. (It's also true that I'm not

public ceremonies, but I didn't think it was worth mentioning it in this article.

my letter. In any case, I'd have disappointed and pained more than one of my monk friends, by abs- p . 757 stubbornly refused to attend any of the "grand occasions"<sup>296</sup> (\*), to which they never tired of inviting me). I had to add a few words about the beneficial side of illness, which forces us, in spite of ourselves, to "unplug" from our occupations and give the body what it craves. Fujii Guruji himself had been bedridden a lot during the past year, which must have weighed heavily on him, given his action-oriented temperament and uncommon energy. Although it had been over seven years since I had received any personal communication from Fujii Guruji, I was surprised to receive a letter from him, dictated by him while he was still bedridden. The letter (which I've just reread) is dated July 13, 1984. It's a letter full of delicacy, in which he worries about my health, and laments not being able to send someone to take care of me. He also talks about his health, and the mood in which he endures his forced inaction. He ends with these words, in very "Japanese" style, which should be taken with a (large!) grain of salt, and which showed me, perhaps even more than the rest of the letter, that my tone was as good as ever<sup>297</sup> (\*\*):

"Indeed I am a very old decrepit man of no use even if I may get back to normal life. Yet still, I would like to live and see how the world turns."

There he was able to watch the world go round again for almost six months. ...

My links with the Nihonzan Myohoji group go back to 1974. There's no way I can even begin to sketch out these many and varied relationships here - I'd need a whole book to do that.

volume. They are among the richest "spin-offs" from the "Survive and Live" episode<sup>298</sup> (\*\*\*) which followed my p . 758

<sup>296</sup>(\*) Chief among such "grand occasions" was the inauguration of "Shanti stoupas", or "Pagodas of Peace". The construction of these Pagodas, or places of meditation for world peace, goes back to a very ancient tradition in the Buddhist world (initiated by King Ashoka in India), and was one of Fujii Guruji's main preoccupations. It has inspired the construction of a large number of Shanti Stoupas around the world, including three in Europe and one in the USA.

<sup>297</sup>(\*\*) The letter was dictated in Japanese (the only language Guruji spoke) and translated directly into English. French translation of the lines quoted: "Certainly I am a very old and decrepit man and of no use even if I can regain normal health. And yet, I'd like to live and see how the world turns out."

<sup>298</sup>(\*\*\*) This episode is alluded to several times in "Fatuité et Renouveau" (the first part of *Récoltes et Semailles*). *Survivre et Vivre* (first called "Survivre", then "Survival") is the name of a group, initially pacific, then also ecological, which originated in July 1970 (on the bangs of a "Summer School" at the Université de Montréal), in a milieu of scientists (and above all, mathematicians). It rapidly evolved towards a "cultural revolution" direction, while broadening its audience outside scientific circles. Its main means of action was the bulletin (more or less periodical) of the same name, whose successive directors have been Claude Chevalley, myself, Pierre Samuel, Denis Guedj (all four mathematicians) - not to mention an English-language edition, maintained at arm's length by Gordon Edwards (a young Canadian mathematician whom I had met in Montreal and who was among the few initiators of the group and the bulletin).

departure (between 1970 and the end of 1972). There had been mention of this group, and of the (not very periodical!) bulletin of the same name, and also of my "departure from maths" and my "trajectory", in a Japanese newspaper (or newspapers?), in 1972 or 73. The "criticism of science" and denunciation of the military apparatus, and also, perhaps, the "criticism of a civilization" aspect, must have "passed" in some article, attracting the attention of one of the monks at Nihonzan Myohoji. He told others about it, and in particular a younger monk from the same town (Kagoshima), who had become a monk under his influence and was something of a "pupil". This

p. 759

was the first missionary monk of the group to land in the "West", in Paris to be precise, in the spring of 1974<sup>299</sup> (\*). He came to find me a few weeks later and unannounced, in the remote village where I was living about fifty kilometers from Montpellier. Since that memorable day in May, when I saw, under the midday sun, a strangely dressed man, singing on the road to the accompaniment of a drum and heading (there was no mistake. . . ) towards the garden where I was working alone - since that day I've had the privilege and pleasure of seeing many Gurujī devotees and<sup>300</sup> (\*) sympathizers pass through my house. Their contact has been of great benefit to me. At the beginning of November 1976, I even had the honour and joy of welcoming Fujii Gurujī himself, then aged 92, to my rustic home, accompanied by a group of seven or eight monks, nuns and disciples. I had already met him the previous year, at the solemn inauguration of the group's temple in the eighteenth arrondissement of Paris. Over and above the *de rigueur* words of courtesy, there was then a strong contact, an immediate sympathy. The more intimate and personal context of a several-day visit to my home gave me, of course, a much richer apprehension both of Fujii Gurujī as a person, and of his relationship to the group of which he was the head, and the soul.

Interestingly, this visit from Fujii Gurujī followed very closely, by just two weeks, the crucial turning point in my life that took place between October 15 and 18 of the same year, mentioned elsewhere<sup>301</sup> (\*\*). The weeks that followed those days of crisis and renewal were among the most intense of my life, with each day bringing its own unexpected harvest of inner events and discoveries. To tell the truth, this visit, planned and prepared for weeks, of a whole group of monks and nuns around their revered master, seemed to come there as a kind of strange interlude, like a diversion in the adventure that was then absorbing the totality of my being. It was respect for my hosts, and in particular for Fujii Gurujī who had come to honour my home, that enabled me to remain there for these few days,

---

The first bulletin, written entirely by me (naive and full of conviction!) and printed in a thousand copies, was distributed at the International Congress in Nice (1970), which brought together (as it does every four years) several thousand mathematicians. I was expecting a massive turnout - there were (if I remember correctly) two or three. Most of all, I sensed great embarrassment among my colleagues! When I talked about the collaboration of scientists with the military, which had infiltrated scientific life from all sides, I was really putting my foot in it... It was in the "big scientific world" that I felt the greatest discomfort - the echoes of sympathy coming from there were reduced to those of Chevalley and Samuel. It was in what I have elsewhere called the "swamp" of the scientific world that our action found a certain resonance. The bulletin ended up with a print run of some 15,000 copies - an insane amount of housekeeping, by the way, when distribution was done by hand. Didier Savard's juicy drawings undoubtedly contributed greatly to our canard's relative success.

After my departure and that of Samuel, things turned into a leftist groupuscule, with sharp jargon and unanswerable analyses, and the bulletin died a natural death. What had been to be understood and said, at a certain point close to the effervescence of 1968, had been understood and said. After that, there was little point in spinning a record over and over again. ...

<sup>299</sup>(\*) He did assure me that he was the first Buddhist missionary monk in the West, in the history of Buddhism - but I can't guarantee that this information is reliable! It's not clear that becoming a missionary was really a great "step forward" for Buddhism. Right from the start, this aspect of the Nihonzan Myohoji group aroused reservations in me, which have only grown stronger over the years.

<sup>300</sup>(\*) It was precisely one of these who had the honor, as an "illegal alien", of being the occasion for the first literal application, in French jurisprudence, of a certain rather incredible article of a certain "Ordinance of 1949". I had the honor of finding myself in the Correctionnelle, for having "lodged and housed" such an outlaw free of charge. See about this episode in the section "My farewells - or strangers" (n° 24).

<sup>301</sup>(\*\*) See the section "Desire and meditation" (n° 36) and the note "Les retrouvailles (le réveil du yin (1))" (n° 109).

the availability that the occasion demanded. As has often happened to me, it was only once I got to the heart of the event that I realized that it was in no way an "interlude" or a "diversion", but rather an opportunity for me to take part.

□ that it was part of the adventure I was living. Underneath its very "tales from the Orient" exterior, a perfect delicacy and unusual charm, this so-called "interlude" brought me into the presence of men and women like myself and the men and women I'd always known, in less exotic, less extraordinary contexts. It was because I sensed this kinship that I also felt that my hosts were friends and brothers, and not characters straight out of a tale of a thousand and one nights, as must have been the case for many of the astonished villagers. And Fujii Guruji himself, who spoke so familiarly to me while his "relatives" remained at the proper distance demanded by the respect due to the revered master, I felt very, very distant (from me as well as from his relatives), and yet close at the same time, as if he had been my father, or a benevolent elder brother.

p. 760

And as is not uncommon with even the most benevolent of fathers or older brothers, he had an expectation of me, one he made no secret of, an expectation shared by those accompanying him, all of whom were my guests. And I also knew I couldn't meet it. My adventure was linked to Fujii Guruji's, by links I could only dimly discern, perhaps deeper than I could see, and to those of his disciples who followed him with their eyes closed. But it was no more that of my prestigious and benevolent host, than it was that of my father, also prestigious to me and benevolent, very close and yet different: another person, another destiny.

It wasn't easy to "get over" the fact that I wouldn't be one of them in an undertaking that was theirs, and that I didn't feel was mine. According to the picture of me that Fujii Guruji and his followers had been given, this was the last thing they would have expected - and all the more so as the relationship on a personal level, between the group or the various members of the group and myself, was a veritable honeymoon. It was during this visit, too, that some long-standing resistance, due to my upbringing, vanished, and I joined my hosts in chanting their mantra with them, accompanied by drumming:

"Na mu myo ho ren ge kyo!"

This mantra is the foundation, the alpha and omega, of their religious practice. They sing it most often accompanied by the prayer drum, one hour in the morning and one hour in the evening. Following the teachings of the Japanese prophet Nichiren, this drum chanting is in itself the sovereign good, the dispenser of peace in the world.

the one who sings it and around him. This song is therefore for my □ Japanese friends what is commonly called a "prayer". The meaning they give it, in agreement with Nichiren, and with their direct "preceptor" Fujii Guruji, is that of an **act of respect** for the person addressed, and through him, for every living being in the universe - as a being promised (according to the Lotus Flower Sutra) to become Buddha, incarnation of perfect wisdom. These seven syllables also serve as a greeting for any other person, or even for any other being we wish to greet, with this connotation of respect for what is of divine essence in the other. They also serve as a thanksgiving before the meal. To tell the truth, it seems to me that there is hardly an occasion, whether in moments of surprise, emotion or contemplation, that is not conducive for a Nichiren follower to say the sacred words. As for me, without sharing the religious beliefs of my monk friends<sup>302</sup> (\*), it's with joy that I join them, when the occasion arises, to do Odaimoku - to sing on the drum what they call "the Prayer". It's in their memory, and as an act of affectionate respect

p. 761

<sup>302</sup>(\*) I don't feel I belong to any particular religious denomination. Through my parents' upbringing, I was an atheist (with an anti-religious undertone) until the age of fourteen. A remarkable lecture by my natural science teacher, on the history of the evolution of life on earth, made me understand, without the slightest possibility of doubt, the presence of a creative intelligence at work in the Universe. This understanding, which at the time remained at the level of the intellect alone, broadened and became clearer in the course of my subsequent maturation, continuing after my departure from the mathematical

## 2. A walk through a work or the Child and Mother

scene in 1970.

to their master, Nichidatsu Fujii Gurugi, that I have also included "the Prayer" in my daily life, chanting it before each of the two main meals of the day, at least when I'm at home, or with friends, or with people I know won't mind<sup>303</sup> (\*\*). This is one of the most valuable things I owe to Fujii Gurugi and to those of his disciples whom I have known and who have given me their affection, without tiring of my reluctance to associate myself in any way with their missionary activities.

There are several million Nichirenite Buddhists in Japan, divided into a number of different sects. very different physiognomies. The Nihonzan Myohoji group is one of the smallest in terms of numbers, comprising just a few hundred active monks, nuns and sympathizers. Yet it is well known in Japan and elsewhere,

distinguishing itself from all traditional religious groups by an unequivocal political commitment, including the main emphasis is on the struggle for peace, anti-militarism and, in particular, anti-nuclear action. At the time of the Vietnam War, it was the only Buddhist group (unless I'm mistaken) to take a clear stand against the Americans, and to fight against the presence of American bases in Japan (which served as logistical support for the continuation of the war in Vietnam). In recent years, Fujii Gurugi has also been in close contact with the leaders of the American Indian Movement (AIM). Monks from Nihonzan Myohoji have taken part in marches organized by American Indians, not to mention other Peace Marches in various parts of the world. Indian leaders were visibly attracted and impressed by Fujii Gurugi's unusual personality. The fact that this man of indomitable energy, approaching a hundred years of age, was a great missionary of a religious faith different from their own, didn't seem to bother them at all. On the contrary, the religious dimension of the venerable Master's zinc-spiked "anti-American" options was surely, in addition to his age, one of the reasons why they welcomed Gurugi as they would have welcomed one of their own, like a highly respected father or grandfather in whom they recognized themselves<sup>304</sup> (\*).

I'm sure that this religious dimension played a similar role for me - it brought Fujii Gurugi closer to me, even though I don't claim to belong to any particular religious faith. If I ask myself what attracted and struck me most about him, I see several things. The most obvious is an inner **joy**. This joy seems to flow spontaneously from a **unity** within him, or rather, perhaps, from a **fidelity** to himself. One senses that this man is happy, because all his life he has done without hesitation what he felt he had to do. He never appears to me not free of contradictions, but devoid of ambiguity. The meaning of some of his acts or omissions escapes me, but at no time has it occurred to me to doubt the man's total integrity. If he This is not the result of an analysis of what I know about him through other people. You only need to have met him once to know that he is a man who knows no ambiguity, a man in deep accord with himself. This is what the Indian chiefs of the AIM must have sensed, to give him the place they have made for him among them. This is surely where his extraordinary ascendancy lies over those who claim to be him, men and women whose ideological and philosophical options cover a spectrum ranging from hard-line Marxism-Leninism to the good-natured conformism of a chain's CEO.

<sup>303</sup>(\*\*) I refrained in particular from singing the prayer at the weekly meal I had at the Faculty, in the company of a few students or colleagues, not being sure that one or other of them would not feel some kind of constraint, which I would impose on him thanks to my position as elder or "boss".

<sup>304</sup>(\*) To give an idea of the bond of trust and respect linking the Indian chiefs to the person of Gurugi, I'd like to point out here that during the great annual initiation festival, held around the "sun dance", Gurugi's monk disciples took part, beating the great prayer drum from sunrise to sunset, to the throbbing rhythm of *Na mu myo ho ren ge kyo!* These large drums, hollowed out of a single trunk and stretched with ox skins, are unusually powerful, and (I presume) hard to bear for twelve hours on end. (I experimented with this for two hours, during the inauguration of the temple in Paris, an experiment that was conclusive. ...). ) In any case, Robert Jaulin (who, along with the monks, was among the few non-Indians invited to take part in the festival) told me that the Indians stoically endured Grandfather Gurugi's sacred drum from the beginning to the end of the initiation, of which the Gurugi tam-tam was one of the many trials. ...

department stores. What unites them is not the veneration of a certain Sutra, which perhaps none of them has had the effrontery to read<sup>305</sup> (\*), nor a certain prayer of Pali origin, restored to Japanese via Chinese translation, and which professes veneration of this Sutra. What brings them together (or should we say, what had brought them together?) is one **man**, exerting over them an ascendancy he no more sought to exert, than the sun sought its planets.

I also saw that this man was **alone**, and that solitude didn't weigh heavily on him. It was his natural condition, perhaps always had been. This solitude, and this integrity, or accord with himself, appear to me as so many different aspects of one and the same thing. Yet another aspect of the same thing is that of **strength** - strength without violence, and which doesn't care about being or appearing "strong". It's the sun's force, again, which suffices to be itself in order to create this field of forces around it, and the orbits that the planets travel in.

Surely, this is also the force I spoke of more than once in Harvest and Sowing, as "**the** force" in us - with the difference that in one man it is fully apparent and sensitive to all who approach him, and in another it is buried more or less deeply, to the point where sometimes we could even "see" it. believe it to be non-existent. But if some of my monk friends seem to deny it in themselves, this Sutra nevertheless they profess to venerate, and the very prayer they chant day after day, clearly proclaim that a p. 764 such a force lives in every living thing in Creation, promised like them, and like their revered master Osshosama himself, to the Buddha's destiny.

### 18.2.12.5. (e) Prayer and conflict

**Note** 161 (January 13)<sup>306</sup> (\*) It's been another four days since I've had the peace and quiet to work.

- to continue the notes, I mean. The main reason lies in the rather incredible difficulties I'm having in getting this third part of Récoltes et Semailles typed out on the net. In the thirty-plus years I've been in the habit of getting typing work done, I've never experienced anything like it. Clearly, having this highly personal, not to say intimate, text in my hands triggered (surely unconscious) reactions of considerable force in the people in charge of typesetting, each time going in the direction of a veritable sabotage of the work entrusted to them. In the space of a few months, the same scenario was repeated three times in a row, with some variations, with three secretaries in a row, all of whom had not given each other the word<sup>307</sup> ! This third time, moreover, a sordid note was added, as the secretary, Mme J., pretended to use the rather unusual manuscript that had been entrusted to her care,

<sup>305</sup>(\*) More than one of Guruji's disciples has made it clear to me that he would consider it an overstretch to pretend to read the Lotus Flower Sutra, even though a Japanese translation exists. Only a man of great depth of spirit, such as his master Fujii Guruji himself, would be able and worthy to read this sacred text, which is infinitely beyond the intelligence of the layman. Clearly, the faith of these men and women is not in some more or less deified historical figure, such as Buddha, or the perfect Bodhisattva and prophet Nichiren, but in Fujii Guruji himself.

<sup>306</sup>(\*) (January 23) The whole first part of this note was written against strong resistance to mentioning the disturbances interfering with my work. These took on a vaguely ridiculous figure, and to even mention them was a bit like graciously providing the rods to get beaten! On the other hand, these disturbances, "which can literally saw you off", had become so grating and invasive in my work, especially during a week or two, that it would have been a kind of cheating, an inauthenticity in the testimony, to pass them over in silence as if nothing had happened. I come back to my setbacks ten days later, in the note "Jung - or the cycle of 'evil' and 'good'".

(March 7) This last note, the first of a whole series of "reading notes" on C.G. Jung's autobiography, was finally discarded in a final section of Harvest and Sowing, made up of the part of the reflection prompted by this autobiography.

<sup>307</sup>(\*\*) Those who wish me well will have no trouble accusing me of delusions of persecution - after the brotherhood of movers, here comes the brotherhood of typists-secretaries who are mobilizing to do me harm! See, for precedents, the note "Le massacre" (the name of the note already says enough about me... ) p. 538, about my friend Ionel Bucur's move... .

as a means of blackmail to extort some sort of ransom. She is a former executive secretary, with a great ☐ habitude of the trade. The first eleven pages of typing were impeccable and without a single mistake and in the next fifteen pages alone, there were eleven lines skipped - I've rarely seen a text crippled so badly! I didn't ask what the ransom was (over and above the price agreed for the text already typed) to get my manuscript and the typing back, as I have no desire to encourage this kind of procedure. This means I'll probably have to resort to legal action.

Fortunately, I still have a draft of the manuscript, which I can use if need be. Don't forget that this kind of circus, especially when it becomes repetitive, can literally "saw you off". When I imagined the difficulties and antagonisms that my modest meditative and autobiographical paving stone would undoubtedly raise, I certainly didn't imagine that it would be from this side, from the brotherhood of secretary-typists (instead of that of my honored mathematician colleagues) that the first trouble would come, and in the nature of a sort of war of attrition! Now I'm not so keen on entrusting this same text (once recovered) to the hands of a fourth secretary, when there's nothing to suggest that she'll have any more commiseration for it than those she'll be taking over from. And doing the secretary's job myself would require a time investment of well over a month, which I'm absolutely not willing to provide.

Perhaps I'll have to forego a typesetting of this third part of *Récoltes et Semailles*, which I'll entrust directly to the publisher in the form of a rough manuscript. (I don't anticipate the same kind of trouble with the protes responsible for typesetting the text for printing!) This would mean, above all, that I would forgo including this third part in the limited pre-edition of *Récoltes et Semailles* to be produced by my university, USTL, for personal distribution among colleagues and friends. Or maybe I'll have it printed later, if I end up finding a secretary who does a decent job. I'll only send out this part (surely the most "difficult" of the three) at the express request of those really interested in receiving it, among those who will have received the first two parts. I'm really looking forward to getting these printed and sent off (although I'm in less of a hurry for the third part). The typing of these two parts was completed months ago, and had been handled (without any problems) by the USTL secretaries. They could have been printed a long time ago, if I hadn't wanted to include

a table of contents of all three parts of *Récoltes et Semailles*, when for more than three months I think ☐ I've been on the verge of finishing this interminable third part. Now I'm going to give myself until the end of this month to finish, or if not, to take care of the printing of the first two parts (Fatuity and Renewal, and Burial I, or the robe of the Emperor of China), without including a complete and definitive table of contents of the third part (Burial II, or the key to yin and yang).

And now, after all these unpleasant incidents, I have to find my way back to a train of thought that was cut short.

The death of Fujii Guruji in his one hundred-and-first year, on January 9th, was an opportunity to evoke, with him, an aspect of my life that I hadn't touched on before. Unable to see Guruji again on his deathbed, and to take part in a wake with his loved ones, I spent the night after his death in a solitary vigil, jotting down until morning some of the reminiscences and thoughts prompted by the event. In retrospect, I thought it would be a good idea for me to try, on this occasion too, to say what the encounter with Fujii Guruji, and with those of his disciples with whom I had a close acquaintance, had brought me.

In the notes from five days ago, I already mentioned the Na mu myo ho ren ge kyo chant, which for many years has entered my life, and which is a blessing. There's also the affection received by Fujii Guruji himself, and

by many of his disciples, young and old. It is this affection, surely, that gives its price and beauty to the song I received from them, which is itself an act of respect and affection for all living things in creation, including them and myself.

Also, my contacts with the monks and nuns of Nihonzan Myohoji were my first and only close contacts with men and women whose main, if not total, investment is in religiously-motivated tasks (just as for a long time my own investment was in mathematical discovery work). This was an opportunity for me to realize that, as elsewhere, beyond a certain affinity with a common (so-called religious) vocation and allegiance to the same strong and engaging personality, differences in temperament, conditioning and even profound **choices** remain just as marked, and just as active in person-to-person relationships. To put it another way,

the efforts of some people to **model** themselves after some religious ideal (in this case, that of the "Boddhisatva", the infati-

gable propagator of the Buddha's teachings) débouchent sur des **attitudes** plus ou moins à fleur de p . 767

skin, not on a process of inner **transformation** or maturation. On the other hand, the adoption of a "creed" (however sublime it may be) and investment in a so-called "religious" activity, seems to have no essential impact on the play of habitual egotic mechanisms. Conflict is no less present in monasteries, convents, temples and other religious communities of all denominations than anywhere else in the world. And often the religious vocation is taken as one means, among others, of evacuating conflict, by convincing oneself that it has disappeared by virtue of the creed.

It's also true that, on different occasions, in one of my monk guests there was an inner peace and joy that radiated from him, sensitive to me as to all who approached them, and beneficial to themselves as to all. Clearly, such a state of harmony and wholeness, of profound accord, is alien to any effort to be this or that - it is an "effortless" state, a state of perfect naturalness.

For four of the monks in whom I sensed such radiance, I have the impression that this has been their customary state for many years, even decades. This is particularly true of Fujii Guruji himself. For two other friends of mine, I've seen them on other occasions as knotted and as torn as anyone else. It was as if that state of harmony in which I had known them, and a certain spontaneous understanding of things that was one of the signs of it, had become null and void - as if they had left no trace of themselves. I'm convinced, however, that there is an indestructible "trace", deeper than a simple mark recorded in memory - a trace in the nature of **knowledge**. Like everyone else, these friends are free at any time to take account of the knowledge deposited in them at the creative moments of their existence, to let it act and bear fruit; just as they are also free to ignore it, to bury it, to "play dumb" in short. This is, after all, the most common thing in the world... .

The thought occurred to me that this state of perfect naturalness, of profound agreement with oneself, and the radiance that accompanies it, are **not** very common things, on the other hand. It's quite remarkable that in the rather small group of monks I've been able to welcome into my home, be it for a few days or a few weeks, there have been so many in whom I've found this state of inner harmony, of strength at the core of their being.

She's the one who unites humility and fortitude, the gentle and the incisive. Wouldn't that be

end of committee, well and truly the action of a creed, or of the Prayer that expresses it? This one' □ if obviously not

p . 768

can on its own create a state of grace, perhaps it tends to **encourage** the emergence of such a state, and its renewal day after day? After all, the very act of singing a beautiful song and putting our whole selves into it is already to some extent a "state of grace" - and the very beauty of a song (or a prayer) already encourages us to "put our whole selves into it".

It's also true that the most beautiful of songs, when we repeat it with our minds elsewhere, remains inactive, for want of

it's up to us to open up to it. Or to put it another way, what we play back **is not** the song we think it is, and our soul doesn't feed on it, any more than a paper or plastic rose is a rose, and a bee would come and pick it.

#### 18.2.12.6. (f) Belief and knowledge

**Note** 162 (January 14) As I concluded the reflection of a week ago, I had the feeling that I had "put the doigt" on something important. That very night, I wanted to lapidarily express this "something" in the name given to this note, "The cause of causeless violence" (note n° 159). I also knew that this sudden flash of understanding was in no way the culmination, or even the final point, of a reflection that for more than a month<sup>308</sup> (\*) had been revolving around the mystery of "causeless violence", or "gratuitous violence". On the contrary, the new "perspective" that suddenly appeared was rather like a new point of departure. The mechanism of the "displacement" of resentment or resentment for wrongs and damages suffered in earlier days, to an **acceptable** "target" in place of the real culprit(s), felt to be out of reach or "taboo" - this mechanism, which I had first recognized sporadically, in this and that isolated case in the course of my life, and tacitly taken for some kind of strange, erratic aberration of the unconscious, is at last recognized as one of the "basic mechanisms of the human psyche". At the same time, it appears to be responsible for the innumerable and disturbing manifestations of "causeless violence", whether between wife and husband, lover and lover, parent and child, or the "anonymous" violence that reaches its climax in times of war or large-scale violence.

social convulsions.

p. 769

□ I don't know whether these links have long since become part of the B.A.BA of psychological science or psy-

chiatric science (assuming such a "science" exists), or whether what I say here will come across as the phantasmogoria of a "psychoanalytic dilettante". As my aim is not to present a doctoral thesis in psychology, nor even to break new ground for some old or new theory, but to understand my life through the situations in which I am involved, I don't care about the "status" of what I happen to put my finger on, or the "perspectives" I suddenly see opening up here and there. I'm well aware that, in any case, if I want to understand anything at all, I can't do without personal reflection, be it in mathematics, or in my life and in those to which my life is linked in one way or another. All the more so, when what we're trying to understand seems to defy reason from the outset, and when I see everyone around me and elsewhere evading it like the plague, with reassuring clichés. (And it seems to me that psychology professionals are no more an exception than anyone else, at least when it comes to themselves).

I was well aware that the "sudden conviction" that came with "the last dot on the last i", namely that "I'd put my finger on the spring common to all situations of 'gratuitous violence'", in no way absolved me from the task of examining on the spot, and from every angle, this new intuition that had arrived in the field of conscious gaze, not yet free of the diffuse halo of what had just emerged from the mists. On the contrary, this was precisely the first job to be done, and I could already see a host of new questions arising, both specific to particular cases and general. If there was any certainty in this cookie-cutter "conviction", or to put it more accurately, a kernel of certain knowledge, it in no way told me that the formulation I'd just given to this conviction was "true", "correct", without any major reservations or alterations perhaps; but rather, that I had indeed put my finger on a **new** (for me) and **essential fact, that a new perspective** on violence had indeed just emerged.

---

<sup>308</sup>(\*) Specifically, since the December 7 memo "Velvet paw - or smiles" (n° 137).

<sup>309</sup> (\*). As for the precise and nuanced meaning of this new fact and this new perspective, its exact scope and also, perhaps, its unforeseen extensions and repercussions, they cannot fail to emerge, as soon as I invest the necessary work in them. The "knowledge" that had just appeared told me, in particular, that the time was ripe for such work, for entering further into an understanding of violence, and in any case, into that of "gratuitous violence"; that every hour and every day that I would devote to this task, to follow through on what had just appeared, would take me further into this understanding. I don't recall that such a feeling of the appearance of something new and essential (even though it would still remain diffuse and approximate), and the intimate conviction of being able to penetrate further into the understanding of this thing, ever deceived me. If there has been a sure guide in my research to "place" my investments in this direction or that, it is the feeling of the appearance of the **new**, and this intimate conviction that tells me when the time is ripe to enter further into this "new" glimpsed and to know it<sup>310</sup> (\*).

□ This doesn't mean that, whenever the time is ripe to launch myself in such and such a direction, and to to know such things, I'm going for it! It was impossible even when I was investing all my energy in mathematics, when I gradually found myself with ten irons, then a hundred at a time in the fire!<sup>311</sup> (\*) And it's been the same in meditation, that is, in self-discovery. At the level of conscious work, we can, alas, only do one thing at a time (which isn't bad, however, when you take the trouble to do it right. . .). This work on **one** of the "hundred irons in the fire" can, it's true, in the mysterious ways of the unconscious, also benefit all the others, or at least several of them - it can "warm them up", make them more receptive to hammer blows on the anvil of conscious attention, from the moment we turn our attention to them. But we need to know how to choose "the right" iron from among the hundred - the one whose shaping will also advance the work on others, which are in the process of heating up like it.

p. 771

<sup>309</sup> (\*) As I was writing these lines, the comparison with the "standard conjectures" on algebraic cycles, which I presented at the Bombay symposium in 1968, came to mind. They seemed to me then (and still do today) to be, along with the resolution of singularities, one of the most burning issues in algebraic geometry. As I worked out these conjectures, I sensed that a "new perspective. . . had just been established", this time on algebraic cycles, their relation to Hodge's theory and Weil's conjectures. What struck me most was that I could see the beginnings of an approach to Weil's conjectures that would be "purely geometric", by which I mean, without having (at least in appearance) to go through the medium of a cohomological theory.

As I have already pointed out elsewhere (in sub-note n° 106<sub>1</sub> of the note "Muscle and tripe"), the reality of this "new perspective" and its scope, is entirely independent of the question (which remains in the limbo of the future) whether this conjecture will be

true or false. A conjecture, for me, is not a **bet** (that you win or lose), but a **guess**.

- and whatever the answer, we can only come out "winners", by which I mean: with renewed knowledge. (Compare with the reflection in the section "Error and discovery", n° 2.) Assuming that the conjecture turns out to be wrong, I can already see two or three "less optimistic" variants, which from then on affirm it, the weakest of which is practically equivalent to the existence of a "reasonable" theory of semisimple patterns over a body.

Identifying these variants, for someone with a bit of experience, is an exercise lasting an afternoon or two (and perhaps the starting point for a long journey into the unknown. . .). Unpacking the first statement (inspired, as usual, by an idea of Serre's, set out in his article "Analogues kählériens des conjectures de Weil"), was not an exercise, but indeed a **discovery**; or again (to use the expression from Zoghman Mebkhout's letter, quoted in the note "Echec

d'un enseignement - ou création et fatuité", n° 44') a **creation**. And it was an understatement when Zoghman shyly ventured to say that "my students don't know very well what a creation is" - or rather, I'd say: they did, but have long since forgotten this, busy as they have been pushing the wheels of a funeral wagon... ..

<sup>310</sup> (\*) Compare with the note "The child and the sea - or faith and doubt", n° 103.

<sup>311</sup> (\*) See note "A hundred irons in the fire, or: nothing's worth drying out!", n° 32.

### 18.2.12.7. (g) The hottest iron - or the turning one

**Note** 162 In the course of reflecting on the Burial, I came across many "irons" that asked me to work on them, more or less hot depending on the case. It seems to me that they all warmed up in the course of the work, some more, some less. The very first of these "irons" was the question of **self-contempt** in the case of my own person, first posed as a matter of conscience, on the bangs of the first embryo of Récoltes et Semailles<sup>312</sup> (\*\*). It remained rather tepid, until the reflection of December 13 (a month and a day ago), in the note "La violence du juste - ou le défolement" (n° 141). It was the first time in my life, I believe, that I had devoted a reflection, however brief, to the few cases in my life where I myself have exercised and caused to be exercised "violence without cause", violence "beyond comprehension". I've thought about it from time to time in recent years, but always in passing, without dwelling on it, and above all: without devoting any written thought to it.

p. 772 Yet violence-which-doesn't-say-its-name had profoundly shaped my life - it was one of the crucial things, if not **the** crucial thing <sup>between</sup> ~~all~~ of them, that I needed to understand as deeply as I could. could, to understand my life, and "life" in general, human life. But the fact that this is the case, which is obvious as soon as I take the trouble to think about it, had remained hidden. It finally emerged, as if by chance, on the bangs of the reflexion in the days leading up to that of December 13, continued in the set of four notes brought together under the name "La griffe dans le velours" (n° s 133-136). It is in these notes that, for the first time in Récoltes et Semailles, "**violence**" is named, and becomes the object of attention. It has remained the focus of attention until now, or at least until the note of January 7 (a week ago), "The cause of causeless violence".

This promising title may give the impression that this latest note is a sort of culmination of the re-flection on violence that has been ongoing throughout the past month. And it's true that it is one of the main fruits of that reflection. However, I am well aware that if this new perspective suddenly appeared, and this feeling of intimate conviction concerning a certain link suddenly glimpsed, it was because **my own person** was also directly involved in what had just appeared, among this "crowd of fragmentary and heterogeneous impressions stored up over the course of my life". The last and freshest of these impressions, felt at the time to be very "fragmentary" and indeed insufficient, was precisely that reflection of December 13th on **violence within myself**. This reflection, which to the superficial reader may seem like a digression among many others in the investigation of the Burial, appears to me now, with hindsight, as a pivotal moment and a crucial turning point (in potential at least) in my self-reflection. The very same day, moreover, I felt that I had at last taken the first step in a direction I'd been avoiding until then, and which would lead me straight to the heart of the conflict within myself. This "lukewarm iron", which had been lying there as if for memory for ten months already, was suddenly red-hot - all I had to do was stop and blow and strike, for it to turn red-white and reveal a shape and a message to me. And so it remains today.

Clearly, however, this is not the place to discuss this iron. Of all those appearing in Harvesting and the Semailles is certainly the one that burns the brightest for me, and after it, the one that closely followed "La cause de la violence sans cause", if the child didn't have a terribly adult, stubborn boss on his back. <sup>p. 773</sup> rivé à des tâches de longue haleine et aux "priorités" qu'elles imposent, c'est dans cette direction assurément, leading me to the heart of the conflict within myself and others, that I would now launch into, without having to probe myself! But as the name suggests, it's usually the boss, not the child, who orders and decides on investments. The "enigma of evil" will therefore wait for the more propitious moment when the boss would be able to make the investment.

---

<sup>312</sup>(\*\*) See note (n° 2) referring to the June 1983 section "Infallibility (of others) and contempt (of self)" (n° 4).

when he's on vacation (a rare occurrence), or when he's not too busy with other pressing "priorities", such as finally completing the writing of *Récoltes et Semailles*!

### 18.2.12.8. (h) The endless chain - or handover (3)

**Note 162**” But before returning to the Burial, I'd like to note at least one of the associations of ideas aroused by the reflection of a week ago - one, perhaps, less obvious than others, and which for that reason risks vanishing without trace if I don't note it now. It's linked to the Hindu idea of karma, and goes in the same direction as the association that appeared in the note "Le Frère ennemi - ou la passation" (n° 156): in the sense of the tenuous intuition of a kind of "**law of conservation of karma**".

This original, diffuse resentment in a person, which later translates into seemingly "gratuitous" impulses of aggression and violence, does not arise from nothing. It is the response to deep-rooted aggressions that were indeed experienced, especially those suffered in early childhood. It's true that many of these repressive assaults are not "acts of violence" in the strict sense of the term, i.e., they stem from an intention to injure or harm, particularly on the part of parents towards their child. It's also true that such intent (almost always unconscious) is present in many more cases than is generally accepted. But perhaps, from the point of view of the creation or transmission of karma, the question of **intentions** or **motivations** (overt or covert) is secondary, when "violence" is indeed taking place, inflicting "harm", causing "damage". I couldn't say.

Still, in most cases, a superficial look can give the illusion that the "harm" suffered is null and void, that it has been cashed in, and that once cashed in, it has "disappeared" without a trace. And this is a fact that it's not very often that those who have sown their children with anguish and powerlessness to be themselves, end up reaping <sup>directly</sup> ~~indirectly~~ <sup>resentment</sup>, at the hands of these same children, what they once sown; or at least, one has the impression that they're only reaping a tiny fraction of it! Or to put it another way, of the diffuse resentment they have aroused in their children, only a tiny portion condenses into a "hard" resentment, directed at them - and which they complain about loud and clear, as if it were the blackest of ingratisudes, it's a given! But the rest of this resentment or accumulated "karma" is not lost for all that. It finds effective use, in a way that may seem inexplicable, through the mechanism of "displacement" of resentment towards makeshift targets; sometimes erratic targets, sometimes specially matched targets, pampered so to speak, nurtured over a long lifetime!

In ordinary times, this intense work of karma, like an abscess deeply implanted in human life, takes place in the shadows, and everyone makes a point of ignoring it, of agreeing to see it only as an occasional "burr" here and another there, in relation to what is considered normal and proper.

It's in times of exception, when war or misery are raging (or in places of exception, like penitentiaries and asylums), that this underground work erupts and spreads out freely in the full light of day, in a frenzied blaze of contempt and murderous madness, exalted by grandiloquent flags over heroic mass graves and cold, naked cities... .

**Part four.**

**BURIAL (III)  
or the Four Operations**

# The funeral ceremony (continued)

## 18.3. Final homework (or visit)

### 18.3.1. (1) Duty done - or the moment of truth

**Note** 163 □ (February 16) Today is exactly a month since I began the impromptu reflection, triggered by reading C.G. Jung's autobiography. I thought I'd spend a few days there, putting down on paper the first strong impressions I'd gained from reading it - and today I'm still working through them! They were enriched and transformed in the course of reading, by virtue of the work triggered by it and by the writing of my reading notes. I've just had time to go through the first four chapters on Jung's early years - the chapters written in Jung's own hand. I was about to confront these impressions with others, not always concordant at first sight, aroused by later chapters. But just as I was about to do so today, I realized that this digression (which is already approaching a hundred pages. . . ) really doesn't belong in this other "digression", already long enough on its own, which I've called "The key to yin and yang". (A digression which, a month ago, I thought was nearing its end<sup>313</sup> (\*).) It's true that my reading notes on Jung fit in well with the dialectic of yin and yang, and that they have also led me, without having sought to do so, to clarify many things that had been barely touched upon previously, both about my life and about life in general. It doesn't seem enough to me, however, to open a parenthesis of such prohibitive dimensions within another parenthesis, itself situated in the final chapter, "The Funeral Ceremony", of a long reflection on my funeral. It's time to take up this reflection and bring it to a successful conclusion!

Ultimately, therefore, I'm not going to include these reading notes in "The key to yin and yang", or even in Burial, with which they have only a tenuous connection. They can be seen as an illustration of what I've tried to express, in general terms, in the notes on (among others) "Surface and Depth" and "In Praise of Writing" (n°s 101, 102). I hesitate whether to include them in *Récoltes et Semailles*, as a fourth part, or whether I'll make it a separate text in volume 2 of *Reflexions*<sup>314</sup> (\*\*). He

□ is true that this reflection on Jung's life, as it actually unfolded, is indeed a part inseparable from the long reflection I've been pursuing for the past year, which for me has been called Harvesting and

<sup>313</sup>(\*) (March 26) As I wrote this line, I was still under the impression that the note I was starting was going to be part of "The key to yin and yang". It was only over the next few days that I realized that another stage of reflection had already begun. "The key" therefore takes fi n with the previous note "The chain without fi n- or passing (3)" (n° 162").

<sup>314</sup>(\*\*) (March 26) Finally, these reading notes will form (not the fourth, but) a fifth and final part of *Récoltes et Semailles*, which will no doubt form part of volume 3 (not volume 2) of *Réflexions*, along with other texts of a more mathematic nature. The set of notes on Burial that form the "third breath" in the writing of Harvest and Sowing, beginning on September 22 last year, a set of which I was thinking of making a third part of Harvest and Sowing, will be divided into two distinct parts, under the respective names "The key to yin and yang" and "The four operations", forming the third and fourth parts of Harvest and Sowing respectively.

Semailles - and I'm as directly involved in it as I am anywhere else in these notes. It would therefore be artificial to separate this part of the reflection from Harvest and Sowing, for the sole reason that it unexpectedly hatched in the middle of a Funeral, and that it "overflows" a little too much on the latter's central theme.

For the moment, I'm going to take the opportunity of this caesura in my reflection on Jung's autobiography, to get back to my sheep, and to bring this Funeral Ceremony to a successful conclusion, if I can!

It's about time I wrote an account of my friend Pierre's visit to my home last October. I report his arrival in the note of October 21st ("L' Acte", n° 113), having just arrived the evening before, with his daughter Nathalie (two years old). After the departure of my visitors (in the note "Le paradis perdu" of October 25, n° 116), I write: "In a few more days, it will be time to take stock of what this visit has brought me - a visit on which I was no longer counting. . . "Those "few days" have become almost four months - but here I am at last!

I would have liked to give an "on the spot" account of this encounter, which for me represents an important episode in the adventure of discovering the Burial, its reality and its meaning. This time, however, I feel restrained by a concern for discretion, to deliver as is the totality of the multiple and vivid impressions left on me by the passage of my friend. It's true that I had no such hesitation in including one of these impressions in my reflections (in the December 26th note "Le désaveu (2) - ou la métamorphose", n° 153). But mentioning a certain impression one had of such and such a friend at such and such a time, and giving a vivid description of the precise "moment" when such a diffuse impression suddenly became

p. 777

manifest, irrefutable - these are two quite different things. The second is a bit like taking a photo of a friend at a time when he doesn't feel observed, and, what's more, circulating it □ without having been assured of his agreement. So I'll confine myself to giving a few impressions left by this visit, and refrain (as elsewhere in *Récoltes et Semailles*<sup>315</sup> (\*) from taking indiscreet photos!

I'd first have to **put** this visit **in context**. I had originally intended to visit Pierre at his home<sup>316</sup> (\*\*) to have him read *Récoltes et Semailles*, including *l'Enterrement*. At the beginning of May, I wrote to him, saying that I'd like to see him soon and have him read a text, intended above all for "my friends of yesteryear and pupils of yesteryear in the mathematical world", into which I had "put my whole self" - "I don't think I've ever cared for a text like that". I thought the typing would be finished by the end of the month, and proposed to come and see him in the first half of June. In the end, because of delays in the typing, not to mention the work involved in putting the finishing touches to *l'Enterrement* (as it was then planned, i.e. essentially what is now part I of *l'Enterrement*), my visit was postponed several times, and in July and August Pierre was not in France. Moreover, he had shown no curiosity about the work I was so anxious to hand over to him and have him read before anything else. Finally, in June I sent him the first part of *Récoltes et Semailles*, "*Fatuité et Renouveau*", thinking it would be a good thing for him to get to know it, before sending him *l'Enterrement* - in case my reflection on myself "clicked" with him and triggered something - you never knew! I'd been ill for ten days or so, and there was no question of me going to Paris any time soon.

I couldn't wait to get him to read *L'Enterrement*, in which Pierre was crucially involved, and

<sup>315</sup>(\*) There is one exception, however - the "photo" I took of J.L. Verdier during a telephone conversation, in the note "*La plaisanterie - ou "les complexes poids"*" (n° 83). I remember that, in order to describe the little scene "on the spot", I had to silence a certain reluctance within myself - I felt a little as if I'd been holding up a sign to my ex-student, which is absolutely not my style. Of course, I was also delighted and pleased with myself that he'd taken the plunge, even though it was one of the biggest and most obvious pitfalls. Serves him right!

<sup>316</sup>(\*\*) I express this intention at the beginning of the note "My friends" (n° 79), and in the first footnote to it.

I would have liked him to come and read it at my home, before he left on vacation. With this in mind, I sent him the complete Introduction towards the end of June, as well as the table of contents of the Funeral - I thought it would come as a shock to him, and that he would be keen to come and see me as soon as before he left p. 778

to find out in detail what I had to say about this famous funeral and his role in it. Instead, I didn't hear from him again until late August - to the point where I wondered whether he'd received my letter at all. That was the great suspense! In his second letter after his return (dated August 25) he finally said a few words about the introduction and table of contents, in terms that seemed to me most evasive. "I got the impression that you didn't know much about the love with which your "orphans" were surrounded. . . ", he wrote, enclosing an annotated bibliography in support, a sign of obvious good will to clear up what he seemed to feel was a sorry misunderstanding. In his next letter (dated September 12), he announced that he would be moving to Princeton on October 7, and said he would try to stop by my place before then. Receiving no further word from him, I thought he'd left for Princeton - but no, when I phoned IHES I learned that his trip had been delayed. And a week later, when I didn't expect to see him for a long time, here he was, in the flesh, in the company of little Nathalie!

(February 17) The meeting took place in an atmosphere that, to all appearances, could not have been more peaceful and friendly. A superficial observer in the vicinity would have sworn that Pierre was poring over a mathematical manuscript, and that from time to time he submitted to me his observations and constructive criticism as a mathematician well "in the know". As far as Pierre himself was concerned, it had to be understood that he had come along (out of consideration for me, who had, after all, been his "master"), sacrificing two precious days of a very busy man's time, to do his best to clear up an unfortunate misunderstanding that had crept up on me, through who knows what unfortunate combination of circumstances. Both his good faith and mine were certainly above suspicion, and there was no need even to mention it, as it was so obvious. His role, on the other hand, was to enlighten me on any points of material detail that didn't seem entirely clear in my notes, or on which I might have made a mistake. He made a list of his observations as his reading progressed, and submitted it to me on the day of his departure - I had the good sense to make a note of it on the spot, using keywords. He did, in fact, manage to read, in two days, the bulk of Burial I, and in any case, all the notes (listed in the table of contents), and by internal references in the text) that directly concerned his person. A fine performance, if p. 779 consider that it took me two months to write these notes full time...

During these two days, little Nathalie has been the wisest of wise little girls. I can hardly say that I heard the sound of her voice - whether she was talking, screaming or crying. She didn't seem to dislike me, but she didn't show much. As for her daddy, he was the real model daddy.

- always available at a moment's notice, to feed, walk or take to bed a little girl who wasn't overly demanding or annoying. He had brought her, he told me, because after the big preparations for the move to Princeton, Mom was too busy cleaning the house to take care of Nathalie. But beyond this practical and force majeure reason, I thought I sensed another, surely unspoken, reason: the little girl's presence added a note of sweetness to the atmosphere of a meeting that my friend, without perhaps wanting to admit it even to himself, was dreading. At the same time, her presence was a living, shining sign of the unspoken willingness with which he had rushed to the United States in the rush of the move - a willingness of obvious good faith and equally obvious goodwill.

For my part, I had not the slightest intention of rushing my friend, to get him to tackle anything.

whatever - I was at his disposal to go into greater depth with him on any question he felt prompted to enter into. As it happened, his main concern was not to go **into the substance of** any of the many situations examined in my notes, where his probity as a mathematician (or his probity at all) was clearly called into question. An observer who overheard our conversation, which sometimes even veered into a ma- thematic discussion (something that hadn't happened between us for more than three years<sup>317</sup> (\*)!), would never have suspected that there was anything in the text my friend was commenting on that would call him into question in any way whatsoever. As for me, I sensed that my friend was firmly clinging to this fiction, painfully maintained, of patently best faith in the best of all worlds. He cautiously avoided anything that might have shattered it, by making it clear that the tacit "consensus" he wanted to establish between us, against all odds, was in no way a reality, but rather a fiction, playing the role of a "straw" to cling to... ..

p. 780 □ During those two days, I could feel just how false the situation was, charged with anguish beneath those outwardly peaceful and good-natured. It was like the rope in the hanged man's house, which nobody talks about, even though it's on everyone's mind! In the end, I made a remark along these lines - I think it was on the day of departure, after lunch. After all, in those notes he was reading, and in the introduction he must have received nearly four months ago, I had expressed myself quite clearly and forcefully on a number of **acts** of his own. Did he really have nothing to say on the subject? He replied, with blurred eyes and a pale, miserable smile, that he was trying his best to "preserve himself" - without specifying (as far as I can remember) what he was trying to "preserve" himself from, surely, my inquiry must have been felt by him as a violent intrusion into a life which had hitherto seemed to him most tranquil and untroubled - where everything must even have seemed to him astonishingly **docile** ; so docile, perhaps, that he had forgotten that it could be otherwise. **To assume** the situation in which he has placed himself, to simply confront it, to examine it as it is - this would represent an upheaval of such magnitude in his vision of himself and the world, such a collapse of the rigid structure of the ego, that most would rather die a thousand deaths and set the world on fire (if they could), than risk such a leap into the unknown. It was from all this, surely, that my friend was (and no doubt still is) keen to "save himself".

I shouldn't be surprised, having seen this kind of scenario repeated hundreds of times, an expression of great fear in the face of the reality of things, and above all, beyond that, in the face of the risk of inner renewal. I certainly shouldn't be surprised, and yet, each time I am again, I am astonished, when I see the most blatantly obvious denied, and suffer and inflict a thousand torments, for the sole purpose of avoiding what I know well, and with certain knowledge, to be the greatest of blessings... .

p. 781 Anyway, after this unsuccessful attempt on my part to "get off the rails", the conversation turned to short. Those minutes were I think the only<sup>317</sup> (\*), during those two days, where our conversation took a person □ nelle turn - or something was said that went beyond the fiction of "consensus", maintained despite evidence to the contrary! I'm afraid that, as is often the case, I didn't have the affectionate yet straightforward "roundness" that could have helped my friend on this occasion, by de-dramatizing an atmosphere which, despite appearances, was extremely tense, and had been for months. As I went about my domestic duties, gardening and writing, leaving my friend to his reading, and also during meals together, there was a silent **expectation** in me towards my young friend - the expectation of an **answer** to what I was saying, through this text in his hands.

---

<sup>317</sup>(\*) On the cessation of all mathematical communication between Deligne and myself, see the note "Two turning points" (n° 66).

Surely, it would have been a relief for him if I'd taken the lead in some way, even if it meant starting with a neat argument that he hadn't stolen, no, and finally establishing a **contact where there was** none.

It's true that, over the past fifteen years, whenever I'd tried to raise something personal and close to my heart with him, I'd been met with complete silence, or (when it was in person) with the de rigueur astonished inflections, in the purest "velvet paw" style. It's true that I no longer felt like playing that game, which I'd left with no desire to return to since the 1981 "turning point"<sup>318</sup> (\*). But it's also true that this time there was a visibly unique "moment" in the relationship between us, which might have merited a departure from the rule (or habit, which has become second nature. . . ) of not going against someone else's reluctance to broach such and such a thing. Sometimes it's a good idea (and within certain limits) to "force the hand" a little, a bit like taking a kid to the dentist despite his (irrational) fear of it...

I'm not saying all this just to feel sorry for poor friend Pierre, who didn't get all the kind encouragement from me he might have wished for, and what's more! After all, it's normal for me to have my limits, just like everyone else, and what's more, it's not necessarily my role, and even less my obligation, to cushion the blow for those who have put themselves in situations (even if unwittingly) that were likely to come back to haunt them, one day or another and in one way or another.

□ By the way, after seeing Pierre and Nathalie off at the Orange train station on the evening of October 22, I had only not at all the feeling of a "meeting for nothing", of a "missed opportunity". I hadn't been naïve enough to expect much - it's so rare for two people to get to the heart of an issue that deeply concerns them both! There was no dialogue, that's a given - and yet I felt I'd learned a great deal. There had already been these "material details", more than one of which was very interesting, and which dotted the last i's and crossed the last t's, as regards the question of the "scenario" alone of certain operations that had taken place, and their contexts. I'll come back to this, in continuation of the present note<sup>319</sup> (\*). More importantly, during those two days, I observed my friend with new eyes, in the light of what I had learned of him during my reflection on the Burial. I can say that I "reacquainted" myself with him - in his relationship to me, to things, to his daughter... . This chapter remains a private matter - it's here that the natural reserve that I mentioned at the beginning of today's notes comes into play.

p. 781

But from the point of view of understanding the Burial, there was another reason above all, more subtle than the previous two, why it was important for this meeting to take place. I think I had sensed this importance from the moment I had decided to go to Paris to meet my friend, but I couldn't say why then, apart from the fact that it's always important to talk face-to-face with the person concerned, if at all possible when there are things of consequence involving both of us. Here, however, we didn't talk about these very things - and yet I had the impression of having learned, about the **reality of** the Burial, what I still had to learn.

I could put it that way too. Before this encounter, all the circumstances and actions that make up the Burial seemed so **implausible**, so crazy, so delirious, that despite all the tangible, irrefutable material "proof" that had accumulated over the weeks and months, and despite the three hundred or so pages of notes I had already devoted to it - somewhere deep inside me, I

<sup>319</sup>(\*) See the note "Dotting the I's" (n° 164) which follows this one.

me,

far from it - that a stubborn doubt may linger for some time, a tenacious vestige of resistance against the discarding of an old vision of things, a vision often more comfortable, or more in line with current consensus, than the one that has taken its place. Sometimes, too, this doubt is not simply the expression of inertia against a creative change in vision, but also reflects a healthy, valid element in the old vision, of a **real** aspect of things, which had perhaps been thrown overboard a little too hastily, along with the rest! The fact remains that, as always when a doubt arises, the right thing to do is to become aware of it (which is not always easy, given the inveterate reflex to "silence" unwelcome doubts), and, having done so, to examine it carefully. I can't remember a single time when I've examined a doubt carefully, without having learned something interesting (or even important to me), and of such a nature as to make any doubt disappear<sup>321</sup> (\*). Any doubt is the unmistakable sign of work that needs to be done.

p. 784 In the case in point, namely that of my unexpressed, perfectly irrational doubt about the very reality of a so-called "Funeral", I must confess that before this meeting with my friend, I hadn't even reached this first prerequisite for any work: I hadn't really become aware of it. I hadn't really become aware of it. It remained a simple, diffuse **uneasiness that didn't** say its name - it was up to me to question it! It was only afterwards that I became aware of the malaise and its meaning, just as it had dissipated, precisely by virtue of the encounter with my friend. In fact, I believe that this effect would have occurred regardless of the attitude he adopted - whether it was that of a sort of eager collaboration to provide me with all the missing "material details" (as was the case), or, let's say, on the contrary, that of a vehement denial, furious perhaps, of the most obvious facts. In any case, the **psychic** reality of the Burial could not fail to appear to me, this time by direct perception (and not by "induction" from documents, and by cross-checking from other facts known to me etc.), seeing my opposite number purely and simply **ignore** the ubiquitous absurdities of the "best of all possible worlds" version, absurdities whose very enormity had made me doubt at first, in my innermost being, the reality of the said Burial!

To give just one example: I had to learn from Deligne himself that he had indeed learned the "God's theorem" from Zoghman Mebkhout himself - but that he hadn't wanted to do it.

<sup>320</sup>(\*\*) This **incredulity** in the face of the testimony of our healthy faculties, when these too violently upset the current consensus or the ways of seeing we hold dear, was already evoked in the note "The robe of the Emperor of China" (n° 77). Clearly, writing this note had been a way for me to (at least partially) overcome this incredulity in the face of evidence, by putting my finger on this inveterate reaction. In so doing, however, I **distance** myself from this incredulity, presented as that of ordinary mortals (adults), by identifying myself with the "little child who believes the testimony of his eyes" ("even though what he sees is quite unheard of, never seen before and ignored and denied by all"). This must have been my unconscious intention in writing this note - to distance myself from an attitude of disbelief in my own faculties, and from a gregarious instinct to "do as everyone else does". Such attitudes and instincts do exist in me, as they do in everyone, but (like everyone else) they remain mostly unconscious. So it was like an attempt to exorcise that part of me which was alienating me from myself - and I think the main result was to push that which I wanted to distance myself from **deeper** into the unconscious. The insidious doubt, acting as a secret flaw in my knowledge of things, was not eliminated for all that, nor was the unfortunate incredulity "overcome" ("at least partially", sic)!

I realize once again that, at that point in my thinking, it was still below the level of what I call "meditation". - which is a reflection in which obscure and delicate inner movements (such as that secret disbelief, and the real motivation in me writing the note, which was to "exorcise" that troublesome disbelief) remain constantly the object of vigilant attention.

<sup>321</sup>(\*) It would be more accurate to say that the doubt has been transformed into **knowledge**, which has taken its place. This has nothing in common with what happens when we dispel (or "overcome"! ) a doubt, which has the effect of making it disappear from view, whereas it has taken refuge (or been exiled. . . ) in invisible, deeper layers. It is further than ever from being resolved (and transformed into knowledge), and it continues as ever to act, like a secret **flaw**, a malaise, a sign of a work that remains eluded. Compare this with the comments in the previous footnote.

refer to him in his article with Beilinson and Bernstein<sup>322</sup> (\*), out of **scruples** (!) towards Kashiwara, not being sure (as a non-specialist) what was the share of one and the other in the said theorem<sup>323</sup> (\*\*\*) - he will have

I had to hear Deligne express himself in these terms, to see with my own eyes this strange combination of good faith in detail, and phenomenal and dazzling bad faith in substance and essentials. I didn't think it necessary to draw my friend's attention to the curious way (highlighted in the note "Le Prestidigitateur" (n° 75), which he had read!) in which he had gone about this result "which should have found its place" in his article, to give the appearance that it was none other than himself (or at least, one of the three authors of the prestigious article) who was the brilliant author! Nor did he have any explanation to offer for the strange fact that this Colloquium, which I called the "Pervers Colloquium", was essentially held in the wake of the work and philosophy developed by Mebkhout in previous years (something which Deligne did not even pretend to dispute<sup>324</sup> (\*)), but that his name is rigorously absent from the Colloquium Proceedings published in Asterisk<sup>325</sup> (\*\*). He seemed to regard this as some kind of unfortunate **coincidence**, in which neither he nor anyone else had anything to do with it. All in all, what I've called "l'Enterrement" (the funeral) can be reduced for my friend Pierre to some twenty or thirty such "coincidences".

p. 785

I rediscovered a game I knew well from him - and not only from him; a game where you play the fool with the most innocent air in the world, with the certainty of never being stuck. And it's been a while since I've been wasting my time trying to convince anyone (for example) that certain so-called "coincidences" aren't mere coincidences. Pointing out the obvious can be useful at times, but once you've done that, it's a waste of time to try and convince anyone that these are indeed **things**, and not just imaginations - what would you expect? It's a waste of time to try and convince people of bad faith, whether it's conscious or unconscious - it's all the same, and whether it takes the form of idiocy or finesse - it's all the same.

p. 786

<sup>322</sup>(\*) See the notes "L'inconnu de service et le théorème du bon Dieu" (n° 48') and "L'Iniquité - ou le sens d'un retour" (n° 75), as well as the notes that follow the latter, forming with it the Cortège "Le Colloque - ou Faisceaux de Mebkhout et Perversité".

<sup>323</sup>(\*\*\*) Of course, there is no more reference to Kashiwara than to Zoghman Mebkhout in the article by Beilinson, Bernstein and Deligne, developing the formalism of so-called "perverse" beams (not to call them "Mebkhout beams"), based on the philosophy of Mebkhout-never-named. Deligne knows better than I do the role of Kashiwara in the theorem of the good God (aka Mebkhout): Kashiwara's constructibility theorem enabled Mebkhout to define the functor from a triangulated category of "continuous" coefficients (complexes of differential operators) to another formed of "discrete" (constructible) coefficients - something nobody in the world had thought of doing before him, let alone suspected that we'd have category equivalence. This was precisely the "missing link" in the duality formalism I had developed over a period of ten years (1956-66), and which my cohomology students, led by Deligne, were quick to bury after I left in 1970.

<sup>324</sup>(\*) Deligne only pretended to qualify my view of things somewhat, saying that in his opinion, the influence of Mac Pherson's ideas in the June 1981 Colloque de Luminy (known as the "Colloque Pervers") was even greater than that of Mebkhout. I wasn't in the know enough to discuss the matter on the spot, and it was obviously a point of detail, which would hardly mitigate the enormity of what happened. Moreover, Deligne did not dispute that neither the Colloquium in question, nor the far-reaching renewal in the theory of the cohomology of algebraic varieties of which it was the sign, would have taken place without Mebkhout's pioneering work in the years leading up to it, and without the philosophy he had developed in complete solitude.

It was my understanding that Mac Pherson's idea of the "intersection cohomology" of varieties, developed by him independently of Mebkhout's ideas, remained somewhat of a dead letter until Mebkhout's "philosophy" illuminated it in a new and unsuspected light (something discovered by Deligne). This was the start-up of Mebkhout's beam theory (wrongly called "perverse", in place of a certain Colloque. . . ). This was the main **event** of the Colloquium, and (it would seem) a turning point in the history of our understanding of the cohomology of algebraic varieties. The keystone of this new understanding seems to me to be the theorem of the good God, which had been "up in the air" since the early sixties and which neither I nor (subsequently) Deligne had managed to clear up.

<sup>325</sup>(\*\*) The term "rigorously absent" is true, to the letter, at least for volume 1 of the Proceedings (consisting of the Introduction and the paper by Beilinson, Bernstein, Deligne), which constitutes the main part of the Colloquium. There are two thumbnail references to Mebkhout in the bibliography to two of the papers in Volume 2 (one by Brylinski, the other by Malgrange), neither of which concerns the authorship of the theorem of the good Lord.

What had changed when we first met, however, and what put a note of anguish in my friend that he was doing his best to control and hide, was that this time the game was no longer confined to a harmless little sport between four eyes, neither seen nor known - and with a **dead person**, too! This time, the cards are open on the table, and **it's a public game**. All bets are off as to what the famous Congregation will endorse and tolerate. It's true that it has already tolerated and endorsed a great deal over the last ten or fifteen years, and it may well continue to do so, who knows? Like my friend Pierre, she may not be more than twenty or thirty "coincidences" away...

(February 18) When I finally drove Pierre and Nathalie back to the Orange train station on the evening of October 22, I felt like an idiot. Pierre looked like someone who had scrupulously and meticulously fulfilled all his duties, according to the timetable he had set himself - and I felt a dull frustration that nothing had been said or discussed at this meeting, which had finally taken place, after months of talk about it.

It was dark, the little one (in the back seat) must have been asleep - it would be about forty minutes in the car to the station, driving dry. We didn't speak for quite a while. It was I who broke the silence, under the impulse of this discontent within me that was looking for some outlet; a discontent with myself surely, rather than with anyone else. That didn't change the fact that I'd gone there to nag...

a bit of a friend. I told him I wasn't quite sure myself, if I wasn't going to sue. □

p. 787

legal action against Springer, forcing them to withdraw the pirate volume SGA 4 from circulation<sub>2</sub>,<sup>1</sup> published in Lecture Notes<sup>326</sup> (\*). I couldn't even tell when I'd been touched by this idea, which I'd brought up again at random, as a way of sounding out my friend ("ihm auf den Zahn fühlen", as they say in German). To tell the truth, he didn't react too much; it was more of a monologue that I was doing, picking up on a "thread" that I'd dropped a long time ago, in April or May no doubt. I realized, as I followed it, that a simple judicial showdown didn't make much sense after all - that it would only make sense to take SGA 4<sup>1</sup> out of circulation under its current title and presentation if the initiative came from someone other than me - either Springer or, better still, who knows, Deligne himself. I had to add that I didn't think it would be a luxury for Deligne to make such a public gesture, to make amends for certain things he'd done to me. It would clear up a much-needed atmosphere!

My friend followed my monologue with monosyllables, placed here and there. He implied that Springer might not be so keen on throwing away his entire stock of SGA 4 copies<sup>1</sup> - to which I<sup>2</sup> retorted that all he had to do was change the cover, as he'd already done on another occasion and without any problems<sup>327</sup> (\*\*), so it shouldn't have cost him much. And even supposing he scrapped the stock - one Lecture Notes title out of more than a thousand, you can imagine if that was going to be written off! Not to mention that Deligne, supposing he really wanted it, had the few million old francs he'd need to cover the shortfall...

I didn't have to say, but it was implied (and surely heard), that what was at stake was perhaps more valuable than one or two months' salary for any of us. In the end, I had to say that in this kind of thing, what counts first and foremost is not seeing **how to** do something (or, at least, how to do it right), but how to do it right.

p. 788

On the contrary, to list the **obstacles** to doing so), but first of all to be clear about what you **want to do**. □

<sup>326</sup>(\*) On this volume, see in particular the four notes "Le compère", "La table rase", "Le feu vert", "Le renversement", n° 63", 67, 68, 68'.

<sup>327</sup>(\*\*) This was my first misadventure with the Springer publishing house, which had published Hartshorne's notes (on a course in which I had developed the local cohomology formalism) with Hartshorne as author. This was Lecture Notes volume no. ° 41 "Local Cohomology", where the covers had to be changed. Springer had the courtesy then to apologize for the mistake, and to do their utmost to rectify it. Household customs have changed since. . .

Once that's done, the rest becomes a matter of stewardship, and "follows" (when it wants to "follow" indeed).

As my reluctant interlocutor failed to explain his true feelings, I took it for granted that he was well aware that it would be a good thing to "clean up", in short, a much-needed situation - but that he was simply undecided as to what he was going to do about it, "face to keep" no doubt, things like that. I was way off the mark, in fact! It finally dawned on me, when we were already on the station platform waiting for the train. That was when Deligne came back to me, a little sheepishly, to tell me that he'd prefer it if I contacted Springer about SGA 4<sup>1</sup>. Clearly, he didn't want to get involved, or even, at the moment, to offer an opinion on the fate of the book he had authored (admittedly, with my "collaboration"<sup>328</sup> (\*)).

It was only then that I realized that my thoughts along the way had been a monologue - and that it was still not clear to my friend Pierre that there was something not quite "in order" about a certain "SGA 4<sup>1</sup> - SGA 5 operation". It's surely no coincidence, then, that<sub>2</sub> it was on this theme, of all others, that I had branched out, looking for an outlet for my discontent. It was this operation, linked to the massacre of a beautiful work in which I had put the best of myself<sup>329</sup> (\*\*), that had touched me the most - by a breath of violence (in the massacre) and quiet impudence (with regard to what had been massacred). And I was touched again, by this affectation (which I knew all too well in my friend) that, in the end, it didn't concern him at all, the "ideas" I might have had about this and that.

The train was about to arrive, and this was the first time I'd been able to get **to the bottom of** something **that was** close to my heart, in a few words, thanks to an **emotion** that was finally coming to the surface. It didn't take long to say what I felt about it. These were real feelings, of someone wounded in a sense of decency, by someone he cared about who had played him for a fool - this was no longer literature, a little scientific around the edges, dutifully annotated with a pencil in hand.

□ He was taken aback by the blow, still trying as best he could to keep his imperturbable composure. I must have said something like: "And so, you think it was a beautiful thing, this title "SGA 4<sup>1</sup> ", to suggest that it was stuff that came **before** SGA 5 - where you had learned, eleven years before, the maths that has served you every day to this day!". He replied in the tone of someone reciting a lesson, that if he had called it SGA 4<sup>1</sup>, it was only to indicate a relationship of **logical** dependence, not anteriority.

p. 789

And so it was that I was given to hear with my own ears, and from the mouth of the person concerned himself, this "farce" so enormous that I could hardly believe the testimony of my eyes, when I had read it in black and white, first from his pen (in "SGA 4<sup>1</sup> "), then from Illusie's (in the volume called SGA 5, which followed, as was "logical", that of my predecessor... ) !

I had to tell him that he knew just as well as I did that SGA 5 "stood" entirely on its own, with no prerequisites or conjectures of any kind, and that it depended neither logically nor in any other way on later contributions. I looked him straight in the eye as I spoke to him, and as he replied. He repeated his lesson in the same atonal voice, that SGA 5 was logically dependent on SGA 4<sup>1</sup> - but I saw in his wavering eyes that he knew as well as I did what was really going on. His eyes were more honest, despite themselves, than his mouth.

So it finally happened between us, the "moment of truth" - but no camera, no tape recorder - and we were left to our own devices.

<sup>328</sup>(\*) On this subject, see the note "Le renversement" already quoted, n° 68'.

<sup>329</sup>(\*\*) See the note "The massacre" (n° 87) and the two notes that follow it.

phone, couldn't have detected it. Only he and I knew what was going on.

The train arrived within minutes, I think. Anyway, that day there was nothing more to say to each other.

## 18.3.2. (2) Dotting the i's

**Note** 164 (February 20-21) To conclude the retrospective of Deligne's last visit (last October) to my home, I'd like to review here the clarifications he kindly provided on a number of points, which remained vague in my reflective notes on Burial I, or even erroneous. This will be an opportunity for me to provide some additional clarifications, prompted by those

p. 790 supplied by Deligne.

## I Motifs ("Lecture Notes 900" volume).

1. Deligne told me that the main purpose of the LN 900 volume<sup>330</sup> (\*) had been to develop a "theory of the **motivic** abelian class field" on a number field  $K \subset \mathbb{C}$ , a finite extension of  $\mathbb{Q}$ . In other words, to determine the "motivic Galois group of  $K$  over  $K$ , made abelian". In this connection, I recalls that I was the first (and with good reason!) to raise this question, towards the end of the sixties. The question has a precise meaning, for a chosen notion of pattern, using the "Betti free functor" on the category of patterns over  $K$ , thanks to the given inclusion of  $K$  in the field of complexes  $\mathbb{C}$ . In fact, I had posed the somewhat more general question of determining the "**metabelian**" **motivic Galois group** of  $K/K$ , deduced from the complete motivic Galois group by making abelian, not all this proalgebraic group, but only its neutral component. We were to obtain a completely canonical extension of the profinite group  $\text{Gal}(K/K)$  by the projective limit pro-tore of the (tores on  $\phi$  associated with the) multiplicative groups  $L^*$  of the finite sub-extensions  $L$  of  $\mathbb{C}/K$ . I remember that Serre was very intrigued by this question, but neither he nor I (nor Deligne, whom of course I had thrown into the mix) could improvise a plausible "candidate". The question then fell into complete oblivion, as did the yoga of motives from which it sprang. This silence was only broken in 1979 by Langlands' article (mentioned to me by Deligne in an annotated bibliography of motives, in his letter of 28.5.1984)<sup>331</sup> (\*\*), in which my idea of the motivic Galois group would be made explicit in the literature for the first time. As I didn't have the honor of receiving a reprint of this article, I don't know whether it refers to my humble self. The next appearance of the motifs in the literature seems to be LN 900, where any allusion to my person, as having anything to do with the theme and main problem of the volume, is absent<sup>332</sup> (\*\*\*)).

p. 791 2. Deligne pointed out that, contrary to what I had thought  $\square$  was true (according to a certain "maison style". . . ), the Deligne-Milne article in LN 900, taking up "ab ovo" the Galois theory of Tannakian categories(\*\*\*) developed by N.R. Saavedra, was written almost entirely by Milne<sup>333</sup> (\*). Deligne also explained to me the error in Saavedra's work, which obliged (if you wanted to have the

<sup>330</sup>(\*) For details of this "memorable volume", see the two notes "Souvenirs d'un rêve - ou la naissance des motifs" and "L'Enterrement - ou le nouveau Père", n° s 51,52.

<sup>331</sup>(\*\*) This is R.P. Langlands' article "Automorphic representations, Shimura varieties and motives. Ein Märchen Corvallis", in Proc. Symp. pure Math. 33 (1979), AMS, vol II P. 205-246.

<sup>332</sup>(\*\*\*) (April 8) I recently learned that the motifs are used in a 1979 article by Deligne (published in the same volume as the Langlands article cited in the previous b. de p. note).

(May 12: this "fi n" has become the sub-note "Pre-exhumation", n° 168(iv))

<sup>333</sup>(\*) On this article by Deligne-Milne, see the note "L'Enterrement - ou le nouveau Père" (n° 52), and also the comments in the later note "La table rase" (n° 67).

formalism of a Galois-Poincaré theory of fiber functors) to reinforce Saavedra's definition of a so-called "Tannakian" category. The work in Deligne-Milne's article did no more than make this adjustment, once the error had been spotted. Incidentally, this raised the very interesting question of a manageable internal characterization of  $\otimes$ -categories that are "true" Tannakian categories (which, more suggestively, could be called  **$\otimes$ -categories of Galois-Poincaré**, since it is for them that we can develop a theory of a Galois-Poincaré groupoid<sup>334</sup> (\*\*)). This question was not addressed in the article in question, nor has it yet been satisfactorily resolved. Clearly, the aim was not to pose or resolve interesting mathematical questions, but to provide a substitute reference for Saavedra's article. (See the end of the note "La table rase" (n° 67).)<sup>335</sup> (\*\*\*)

3. On several occasions in Burial I, I stressed the fact that the Hodge-Deligne theory, developed by Deligne in the late 1960s, was only a first step towards a theory of "Hodge-Deligne coefficients" on a finite-type scheme over  $\mathbb{C}$ , and towards a "six-operation formalism" for such coefficients. I was (and remain) convinced that, were it not for Deligne's deliberate move against some of the key ideas introduced by me (such as the six-operation formalism), Hodge-Deligne theory would have reached "full maturity" by now. Deligne pointed out that the only definition

of a category of Hodge-Deligne coefficients on a finite-type scheme over  $\mathbb{C}$ , ran into serious  $\square$ ses difficulties, which he would not have been able to overcome. (It would have been all the more compelling to clearly **formulate** this p. 792

question from the very beginnings of the theory, as well as the closely related question of the formalism of the six operations for such coefficients, something Deligne has always refrained from doing). In his view, Mebkhout's point of view and Mebkhout's bundles<sup>336</sup> (\*) should provide a way of approaching the right definition. (And if it hadn't been for this deliberate intention, Deligne certainly wouldn't have waited for Mebkhout to develop the philosophy the latter had developed (against the grain of his elders), and to use it for a visibly fundamental work that for fifteen years has remained on the sidelines and still not even reported in the literature, except by myself in Récoltes et Semailles).

4. I mistakenly thought that I had introduced the "filtration by weights" of a pattern, reflected (for any  $l$ ) in the corresponding filtration on the  $l$ -adic realization of this pattern (filtration defined in terms of absolute values of Frobenius eigenvalues). In fact, Deligne reminded me that I had only worked with "virtual" notions of weights (which amounted to working with virtual patterns, elements of a suitable "Grothendieck group". . . ). It was Deligne who discovered this important fact, that the virtual notion I was working with should correspond to a canonical **filtration**, by "increasing weights"<sup>337</sup> (\*\*).

<sup>334</sup>(\*\*) The term "groupoid" (de Galois-Poincaré) has the advantage of suggesting a close kinship with the notion of the fundamental groupoid of a topological space or topos. Technically speaking, however, the term "sheaf" (de Galois-Poincaré) would be more appropriate. This is the sheaf of "fiber functors" defined, not only on the base field  $k$  of the  $\otimes$ -category envisaged, but on any objects of the fpqc site of schemes on  $k$  (with particular attention paid to objects of this site that are of the form  $\text{Spec}(k')$ , where  $k'$  is an extension of  $k$ , or even a **finite** extension of  $k$ ).

<sup>335</sup>(\*\*\*) (May 12) Having recently become acquainted with Saavedra's book, it now appears that it, and the very name ("Tannakian category") of this notion, which I introduced around 1964 and which gives the book its name, is a **mystification**. I dismantle it in detail in the suite of notes entitled "Le sixième clou (au cercueil)" (n° s 176<sub>1</sub> à 176).<sup>7</sup>

<sup>336</sup>(\*) These are the beams that Deligne had introduced under the name of "perverse beams". (On this subject, see the two notes "L'Iniquité - ou le sens d'un retour" and "La Perversité", n° s 75, 76.) He wasn't annoyed and, in our conversations, kindly referred to them as "Mebkhout's beams". . .

<sup>337</sup>(\*\*) The heuristic reason that convinced Deligne of the existence of such a (necessarily unique) filtration of a pattern is that there are non-trivial extensions of abelian varieties by tori (whose motivic  $H^1$  thus provides a non-trivial extension of a pattern of weight 2 by a pattern of weight 1), but not the other way around. This may sound thin - yet I myself was convinced more or less on the spot - it was too seductive to be wrong! A more serious reason, at the level of  $l$ -adic representations from patterns on a **finite  $K$ -field**, would be to prove that any extension of a module

This discovery (just as "conjectural" as the "conjectural theory of patterns") immediately provided the key to a formal definition of **Hodge-Deligne structures** (also known as "mixed Hodge structures") on the field of complexes, as a "Hodge-like" transcription of "already known" structures on the pattern and on its made by Hodge

p. 793

□ Technically speaking, the influence of my ideas in the definition of Hodge-Deligne structures is twofold. On the one hand, via the notion of weights of a pattern, suitably clarified by Deligne into a structure of "**filtration** by weights". On the other hand, since the 1950s, I had emphasized the importance of the algebraic **De Rham cohomology** of a smooth algebraic variety  $X$ , not necessarily proper, as a richer invariant than the naive Hodge cohomology (direct sum of  $H^q(X, \underline{\Omega}^p)$ ), which is related to the former by the well-known spectral continuation, associated with a canonical filtration (**the De Rham filtration**) of the De Rham cohomology. I was the first to define the algebraic De Rham cohomology (at a time when nobody would have thought of looking at the global hypercohomology of a complex of differential operators, such as the De Rham complex), and to insist on its **filtered** graded structure, in contrast to the bigraduated structure of the Hodge cohomology, which since Hodge had been on the forefront. In the case of  $X$  proper (i.e., where Hodge theory is available, implying that the preceding spectral sequence degenerates into a zero-square), and on the base field  $\mathbb{C}$ , we recover the bigraduated structure on De Rham's cohomology, from its filtered structure, by taking the "intersection" of this filtration and the conjugate complex filtration (thanks to the "real structure" of De Rham's cohomology, isomorphic to Betti's cohomology  $H^*(X, \mathbb{C})$ ). I subsequently proved (when no one but myself believed in De Rham cohomology in the non-clean case), that for a scheme  $X$  smooth over the field of complexes, De Rham cohomology (which has a "purely algebraic" meaning) is canonically isomorphic to complex Betti cohomology (defined by transcendental means).

That said, once we had postulated the existence of a notion of pattern (not necessarily semisimple) on  $\mathbb{C}$  and of a motivic cohomology of a  $\mathbb{C}$ -schema  $X$  (not necessarily clean, admittedly), and of a notion of "Hodge realization" (suitable and to be found) of a pattern on  $\mathbb{C}$ , which (according to my ideas) was to associate with the motivic cohomology of smooth  $X$  a "generalized Hodge structure" (to be defined), having as its basic set the De Rham cohomology  $H_{RD}(X)$ , the first structures we read about on the latter, namely De Rham filtration (introduced by me as early as the 1950s) and filtration by weights (introduced by Deligne on the basis of my ideas on virtual weights, clarifying Serre's ideas, themselves stemming from Weil's conjectures), we fall very exactly on the notion of "mixed Hodge structure" introduced by Deligne.

p. 794

□ Bien entendu, cette filiation d'idées (164) était parfaitement connue de Deligne. It would have been in keeping with the ethics of the trade (which I was unable to pass on to him) that he clearly indicates in his work introducing mixed Hodge structures<sup>338</sup> (\*). He preferred not to mention it in this work, which is also **his thesis**, just as he saw fit, on this particular occasion, not to mention the name of the man who had been his teacher.

5. In the annotated bibliography on the motives (attached to his letter of August 25), Deligne states that "one of the reasons why we [!] hesitated to build on them [on the few "classic texts"]<sup>339</sup> (\*\*)

---

Galoisian module of weight  $i$  by another of weight  $j$  is trivial if  $i < j$ . I can't remember whether Deligne or I were able to demonstrate this statement, which would prove the existence of a canonical filtration "by increasing weights" for the  $l$ -adic Galoisian module associated with a pattern (an object already quite close to the pattern itself. . . ).

<sup>338</sup>(\*) This is the article "Hodge Theory II" (Pub. Math. IHES 40 (1971) pp. 5-58). On the other hand, Serre and I are mentioned in the same line, in the "Hodge I" announcement at the Nice Congress (in 1970), as I point out in the note "The victim". (n° 78, on page 308). For comments on this subject, see sub-notes n° 78, 78'.

<sup>339</sup>(\*\*) These are the few sporadic ("classic") texts on motifs by Kleiman, Manin, Demazure, published up until

on motives] is the use made of conjectures about the existence of algebraic cycles - conjectures for which there is no real evidence, whereas motives are, for me, indubitable".

My answer to this explanation is that these "classic texts" are in no way representative of the "state of the art" at the end of the sixties - indeed, they're far from it - and it's **not** from these texts that he, Deligne, learned this "state of the art"! He knows full well that my "standard conjectures" were **one** of many possible approaches to a provisional "construction in form" of a notion of (semi-simple) motif on a body, which in no way limited the scope and internal dynamics of the ideas he got from me. (See sub-note n° 51<sub>1</sub> of the note "Souvenir d'un rêve - ou la naissance des motifs" n° 51.) Killing two birds with one stone, he endeavored after my departure both to discredit the standard conjectures as "unapproachable" and devoid of interest, and to discredit a certain approach to motives which would have been mine and which would have represented a cul de sac, indissolubly linked as it would have been (to hear him tell it) to these hopeless conjectures.

so much so that it was more charitable for me, in the LN 900 volume where at last the work that really needed to be done is done, to pass my name <sup>340</sup> pudiously under silence... (\*)

p. 795

6. In the same "annotated bibliography", I read:

"From this "classical" point of view<sup>341</sup> (\*\*) there is a regrettable gap in the literature: your conjectural description of the  $\otimes$ -Tannakian category of motifs on  $F_p$ , with unique equivalence to non-unique isomorphism - with these various fiber functors (crystalline and l-adic), cf. Tate,

isogeny classes of abelian varieties over a finite field, Sémin. Bourbaki 352 (1968)."

These are crocodile tears, over a "regrettable lacuna" which is due to no one (apart from me. . . ) but my friend Pierre Deligne himself, since apart from me, he must have been the only mathematician in the world who knew of the "conjectural description" in question. . . It was up to him to include it in the same LN 900, for good measure! There was nothing conjectural about this description, as far as I recall, except that it was necessary to assume that we had a category of "patterns on  $F_p$ ", satisfying some reasonable conditions, which we have the right to expect from a category of this name. If I remember rightly, the reference to Tate-Honda implied that the category in question was generated multiplicatively by the Tate motif (and its inverse) and by the abelian varieties defined on  $F_p$ . There were some nice things (and many more), which I had entrusted into the hands of my brilliant ex-student and which have remained carefully buried until today. ...

## II Staggered cohomology ("SGA 4 1/2" SGA 5, SGA 7, discrete Riemann-Roch).

1. One of the first comments Deligne made to me about <sup>□</sup> l'Enterrement I concerned the vicissitudes of the conjectural theorem I had worked out in SGA 5, known as the "discrete Riemann-Roch theorem". I write about it in some detail in sub-note n° 87<sub>1</sub> to the note "Le massacre" (n°

p. 796

1970. They don't go much beyond the initial idea of a motif, and can't give any idea of the finessse of the "yoga" I had developed, and which I had tried to communicate to anyone who would listen. In particular, there is no mention of the motivic Galois group, which had been an essential initial motivation for developing yoga. In particular, there is no mention of the Galois motivic group, which had been an essential motivation for developing yoga in the first place (see "Souvenir").

of a dream - or the birth of motifs, n° 51.)

<sup>340</sup>(\*) Deligne took the lead on any questions I might have asked him on this subject, from the very first day of his stay with me, in saying to me with his most beautiful smile: "Do you really think that everyone doesn't know about it, even though you're the one who introduced the motifs! The amazing thing was that, despite everything my friend had done to make people forget about it, I could see that it was still generally known. But in the absence of any written references for my ideas, Deligne had every opportunity to create the impression that my contribution had had to confine itself, as usual, to proposing a vague general idea (moreover unusable as it stands, given its dependence on conjectures "as unapproachable today as they ever were". . . ) - so vague, in fact, that it really didn't merit any serious mathematician, doing real work, taking the trouble to make even a token reference to it...

<sup>341</sup>(\*\*) See penultimate note of b. de p.

87). Deligne tells me that when he communicated my conjectural statement to Mac Pherson, he saw himself as having the role of "factor", of intermediary. He did not add a new ingredient to my statement - the idea of translating my statement into homological language, to give it meaning for singular spaces, was Mac Pherson's doing, not Deligne's. He told me he was surprised, on receiving the offprint of Mac Pherson's paper proving my conjecture in the analytic-complex case and in the homological context (by transcendental arguments), to find the conjecture under the name "Deligne-Grothendieck conjecture". He had thought of writing to Mac Pherson to rectify the misunderstanding, but (he wouldn't have known himself why) he didn't in the end. ...

2. Contrary to what I assumed and implied, Deligne had not committed himself at the time of the SGA 5 oral seminar to writing one or more of the seminar papers, for example the paper on the cohomology class associated with an algebraic cycle (which he ended up writing eleven years after the seminar for inclusion in the volume of his composition called "SGA 4<sup>1</sup>", without further ado<sup>342</sup> (\*)).

In this connection, I asked whether he didn't think that the privilege of having been able to learn "on the spot", in SGA 5, the basic techniques that served him in all his subsequent work, didn't impose on him an **obligation** or a responsibility to do his utmost to make these techniques available to the mathematical public, through a rapid publication of SGA 5. Deligne replied that **he didn't think so**. I refrained from asking him the same question about the philosophy of motives, which was his main source of inspiration for the cohomology of algebraic varieties (which constitutes the central theme of his work. . . ).

□

p. 797

3. It was Deligne who took the initiative of asking Verdier for his agreement to include in "SGA 4<sub>2</sub><sup>1</sup>" the famous "Etat 0" of Verdier's work on derived categories. Verdier initially objected, deeming it would be pointless (I can't remember the exact expression). It was Illusie who finally convinced Verdier to agree. Verdier's initial reaction seems to me to be the most natural and in line with simple mathematical common sense. What's more, Verdier had decided years ago to bury the derived categories, in the form of a major "work on parts", which was one day supposed to constitute his thesis - so it was going to look a bit goofy to publish a preliminary sketch that had long since been largely covered by the literature. I think I understand why Deligne and Illusie were so keen to publish this Etat 0, in which my name was not mentioned. As for Verdier's reasons for going back on his initial common-sense reaction, I think I can sense them, and I've written about them in the note "Thèse à crédit et assurance tous risques" (n° 81). 4. In the note "La table rase" (n° 67), I pointed out the ambiguity of the expression "ce sémi- naire" in the passage of the Introduction to SGA 4<sup>1</sup> (p. 2) where it says: "For the application to *L-functions*, this seminar contains another demonstration, this one complete, in the particular case of the Frobenius morphism". This ambiguous expression, given the context and its spirit, had every chance of being read as meaning "SGA 4<sup>1</sup>", so as to suggest that the parent seminar SGA 5 did not contain a "complete" demonstration of the rationality of *L-functions*. Deligne clarified to me that in his mind, "this seminar" did indeed mean "SGA 5". To tell the truth, this clarification means nothing to me. I'm well aware that Deligne knows as well as I do that in SGA 5 there's a "complete" demonstration, but yes, of a trace formula, which overflows

<sup>342</sup>(\*) This act of dismantling (among many others) the SGA 5 seminar in favor of the volume called "SGA 4<sup>1</sup>"<sub>2</sub> fulfilled two functions, both in the sense of a "reversal" of roles: to make me a "collaborator" of

Deligne, and support the claim of anteriority (already suggested by the misleading name SGA 4<sup>1</sup>, and spelled out "between the lines" in the introduction to both SGA 4<sup>1</sup> by Deligne, and SGA 5 by Illusie) of "SGA 4<sup>1</sup>" over SGA 5 (where references to SGA 4<sup>1</sup>, via the aforementioned pirated presentation of SGA 5, abound). On this subject, see also the comments in the note "Le renversement" (n° 68'), where I finally discover the meaning of the strange name given to the pirate-volume, and of the presence in this volume of my talk on cycles algebraic.

He also refers to "the special case of the Frobenius morphism" (contrary to what he implies). But it's no coincidence that Deligne's writings abound in inaccuracies and ambiguities, if not blatant untruths, which all point in the same direction: to suggest an impression, concerning my work or that of Mebkhout and others linked to me, likely to discredit it, while enhancing his own credit, or creating some from scratch<sup>343</sup> (\*).

□<sup>5</sup>. I'd like to take this opportunity to add a few comments about SGA 7 II (seminar presented p. 798 as directed by P. Deligne and N. Katz), on which I had already commented in some detail in note (unnamed<sup>344</sup> (\*)) n° 56. A more detailed examination has shown me that, on this occasion, N. Katz did not hesitate to discreetly push the wheels of Deligne's well-mannered Funeral Van, in many ways.

Katz agreed to appear with Deligne as co-author of the volume and the seminar, which in no way corresponds to the reality of what had taken place during the oral seminar, four years before the volume was published. The overall conception of the SGA 7 seminar (which continued over the two years 1967-69) came from me, and the seminar was presented as a seminar directed jointly by Deligne and myself. N. Katz appeared as a collaborator and lecturer, among a number of others. But since N. Katz agreed to sign as co-author of the volume (of which he wrote five papers, but none of the main results), it's only natural to consider him co-responsible, along with Deligne, for the overall structure of the volume, and for the fact that I was not mentioned.

I'm thinking first and foremost of the oversight in the introduction to the volume (signed by Deligne), where nothing suggests that I had anything to do with any of the themes or results presented in the text, even though one of the two "key results" of the seminar featured (namely, Lefschetz's theory of brushes

) had already been developed by me before the SGA 7 seminar, and had in fact been one of my motivations for considering a seminar on the theme of monodromy. In Katz's presentation of this theory (Exp. XVIII), entitled "Etude cohomologique des pinceaux de Lefschetz, par N. Katz", my name does not appear in the title as is customary ("d'après A. Grothendieck"), but appears in a laconic footnote after N. Katz's name, "D'après des notes (succinctes) de GROTHENDIECK". The qualifier "succinct" seems to have been added to minimize the fact that these unfortunate "notes by Grothendieck" played a role here. They may have been "succinct", but they were nonetheless the culmination of several days' work on the task - by no means obvious at first sight - of transcribing into

an entirely different technical context, results stated and demonstrated by transcendental means. As with étale duality or □the Nielsen-Wecken theory<sup>345</sup> (\*), the classical arguments werep

We had to redo the whole thing, taking the classical **results** as a guideline and completely forgetting their traditional "demonstration" (if you can call it that). It's only natural that, even with the help of my detailed notes, Katz had to make an effort to get into the swing of things, just as I had to do before him - but this in no way implies (at least, not according to the generally accepted rules of the game) that he is the author of Lefschetz's brush theory in étale cohomology!

Continuing in the same vein, in the introduction to the same talk (p. 225), Katz pretends to introduce Mrs.

<sup>343</sup>(\*) Suggesting, in particular, his authorship of the motifs' key ideas, that of staggered cohomology, and that of the "theorem of the good Lord" and the Mebkhout philosophy that goes with it.

(March 26) For the case in point and "this seminar", see also the sub-note "Les doubles-sens- ou l'art de l'arnaque" (n° 169 ).<sup>7</sup>

<sup>344</sup>(\*) (March 26) In the meantime, I have filled this gap by including this note in the table of contents under the name "Prélude à un massacre".

<sup>345</sup>(\*) Less restrained than his friend N. Katz, Deligne didn't think it worth mentioning that I had something to do with what he called "the Nielsen-Wecken method" - on this subject, see sub-note no. ° 67<sub>1</sub> to note "La table rase" no. ° 67.

Raynaud as the author of the structure theorem of the "prime to  $p$ " moderated fundamental group of an algebraic curve in  $\text{car. } p$ . If I remember correctly, it is this theorem (demonstrated by me in 1958, before I had even met my future student) which, along with the "Lefschetz cow theorem", constitutes the deep technical ingredient of the theory, and I was quite happy, in the demonstration of the irreducibility theorem, to have to use it in all its force.

In the introduction to Katz's lecture XXI (pp. 364-365), after describing the main theorem of the exposed, concerning complete intersections in projective space, it is stated:

"There are heuristic arguments due to A. Grothendieck and relying on the yoga of crystalline co-homology, which make the general statement plausible for any projective and smooth  $X$ , by essentially the same method."

This comment implies that I was inspired by the method of the text (by an unspecified author, who can hardly be more than one of the two authors of the volume), to embroider on it "heuristic arguments" that allow the proven result to be generalized. I seem to remember that it's just the opposite - that it's my "heuristic arguments" (which I had developed in my corner long before the seminar, in the wake of my thoughts on Griffiths' theorem and Lefschetz's brushes<sup>346</sup> (\*\*)), which happen to "work".

p. 800 □(without conjectural ingredients what's more) in the case where  $X$  is a complete intersection. Moreover, in the previous paper (also by Katz) devoted to said Griffiths theorem, it is stated in the introduction that **"the demonstration given here** (due to GROTHENDIECK) is the translation into purely algebraic terms of the original, more or less transcendental demonstration by GRIFFITHS". This comment may give the impression that there are several demonstrations of Griffiths' theorem to choose from, and that I've been given the honor of choosing mine. In fact, as far as I know, there is no other. Moreover, from the work I was obliged to put into it, I doubt that this demonstration is a simple "translation" of Griffiths', any more than the demonstration of any of the great key-theorems in étale cohomology was a "translation" of an already known demonstration, or (while we're at it) than mastering the étale cohomology of schemes was a matter of "translating into purely algebraic terms" the familiar theory of ordinary cohomology.

I've reviewed **the** three references to me in the texts of N. Katz's talks (there's only one in all eight of Deligne's talks! ). All three seem to me to reflect the same deliberate intent. Finally, I'd like to point out that in the text of the last talk in the volume, by N. Katz, devoted to the "mod.  $p$  congruence formula" for an  $L$  function in  $\text{car. } p$ , my name does not appear<sup>347</sup> (\*) - not even for the ordinary cohomological expression of the  $L$  function. In fact, the analogous expression in terms of crystalline co-homology (which remained conjectural), had led me to conjecture the congruence formula for several years. I had communicated this conjecture to Deligne, who had found a surprisingly simple demonstration, thanks to his symmetrical Kunneth formula (discussed in SGA 4 XVII 5.4.21). I assume that Katz, who was well versed in this sort of thing, was also well aware of the origin of the conjecture, without seeing fit to mention it. (In the text, he presents a different and much less elegant demonstration than Deligne's).

<sup>346</sup>(\*\*) These reflections, along with my thoughts on the theory of evanescent cycles in abstract algebraic geometry (another of my "purely algebraic translations of transcendental theory"! ), were the inspiration for the SGA 7 seminar.

<sup>347</sup>(\*) That's not entirely true - he figures there (so it's a fourth reference to me), in a talk with Deligne, on page 410, to thank us for explaining to the author various equivalent reformulations of the form in which he presents the congruence formula. The funny thing is that, of the three numbered references he gives for these brilliant variants, none exists in the presentation, so these thanks take on the appearance of an amiable hoax! (It's not the first one I've come across in L'Enterrement... )

A funny detail: at the end of the introduction to this ultimate presentation of SGA 7 II, we read that Deligne's demonstration "should appear in the reissue of SGA 5" (which SGA 5 hadn't yet had the chance to publish).

to know its □ première "edition"). This may suggest that five years before the APG 4 operation<sup>1</sup> - APG<sub>2</sub> 5, Deligne still intended (as was normal) to include in the future published version of SGA 5 the additions he had made since 1966 to the theory of staggered cohomology, developed in SGA 4, SG4 5<sup>348</sup> (\*).

p. 801

### III Mebkhout's philosophy (Colloque de Luminy June 1981, paper on the "per-vers beams" of Beilinson, Bernstein, Deligne).

I'll repeat here what I said on this subject in the previous note.

1. Deligne told me that he had learned about the "theorem of the good Lord"<sup>349</sup> (\*\*) in a conversation with Mebkhout at a Bourbaki seminar - at any rate, this was before the summer of 1980. This tallies with what I know from Mebkhout, namely that the theorem in question had been communicated by Deligne to Bernstein and Beilinson in October 1980, to be immediately used by them in their proof of the Kazhdan-Lusztig conjecture<sup>350</sup> (\*\*\*). Deligne adds that he had not cited Mebkhout in his paper with Bernstein and Beilinson, not being sure how much of this theorem was due to Kashiwara<sup>351</sup> (\*\*\*\*).

2. Deligne did not deny that the Colloque de Luminy in June 1981 (where he himself was the star attraction) would not have taken place without Mebkhout's work in the preceding years. He only made a point of adding that the role of Mac-Pherson's ideas seemed to him "even more essential". He did not suggest that there would be anything strange or abnormal about Mebkhout's name not appearing in the Colloquium Proceedings.

### IV Duality formalism in cohomology, derived categories ("The right reference", "State 0" of derived categories).

□<sup>1</sup>. Deligne tells me that he was unaware of Verdier's article<sup>352</sup> (\*), which (between others, without naming myself) the formalism of homology and cohomology classes associated with a cycle (which I had developed in SGA 5 in 1965/66) only **after** the publication of SGA 4<sup>1</sup> in 1977, i.e. a year later. at least after the publication of the article in question. This seems to contradict the impression I had that Verdier's brilliant operation in 1976 was a sort of "trial balloon" for the considerably larger operation by Deligne et al. that followed the year after.

p. 802

Deligne told me that it was clear to him, from reading Verdier's article, that it merely expounded some of the ideas I had developed in SGA 5. He was even pleased that Verdier had finally taken it upon himself to provide a reference. (The idea that the publication of SGA 5 might have provided a more adequate reference must not have occurred to him. . . ) To a question from me along these lines, Deligne replied that he hadn't

<sup>348</sup>(\*) I presume it was the lack of any reaction (from any of the people who were in on it) to the swindles that took place in SGA 7, which must have encouraged Deligne to the next step in his escalation: the large-scale swindle of the SGA 4<sup>1</sup> - SGA 5 operation.  $\tau$

<sup>349</sup>(\*\*) See note "L'inconnu de service et le théorème du bon Dieu", n° 48'.

<sup>350</sup>(\*\*\*) See the May 28 footnote to "Iniquity - or the meaning of a return" (n° 75), and also the note "A feeling of injustice and powerlessness" (n° 44").

<sup>351</sup>(\*\*\*\*) See the comments on this subject in the previous note "Le devoir accompli - ou l'instant de vérité", especially p. 784, and the footnote about "Kashiwara".

<sup>352</sup>(\*) This is the article cited in the note "Les bonnes références" (that was definitely the right name!), n° 82.

(May 12) For comments on this diffi culty believable version by Deligne, see the note "Gloire à gogo - ou l'ambi- guité" (n° 170(ii)), pages 930,931.

noting that my name didn't appear in Verdier's article - adding that he confessed he hadn't even thought to ask himself the question. I had the impression that he was tacitly implying that this sort of thing was the least of his worries and not worth dwelling on. ...

2. In Beilinson, Bernstein, Deligne's paper (often cited in Burial I), written by Deligne and presented by him at the Colloque de Luminy<sup>353</sup> (\*\*), the duality in staggered cohomology (which I had developed in 1963) is called "Verdier duality"<sup>354</sup> (\*\*\*).

p. 803

□ I asked Deligne about this strange appellation. He replied (with a touch of embarrassment this time) that it was because "everybody" called him that. I didn't ask him to tell me who "everybody" was, or why, even though he, Deligne, knew perfectly well whose theory it was.

This reminds me of something that had struck me long ago. When talking to me at least, or writing to me, Deligne never used the expression "catégorie dérivée" without adding "de Verdier". It gave me an unpleasant impression every time, without me ever stopping (until I discovered l'Enterrement) to probe the meaning, let alone dot the i's and cross the t's. I would no doubt have stopped there, if I'd taken the trouble to take a slightly curious look at "SGA 4<sup>1</sup>", and at the "Etat 0" of Verdier's<sub>2</sub> "thesis" exhumed there. (For details of the latter, see II 3 above).

## V The Eulogy

1. The IHES jubilee booklet containing my Eloge Funèbre<sup>355</sup> (\*) was not written by its founder and first director, Léon Motchane (as I had thought). What's more, the identity of the booklet's author, which I learned from Deligne, is of little importance here. He confirmed that it was indeed he who had written the passage concerning me, and that this passage, like the one concerning Deligne (due to the author of the booklet), had indeed received his "green light" before being sent to the printer. The text he had dedicated to me was initially longer, and had been (with his agreement) truncated by the author of the booklet. Deligne had also revised and corrected his own text. These texts therefore represent Deligne's point of view, concerning his work and mine.

p. 804

2. I asked Deligne if I'd made a mistake, assuming that in none of his publications did he suggest that he'd learned anything □ from me. He confirmed this, with just one comment reserve. It concerns the biographical note he had written for the Fonds National de la Recherche Scientifique (Brussels), on the occasion of the award of the "Prix quinquennal". This prize had been awarded to him (in 1974, I believe) in recognition of his demonstration of Weil's conjectures. It's true (he added) that

<sup>353</sup>(\*\*) On this "memorable Colloquium" and the article in question, see the note "L'Iniquité - ou le sens d'un retour", n° 75.

<sup>354</sup>(\*\*\*) This operation took place in several stages. After 1963, at my suggestion, Verdier developed a theory of "six operations" duality in the context of ordinary topological spaces, following the masterwork I had developed in the coherent and stale algebraic context. This duality had been christened by my cohomology students, appropriately enough, "Verdier duality" or "Poincaré-Verdier duality", with no mention of my modest self. In the "good reference" of 1976, Verdier takes up again, in the analytic context and without naming me, part of the formalism I had developed in the coherent framework in the fifties (without having to change anything). As a result, this duality, in the analytical context, is still known as the "Verdier duality", or sometimes as the "Serre-Verdier duality", always without any mention of myself - even Mebkhout follows the general trend! But (in a stroke of genius) it's quite clear that algebraic coherent duality is merely a "purely algebraic translation" of transcendental analytic theory, just as étale duality is such a "translation" for transcendental topological theory. It was therefore only natural to call them "Verdier duality" (Serre and Poincaré being left out, as they are far away). According to what Deligne told me, that's what "everyone" did in a hurry. Curtain...

<sup>355</sup>(\*) See the two notes "L'Eloge Funèbre (1) - ou les compliments" and "L'Eloge Funèbre (2) - ou la force et l'auréole", n° s 104, 105.

this biographical note is not part of a mathematical publication, and its distribution has remained more than limited. I myself was unaware of its existence. At my request, he sent me a photocopy within a few days, and I'll come back to it in the following note.

Deligne's systematic disavowal of me didn't seem to bother him. He didn't seem to find anything strange about it, worthy of attention. Given this disposition, I didn't feel prompted to ask him any questions along these lines - I don't think I'd have got anything more out of him.

To conclude this retrospective, I would only add that as far as "material facts" in the strict sense of the term are concerned, I have no doubts whatsoever about Deligne's good faith, which seemed obvious to me<sup>356</sup> (\*\*). The only exception in this respect is his assertion that the SGA 5 seminar (of 1965/66) would logically depend on the results of SGA 4<sup>1357</sup> (\*) (developed from 1973 onwards, alongside Deligne's presentations on his demonstration of Weil's conjectures). It's true that by "capturing" some of the talks given at the SGA 5 mother seminar (especially the one on the cohomology class associated with a cycle), with the connivance of Illusie (who was responsible for editing SGA 5) and many others, he has achieved the brilliant result that SGA 5 is full of references to SGA 4<sup>1</sup>, so as to give the impression (to an inattentive reader) that SGA 5 does indeed depend on SGA 4<sup>1</sup>, which is presented in every respect as an "earlier" text. It's a sleight of hand that's probably unique in the annals of our science, and one that seems to me to distinguish the seventies of our century from all the other eras that mathematics has known.

**Note 164** □ Concerning the "philosophy of weights", stemming from Weil's conjectures, the "filiation" seems to me p. 805 1

can be summed up as follows.

a) As stated in sub-note n° 46<sub>9</sub> of the note "My orphans", Serre had communicated to me, as part of the "philosophy" behind Weil's conjectures, a kind of "yoga of **virtual** weights", at the level of l-adic cohomology of finite-type scheme over a body. He had not attempted to give a precise explicit formulation, and the relationship between what was happening for different *l*'s remained entirely mysterious.

b) One of my two main motivations for developing a "yoga of motifs", from the early sixties onwards, was precisely to link together "virtual weight structures" for different *l*. (See "Souvenir d'un rêve - ou la naissance des motifs" (n° 46), and especially p. 208). From then on, it became clear that this structure had to be found on all possible "realizations" of a pattern, not just l-adic realizations - and in particular (on the base body C) on the De Rham-Hodge realization.

c) Made aware by me of this philosophy of virtual weights, whose ultimate source is the pattern, Deligne brings an important clarification to this yoga, with the presumption that the structure of virtual weights on a pattern is linked to a (necessarily canonical) **filtration by increasing weights**. This filtration should then be found on all realizations of the pattern - both the l-adic realizations and (on the C-body) the De Rham-Hodge one.

This "presumption" of Deligne's was the starting point of his theory of "mixed" Hodge structures (which I call "Hodge-Deligne structures"), and one of the two essential technical ingredients of his definition

<sup>356</sup>(\*\*) (May 12) With hindsight, however, certain reservations about this impression have emerged, such as those referred to in a previous b. de p. note (\*\*) p. 802). It also became apparent that Deligne had omitted to point out to me two gross material errors in my notes, which could hardly have gone unnoticed by him (it had escaped me that he revealed part of the "yoga of the weights" in Hodge I as early as 1970, and that he had spoken of the motives as early as 1979).

<sup>357</sup>(\*) It's true that this confirmation came, not through Deligne's spontaneous initiative in bringing me "material clarifications" to enlighten me and show his complete good faith, but under the unforeseen pressure of the need to "keep face", when I had just expressed my feelings to him verbally about the incredible SGA 4<sup>1</sup> - SGA 5 operation. See this subject the last part (dated February 18) of the previous note "Duty done - or the moment of truth". 2

in the form of these (the other being De Rham's filtration, which I introduced back in the 1950s). It is the success of his attempt to describe a "Hodge cohomology" for separate schemes of any finite type over  $\mathbb{C}$ , which can be regarded as the main (if not the only) "evidence" we now have about the validity of the "presumption" about the existence of a filtration of weights on patterns.

Of course, it was part of my great program of work on motifs, of which Deligne was informed first-hand and on a day-to-day basis, to explain a notion of "Hodge coefficients" on a schematic.

p. 806 of finite type on  $\mathbb{C}$ , such that a pattern on  $X$  corresponds to a "Hodge realization", and that for smooth and pure patterns on  $X$  (e.g. those coming  $\square$  from a clean and smooth scheme on  $X$  taking his "motivic cohomology on  $X$  in dimension  $i$ "), we find the notion (more or less already known) of "families of Hodge structures" (studied in particular by Griffiths in the sixties). Moreover, for variable  $X$ , these categories of "Hodge coefficients" had to satisfy a formalism of six operations, reflecting the same formalism at the level of patterns - Deligne's contribution represents a first step towards the fulfillment of this program - namely (essentially) the description of the category  $Hdg(X)$  for  $X$  reduced to a point<sup>358</sup> (\*), and that of the "realization" functor i.e., essentially, the construction of a cohomological theory on separate  $\mathbb{C}$ -schemas of finite type, with values in this category of Hodge-Deligne structures.

## 18.4. The Dance of Death

### 18.4.1. (1) Requiem for a Vague Skeleton

**Note** 165 (February 22) Since his visit last October, and even since his letters at the end of August<sup>359</sup> (\*\*), my friend Pierre has been with me the cream of ex-students and good boys, visibly filled with a touching goodwill to clear up the unfortunate misunderstandings that have crept in between us, and to make me feel his good disposition and good faith. It was agreed that, until the planned pre-publication of *Récoltes et Semailles* by my university (USTL), he would keep confidential the content of his readings of my notes, and even their existence. I don't know if he was entirely true to his word - but I do have the impression, from various echoes that have come back to me<sup>360</sup> (\*\*\*) that he must have had a word with both of them, to suggest that this might be a good time to give a few signs of consideration to the master (the one we sometimes talk about in small groups, but carefully refrain from naming in public. . . ).

---

<sup>358</sup>(\*) To get it right, we'd have to complete Deligne's definition by introducing a suitable **triangulated** category  $Hdg^*$  (Is this also the category derived from  $Hdg$ ?). That he failed to do so seems to me one of the first signs (among others of the disaffection with the yoga of derived categories and the six operations that prevailed until the "turning point of the Pervers Colloquium" in 1981.

<sup>359</sup>(\*\*) See the note "Le devoir accompli - ou l'instant de vérité" (n° 163), where I "situate" this visit, as well as the two letters of late August (received after a silence of almost two months, followed by my sending the introduction and table of contents of *l'Enterrement*).

<sup>360</sup>(\*\*\*) So I received an undated preprint from Illusie (I imagine it must be last-minute) of a talk from an unnamed seminar (a talk which, it says, does not correspond to any oral presentation in the seminar). Incredibly, my name appears in the title, but yes: "Déformations des groupes de Darsotti-Tate, d'après A. Grothendieck", by Luc Illusie! And in the introduction, there's still an arm's length of "Grothendieck" - I thought I was dreaming. Something must have happened...

There was a letter with it, where he asks for my insights on points of Grothendieck-style homotopic algebra, and wonders why "people (i.e. Quillen et al.)" in *K-theory* work with beams rather than with the complexes (pseudocoherent or perfect) of the panoply I had introduced over twenty years ago. Indeed, one wonders why... In my reply, I must have implied that it wasn't for him or any of my ex-students to ask me such questions. I haven't heard from him since.

□ I have the impression, moreover, that deep down, my friend doesn't believe (or doesn't want to believe, at least)

that I'm going to

p. 807

publish *L'Enterrement*, along with the first part of *Récoltes et Semailles*. This is very much in keeping with the image of the "sugar daddy", scrupulous about naming anyone who might feel sorry for him, and quite willing to acknowledge in public the various failings of his own making that come to mind. Reading this section on "Fatuity and Renewal", which I read briefly before my friend went on vacation and before I sent him the introduction to *L'Enterrement*, didn't worry him at all - on the contrary, it would have stimulated an air of self-satisfaction that has become quite familiar to me in him.

- that air of condescension, or at least protectiveness, towards the decidedly deceased master. It's not at all the same with *L'Enterrement*, where the cards are suddenly laid squarely on the table! I suspect that reading the introduction must have come as a shock to him - and it's a pity I wasn't there at the time, perhaps something might have happened. In any case, he gave himself time to pull himself together, before coming to see me, out of the blue, five minutes before he was due to move to the States. And he came in such good spirits, and the meeting took place in such a family atmosphere, so "cakey", that it seems to eliminate, so to speak "by the absurd", that the aforementioned sugar daddy could himself take seriously a certain text that hardly resembles him (let's say no more about this text, which is best forgotten. . . ), and even spread it among people who are just as reasonable and "well" under all circumstances.

relationships, that my friend Pierre himself and that the ex-deceased as he always knew him...<sup>361</sup>(\*)).

□ As he had promised, and in the very days following his return to Bures, my friend made me I received this biographical note he'd told me about, which he'd written in 1974 (or 1975) for the Belgian Fonds National de la Recherche Scientifique<sup>362</sup> (\*). It's a fairly short text, two short pages, which I read with interest at the time, and which I've just reread (I think it's the third time I've read it). At first glance, however, I didn't feel that this text offered anything new, and that it deserved a closer look in *L'Enterrement*. It's true that the technique of escamotage, with which I was already sufficiently familiar in my friend's work, is illustrated here in a particularly striking way, in a compact text of around a hundred lines. My name appears four times (as does Serre's, and Weil's three times) - with nothing to suggest that he may have met me other than as an anonymous listener at my seminar (on an unspecified theme) in 1965-66. In three of the four passages in which I'm mentioned, I'm mentioned in one breath with another mathematician (twice Serre, once Rankin), so as to avoid giving the impression that I played any special role with him. This is a technique that has already proved its worth elsewhere<sup>363</sup> (\*\*). As it won't take long, I'll take the liberty of quoting in extenso the three passages in which my modest person appears, to enlighten readers who, like me, don't have access to the text of the biographical note.

p. 808

The third paragraph continues with the evocation (just given) of the year 1965-66, spent "in the ideal atmosphere of the Ecole Normale Supérieure as a foreign boarder"<sup>364</sup> (\*\*\*):

□ "In Paris, I attended Grothendieck's seminar and J.P. Serre's course. Three hours of lectures

p. 809

<sup>361</sup>(\*) However, at no time was there any hesitation in my intention to make all my notes on Burial public, in the same way as the first part of *Harvest and Sowing*; and I have, of course, left no ambiguity on this subject.

<sup>362</sup>(\*) This biographical note is mentioned for the first time in the last footnote to "Le nerf dans le nerf - ou le nain et le géant" (n° 148). See also the end of previous note n° 164 (part V 2).

<sup>363</sup>(\*\*) I'm thinking here of the laconic one-line reference, quoting in a breath Serre (without naming him) and "the conjectural theory des motifs de Grothendieck", in Deligne's announcement (at the Nice Congress) of his results in Hodge theory. For further details and comments, see sub-note n° 78' of the note "La victime" (n° 78').

<sup>364</sup>(\*\*\*) For some reason, Henri Cartan is not named here. Perhaps it's because Deligne, encouraged by a certain deliberate intention I had for him (see note "L'être à part", n° 67'), was to carefully avoid any appearance that he might have been anyone's pupil. The situation of "normalien" immediately gives rise to the association of ideas "pupil of Cartan", and a such an association would have been strengthened by mentioning Cartan by name.

per week but, despite working happily and relentlessly, the rest of the week was barely enough for me to assimilate them (165<sub>1</sub>). From Grothendieck I learned the modern techniques of algebraic geometry, from Serre the fascinating beauty of number theory (165<sub>2</sub>). Serre's lectures were devoted to the theory of elliptic curves, where...",

to continue on the charms and variety of these Serre courses. The reader not in the loop will think that it was these courses, at a rate of three per week, that were the object of the "happy and relentless work" of which the author speaks (implying: no need for work to assimilate the "greatest natural generalities" of a Grothendieck seminar. . . 165<sub>1</sub>).

In the fifth paragraph, in connection with his demonstration of Weil's conjectures, we read:

"My most notable achievement is to have proved the "Weil conjectures" (. . .). I undoubtedly achieved this for being familiar both with Grothendieck's work and, in an entirely different field, with Rankin's work on modular forms."

Admire the dubious "sans doute" (masterfully placed there!) and the "dans un tout autre domaine" (sug-  
gérant que mon oeuvre n'aurait rien à voir avec les formes modulaires<sup>365</sup> (\*)), and above all the "tant avec"  
with which I have the honor of being introduced, to equate the vast groundwork I had done<sup>366</sup> (\*\*), with a  
"punctual" technical idea borrowed from Rankin.

Finally, in the next paragraph referring to Deligne's work on Hodge theory, it says:

□ "Inspired by arithmetic, and more particularly by Grothendieck's conception of the deeper meaning of Weil's conjectures, I generalized (non-trivially) his theory to the case of arbitrary varieties and (in collaboration with Sullivan) to other "form" invariants than just cohomology. The root of this theory is already old, with Picard's treatise on "algebraic functions of two independent variables" (circa 1890), but we probably know little more today than a vague skeleton."

p. 810

I had to take the trouble to recopy this passage, only to realize that "Grothendieck's conception of the deeper meaning of Weil's conjectures" was my brilliant ex-student's masterly "thumb" way of not naming the **motives**, though he could not be blamed for passing them over in silence! There's no doubt that "his [hence, **my**] theory", about which I'm only just wondering (this whole passage had escaped my attention in previous readings), can only mean the famous theory of motifs, which there had been no question of mentioning by name for four years already (and which we won't be mentioning for another eight!). The formulation was even so vague and, to put it bluntly, incomprehensible except to a small handful of people in the know (who, like me, will doubtless not have had the opportunity to read this pre-Funeral Eulogy), that it wasn't even worth pointing out here that this "theory" (which he had generalized) was, nonetheless, entirely conjectural! The "generalization" in question can hardly mean anything other than the Hodge-Deligne theory, given the context. It's a little symbolic satisfaction that my friend is giving himself, by asserting here (without fear of ever being contradicted, given the location, and the vague elusiveness of the formulation) that the theory

<sup>365</sup>(\*) It's true that "modular forms" represent an unfortunate hole (among many others) in my mathematical culture, just like analytic number theory, on which I've never yet "latched on". Still, I'm sufficiently well-informed to know that an understanding of modular forms is hardly conceivable without the ideas coming from algebraic geometry, which gives the theory its "geometric" content, and that the deepest questions of modular form theory are intimately linked to the (long unspoken) presence of **motifs**. As we shall see, they also appear, just as tacitly, in the next paragraph of the biographical note (aka Eulogy (3)!).

<sup>366</sup>(\*\*) On the notion of schema and the development of a formalism of staggered cohomology, to which Deligne is careful not to allude, except in the preceding quotation by the kindly and impersonal euphemism "modern techniques of algebraic geometry" .

of Hodge-Deligne (which still remains in its infancy) would "generalize" the vast picture of patterns I had shown him. In the latter, however, a fully matured "Hodge theory" appears as one of the "planes" of the picture among many others<sup>367</sup> (\*) As for "other invariants of form", it was "well known" to me as early as the sixties (as part of my "yoga of patterns") that algebraic varieties

"arbitrary" (as Deligne insists) had a "motivic homotopy type", whose  $\pi_i$  higher ( $i \geq 2$ ) generalize the fundamental "geometric" motivic group, and are explained (for a given fiber functor on a number field  $K$ ) as affine algebraic pro-groups on  $K$ .

□ As for the reference to Picard as "the root of this theory", this is, it seems to me, an entire passage- The term "vague skeleton" was introduced for the double reason of "looking good", and at the same time to introduce the final paragraph, which immediately follows<sup>368</sup> (\*). The term "vague skeleton" also seems to me to be the expression of another "symbolic satisfaction" that my friend is paying himself, by treating inwardly and yet without seeming to do so (always in the same "thumb!" style) this vast vision from which he has secretly drawn inspiration, while keeping it buried<sup>369</sup> (\*\*), as nothing more than a "vague skeleton".

p. 811

In the end, these all-encompassing escamotages turned out to be more interesting than I had anticipated, when I was about to point them out in passing, out of a sense of conscience. What strikes me most now is not (as on my first, quick and superficial readings) the perfection of the "pouce ! It's rather that this text, written nine years before the *Eloge Funèbre*<sup>370</sup> (\*\*\*), foreshadows the latter in a striking way, and this (it seems to me) in two ways. On the one hand, by the vague rigor that must surround every appearance of my modest person (as opposed, here, to the luxury of technical detail that accompanies the evocation of the *Cours de Serre*). On the other hand, and in the same vein, the complete silence surrounding

□ de étale or *l-adic* cohomology, as a new and essential tool that I have developed from nothing, and without which Weil's conjectures would probably not be demonstrated even a hundred years from now! In fact, as in the Eulogy, the word "cohomology" is not mentioned in connection with my name - nor is there any allusion to the fact that Deligne's demonstration of Weil's conjectures was simply **the last step** in a long journey, the longest and most innovative part of which was accomplished by someone other than him, even before my brilliant pupil appeared on the mathematical scene<sup>371</sup> (\*).

p. 812

**Note 165<sub>1</sub>** As I point out a few lines further on, the wording irresistibly suggests that the "three hours a week" refers to the "J.P. Serre lectures" just mentioned, and referred to again two sentences later. In fact, Serre only gave one lecture a year (at the Collège de France), for one hour a week. If we try to resolve the ambiguity by interpreting the text as

<sup>367</sup>(\*) (February 27) For further details, see "La Mélodie au tombeau - ou la suffi sance" (n° 167).

<sup>368</sup>(\*) This final paragraph will be the subject of the note (n° 165) which follows this note.

<sup>369</sup>(\*\*) The vision of patterns remained "buried" in two ways. On the one hand, with regard to the **outside**, the mathematical public, by refraining from any allusion to the notion of pattern (except in Hodge I's half-line "inch!", in 1970, cf. note 78'), until 1982 when the notion was exhumed "with great fanfare" under the tacit paternity of Deligne (see notes n° 51 and following). But on the other hand, even for his own use, I can see that this vision has been stripped by Deligne of its true **breath**, of that which makes it was **more than just** a collection of all-purpose recipes (for getting to grips with the cohomology of algebraic varieties), but a **dream-force** vast and deep enough to serve as an inspiration, a line on the horizon, for perhaps generations of arithmetician geometers.

The term "vague skeleton", by which Deligne refers (always tacitly) to this vision, captures the **gravedigger-like** disposition in which he maintains himself, in his relationship to this dream and to the worker from whom the dream springs. These are not the attitudes in which one can still feel a breath (as he had once felt), nor embody a dream. You don't embody a dream by **using it** for your own ends (and denying it at the same time. . .), but only by **making** yourself its **servant**.

<sup>370</sup>(\*\*\*) See the two notes "L'Eloge Funèbre (1) - ou les compliments" and "L'Eloge Funèbre (2) - ou la force et l'auréole", n° s 104, 105.

<sup>371</sup>(\*) This contribution by another is glossed over by Deligne under impersonal terms such as "modern techniques [or, elsewhere, "powerful tools"] of algebraic geometry".

referring to Serre's "courses" in successive years (contrary to what the context suggests), we come across another inconsistency, since Serre changed his theme every year, and by no means limited himself to that of elliptic curves (as stated two sentences later).

While Serre's persona is used here by my friend to try and give the lie to the role I played in the crucial years of his mathematical training, it's interesting to note that the one and only reference I'm aware of in the literature to the fact that Deligne was my pupil comes from Serre's pen, thus repairing (without noting) the glaring omissions of my brilliant ex-student himself. This is the report Serre wrote in May 1977 on Pierre Deligne's work, for the International Committee responsible for awarding the 1978 Fields Medals. This report was made public after the Fields Medals were awarded at the 1978 Helsinki Congress. The report begins:

"Deligne's first works, directly inspired by Grothendieck, whose pupil he was, concern various technical points of algebraic geometry. I'll just mention them: . . ."

p. 813 □ Further on, Serre also mentions the influence of my ideas and results in the demonstration of conjectures of Weil, and (via motifs) in Deligne's work on modular forms, but not in the Deligne-Mumford work on modular multiplicity of algebraic curves of type  $(g, \nu)$ , nor in the idea of Hodge-Deligne cohomology, whose relation to the yoga of motifs and Weil's conjectures seems to have escaped him. (True, Deligne did his best to hide it.)

The speech on Deligne on the occasion of the award of the Fields Medal would have been another opportunity, in accordance with established practice, to publicly remind people of this link to me, which had been kept quiet until then by the person concerned. For some reason, the mathematician in charge of presenting Deligne's work was not J.P. Serre, but N. Katz, the "co-author" with Deligne of SGA 7 II (see note n° 164 (II 5)). Needless to say, N. Katz makes no mention of the link in question, which was well known to him at first hand. (On the other hand, he does, incidentally, make good a number of the illustrious laureate's rather embarrassing omissions about me... .)

**Note 165<sub>2</sub>** The choice of qualifiers here ("modern techniques" for me, "fascinating beauty" for Serre) is certainly no accident. I clearly perceive in it my friend's intention to evacuate (symmetrically) precisely that **fascination** which, since our meeting (and perhaps even before that) had bound him to my person and my work, which he saw being made and unfolding before his eyes, day by day.

On other occasions, I've noticed a deliberate intention on the part of my friend to view and present my publications (notably the EGA ("Eléments de Géométrie Algébrique") and SGA ("Séminaire de Géométrie Algébrique du Bois-Marie") as a kind of "compilation" of more or less technical results, which "everyone" has always known about, and for which I would make the laudable effort of putting them in black and white, in order to finally provide the missing references so that no one would talk about them any more. He knows, however, what he's getting at: that each volume of the EGA and SGA presents ideas that I introduced and of which I was the sole holder and advocate for years, and techniques that no one had dreamed of (except me), and which I had to develop, test and perfect with tireless patience, before they could be used by the public.

p. 814 perfectly honed, ready to enter the realm of the "well known". He knows this better than anyone, but at the same time, this deliberate purpose he has been displaying □ depuis depuis plus d'une décennie has ended up becoming a "second nature", he himself became the first (if not the only) dupe.

I was reminded of this only a few weeks ago, when my friend, who has been very considerate of me since his visit to my home in October, sent me a copy of an exchange of letters with Dr. Heinze (in charge of "Ergebnisse der Mathematik" at Springer) about a project to reissue the EGA (of which many

With one exception (the second part of EGA III, where the presentation would have been better using derived categories (sic!)), this treatise "has aged very well". Its great merit would be to provide indispensable references: "Thanks to it [EGA], in algebraic geometry (as opposed to analytic geometry, for instance) one can march securely on the ground without having to worry if this or that is indeed in the literature". (He follows this up with a number of constructive suggestions, about possible appendices that could be added to some of the volumes, and mathematicians who would be able to provide them. ... )

It is typical of Springer's relationship with me that this correspondence (about the republication of books I had authored) continued **with Deligne**, and without Springer having deemed it necessary to inform me about the project in the first place. It was more than a month later (in a letter dated 24.1) that Dr. Heinze told me in passing, as a matter of conscience, about the matter - that Mr. Professor Deligne "had been kind enough to give me a copy of his letter of 19.12.84" (it was really kind. . . ), and that "of course, we [Springer] would be interested to know your opinion on this subject [the republication project]" (it's really too much of an honor. . . ). I replied that, in view of Springer's publishing procedures (thinking of publishing SGA 7 and SGA 5 in Lecture Notes, without even informing me, let alone asking for my agreement), it seemed to me perfectly superfluous to inform Springer Verlag of "my opinion", which was obviously irrelevant. That's where things stand...

## 18.4.2. (2) The profession of faith - or the truth within the falsehood

**Note 166** (February 23) In the end, I didn't get to my real point yesterday, talking about my friend Pierre's biographical sketch. The "vague skeleton" encounter (a.k.a., pattern theory) has been a unexpected episode, just as I was about to move on to the final paragraph of the notice, *sui generis* immediately the last passage quoted. So here, at last, is the final word in the "biographical note", which is what I wanted to get to all along:

p. 815

"In conclusion, I would like to emphasize how precious to me is contact with the work of past mathematicians (from 1800 to the present day), whether direct or relayed by scholars more erudite than myself, such as A. Weil and J.P. Serre. We "are dwarfs perched on the shoulders of giants", and the finest modern mathematical theories are motivated by the hope of solving some of the problems they bequeathed us.

Pierre Deligne

As is often the case, my first reaction to these lines, a sort of profession of faith in this case, stopped at the surface, at the literal meaning - but I must have sensed, however, that beyond the literal meaning there was something fishy going on. This quotation (from a famous mathematician, no doubt, whom I was supposed to have read, "like everyone else") wasn't coming back to me. I sensed a deliberate attempt at modesty, even humility, which had all the hallmarks of a pose, and which simply didn't correspond to the simple reality of things. If each generation were "smaller" in size than its predecessors, the human species would have long since died out, reduced to a paltry mass of homunculi! I'm well aware that human creativity is no less today (nor, no doubt, greater) than it was a hundred years ago, or a hundred centuries ago. I'm also well aware, speaking only of maths, that the ideas and work of people I've known well, without excluding myself from their number, would have been to the credit of even the greatest mathematicians of the past. And I'm well aware that **my** motivation in doing math,

and certainly not that of most of my former friends in the mathematical world<sup>372</sup> (\*), lies in the "hope of solving some of the problems" bequeathed by my predecessors! If it were otherwise, our science would be powerless to renew itself - it would have ceased to be creative.

What must have shocked me even more about this borrowed profession of faith, or to put it more accurately, **pained** me, was that I knew above all that the person who made it, more than any other person in the world I had known, had shared "means" that had amazed me, and that I had also known to him.

p. 816 a "freshness" in his approach to mathematical things, whereby he was called upon to do great things, as few mathematicians have had the privilege of doing. There was in me a sorrow, and also like a spite, because behind the pose of one who claims to have found humility in dealing with the great men of the past, I sensed an **abdication**. An abdication of that creative force within him, which he seemed to have forgotten a long time ago, and which made him **something** quite **different** from what was suggested by that derisory image of the dwarf perched on the shoulders of a giant<sup>373</sup> (\*).

This is the first time, since my first reading of the biographical note, that I've tried to pinpoint what feelings this reading first aroused in me. In the days that followed, and without any deliberate intention on my part, it continued to work. It was this last passage in particular that kept running through my mind, like something decidedly unusual, and which hadn't "gone away". Behind the apparent absurdity of the profession of faith that closes this short biographical text, I must have sensed a **meaning**, which was undoubtedly directly perceived at an unconscious level, and which gradually rose to the superficial layers, without there being any reflection as far as I could remember. After all, I knew that my friend Pierre wasn't in the habit of haunting the writings of the past any more than I was. While he certainly read more than I did, it wasn't the old grimoires, but rather the latest reprints and preprints circulating in well-informed circles, of which he was always the first to have access. And I also knew that it wasn't from Picard or other venerable precursors of the last century, or even of this century, that my friend had drawn the inspiration that had nourished his work since (and even before) my departure from the mathematical scene! And if it's true that he had enjoyed "perching on someone's shoulders", not in a public and rhetorical profession of faith, but secretly and **genuinely**, I was after all in a good position, since I'd been reflecting on a certain Burial, to know **who** had been the one to do it, so to speak,

p. 817 the costs! In place of Celui-qu'on-nommais-jamais<sup>374</sup> (\*\*), (and who nevertheless remains ever present. . . ) we verbally substitute "the great men of the past", to whom in the preceding paragraph we come from elsewhere all just to tacitly attribute authorship of the motifs (a.k.a. "what today is little more than a vague skeleton") - thus making the **true** identity behind the surrogate figure all the more striking. ...

I've observed time and again that there's a force within man, apparently universal in nature, that pushes him to express against all odds, often in a roundabout and symbolic way, desires and intentions (both conscious and unconscious) that cannot be manifested openly, thus giving them an outlet and satisfaction that may seem derisory (in "rational" terms and according to current consensus), but are no less substantial. It's a force, in a sense, that pushes us, as if in spite of ourselves, to proclaim the truth of our being to whoever will listen (and there's "someone" in all of us with a keen ear. . . ), **even though** what is thus "proclaimed" would be the greatest secret and would be anathema, before others as well as ourselves. The ideal terrain for the expression of this force is the dream, and this is one of the reasons why the dream is the most powerful key of all for us to enter into the world of our dreams.

<sup>372</sup>(\*) Including, incidentally, Pierre Deligne himself!

<sup>373</sup>(\*) (February 25) This impression of "abdication" is strongly associated with that aroused by a certain "third part" to my Funeral Eulogy. See the reference to it at the end of the note "L'Eloge Funèbre (2) - ou la force et l'auréole" (n° 105), p. 459-461.

<sup>374</sup>(\*\*) Or, if we can't avoid it, we'll call it "by the tape", in the de rigueur "thumb!" style... .

knowledge of ourselves. But because of the intimate, personal nature of dreams, which speak to us about ourselves to no one but ourselves, this means of expression is by no means sufficient for us, as it is unfit to assert the truth of our being **before others**, or even, symbolically, before the whole world. This is why, behind every nonsense that seems to defy reason, a "meaning" is hidden - or to put it better, nonsense is the **privileged means of expression**, chosen by the unconscious with infallible instinct, to **proclaim this meaning**, both hidden and ostentatiously displayed before everyone<sup>375</sup> (\*)!

This is surely what I felt darkly, in the days that followed my reading of this "nonsense": the "dwarf" (born to be a giant) perched on the shoulders of a "giant" (of much more modest means). than those of the so-called "dwarf", perched on top of him while denying him... .). One of the reasons<sup>376</sup> (\*\*) □ for my difficulty in p. 818

to become clearly aware of the meaning revealed by this nonsense, was undoubtedly my reluctance to recognize myself in this cookie-cutter image of the "giant"; or rather, perhaps, to recognize myself in a certain pose or brand image which was indeed mine and which, through the unexpected tricks of this grating nonsense, was suddenly calling out to me! It wasn't until weeks later, in the December 18 note "Le nerf dans le nerf

- ou le nain et le géant" (n° 148), that I finally return to the unusual image of the dwarf and the giant, this time by working on pieces, at a time when the context of reflection on the Burial was all set to welcome it. This image immediately revealed itself (on the very same day) as an "image-force" crucial for understanding my friend's relationship to me, and more profoundly and above all, for the beginning of an understanding (doubtless destined to remain forever fragmentary) of my friend's relationship to himself, i.e. also: of **the** particular form taken by **division in his own person**. And insofar as L'Enterrement was implemented, before any other, by my friend's ex-student and ex-heir<sup>377</sup> (\*), it is this same image that now appears to me as **the** neuralgic force obstinately at work throughout this long Burial, as its true **nerve**. It is at the center of reflection in the fortnight following the crucial moment of its appearance in the notes, throughout the nine notes that follow one another, between December 18 (with the aforementioned note "Le nerf dans le nerf - ou le nain et le géant") and the December 3 note, "Le Frère ennemi - ou the handover" (n° 156).

The "validity" of the role of neuralgic image-force taken on in my thinking by this image of anodyne appearance, that is to say, also, the question of **the** □ **reality**, in the psyche of my friend himself, of such an image- p. 819  
force, the expression of deep-seated conflicts and the driving force behind irrepressible acts of compensation<sup>378</sup> (\*) - this question, it seems to me, cannot be settled by a "demonstration", i.e. by a so-called "demonstration" approach.

<sup>375</sup>(\*) For another particularly ostentatious example of **meaning** proclaimed by apparent nonsense, see the note "La plaisanterie - ou "les complexes poids"" (n° 83). See also the comments in the note "La surface et la profondeur" (n° 101), particularly at the end of the note (p. 440), and in the following one, "Eloge de l'écriture" (n° 102).

<sup>376</sup>(\*\*) Another reason, which seems to me to have been the main obstacle, is a certain **inertia**, or more precisely, a kind of **pusillanimity** in "believing the testimony of one's eyes, even though what one sees is quite unheard of, never seen before and ignored and denied by all". I was confronted with this again recently in the note "Le devoir accompli - ou l'instant de vérité" (n° 163). See in particular the b. de p. note (\*\*) on page 782, where I probe this kind of "incredulity" in the face of the obvious. ...

<sup>377</sup>(\*) It's true that in this "implementation", he acted in close connivance with "The whole Congregation", to whom he served as a kind of instrument for the accomplishment of a collective will. (See note "Le Fossoyeur - ou la Congrégation toute entière", n° 97.) But it's possible that this same image-force that I perceived in my friend, was also present at the level of a "collective unconscious" in the said Congregation, finding its expression in the unconscious of many of its members, including some of my students (and not just Deligne).

(May 12) This intuition has come a long way since these lines were written, and now it imposes itself on me with the force of evidence. On this subject, see the note "Le messager (2)" (n° 181).

<sup>378</sup>(\*) By the term "irrepressible", I in no way mean to suggest that the presence of this force has become a kind of inevitability. that would have escaped my friend's responsibility. The action of such a force within us is "irrepressible" only insofar as we enjoy and persist in evading knowledge of it, in order to cash in on the various benefits and gratifications we "buy" through this deliberate "ignorance". The price is exorbitant, it's true, but ignoring that price too is part of the same deal.

It's an "objective" fact that's bound to win the support of any good-faith and sufficiently informed interlocutor. For me, this reality is beyond doubt, and my firm conviction is not the result of such a "demonstrative" approach. It is true that it has deepened in the course of the fifteen days of reflection I mentioned earlier (a reflection which I won't attempt here to "summarize" or "assess"). But it was there from day one - from the moment I took the trouble, for the first time since my reading, to write down in black and white what it inspired in me, as if under the dictation of a silent voice<sup>379</sup> (\*\*) which then "reminded" me of what, deep down, I already "knew". I had to "know" it, by means of faculties of perception that are by no means extraordinary, but incomparably more unbound than those we commonly allow to come into play at the level of **conscious** awareness of things. These mechanisms of repression of what is perceived "somewhere" within us, and which doesn't "fit" with the routine logic of our received ways of seeing (or rather, **not** seeing) reality around us - these mechanisms, needless to say, are as strong in me as in anyone else. If there's a difference in this respect between me and others, it's that I've come to realize their silent action within me, and especially since I sometimes "meditate": that I sometimes take the trouble, prompted by an indiscreet curiosity, to **put down** on those things I wish to know, which has the effect of **bringing to the surface** of consciousness what was obscurely perceived in deeper layers and giving it form.

p. 820      □ The initial perception, moreover, is transformed in the course of the **work**, which gives it shape while bringing it

out into the open. This work is at the same time a **decantation**, by which little by little the conscious translation of perception (into intelligible words) frees itself from the subjective a-prioris that unknowingly tainted it. In this case, one of these distorting a-priori (detected in the last of the notes quoted earlier) is the inveterate mechanism within me that leads me to "see myself as yang", and this even in situations where, visibly, it's the yin side of my being, "the woman in me", that provides the key to understanding (or at least, one of the keys, or "illuminations", indispensable for a nuanced understanding). Elsewhere, I've talked about the **signs** - all "subjective" but nonetheless unmistakable - that tell me the **progress** of such work<sup>380</sup> (\*), and others that warn me when I'm on the wrong track, or when there's momentary stumbling, which ends as soon as it's detected.

### 18.4.3. (3) La mélodie au tombeau - or sufficiency

**Note** 167 (February 25) Most of yesterday was spent writing a long letter to a young colleague, Norman Walter, who seems motivated to take up pattern theory, unimpressed by a decidedly unpromising economic climate. This time, it was eight tight pages (typewriter), on the "six operations" for pattern categories and for the most important "coefficient categories". It made me realize again, with amazement, that in the twenty years or so that the question has been asked (not in the literature, admittedly. . . ), none of the "good" categories of "usual" coefficients (sic!) for the cohomology of schemes has yet been defined, with the sole exception of the "l-adic coefficients" for *the* first to the basic scheme  $X$ ; and even this work, in the framework of triangulated categories (indispensable for the six-operation formalism), carried out in Jouanolou's thesis, has never been published. I myself have never held a copy of Jouanolou's work in my hands.

<sup>379</sup>(\*\*) This image of "dictation" by a "silent voice" has come to me more than once, I believe, in the writing of *Récoltes et Semailles*, and each time as a matter of course. This is by no means the repetition of some "stylistic effect", but reflects (it seems to me) a common aspect, more or less evident from one situation to another, of the process of discovery.

<sup>380</sup>(\*) On this subject, see the note "L'enfant et la mer - ou foi et doute", n° 103.

thesis by this student<sup>381</sup> (\*\*). These are striking signs of the general disaffection with the program of foundations that I had undertaken in the sixties, and which I certainly would not have suspected would not continue in the same vein, but would be broken off (or "cut up". . . ) as soon as I left the mathematical scene. . .

When the prime number  $l$  is **nilpotent** on the scheme  $X$ , the category of " $l$ -adic coefficients on  $X$ ",  $Z_l^*(X)$  let's say<sup>382</sup> (\*), should be none other than that of "crystalline coefficients", with Frobenius operation  $F$  and **filtration** to boot. The construction in form of this triangulated category, not to mention the

six operations, is still waiting for someone to do it. As for the "recollement" of the "ordinary"  $l$ -adic case (although not found!) and the previous "crystalline" case, via a "mysterious functor" that I foresaw as early as the late 1960s, to arrive at the definition of the unrestricted coefficient category  $Z^*(X)$

on  $l$ , it is still not done even in the simplest non-trivial case of all,  $X = \text{Spec}(Z_l)^{(*)}$  As for the De Rham-Hodge coefficients  $DRHdg^*(X)^{383}$  (\*) for a general scheme, I had little precise idea how to describe them, and Deligne failed to pin them down in a truly satisfactory way. The idea Zoghman Mebkhout is the author of this innovative work - and we know what adversity he had to work under, and what fate befell his person, once the scope of his ideas had been (very partially) re-known. The fact remains that we now have a reliable guideline for approaching a construction in the form of  $DRHdg^*(X)$ , in terms of conditions of finiteness, holonomy and regularity on complexes of "crystals" (absolute - i.e. relative to the absolute base  $\text{Spec}(Z)$ ?), with perhaps the additional data of a "De Rham filtration" and another "filtration by weights" - and with the hope that we may arrive at

<sup>381</sup>(\*\*) Jouanolou's thesis, written without any real conviction (which set it apart from all my other "students before I left"), dragged on and on, and was not defended until after 1970. As with Deligne's thesis, I don't recall being informed of the defense, let alone being asked to sit on the jury. Jouanolou did not see fit to send me a copy of his work. I wrote to him last year to request one. He informed me (without comment) that, to his regret, there were none left. . .

(May 12) My memory misled me here - in fact, Jouanolou's thesis was defended as early as 1969. For details, see the final note (still unwritten at the time of writing) n° 1767, in the suite "Le sixième clou (au cercueil)".

<sup>382</sup>(\*) The sign \* after the indication of the base ring for the chosen theory (here, the ring  $Z_A$ ) indicates that we are working, not with "constructible bundles" without more ( $l$ -adic in this case, in a suitable sense) but with "constructible" **complexes** of bundles, objects of suitable triangulated categories (whose description in form can be tricky, even though the category of constructible bundles, in this case  $Z_A(X)$ , would already be known). When working with patterns (by which, more often than not, we mean "iso-patterns", i.e. "isogenically close patterns", forming a  $Q$ -abelian category), the natural coefficient categories for "realizing" such (iso)patterns must themselves be  $Q$ -abelian.

take  $Q_A(X)$ ,  $Q^*(X)$ . When we want to work with all  $l$  at once, the most natural thing is to work with a category of "adelic" bundles (or complexes of such), whose base ring is the ring of adels  $\hat{Z} \otimes_Z Q$ , obtained by "tensorizing" the product of all categories of coefficients  $Z^*(X)$  by  $Q$ .

Note that when the prime number  $l$  is not prime to the  $X$  scheme, then in the description of the "coefficients  $l$ -adic" elements on  $X$ , the nilpotent elements of  $Q(X)$  cannot be neglected - they intervene in the vicinity of the fibre  $X(l)$  of  $X$  in  $l$ . A fortiori, the same will be true of the adelic coefficients on  $X$ , which brings them closer to the coefficients (just as hypothetical for the moment) of De Rham-Mebkhout, discussed in the next paragraph. In fact, I have the impression that the two main types of coefficient, the adelic coefficients and De Rham-Mebkhout's coefficients (provided the latter are equipped with all the richness of structure alluded to below), are of comparable "fidelity", as (weakened) descriptions, or "realizations", of the same **motif**, very closely circumscribed by one as by the other. In the sixties, I put forward some conjectures about this "fidelity", similar to those of Hodge and Tate (which my friend buried with the rest. . . ). I intend to return to them in the volume of *Réflexions* that will be devoted to the "vast array of motifs". One senses a strong kinship between the two types of coefficient (adelic, De Rham-Mebkhout, the latter taken here "within isogeny"). The advantage of the latter over the former, which makes them appear "more fine" in some respects, is that the natural base ring for them is  $Q$ , whereas it is the (much larger) ring of adels for the adelic theory.

<sup>383</sup>(\*) (May 12) As we'll see below, this "improvised" name and notation prove to be inappropriate. I have finally opted for the notation  $DRM^*(X)$  or  $Meb^*(X)$ , dual to  $DRD^*(X)$  or  $Del^*(X)$ , for the coefficients of De Rham-Mebkhout and De Rham-Deligne respectively. The latter were left behind by their father in 1970, and adopted by in the year of our Lord 1985, as one of the basic ingredients (along with Mebkhout's coefficients) in the Grothendieckian panoply. ...

make something, moreover, that holds up without restricting itself to the null characteristic, and which for a given positive characteristic more or less gives back the "habitual" (sic!) crystal coefficients. The extraordinary thing is that I seem to be the only person in the world to feel the task - Zoghman Mebkhout himself, no doubt instructed by bitter experience, doesn't seem to have the slightest inclination to think for even one more day about questions of the foundations of **his** philosophy! It would be wrong of me to be surprised by this, as I see Deligne preaching by example with Hodge's theory, cutting short his own impetus, which had animated him "in my day" and brought forth an approach rich in promise (unfulfilled. . . ). I suspect that the formalism (not yet even in limbo) of Hodge coefficients (above complex algebraic varieties  $X$ ) should be more or less contained in that of the coefficients I used to call (following my language reflexes of the sixties) "De Rham coefficients", or also "De Rham-Hodge", to recall the link between the **filtered** De Rham object and the associated **graded** object (called "Hodge"). But given the crucial role played by Mebkhout's philosophy in understanding these categories of coefficients (which are still hypothetical, of course), it would probably be better to call them "**De Rham - Mebkhout coefficients**" ( $DRM^*(X)$ ) or, at a pinch, "De Rham-Hodge-Mebkhout coefficients",  $DRHM^*(X)$ . When  $X$  is of finite type over the complex field  $\mathbb{C}$ , we should be able to reconstruct the hypothetical  $Hodge \boxtimes HDG$  coefficient categories<sup>384</sup> ( $X$ ) (which I certainly wouldn't call Hodge-Deligne, whereas Deligne

It seems to me that we've done everything to hide the problem, far from highlighting it!), in a more or less "tautological" way, as well as the six operations on them, based on De Rham-Mebkhout coefficients, to which we simply add an additional structure (of a transcendental nature) called "de Betti". It seems to me, therefore, that the main issues in describing "categories of 'natural' coefficients" for the cohomology of algebraic varieties<sup>384</sup> (\*) are currently as follows:

1. Description of the category of  $l$ -adic coefficients  $Z_l^*(X)$ , for  $l$  given prime number and for **any** scheme  $X$  (not necessarily "prime to  $l$ "), and a formalism of the six operations for these coefficients. (This question appears more or less equivalent to that of the "mysterious functor").
2. Description of the  $DRM$  category<sup>\*</sup> ( $X$ ) of "De Rham-Mebkhout coefficients" for any scheme  $X$ , or possibly, of analogous  $DRM$  categories<sup>\*</sup> ( $X/S$ ) for relative schemes (

$$DRM^*(X) = DRM^*(X/\text{Spec}(\mathbb{Z}))$$

), and a six-operation formalism for these coefficients.

For 2), there may be several possible variants, depending on the richness of structure we decide to introduce into these coefficients. In any case, the "theorem of the good Lord" (aka Mebkhout) shows us a priori (for  $X$  of finite type over the field of complexes, at least) that there must exist a formalism of the six variances for crystalline coefficients à la Mebkhout, without having to introduce "over the top" filtering à la De Rham or/and by weight. A third important type of additional structure, which is bound to exist on the De Rham-Mebkhout crystal complex  $K_{\text{sur}} X$  associated with a pattern (or "absolute coefficient") on a general  $X$ -*scheme*, will be the giving for any prime number  $p$  of a "Frobénius"

$$K(p)^{(p)} \rightarrow K(p)$$

where  $K(p)$  denotes the restriction to the subscheme  $X(p)$  deduced from  $X$  by reduction mod.  $p$ , and where the exponent

$(p)$  denotes the "Frobéniusé" of  $K(p)$ , i.e. its inverse image by Frobénius  $X(p) \rightarrow X(p)$ . Thus, according to

<sup>384</sup>(\*) In a sense, these questions are preliminary (or tacitly assumed to have been resolved) to the development of the yoga of motives with all the precision and generality it deserves, and which I saw as early as the 1960s.

additional structures (among the three we have just named) that we can propose to introduce on a crystalline complex, we can foresee a priori a total of **eight** variants, for a notion of "coefficients of De Rham-Mebkhout". It is a work on coins only that will be able to show us which of these variants p. 824 give rise to a formalism of the six operations. It's also true that, for the purposes of pattern yoga, when the aim is to find simple "algebraic" objects that "stick" as closely as possible to the patterns, in order to describe their structure as faithfully and richly as possible, it's the "richest" coefficients that a priori seem "the best". It was in their richness that the main charm of Hodge's coefficients lay - so much so, in fact, that we could hope to reconstruct from scratch the category of patterns on  $C$  (if Hodge's conjecture were true), and even those of patterns on any  $X$  of finite type on  $C$ .

This reminds me that it's possible for some of the structures to be "superfluous", that they follow from the others (but in a way, it's true, so hidden, that it'll be hard to spell it out in down-to-earth terms)<sup>385</sup> (\*). For example, on the De Rham cohomology (relative on  $S$ ) of a scheme  $X$  smooth on another  $S$ , I demonstrated (towards the end of the sixties)<sup>386</sup> (\*\*) the existence of a canonical (absolute) curvature-free connection, which I called **the Gauss-Manin connection**. As a result, the Hodge-Deligne structure associated by Deligne with a smooth  $X$ -scheme on  $C$  (and surely even that associated with any finite-type scheme  $X$  over  $C$ ) is canonically equipped with such a connection, relative to the prime subbody  $Q$ . If anything, the motivic cohomology itself can already be reconstituted from its "realization p. 825 de Hodge", this means that on any Hodge structure that could be called "motivic" or "algebraic" (i.e. originating from a pattern), there would be such a canonical Gauss-Manin connection. It would not be difficult, then, to describe other, more subtle, canonical structures associated with a Hodge-Deligne structure, whose existence "follows from the pattern": the existence of operations of certain profinite Galois groups, for example.

on  $Bet(K) \otimes_{\mathbb{Z}} \mathbb{Z}_l$  (where  $Bet(K)$  is the "network" underlying the Hodge-Deligne  $K$  structure), and "structure Frobenius" on "reductions mod  $p$ " (for almost any  $p$ ). It is precisely this rich multiplicity of seemingly unconnected structures, whose hidden link is **"the motif" common to** all these structures - it is this richness that for me represented (and still represents) the particular fascination of the theme of the cohomology of algebraic varieties, and the fascination of "motifs", which are like the delicate common melody that gives life and meaning to this theme of innumerable variations<sup>387</sup> (\*).

<sup>385</sup> (\*) In the same vein, I'd like to point out the need to pay attention to possible compatibilities, more or less hidden, to be imposed on the set of structures associated with a given type of "cohomological coefficients". I'm thinking here, above all, of the compatibilities (of a more or less algebraic nature) that are automatically realized in the case of "motivizable" coefficients (i.e., that arise from a pattern). It is plausible that they will have to be imposed in the categories of coefficients envisaged, if we wish to have a formalism of the "six operations" (independently even of the aim of "pinpointing" the motives as closely as possible). I'm thinking in particular of the holonomy and infinitesimal regularity conditions for Mebkhout coefficients, and also (if we put a De Rham filtration as an additional structure) the Griffiths conditions linking De Rham filtration and Gauss-Manin connection. These examples make it quite clear, I suppose, to what extent the fundamental task of describing the "right" categories of cohomological coefficients, with the "six operations" constraint, will oblige us to explore and make full use of all the structures envisaged to date on "the cohomology of algebraic varieties", and the relations that can link these structures. This was, in fact, the main purpose of Yoga of Patterns from the outset - to provide a **unity** behind a disparity, and at the same time, a reliable guiding filer for recognizing oneself in that disparity.

<sup>386</sup> (\*\*) (May 2) In fact, it was as early as 1966.

<sup>387</sup> (\*) (March 26) After my brief reflection on the (intimately related) questions of the various types of "coefficient categories" (for "identifying motives"), and the "algebraic conditions" to be satisfied by an "algebraic" cohomology class (i.e. from an algebraic cycle) discussed at the beginning of yesterday's note (n° 176), I decided to include a reflection on the motives, "coefficients", and standard conjectures, as early as Volume 3 of the *Réflexions* (containing the last part of *Récoltes et Sowing*). I believe I now have the principle of a formal description of "the" triangulated category of patterns on a diagram, at least in the crucial case (to which we should be able to reduce ourselves by passages to the limit) where this is of type finor on the absolute basis  $\mathbb{Z}$ . As the only new ingredient compared with my ideas of the sixties, there is the "Mebkhout philosophy" (expressed by the "good God theorem"). In addition, I'm assuming that the problem (surely affordable now) has been solved.

If there's anyone, apart from me, who has heard and felt this melody and allowed himself to be immersed in it for a long time, as it burst forth and unfolded before him, it's Pierre Deligne. If there's anyone to whom I've entrusted something alive, something delicate and vigorous into which I've poured the best of myself, nourished over the years by my strength and my love - it's him. It was a thing made to unfold in broad daylight, to grow and multiply - a thing that was seed and bosom, ready to transmit the life within. This brief contact between yesterday and today was a little like

**reunion** with something I'd long since lost sight of - reunion with not, words, or concepts, nor inert objects, but with a ☐ chose filled with intense **life**. And this contact

makes me realize once again that this "thing" I'd left behind is vast and deep enough to inspire the entire life of a mathematician who gives his heart and soul to it, and of other mathematicians after him.

- because his life will probably not be enough for the task<sup>388</sup> (\*).

It's a strange and welcome coincidence that this encounter should have taken place just as I've had another, equally unexpected "encounter": the encounter with this text in which my friend expresses himself, while refraining from naming it, on the subject of the thing that was closest to my heart, of all the things I've put into his hands. "We probably know little more about it today than a vague skeleton." . .

These words have continued to haunt me over the past three days. I recognize the smugness - the smugness of someone for whom "nothing is beautiful enough for him to deign to rejoice". And, without looking for it, the memory of the "**tomb**"<sup>389</sup> (\*\*) came back to me. The same impression came back to life in me, expressed by the same silent, insistent image. I had once thought I was entrusting this living thing, which was so dear to me, into loving hands - and it was in a tomb, cut off from the benefits of wind, rain and sun, that it languished for the fifteen years I had lost sight of it. Today I find her bloodless, "a vague skeleton... .", the object of the condescending disdain of the man who was kind enough to **use** her, and who is careful never to **give himself away**.

## 18.5. THE FOUR OPERATIONS (on a body)

### 18.5.1. (0) Le détective - ou la vie en rose

**Note 167** (April 22) The note that was to follow on from this one had a long-anticipated name: "Les quatre

operations" (a name which will be explained in detail at the beginning of the following note<sup>390</sup> (\*)). I

thought I'd devote a note, or two at the very least, to this "tidying-up" (of an investigation which seemed to me to have been completed at the time). It's already been almost two months since then, and given the influx of unforeseen twists and turns, I haven't quite got round to it yet. A year on, it's as if the surprise scenario of

the discovery of L'Enterrement is repeating itself, albeit on a different pitch. Finally, in the table of contents, the famous "Four operations" have come to designate not one note or two, but a whole copious set, a little cluttered I'm afraid, of **thirty** notes and sub-notes<sup>391</sup> (\*\*). They are grouped into eight parts (1) to (8), with (I hope) suggestive names, from (1) "The

---

now!) of the "mysterious functor", which plays a crucial role in the complete description I'm now looking at.

<sup>388</sup>(\*) (March 26) It now seems possible that I may have overestimated the scale (though not, admittedly, the scope) of the task. On this subject, see the previous b. de p. note, dated the same day.

<sup>389</sup>(\*\*) On the subject of this strong, long-unspoken impression, which haunted me after the "second turning point" in my relationship with Deligne, see the note "Le tombeau" (n° 71).

<sup>390</sup>(\*) (May 12) After splitting this former note "Silence" (n° 168) into four, the "next note" is "The four operations". (n° 167).

<sup>391</sup>(\*\*) (May 12) Since these peremptory lines were written, this number has increased to fifty-one notes and

magot" to (8) "Le sixième clou (au cercueil)". Along the way, I had to completely rework the four notes<sup>392</sup> (\*\*\*) which had formed the "first draft" of the "Four operations" (between February 26 and March 1). I explained myself at the beginning of the note "Le seuil" (n° 172) of March 22 (exactly one month ago), about this departure from the spirit followed elsewhere in the writing of Récoltes et Semailles.

The four notes in question are: "**Silence**", "**Manoeuvres**", "**Sharing**", "**Apotheosis**" (n° s° 168, 169, 170, 171)<sup>393</sup> (\*\*\*), devoted successively to sketching□d, ensemble each of the four p . 828

"I would advise the reader to read these four notes first, to the exclusion of the footnotes (more copious here than in any other part of Récoltes et Semailles) and the subheadings. I would advise the reader to confine himself first to reading these four notes, to the exclusion of the footnotes (more copious here than in any other part of Récoltes et Semailles), and the sub-notes (also exceptionally numerous and substantial) to which reference is made in the "main" text. He could continue in this vein with the following four main notes: "**Le seuil**", "**L'album de famille**", "**L'escalade(2)**", "**Les Pompes Funèbres**" **im Dienst der Wissenschaft** "" (n° s° 172-175), which are no longer technical in nature.

Readers wishing to take a more detailed look at the tortuous intricacies of these "four operations" can include the footnotes and sub-notes in a second reading, and even (if they have not read the first part of Burial, or feel the need to refresh their reading memories), refer as they go along (as I have often done) to the passages in Burial I (or "The Robe of the Chinese Emperor") to which it refers extensively.

The essential content of each of the thirty notes that make up (or describe and comment on) "The Four Operations" is, each time, non-technical in nature. It seems to me that it can be understood by any interested and intelligent reader, even if he or she is by no means an expert in the cohomology of algebraic varieties, nor even a mathematician or even remotely "scientific". However, for those who are reluctant to get involved and get caught up in all the mysteries of the "art of the con", I would particularly recommend the following sub-notes, whose substance seems to me to be the richest, and whose interest visibly exceeds that of "dismantling" the sometimes abracadabrious and always artfully put together "schemes" (for the use of those who just want to be bamboozled. . . ). These are the sub-notes "**L'éviction**" (n° 169<sub>1</sub> ), then "**Les vraies maths. . .**", ". . . and "**non-sense**", "**Magouilles et création**" (forming the first three of the five sub-notes grouped under the name "La Formule"), and finally the four sub-notes to the note "L' Apotheose" (n° 171), concerning Zoghman Mebkhou's strange adventure: "**Eclosion d'une vision - ou l'intrus**", "**La maffia**", "**Les racines**", "**Carte blanche pour le pillage**" (n° s° 171<sub>1</sub> à 171<sub>4</sub> ). These are eight sub-notes (from a total of twenty-one<sup>394</sup> (\*)) that I particularly recommend to the reader.

□As <sup>for</sup> the other thirteen sub-notes, the reader who won't care about their "documentary interest" for- p . 829 would nevertheless read them, in moments of leisure, in the spirit in which he would read a rocambolesque Roman detective adventure, where the improvised amateur detective (in my modest person) follows the trail and gathers the "clues", some tenuous and elusive and others so enormous that no one could see them anymore ; These clues eventually coalesce into a colorful and indisputable **tableau** (de moeurs), in which a "second Monsieur Verdoux (alias Landru), smiling and affable" proceeds to dismember and calcinate his candid and innocent victims, under the tender (even admiring) eye of all the good people in the neighborhood. Since then, they've been

sub-notes, and nothing proves that (like a sea. . . ) it won't rise again. . .

<sup>392</sup>(\*\*\*) (May 12) These notes, having reached prohibitive dimensions, were finally split into several, into notes n° s° 168 (i) - (iii), 169 (i)-(v), 170(i)-(iii), 171 (i)-(iv).

<sup>393</sup>(\*\*\*) (May 12) These notes, having taken on prohibitive dimensions, were finally split into several, into the following notes n° s° 168 (i) - (iii), 169 (i)-(v), 170(i)-(iii), 171 (i)-(iv).

<sup>394</sup>(\*) (May 12) Twenty-seven in the meantime, not counting the sixth nail in the coffin (which counts seven pleasant notes and delectable).

long accustomed to the somewhat peculiar smell, which obviously no longer bothers anyone. More than a few have even taken a leaf out of the book of their friendly, clever neighbor, and the chimneys are purring and chirping to no end.

The "detective", fully edified, has only to tiptoe away: clearly, the agreement here is unanimous, and all is for the best in the best of worlds... .

#### 18.5.1.1. The four operations - or "tidying up" of an investigation

**Note** 167<sup>395</sup> (February 26) (\*) I seem to have come full circle, more or less, on Burial. An incomplete and provisional tour, to be sure - but for the moment, I don't think I'll go much further. I feel I need to take a step back, and that now is the time to finish. All that's left for me to do is to take stock of what I've learned in the course of this impromptu meditation that was the writing of *Récoltes et Semailles*.

By far the largest part of my work has been the reflection on Burial. This reflection continued on two distinct levels. First, after the much-needed "act of respect" represented by the double note "Mes orphelins" and "Refus d'un héritage - ou le prix d'une contradiction" (n° s 46, 47), there was the gradual discovery of L'Enterrement "in all its splendor". I'd been sniffing it for the last seven or eight years - this "wind of discreet derision" towards a work of art and a certain "art".

p. 830 style, and the equally discreet, unflinching "fin de non recevoir" reserved for those who still pretended to be inspired by it and who, <sup>□</sup>in one way or another, "carried my name". This is the aspect of En- This is examined in the note "Le Fossoyeur - ou la Congrégation toute entière" (The Gravedigger - or the entire Congregation) and in the preceding notes (n° s 93-97), forming the Cortège X alias "Le Fourgon Funèbre" (The Funeral Van). This aspect, which had remained diffuse over the years because I hadn't bothered to think about it in detail, has become considerably clearer in the course of my work, although I haven't found any genuinely new facts.

The new fact, on the other hand, with which I was confronted for the first time on April 19 last year, or the "news item" if you like, is a certain large-scale operation that was carried out around my work, and that of the only mathematician who, after my departure from the mathematical scene, assumed the thankless and perilous role of "Grothendieck's continuator": Zoghman Mebkhout.

The discovery on April 19th (of the 1982 volume Lecture Notes 900, in which the motives were exhumed, after twelve years of deathly silence<sup>396</sup> (\*) and without any mention of myself) was the starting point for what might be called an investigation, in the narrower sense of the term: an investigation into the fate that had been reserved for my work, and first and foremost by those who had been its first and foremost custodians, namely, my students. This investigation brought to light a number of facts, some more unforeseen than others, which over the course of days and weeks, came together to form a picture, somewhat external, of what the Burial had been and who its principal players had been. This picture may not be complete, but it is rich enough in perfectly precise and irrefutable details to satisfy my curiosity in that direction. This is the first of the two "levels" of reflection to which I alluded earlier. It essentially corresponds to the "first breath" of reflection on the Burial, continuing from April 19 until around June 10, and ending with the "illness episode".

This is also, more or less, the "Burial I" part (or "The Chinese Emperor's robe") of my notes. To this should be added the note "L'Eloge Funèbre (1) - ou les compliments" (n° 104), dated 12.

<sup>395</sup>(\*) This note, which was originally intended to be called "Les quatre opérations" and follow on from "La mélodie au tombeau - ou la suffi sance" (note n° 167), predates by almost two months the note (of an introductory nature) that precedes it, "Le détective - ou la vie en rose" (n° 167'). I advise you to read the latter first.

<sup>396</sup>(\*) (April 19) For a correction concerning these "twelve years", see the sub-note "Pre-exhumation", n° 168<sub>1</sub> .

May, but was discarded (somewhat arbitrarily no doubt) in the later and ultimate procession "The Funeral Ceremony", part of "Burial II". I would encourage attach to this "survey", forming the "first p . 831

level" of reflection, the note that follows the one quoted above, namely "L'Eloge Funèbre (2) - ou la force et l'auréole" (n° 105),<sup>397</sup> (\*), continuing moreover in the comments on the following note "Le muscle et la tripe (yang enterre yin (1))" (n° 106). These last two notes are from late September - early October. Also, in the "Funeral Eulogies" tradition, i.e. the (very rare) written documents in which Deligne expresses himself to some extent about me, we can add to this survey the two notes recently prompted by Deligne's biographical note, namely "Requiem pour vague squelette" and "La profession de foi - ou le vrai dans le faux" (n° s 165, 166). Finally, there is the note "Les points sur les i" (n° 164), giving a number of clarifications (mainly material), most of which were provided by Deligne himself during his visit to my home last October<sup>398</sup> (\*\*).

After the illness episode, which put an end to all intellectual activity for more than three months, the "second wind" of reflection (or the "second level" I was talking about earlier) was motivated by an effort to understand the **meaning of** the set of facts, some of them very large, not to say unbelievable, that the investigation of April and May had brought to light. The central part of this reflection is "The key to yin and yang", largely independent of the theme of the Burial itself, which nevertheless reappears periodically, each time re-launching a meditation on myself, my life and existence in general.

It's clear, moreover, that the two levels of reflection, "investigation" and "meditation", are by no means independent or clearly separated, but interpenetrate each other. In concrete terms, this is reflected by the presence, throughout the first part of Burial, of an effort to **understand the** meaning of what I was discovering as the days went by, and also by the appearance, again in the second part, of material facts adding to those already obtained during the preliminary "investigation".

For the time being, my aim is to provide a "summary", or broad outline, of the **facts that** have come to light. day by day throughout the investigation' □ **facts** that I have never yet taken the trouble to order so p . 832 coherent. This will therefore be an **account of** what I now know of this "large-scale operation" targeting my work<sup>399</sup> (\*) and that of Mebkhout. Depending on whether it was the latter or mine that bore the brunt, and on which part of my work was targeted, I can in fact distinguish **four** main operations ("the four operations", in short), which I'd like to review first. As it happens, the order in which they came to my attention in the course of reflection also coincides (apart from a mini-reversal of the last two) with the chronological order in which they were set in motion, after my "departure" in 1970 (and even before).

## 18.5.2. (1) Le magot

### 18.5.2.1. a. Silence ("Motifs")

#### $a_1$ . The "Motifs" context

<sup>397</sup>(\*) This note was actually planned for the day after May 12, when the previous note "L'Eloge Funèbre (1) - ou les compliments" was written. I realized then that the text I'd just looked at a little more closely was a veritable mine, which I was far from having exhausted... (for some details on the Eloge Funèbre, see the beginning of the note "L'Apothéose", n° 171).

<sup>398</sup>(\*\*) For more on this visit, see "Duty done - or the moment of truth" (n° 163).

<sup>399</sup>(\*) As far as I know, this refers exclusively to the part of my work between 1955 and 1970, devoted to developing my ideas on the cohomology of schemes and (co)homological algebra.

**Note 168(i) I "Reasons" operation**

Inspired by some of Serre's ideas, and also by the desire to find a certain common "principle" (or "motif") for the various known (or presumed) purely algebraic "avatars" for the classical Betti cohomology of a complex algebraic variety, I introduced the notion of "motif" in the early sixties. Throughout the sixties, and especially from 1963 onwards<sup>400</sup> (\*\*), I developed a rich and precise "yoga" (or "philosophy") on this theme, alongside my work on the foundations. This vast theory, which remained conjectural and will doubtless remain so for a few generations to come<sup>401</sup> (\*\*\*), nonetheless immediately (and to this day) offers a very sure guide to recognizing oneself in situations where the cohomology of algebraic varieties comes into play, both in terms of guessing "what one is entitled to expect from it" and of "what one can expect from it".

p. 833 wait", than to suggest "the right notions" to introduce and sometimes, to provide approaches towards demonstrations. I say on this subject in the Introduction to *Récoltes et Semailles* ("The End of a Silence", p. xviii):

"Of all the mathematical things I'd been privileged to discover and bring to light, this reality of patterns still strikes me as the most fascinating, the most charged with mystery - at the very heart of the profound identity between "geometry" and "arithmetic". And the "yoga of patterns" to which this long-ignored reality has led me is perhaps the most powerful instrument of discovery I have unleashed in this first period<sup>402</sup> (\*) of my mathematical life."

Apart from tentative sketches of a possible explicit construction (among many others) for the category of semi-simple patterns on a body, the ideas I had developed on this theme in my personal notes remained at the stage of oral communication. I was far too absorbed in the many other tasks of writing basic texts<sup>403</sup> (\*\*) to find the leisure of the few months required to develop my handwritten notes into an overall "masterpiece" of the inner vision that had developed within me, sufficiently "researched" to appear publishable to me. From 1965 until my departure from the mathematical scene in 1970, Pierre Deligne was my privileged interlocutor for my motivic (and other) meditations, and the only one who fully assimilated the yoga of motives and felt its full significance.

Further details on the subject of the "yoga of motives" (more detailed than in the part of the Introduction from which the passage quoted is taken) can be found at the end of the note "My orphans" (n° 46) and especially (concerning the genesis of yoga) in "Souvenir d'un rêve - ou la naissance des motifs" (n° 51). For the insertion of the "yoga of motifs" into the formalism of the six operations (which remains, even today and since my

<sup>400</sup>(\*\*) 1963 was the year of the strong "start-up" of staggered cohomology (developed in the SGA 4 seminar in 1963/64), which in turn brought abundant water to the mill of motivic reflections, which until then had been little more than speculations. The following year, I developed the formalism of the "motivic Galois group", whose detailed conceptual foundation was developed (following the program of theory I had submitted to him) in N. Saavedra's thesis,

published only in 1972 (Springer Verlag, Lecture Notes n° 265).

<sup>401</sup>(\*\*\*) (April 8) It now seems to me that this theory is not as far "over the horizon" as it might have seemed to me - if only we finally get around to it! On this subject, see the comments in the note "L'avare et le croulant" (n° 177) of March 27.

<sup>402</sup>(\*) If I'm restricting myself here to "this first period of my mathematical life", it's because I'm thinking of the "yoga of Anabelian algebraic geometry", which seems to me to be of comparable depth and scope. It's mentioned, to some extent, in "Esquisse d'un Programme", which will be included in the "Réflexions" following "Récoltes et Semailles".

<sup>403</sup>(\*\*) These are primarily the EGA (Eléments de Géométrie Algébrique, in collaboration with Jean Dieudonné) and SGA ("Séminaire de Géométrie Algébrique du Bois Marie) texts, the latter written alone or in collaboration (with students in particular), according to guiding ideas and masterminds of my own devising. During the years 1959 to 1969, the average "output" of these texts, all of which without exception became standard reference texts, was around a thousand pages a year.

This work

of foundations came to a halt overnight, as soon as I left the mathematical scene. On this subject, see the note "Yin the Servant, and the new masters" (n° 135).

initially ignored by my students  $\square$  cohomologists, as a fundamental structure in homological algebra. ... ), p. 834  
 see note "Melody at the grave - or sufficiency" (n° 167). For the thread of ideas (entirely overlooked in the literature) surrounding the yoga of weights (which constitutes one of the essential ingredients of the yoga of motives) and the theory of Hodge-Deligne (directly derived from the latter yoga), see the note "Dotting the i's" n° 164 (part II 4), as well as the sub-note (n° 164<sub>1</sub>) which follows it.

## . Burial. . .

**Note 168(ii)** The "Motifs" operation consisted, firstly and immediately after my departure from the mathematical scene, in the systematic **retraction** of the yoga of motifs and of the very word "motif"; and then, after a twelve-year silence<sup>404</sup> (\*), and with the exhumation (in 1982) of a narrow version of yoga, in the retraction of my modest and defunct person, as having anything to do with the said yoga.

The first obvious evasion of yoga, in the form of the "yoga of weights", took place as early as 1968, i.e. before my departure, in Deligne's article (in Publications Mathématiques) on the degeneration of spectral sequences. It is first mentioned in the note "Poids en conserve et douze ans de secret" (written before the discovery of the "memorable volume" of exhumation), and in detail at the beginning of the note "L'éviction" (notes n° s 49, 63).

This probing retraction, in the absence of any reaction<sup>405</sup> (\*\*), continued and intensified with Deligne's Hodge I, II, III articles, setting out the fine generalization of Hodge's theory developed by him in 1968/69. Although this theory stems directly from the yoga of motives (as mentioned above), Hodge II and Hodge III make no mention of this - a fact made all the more glaring by the fact that Hodge

II constitutes the thesis of Deligne, who had been my pupil during crucial years of his formation<sup>406</sup> (\*). p. 835  
 As for the short Hodge I "announcement" (at the Nice International Congress in 1970), Deligne confines himself to a half-line sibylline reference to "Grothendieck's conjectural theory of motives" (in one breath with a bogus reference to Serre, obviously intended to give the change<sup>407</sup> (\*\*)). The escamotage continues with the presentation of the "yoga of weights" at the International Congress in Vancouver (1974), where neither Serre's nor my name is mentioned. In this paper, as in Hodge I at the International Congress in Nice (1970), he never mentions an important part of the yoga he had learned from me,

<sup>404</sup>(\*) (April 8) For a correction to these "twelve years", see the sub-note "Pre-exhumation" (n° 168(iv)) which follows this "Silence" note.

<sup>405</sup>(\*\*) It was from me in the first place that such a reaction could and should have come. While in retrospect the lack of honesty in the presentation of this article is obvious to me (cf. quoted note, n° 63), I myself did not have the rectitude (or the honesty) to acknowledge it, in the presence of a "slight unease" when I held the article in my hands and skimmed through it. To On the role of a certain complacency or ambiguity in me, which came to the fore in the course of reflection on L'Enterrement, see the note "Ambiguity", n° 63". At the conscious level at least, the thought of the possibility of professional dishonesty, in Deligne or in any other of my students, had never occurred to me; or rather, I had pushed it aside on various occasions when the dishonesty was blatant and signaled to me by this ~~never-identified~~ "malaise".

<sup>406</sup>(\*) There was a kind of connivance between Deligne and me to conceal his relationship as a pupil to me, it being understood that he was far too brilliant for me to claim to have been his "master". I update and examine this connivance in the note "L'être à part" (n° 67').

<sup>407</sup>(\*\*) This refers to Serre's article on the Kählerian analogues of Weil's conjectures, which was the "detonator" that set me off. on 'standard conjectures'. It's a fine article, and there's no question of minimizing it. But I'm well aware that Deligne himself would be hard pressed to explain how this article was "a source" for his generalization of Hodge theory - and no one has ever thought of asking him. Having witnessed the birth of the Hodge theory up close Deligne, I know exactly what his source was (see note no.° 164<sub>1</sub> already cited) - and that he didn't find it in Demazure's exposé on the ABCs of définition des motifs! He cites this article as a reference to "the theory conjectural theory of Grothendieck's motives", so as to give the impression, to any reader who wasn't really well-informed (and there weren't many of them to be well-informed. . . ) that the said "conjectural theory" was reduced to Demazure's exposé in question, thus taking advantage of the absence of any more detailed published trace of the yoga of motives.

in the motivic context (which remains rigorously silent): the behavior of the notion of weight by the "six operations" and, first and foremost, by  $Rf_!$  and  $Rf_*$ . This is just one of many examples of a practice that has become commonplace, and of which Deligne seems to me to have been one of the very first promoters: that of reserving exclusive knowledge of the "big problems" that arise in a given field of mathematics to a restricted group of "people in the know" (or even to him alone), so as to ensure total hegemony, instead of making them available to the scientific community and allowing everyone to draw inspiration from them<sup>408</sup> (\*\*\*). As far as I know, this problem isn't mentioned anywhere before he was solved by Deligne in his 1980 article "Weil II" (in the case of  $Rf_!$ ), without of course mentioning me (who had communicated to him the relevant conjecture in the motivic context, of which the l-adic context he deals with is a reflection, in the same way as the context of De Rham - Hodge coefficients would be. . . ).

To the (very fragmentary) extent that I am familiar with Deligne's work or can form an idea of it, I think I can say that the yoga of motifs that he took from me was the main source of inspiration throughout his work. He kept this source occult, maintaining until 1982<sup>409</sup> (\*) a deathly silence around the notion of motif. The only exception (unless I'm mistaken<sup>409</sup> (\*\*)) is the "half witness line" of 1970, just as incomprehensible<sup>410</sup> (\*\*) to anyone other than him and me (and, at a pinch, to Serre perhaps) as his cryptic reference two years earlier (in the article on the degeneracy of spectral sequences) to "weighty considerations" that had led me to conjecture "a particular case" of his degeneracy result (cf. note on "Eviction", n° 63).

## and exhumation

**Note 168(iii)** A sudden change of scene with the publication of the "memorable volume" Lecture Notes 900<sup>411</sup> (\*\*\*). The motifs are exhumed with great fanfare, and part of the original yoga is finally revealed. In this volume, where my name appears two or three times "in passing" and as if by the greatest of coincidences, nothing could lead the reader to suspect that I had anything to do with the ideas developed here. These ideas are presented in such a way that there can be no doubt in the reader's mind that the volume's brilliant main author, Pierre Deligne, has just discovered them and is presenting them here in their entirety.

warm. It's true that, no more than in Nice or Vancouver, he doesn't claim to be the one who discovered the yoga of the weights, which is the first time it has been explained in the literature, it is nowhere mentioned. It's clear here that he's the one who came up with all these fine ideas, developed (apparently) for the first time in the volume, which is centered, incidentally, around a fine theorem of which he is indeed the author. This is the "inch!" style in which he is a master, on which I comment first in the note "Pouce!" and in "La robe de l' Empereur de Chine" which follows it (n° s 77, 77'); see also the earlier notes, written in the emotion of discovering the "memorable volume": "L' Enterrement - ou le Nouveau père", "La nouvelle éthique - ou la

<sup>408</sup>(\*\*\*) On the subject of this new mentality, of which I never came across any trace until I left in 1970, see the note "Yin the Servant, and the new masters", n° 135, as well as the end (dated February 28) of the note "Les manoeuvres" (n° 169) (x). It's this mentality that I wanted to capture by the name "**The hoard**" given to the set of notes and sub-notes (n° s 168- 169<sub>8</sub>) referring to the first two of the "four operations" around my work.

(x) This fin became the note "Le magot" (n° 169(v)).

<sup>409</sup>(\*) (April 8) For a correction, see the sub-note already quoted "Pre-exhumation" (n° 168 (iv)).

<sup>410</sup>(\*\*) As explained in the previous b. de p. note, the purpose of this inch-reference was not to be "understandable".

or to inform, but to (doubly) mislead. As for Hodge-Deligne's fi liation of ideas from motifs to structures (described in the two notes quoted above), I have every reason to believe that I'm the only person in the world, apart from him, who knows it.

<sup>411</sup>(\*\*\*) Springer Verlag, Lecture Notes in Mathematics, n° 900, Hodge cycles, Motives, and Shimura varieties, by P. Deligne, J.S. Milne, A. Ogus, K.Y. Shih.

foire d'empoigne", as well as "Appropriation and contempt" (n° s 52, 59, 59').

In fact, not only were all the main ideas in volume LN 900 concerning motifs known to me as early as the sixties (where Deligne had every opportunity to learn about them from me from 1965 onwards), but also the central problem of the book had been raised by me (and, of course, communicated to Deligne) as early as the late sixties. For details, see the note "Les points sur les i" (n° 164) (in Part I of this one).

As I point out in the Introduction to *Récoltes et Semailles* (in "La fin d'un secret", p. xviii), Deligne was not the only person to whom I spoke in detail about the yoga of motives, even if he was the only one to make it his own intimately. If, for ten years or so<sup>412</sup> (\*), I completely concealed the very existence of this yoga, and later my role in discovering, developing and deepening it, this concealment could only have taken place with the connivance of many of the mathematicians I counted among my friends, and in particular, with that of each of my (commutative) "cohomology students"<sup>413</sup> (\*\*). This cover-up was carried out for the dubious "benefit" of a single person, but through the acts and omissions of a good number of others.

□ Besides Deligne and my other cohomology students, this is the responsibility of the **co-authors** with Deligne of the "memorable volume" LN 900 which seems to me the most heavily committed, namely that of **T. S. Milne, A. Ogus and K.Y. Shih**. These are mathematicians I don't know personally, and there's no reason for me to prejudge their bad faith. For me, however, this in no way detracts from their full responsibility as co-authors of this unusual volume.

p. 838

## . Pre-exhumation

**Note 168(iv)** (April 8) I was recently reminded of Deligne's paper "Values of *L-functions* and periods of integrals", published in 1979 (Proceedings of Symposia in Pure Mathematics, Vol. 33 (1979), part 2, pp. 313- 346), in the same volume as the aforementioned paper by R.P. Langlands "Automorphic representations, Shimura varieties and motives. Ein Märchen Corvallis" (pp. 205-246). The latter article (but not Deligne's) appeared in the annotated bibliography on motives sent to me by Deligne last August, and I had been under the impression that Langlands' article was the first and only mention of motives in the literature after my departure, before the exhumation of 1982 (apart from the papers by Saavedra and Kleiman cited in the penultimate footnote).

In fact, in the article quoted by Deligne, there's a "chapter 0" entitled "Motifs", introduced by : "It recalls **part of the formalism, due to Grothendieck**, of motifs" (emphasis mine). The presentation is such that it becomes clear that the general principle of construction I had given for a category

<sup>412</sup>(\*) According to an "annotated bibliography of motifs" that Deligne was kind enough to send me last August, there were still two sporadic works on motifs in the literature after my departure, one and the other in 1972 (in N. Saavedra's thesis, prepared with me, and in a report by S. Kleiman). The next reference, by Langlands, was in 1979. After that, it's LN 900 in 1982. Unless I'm mistaken, the word "motif" does not appear in any of Deligne's published texts between 1970 and 1982.

nor is there any allusion in any published text (with the exception, at most, of the biographical note examined in notes n° s 165, 166) to the fact that he may have learned something from me. ...

(April 8) Regarding "unless mistaken", see correction in sub-note "Pre-exhumation" (n° 168 (iv)).

<sup>413</sup>(\*\*) I think I can say that all my pre-1970 students, with the sole exception of Mrs. Sinh (who was not on site, but working in Viet-Nam), were aware of (but had not necessarily assimilated) my ideas on motifs, on which I gave a series of detailed talks at the IHES (in 1967). Those of them who have remained connected to the theme of the cohomology of algebraic varieties therefore seem to me to be in solidarity with the burial that has taken place of the yoga of motifs, on the initiative of the main "interested" Deligne. I'm referring here in particular to J.L. Verdier, L. Illusie and P. Berthelot, each of whom was more active than a mere connivance in some of the other three "operations" discussed below.

of (semisimple, it's implied) patterns over a body, was multivalent - indeed, in section 0.6 it says that "**one of Grothendieck's definitions** of patterns is obtained by...". In this respect, then, the presentation is honest. It's true that the part of the "yoga" of motives presented here is the most elementary part, which practically already existed in the literature (in presentations by Manin, Demazure, Kleiman, Saavedra), and where my paternity  $\square$  was therefore particularly notorious. (On the other hand, it would seem that the concealment of my persona

- and Serre's - in weight yoga, and later in the motivic Galois group, passed without a hitch. ... )

As I have already pointed out (in the note "L'escalade (2)", n° 174), it would seem that, after the temporary culmination of "Operation Burial" in 1977 (with the "SGA 4<sup>1</sup> - SGA 5" operation), there was a relative lull until the "apotheosis" of the Colloque Pervers in 1981, which marked the end of any hint of restraint in the butchering of a corpse. (See the note "L' Apotheose", n° 171.) Deligne's article is obviously written under the sign of this lull. I presume that Langlands' interest in motivic yoga had forced his hand in finally "spilling the beans" (already stale) on the motives, at a time when it was not yet psychologically ripe to simply pass over the name of the deceased. In the three years that followed, there was indeed a striking "escalation" (to use the expression in the note "Les manoeuvres" that follows this one), between this timid "pre-exhumation" of the motifs, and the "exhumation with great fanfares" that took place with the "memorable volume" LN 900 in 1982.

(April 22) The (mini)discovery commented on in the preceding page continued and amplified considerably in the days that followed. I read the article by R.P.Langlands, and the very next day, the "sixth nail" in my coffin<sup>414</sup> (\*), in the form of the book by (my ex-student) Neantro Saavedra Rivano, entitled "Tannakian Categories". So there's still a substantial "continuation of the story" (of the "Motifs operation"), which I developed in the series of sub-notes (n° s 175<sup>1</sup> to 175<sup>7</sup>) grouped together under the obvious name, "The sixth nail (in the coffin)". I thought it preferable to return this suite to the end of the "Four Operations" survey, as the new facts that appear throughout it, and especially in the note "L'Apotheose" (n° 171), and its four sub-notes<sup>415</sup> (\*\*), seem to me essential to situate this "suite" properly and give it its full meaning.

### 18.5.2.2. Maneuvers ("Staggered Cohomology")

#### $b_1$ . The "Weil Conjectures" context

p. 840 **Note** 169(i)  $\square$ (February 27) Now for the second of the "big operations":

**II The operation "Cohomologie étale".** As with the motives, it will be useful first to set the scene in a few words.

The idea of the existence of a theory of "cohomology" of an algebraic variety over any field  $k$ , which would associate with such a variety (at least if it is projective and smooth) "cohomology spaces" whose coefficient field would be of zero characteristic (for example, a  $p$ -adic field), and whose properties would model the well-known properties of Betti cohomology (defined by transcendental neighbour

<sup>414</sup>(\*) This is the sixth of the "nails" in the order of their discovery, but the first of the six, seen in the chronological order in which they were deftly "laid" by my friend Pierre, with patented equipment provided (for the service of science) by the well-known Funeral Company Springer Verlag GmbH (Funeral Service "Lecture Notes in Mathematics"). . .

<sup>415</sup>(\*\*) (May 11) Since these lines were written, the quoted note has been split into four separate notes (n° s 171 (i) to (iv)) and expanded by a further eight sub-notes (n° s 171 (v) to (xii)).

when the basic body is the body of complexes) - this idea can be found "between the lines" in the statement of Weil's famous conjectures (1949). It was in cohomological terms, at any rate, that Serre explained Weil's conjectures to me, around 1955 - and it was only in these terms that they were likely to "hook" me indeed.

At the time, no one had the slightest idea how to define such a cohomology, and I'm not sure that anyone other than Serre and myself, not even Weil if that's what it was, had even the slightest conviction that it should exist. We only had a good direct geometric grip on  $H^1$ , via the theory of abelian varieties and their points of finite order (developed by Weil), and via Albanese or Picard varieties associated with a non-singular projective algebraic variety. This construction of  $H^1$  suggested that the "natural" coefficient bodies should be the  $l$ -adic bodies  $Q_l$ , for  $l$  prime number **distinct from** the characteristic.

For  $l$  equal to the characteristic (when the latter is non-zero), Serre's very partial results, which were particularly convincing in the case of algebraic **curves**, suggested that we should be able to take as our base body the body of fractions of the ring of Witt vectors of  $k$  (assumed to be perfect). It was therefore to be hoped that there would be an  $l$ -adic theory (with a grain of salt for  $l = p$ ) for **any** prime number  $l$  - and in a conceivable sense, they should "all give the same result". Finally, when  $k$  is of zero characteristic, so that we have (at least in the non-singular projective case of  $X$ ) Hodge's cohomology spaces (which made sense for any  $k$ , since Serre's introduction of the "coherent" cohomological theory of algebraic varieties) and De Rham's (which I had introduced on the basis of De Rham's cohomology), we are able to obtain the same result.

Rham differentiable), these immediately provided cohomological theories having all the propriétés voulues<sup>416</sup> (\*), and they were still to give "the same result" as the hypothetical cohomologies  $l$ -adic. . 841

These questions were central to my thinking and to my published and unpublished mathematical work between 1955 and 1970 (when I left the mathematical scene). Leaving aside my work in coherent cohomology (the "six operations" formalism, the Riemann-Roch-Grothendieck formula), it can be said that, broadly speaking, most of my cohomological work consisted in finding answers, or broad lines of answers, to these questions. At least from the point of view of Weil's conjectures, acting as my main source of inspiration, my thinking on the cohomological theme has materialized in four main **currents**, or "**threads**", closely interwoven to form a single, vast weave.

**Thread 1-** I have developed (with the assistance of collaborators<sup>417</sup> (\*\*)), a formalism for **cohomology  $l$ -adic** schemes, for **the** first with residual characteristics, having all the known properties (and beyond . . . ) of the familiar "discrete" cohomology of topological spaces. With just three open questions<sup>418</sup> (\*\*\*), of a technical nature, we can say that we had, "in principle" as early as 1963, and "in fact" as early as 1965/66

<sup>416</sup>(\*) Back in the 50s, I developed the formalism of cohomology classes (Hodge and De Rham) associated with an algebraic cycle.

<sup>417</sup>(\*\*) The main collaborator in the development of the stale cohomology formalism was Artin. The  $l$ -adic adaptations are developed in the thesis of my ex-student P. Jouanolou (which he unfortunately didn't bother to publish, which I never held in my hands, and which has become unobtainable). I intend to give more details about the development of stale cohomology, in "historical" comments that I intend to attach to the Thematic Outline (to appear in Reflections following R and S).

<sup>418</sup>(\*\*\*) These three "open questions" are as follows:

- a. The "cohomological purity conjecture" for a regular subscheme  $Y$  of a regular scheme  $X$ . The relevant statement is proved when  $X$  and  $Y$  are both smooth on a regular  $S$ -base scheme (a sufficient case for most applications), and also (by Artin, making full use of singularity resolution) in the case where  $X$  is excellent of characteristic zero.
- b. Even more serious is the question of the validity of the **fi nitude theorem** for  $R^i f_*$ , for  $f$  a separate fi ni morphism of Noetherian schemes (excellent if need be), when  $f$  is **not** assumed to be clean. We need this result to challenge  $Rf_*$  (and two others among the "six operations") in the "constructible"  $l$ -adic frame. I proved the fi nitude result by means of

(with the developments of the SGA 5 seminar, following on from SGA 4 in 1963/64), of a **complete mastery** of this cohomology, within the general framework of so-called "étale cohomology" - in the form of the "six operations" duality formalism. The principle behind the definition of étale cohomology dates back to 1958, and I proved the necessary and sufficient "key results" for the complete formalism (including theorems of the "weak Lefschetz" type and notions of cohomological depth in the étale context) in February and March 1963.

**Thread 2.** With the yoga of **motives**, I discovered the philosophy that makes it possible to link together the different  $l$ -adic (and other) cohomologies of a variety, as being so many different "realizations" of a "motive" that is common to all of them, and which is the "motivic cohomology" of this variety. This philosophy was born in the early 1960s, with a "yoga of weights" directly inspired by Weil's conjectures (and an idea of Serre's inspired by them, concerning a notion of "virtual Betti numbers" associated with an algebraic variety<sup>419</sup> (\*)). The crucial notion of "motivic Galois group" was added in 1964, in the wake of the start of  $l$ -adic cohomology.

**Thread 3.** inspired by the ideas of Monsky-Washnitzer, who had built a cohomological theory (at constant coefficients) " $p$ -adic" for **smooth** and **affine** algebraic varieties in char.  $p > 0$ , in 1968 I came up with a general definition for a " $p$ -adic cohomology", which I also call **cris-cohomology**.

**talline**<sup>420</sup> (\*\*). This theory was supposed to encompass "coefficients" (so-called "crystalline") not necessarily

constant nor locally constant, and give rise to a "six operations" formalism just like  $l$ -adic theory. It was clear from the outset, at least, that for **smooth** varieties, this cohomology has the expected relationship with De Rham's cohomology, and that it generalizes Monsky-Washnitzer's<sup>421</sup> (\*).

---

assumptions of singularity resolution and "cohomological purity" (cf.a)), which for the moment do **not** apply to algebraic varieties of char.  $p > 0$ . I would point out, however, that in the context of torsion coefficients (as opposed to  $l$ -adic coefficients), the duality formalism of the six operations (thus including Poincaré duality) had been established by me in 1963 without finiteness conditions. This implied, for example, "finitude" for  $H^i$  with constant or locally constant coefficients (torsion or  $l$ -adic) for a smooth (not necessarily clean) scheme over an algebraically closed body.

c. Validity of the "duality theorem" on an excellent regular pattern. Situation similar to b).

The situation was significantly improved by Deligne's elegant (1973?) proof of the finiteness theorem, for a morphism of finitely type schemes over a regular  $S$ -scheme of dimension  $\leq 1$ . This case covers most applications (algebraic schemes over a body, finitely type schemes over  $\mathbb{Z}$  in particular). In the same situation of a scheme  $X$  of type finitely on a regular 1-dimensional scheme, and using similar simple arguments, Deligne also manages to prove the biduality theorem.

<sup>419</sup>(\*) On this subject, see sub-note no. 46 to the note "My orphans" (no. 46).

<sup>420</sup>(\*\*) This terminology is now (and has been for a long time) established by usage, as is the expression "crystalline site". The two new ideas (compared with those of Monsky and Washnitzer) that led me to this theory are that of **crystals** (of modules etc.), linked to an idea of "growth" over "thickenings" (notably infinitesimal) of a starting scheme, and secondly the introduction of a structure of **divided powers** in the ideals of increase of the envisaged thickenings, so as to ensure the validity of a "formal Poincaré lemma" (with divided powers). Thanks to these two ingredients, the De Rham cohomology of a smooth scheme on  $k$  can be interpreted as the "ordinary" cohomology, with **coefficients in the structural ring bundle**, of a suitable "crystal site".

Strangely enough, the crucial intuition of crystal (as well as the more far-reaching one of topos) seems to have been left behind by my students, along with the guiding thread (omnipresent in my cohomological reflections) of the "six operations". This, it seems to me, is the main reason for the regrettable stagnation in crystalline cohomology after my departure, and also in the (closely related) "Hodge-Deligne" theory, since the first strong start of both.

It seems to me at least plausible, not to say obvious, that in either direction, the philosophy developed (in general indifference. . .) by **Zoghman Mebkhout** would have an essential role to play. But his timid suggestions in this direction (to Berthelot in 1978) obviously fell on deaf ears, coming from such an insignificant character. . .

<sup>421</sup>(\*) P. Berthelot's thesis, taking my ideas as a starting point, provides a further justification, by establishing a duality formalism for clean and smooth varieties, rich enough at least to write an expression

□ **Fil 4.** The unifying geometrical notion, linking by a common "topological" intuition cohomology étale and its immediate variants (linked to Zariski topologies, fpqc, fppf etc.), crystalline cohomology, and finally "Betti" cohomology defined in the transcendental context, and (even more generally) the faisceautic cohomology of any topological spaces, is the notion of "**site**", and, beyond this, more intrinsic and more hidden, that of **topos**. From 1964 onwards, the latter gradually came to the fore. I discuss the significance of this notion, central to my work and now banished from geometry, in the note "Mes orphelins" (n° 46), pp. 180-182, from which I shall confine myself here to extracting the following passage:

"This pair of notions [schemas and topos] potentially contains a vast renewal of both algebraic geometry and arithmetic, as well as topology, through a synthesis of these "worlds", too long separated, in a common geometric intuition."<sup>422</sup> (\*)

The language of topos, and the formalism of étale cohomology, are developed in the two consecutive and inseparable seminars SGA 4 (in 1963/64) and SGA 5 (in 1965/66)<sup>423</sup> (\*\*). The first is in collaboration with □<sup>424</sup> d, autres<sup>424</sup> (\*), and develops, in addition to the language of topos, the key results of cohomology, including key duality start-up statements (six-operation style). The second, in which I practically went it alone<sup>425</sup> (\*\*), develops a complete formalism in much greater detail.

p. 845

**crystalline** cohomology for the ordinary *L-function* of such a variety over a finite body. But, as I pointed out in the previous b. de p. note, we are still a long way from a mastery comparable to that which we have in *l-adic* cohomology, which would be expressed by a "six operations" formalism for general "crystalline coefficients". These (according to what Deligne recently told me) have not yet been **defined**, any more than the right "Hodge coefficients" (above complex algebraic varieties)! For some comments on the "coefficient problem", which I believe is crucial to an understanding of the cohomology of algebraic varieties, see the note "La mélodie

to the grave - or sufficiency" (n° 167). This problem was clearly present for me throughout the sixties, but has been buried (among many others, and by the care of my cohomology students) to this very day. ...

(April 23) See also the note "Le tour des chantiers - ou outils et vision", n° 178.

<sup>422</sup>(\*) I propose elsewhere (in sub-note n° 136<sub>1</sub> to the note "Yin the Servant (2) - or generosity" (n° 136), to call by the name of **arithmetical geometry**, this "new science" still in its infancy, "so vast that until today I've never even not thought of giving it a name", born in the early sixties in the wake of Weil's conjectures, and of which the "yoga of motives" is "like the soul, or at least like a neuralgic part of it". With this name, I would like to suggest

"the image of a "geometry" that would be developed "above the absolute base" SpecZ, and which admits "specializations" both in the traditional "algebraic geometries" of different characteristics, and in "transcendental" geometric notions (above the basic bodies C, R, or  $\mathbb{Q}_A \dots$ ), via the notions of analytic or rigid-analytic "varieties" (or better, **multiplicities**), and their variants.

(loc. cit. p. 637). I write above (same page):

"Beyond the edification of the new algebraic geometry, and through towards the "mastery of étale cohomology" (and that of the *l-adic* cohomology which follows from it), it is the elaboration of a master builder of this new science still in the making, which was in my eyes my main contribution to the mathematics of my time."

<sup>423</sup>(\*\*) A second edition (in three volumes) of SGA 4, completely revised compared to the original edition (especially concerning the language of sites and topos, and categorical complements) has been published in Lecture Notes (Springer Verlag). in 1972-73, n° s 269, 270, 305. For the vicissitudes of SGA 5, see details below. An "illusie edition" of a copiously dismantled version of the original seminar was published in the same Lecture Notes (no. 589) in 1977, **eleven years later**, after the end of the oral seminar.

<sup>424</sup>(\*) The development of the language of sites and topos, based on my initial idea of 1958, was mainly driven by and with the help of M. Artin, J. Giraud, J.L. Verdier. For details, see the promised historical commentary, already quoted in a previous b. de p. note.

<sup>425</sup>(\*\*) The only exception (if my memory serves me correctly) was provided by J.P. Serre, who gave some fine talks on finitely generated groups and the Serre-Swan module associated with the Artin conductor, which I needed for the development of the general fixed point formula I had in mind. It was intended that these lectures should appear in SGA 5, but seeing the turn events were taking, Serre had the good sense to make them available to the mathematical public by publishing them elsewhere.

of duality, including the fixed-point formulas leading to the cohomological theory of *L-functions* (which forms an important part of Weil's set of conjectures). I write about this double seminar in the note "La dépouille... ." (n° 88), in the following terms:

"The set of two consecutive seminars, SGA 4 and SGA 5 (which for me are like **a single** "seminar") develops from nothing, both the powerful instrument of synthesis and discover-verte represented by the **language of** topos, and the perfectly perfected, par- ticularly effective **tool** that is étale cohomology - better understood in its essential formal properties, from that moment on, than even the cohomological theory of ordinary spaces was. This whole represents the most profound and innovative contribution I have made to mathematics, at the level of a fully completed work. At the same time, and without wishing to be, while at every moment everything unfolds with the naturalness of the obvious, this work represents the most far-reaching technical "tour de force" I have accomplished in my work as a mathematician. For me, these two seminars are indissolubly linked. They represent, in their unity, both the **vision** and the **tool** - the topos, and a complete formalism of stale cohomology.

While the vision is still rejected today, for over twenty years the tool has profoundly renewed algebraic geometry in its most fascinating aspect for me - the "arithmetical" aspect, apprehended by an intuition, and by a conceptual and technical baggage, of a "geometrical" nature. "

\*      \*

\*

## $b_2$ . The four maneuvers

p. 846 **Note 169(ii)** □ **Operation Cohomologie étale" discredited the unifying vision** of topos

(such as "nonsense", bombing etc.), and by the same token, and by assimilation, the role I had played in the discovery and development of the cohomological tool; and secondly, to **appropriate the tool**, i.e. the **authorship of** the ideas, techniques and results I had developed on the theme of staggered cohomology. Here again, the "beneficiary" of the operation is Deligne<sup>426</sup> (\*), and it is his excep- tional ascendancy (due no doubt as much to his exceptional means as to his implicit position as "heir" to my work) that has made an operation of this scale (of debunking and appropriation) "pass", without apparently making a single wrinkle... .

It was in 1965/66, in the SGA 5 oral seminar and through the texts already written in the previous SGA 4 section, that the young newcomer Deligne made his first apprenticeship in scheme theory, homological algebra (Grothendieck style) and the new techniques of stale cohomology (born two years before)<sup>427</sup> (\*\*) - techniques which were to form the basis of all his subsequent work.

---

For all other presentations, I was the only speaker, or, if there were others towards the end, they followed the detailed notes I had developed for the seminar. The editors' (sic) task was therefore limited to finalizing the notes I had made available to them.

<sup>426</sup>(\*) There were, however, substantial repercussions for **Verdier**, as we shall see later: firstly in 1976, when he gave the "kick-off" for the dismantling of APG 5 with his "memorable article" (see "episode 3" of an escalation below), and then in 1981 at the "Colloque Pervers" (first mentioned in this connection, in the note "Le partage" (n° 170)). dedicated to "Operation III").

<sup>427</sup>(\*\*) This is what I recall (having somewhat forgotten) in the note (of May 27 last year) "L'être à part" (n° 67'). I would add that it was in this same SGA 5 seminar that the young Deligne also learned from me (but "as a

In the operation (which I have elsewhere called "Operation  $\text{SGA}_2 4^1$  - SGA 5") set up by my brilliant ex. As a student, I see four inseparable "**maneuvers**".

**Manoeuvre 1: Discrediting** the  $\square$   $\text{SGA}_2 4^1$  - SGA 5 mother seminar as a "ganguel of nonsense" and others p. 847  
It's all done on the fly (and "mine de rien") in the various introductory texts to the volume, by the pen of Deligne, called by the strange name " $\text{SGA}_2 4^1$ " (subtitle: Cohomologie étale) published in Lecture Notes of Mathematics n° 569 (Springer Verlag). For details of the shaping of the double seminar SGA 4 - SGA 5, where Deligne learned his trade and found his basic tool for all his later work, see the note "La table rase" (n° 67).

**Maneuver 2. Sabotage** the overall editing of my SGA 5 oral presentations<sup>428</sup> (\*). Normally, this should have been done within a reasonable timeframe (a year or two at most), by my cohomology students (for want of other reliable volunteer editors), who had the privilege of learning a great deal about their profession, as well as ideas and techniques that they and the other seminar participants had been the only ones to know about for many years. It was also the best (and quickest) way for them to familiarize themselves with a substance and with ideas and techniques, which during oral presentations tended to go a little "over their heads" (with the exception of the ever-dashing Deligne, needless to say). In any case, this drafting, or rather **non-editing, dragged on for eleven years** - until, as luck would have it, Deligne gave Illusie the "green light" to edit and publish this unfortunate SGA 5, which had until then been left to its own devices by mutual agreement - the moment when it became clear that it would be published (in 1977) **after** a certain volume, written by Deligne himself, composed (in 1973 and the following years) initially for the purpose (as I first thought) of popularizing the "ingredients" ("inputs") of stellar cohomology essential for his demonstration (of the last part) of Weil's conjectures, is christened for the occasion with the unusual name " $\text{SGA}_2 4^1$ ". (This name, however, does not appear to have been bewildered or surprised, even  $\square$  shocked, no one but me ... .  $(169)_1$ <sup>429</sup> (\*) For details, see notes p. 848  
"Le feu vert" and "Le renversement" (n° s 68, 68'), where the sense of volume calling itself " $\text{SGA}_2 4^1$ " begins at appear to me, as do the notes "Silence" and "Solidarity" (n° s 84, 85).

**Manoeuvre 3. Dismantle the original SGA 5 seminar**, of which the published version (by the "care" of my ex-student Luc Illusie) now represents no more than an outrageously mutilated "corpse". I give an account of this shameless dismantling, or to put it more accurately, the **massacre** of what was a splendid seminar entrusted to the hands of my students, in the note of the same name (n° 87) - one of the longest and most revealing of the reflections on Burial.

**Manoeuvre 4: Break up the unity of my work** on staggered cohomology, represented by the two inseparable shutters SGA 4 and SGA 5, by "cutting it in two", "by the violent insertion, between these

---

He had always known it", it has to be said!) the art of putting the description (or "theory") of an interwoven and, at first glance, dense situation down in black and white, in a form that is at once convenient, striking, clear and rigorous. Twelve years later, after he had ransacked the seminar, this did not prevent him from displaying an air of disdainful condescension and contempt towards what remained of it (and the SGA 4 section that formed its basis).

<sup>428</sup>(\*) As I mentioned three notes (de b. de p.) above, there were detailed notes for each of my oral presentations. It would have taken me several months to write them up. If I didn't do it, and as early as the year (1966) of the end of the seminar, it was because, in principle, volunteers (? ? ?) had taken on the task of detailed editing. It dragged on and on until I left in 1970, when I had completely "given up" on questions of this kind.

in favor of tasks that seemed (rightly) more essential and urgent. On this subject, see the note "Le feu vert" (n° 68), in which I ask myself for the first time about the meaning of what happened with "that unfortunate seminar". It was April 27 - and I discover the reality, the "breath" of the "massacre" on May 12, two weeks later. ...

<sup>429</sup>(\*) On this subject, and for clarification of the original and true **meaning** of the acronym APG (from which my name and person were eventually ousted), see the sub-note "L'éviction" (n° 169<sub>1</sub>) which follows this one ("Les manoeuvres", n° 169), and was originally intended as a b. de p. note here.

two-part, foreign and disdainful text"<sup>430</sup> (\*\*), answering to the unusual name "SGA 4<sup>1</sup>"<sup>431</sup> (\*\*\*). This ingenious name says exactly what it's supposed to say - you just had to think of it! With this name alone, the volume presents itself as **the** central and fundamental text on étale cohomology, destined to **replace** the "dense presentations of SGA 4 and SGA 5", "which can be considered as a series of digressions", "some of them very interesting" it's true, but which the central text "should allow the user to forget".

p. 849 There's no need for my brilliant ex-student and friend to compromise himself here in lengthy and pointless discourse: this lapidary name alone, "SGA 4<sup>1</sup>", states and lays down the unanswerable evidence of the **anteriority** of this text in relation to the "digressions" known as SGA 5 (which, as it certainly could not have been otherwise, were published after him. . . ), and at the same time, it takes for granted an (alleged) **logical dependence** of SGA 5 on the "previous" text.

This implausible claim that SGA 5 is logically dependent on the apo-cryphal text is confirmed in the introduction to<sup>432</sup> (\*), where the author announces without batting an eyelid (and apparently without anyone before me - these days - finding anything peculiar in it... ) :

"... its existence [that of "SGA 4<sup>1</sup>"] will make it possible to publish SGA 5 **as is in the** near future" (that's underlining) -

read: in the state of a ransacked and plundered **corpse**. ... Although I had already been aware of my friend's "Motifs" operation for over a week, it took me two days (from April 26, with the note "La table rase", to April 28, with the note "Le renversement" (notes n°s 67, 68)) to grasp the meaning of the "mystery" represented for me by my brilliant pupil's obviously preposterous assertion - and at the same time, to understand the meaning of the seemingly innocuous acronym "SGA 4<sup>1</sup>", which I hadn't even considered the previous two days.

p. 850 The same sham of "logical dependence" is clearly suggested in the introduction to SGA 5 by Illusie (169)<sup>433</sup> (\*\*). It is further rendered plausible, for an uninformed reader, by the innumerable references to "SGA 4<sup>1</sup>" which the late editors of my<sup>434</sup> (\*\*\*) presentations (or of those, **du moins**, that one has well wanted to include in the edition-massacre) are more than happy to stuff their essays. Many of these references are by no means bogus, but refer to two of the original seminar papers (one by Illusie, the other - particularly crucial - by Deligne<sup>435</sup> (\*)), which were incorporated without further ado into the text.

<sup>430</sup>(\*\*) This passage in quotation marks is quoted (from memory) from the note "la dépouille. . ." (n° 88) - the very note in which, for the first time in the reflection on Burial, I "pose" to become aware of the place of the SGA 4 - SGA 5 seminar, in inside "my work fully completed". As for the deeper, "carnal" experience of the "breath of violence" attacking this central, harmonious and living part of my work, it was revealed to me in a dream the very night following this reflection. It found its written expression the next day, in the note ". . . and the body" (n° 89).

<sup>431</sup>(\*\*\*) Subtitle: Cohomologie étale - by Pierre Deligne. ... The subtitle says it all!

<sup>432</sup>(\*) I would remind you that, during his last visit to my home (last October), Deligne gave me an oral confirmation of this same delirious thesis - without any real conviction, it's true, and without even pretending to tell me how my seminar, which formed a harmonious and coherent whole without having waited for him, would depend on Deligne's work, which came out of it seven years later. ... This short scene on a station platform, where we were waiting (with his little daughter Natacha) for the train that was to take them back to Paris, is recounted at the end of the note dedicated to this visit, "Le devoir accompli - ou l'instant de vérité" (n° 163).

<sup>433</sup>(\*\*) For details, see the sub-note "Good Samaritans" (n° 169<sub>2</sub>) to the present note (n° 169), originally intended as a b. de p. note here.

<sup>434</sup>(\*\*\*) (April 9) detailed verification made, the "late editors" in question (and that's an understatement. . . ) are limited to my dear ex-students Luc Illusie and Jean-Pierre Jouanolou. Bucur's and Houzel's drafts were ready before I left, and Illusie didn't go so far as to slip in references to a text called "SGA 4<sup>1</sup>", which didn't see the light of day until some ten years later. He and Jouanolou were content to wait for Deligne's "encouragement" to write what was incumbent on them, eleven years after the seminar's completion, and, for the presentations they had already written "in my time", to stuff them with empty references to the pirate-text of their brilliant friend and protector.

<sup>435</sup>(\*) This is the lecture "The cohomology class associated with a cycle, by A. Grothendieck, edited by P. Deligne". It is stated that this talk was "inspired by Grothendieck's notes, which **formed a state 0** of SGA 5 IV" - by which it is suggested,

in the volume entitled "SGA 4<sup>1</sup>" - not asking me for anything or only informing me of it, but as something that (in the absence of the deceased master) would rightfully belong to them. ...

□ This act of brigandage also allows my ex-student Deligne to achieve this brilliant **reversal of the roles**, to be able to present myself on the cover of the book (and while being just as careful not to consult me. . . ) as his **collaborator** (for the development of staggered cohomology!)<sup>436</sup> (\*) - a collaborator a little "confused" around the edges<sup>437</sup> (\*\*) it is true, but "collaborator" all the same. . .

As for the pirate-text called "SGA 4<sup>1</sup>/<sub>2</sub>", in addition to the two lectures already mentioned, torn from their original SGA 5 context, and in addition to numerous "digests" of some of the results of SGA 4 - SGA 5 particularly important for arithmetic applications, plus an original chapter of applications to trigonometric sums, and apart finally from the "Etat 0" of Verdier's "thesis"-sic (which will be discussed further with "operation III"), it consists of a handful of additions (very useful, admittedly<sup>438</sup> (\*\*\*) to the cohomology formalism □ developed in SGA 4 - SGA 5. There's enough here to make a fine, if somewhat heterogeneous, article, p. 852.

about 30 pages (or 50, if you include the "Trigonometric sums" chapter). In

---

no doubt, that it was an act of charity to rid SGA 5 of this sad state (zero), in order to make the beautiful presentation that we have here in a brilliant volume. ...

As for Illusie's presentation (ex-chapter II), which disappeared from SGA 5 only to reappear (in redesigned form) as an appendix to Deligne's presentation on finitude theorems in staggered cohomology, it developed the theorems of finitude relevant for  $R^i f_*$  (under assumptions of "purity" and "resolution", see b. of p.(\*\*\*) on page 841), and theorems of the "generic Künneth" and "generic local acyclicity" type. No one before me had ever thought of **formulating** only such statements in cohomology. Moreover, the so-called "outdated" demonstrations in the oral seminar, in addition to principles of dependence (e.g., making it possible to deduce from a finitude statement for the functor  $Rf_*$  the similar statement for  $Lf^!$  and for  $RHom(., .)$ ), introduced a uniform technique for using the strong form (à la Hironaka) of the resolution of

singularities, which has proved its worth elsewhere - and it was there and nowhere else that Deligne and my other cohomology students learned it. It was subsequently used, in particular, in my proof of the "algebraic De Rham" theorem for smooth varieties over the field of complexes, and in that of Mebkhout-le-nom-nommé's theorem, known as the "Riemann-Hilbert theorem" aka the "theorem of the good Lord" (which Mebkhout didn't have the advantage of learning the method in SGA 5, from which it had disappeared... .).

Seven years later (??) Deligne found an elegant method to prove in a few pages the finitude of  $Rf_*$ , as well as the biduality theorem (very close technically), under (if not optimal, at least) very unrestrictive assumptions (see b. de p. note quoted). Nothing, either in Deligne's presentation or in his friend's appendix, could lead the reader to suspect that I had anything to do with the notions introduced and used (such as local acyclicity and its "generic" variant), or with the statements proved (of finitude, biduality, Künneth and generic acyclicity), and with the links between them. My name is absent from both the text and the bibliography, which consists of four references to Deligne, all of them post-1970, i.e. my "departure".

I find myself once again, at the turn of this explanatory b.p. note, faced with the deliberate intention of wiping the slate clean of the origins and roots of what my brilliant students wield with such mastery (as if they'd always known. . . ) - that is, of **erasing the traces of a past**, the past before my "death".

(March 16) For the special role reserved for Deligne's "finitude" complements, see the sub-note "Le cheval de Troie" (n° 169<sub>3</sub>) to this "Maneuvers" note.

<sup>436</sup>(\*) This staging (in which I appear as the "collaborator" of my pupil Deligne) is all the more shameless, given that it had been seven years since I had clearly and publicly stated my intention to stop publishing maths (and even less, from then on, as a "collaborator", one might think. . . ).

<sup>437</sup>(\*\*) In his summary (a copy of which he sent to me) of "SGA 4<sup>1</sup>/<sub>2</sub>" for the Zentralblatt (September 1977), Deligne makes a point of pleasure to talk about the "**confused** - albeit rigorous - state of SGA 5" (emphasis mine), which (one would have guessed) the new text was supposed to "remedy". . .

<sup>438</sup>(\*\*\*) These are finitude results (already mentioned three b. de p. notes above and in the one quoted there), filling in a few pages two gaps in the SGA 5 mother seminar, plus an exposé on fixed point formulas "modulo"  $l'$  and  $p$ . The problem of explicating such formulas, and the relevant conjecture for a mod  $p$  expression of the Artin-Weil function  $L$  for a finitary type scheme, over a finitary body had been posed by me as early as the SGA 5 seminar, and were surely part of the problems (unworthy of any mention in Illusie's introduction to SGA 5) posed in the closing lecture (a lecture that disappeared body and well, along with many others, in the Illusie edition). Deligne had found an elegant common solution, using the "symmetrical Künneth formula" (which, for the sake of argument, he developed in one of the apocryphal lectures in SGA 4). It was understood (and taken for granted) that these results would be included in the edited version of SGA 5, from which they were directly inspired. Needless to say, my name does not appear in the eight-page discussion of this formula in the volume entitled "SGA 4<sup>1</sup>/<sub>2</sub>". 2

of my brilliant ex-student, it would have been self-evident to include these few additions, each in its own place, in the two or three lectures of SGA 5 from which they were inspired and which they completed. Instead, they serve as a pretext for the outright deletion of Lecture II from SGA 5 (with the blessing of Illusie, who was in charge of writing it and who "supplements" it by turning it into an appendix in "SGA 4<sup>1</sup>" to the chapter on finiteness theorems), and to rename the biduality theorem in étale cohomology (which I had worked out in 1963, on the model of the "coherent" analogue I had discovered in the fifties) "Deligne's theorem"(\*) (which the aforementioned Deligne was to generously "cede" to his friend Verdier, four years later, as part of the "package" christened "Verdier's duality". . . ).<sup>439</sup>

### b<sub>3</sub> . Episodes of escalation

p. 853 **Note 169(iii)** □(169(iii)) The operation "cohomologie étale" continued throughout the eleven years, from 1966 to 1977, between the end of the SGA 5 seminar and the publication, one after the other, of the cut-and-dried volume "SGA 4<sup>1</sup>", followed by the massacre edition (known as the "Illusie edition") of SGA 5<sup>440</sup> (\*). It was achieved, above all, thanks to the joint participation, in deed and in omission, of my five "cohomologist" students:

**P. Deligne, L. Illusie, J-L. Verdier, J.P. Jouanolou, P. Berthelot**<sup>441</sup> (\*\*). Illusie is responsible for

<sup>439</sup>(\*)The **biduality theorem**, or "local duality theorem" (the two names are those I had given it), both in the coherent context and in the "discrete" (étale, in particular) context, is in the nature of a "local" Poincaré duality theorem, valid for "varieties" (algebraic or analytic, or "moderated" spaces etc.) that can have any singularities. It's an entirely new type of theorem in the arsenal of "basic facts" in the cohomology of spaces of all kinds, and it's an important and profound complement to the "six operations" duality formalism I've developed, to express with maximum flexibility and generality all phenomena of the "cohomology-duality" type.

gique" (like Poincaré). Along with the introduction of the  $Lf$  functor<sup>1</sup> (the "unusual" inverse image), it is one of the main ideas of the Poincaré family.

I've introduced the innovative formalism of the duality of varieties and spaces "of all kinds", both of which form the "soul" of the overall yoga of the "six operations".

In the coherent case, the demonstration of the biduality theorem is trivial. This does not prevent it from being what I unhesitatingly call a "profound theorem", because it gives a simple and profound view of things that would not be understood without it. (On this subject, see J.H.C. Whitehead's observation on "the snobbery of young people, who believe that a theorem is trivial because its demonstration is trivial", an observation I take up and embroider on in the note "The snobbery of young people".

young people - or the defenders of purity", n° 27.) In the discrete case, the demonstration is equally profound, using the full force of Hironaka's resolution of singularities.

Attributing the authorship of such a theorem to Mr. X (Verdier first, in this case, for the discrete analytic case, then Deligne for the discrete étale case, until the two friends agree to award the whole to Verdier alone), on the pretext that the aforementioned gentleman has copied an already known demonstration in a neighbouring context, or that he has been able to broaden the conditions of provisional validity (which I had identified in 1963) - and this without even deeming it useful to recall its origin, is what we used to call "in my day" a swindle. In short, I'll just have to wait for the relevant purity and resolution theorems to be proved, so that (in staggered cohomology) I can perhaps once again claim authorship at least of the biduality **theorem** (in the optimum framework, this time, of excellent schemes) - at a time when the great **ideas** that inspire and give meaning to theorems have become the object of general contempt.

(May 11) I should point out that the validity of the biduality formalism in the analytic case was of course known to me as early as 1963, when Verdier learned of it from me. In SGA 5, I always pointed out the validity of the ideas and techniques I was developing. In the mass-murder edition of SGA 5, Illusie took care to remove all trace of such comments.

<sup>440</sup>(\*) (March 12) It now seems inaccurate to me to consider that the "Cohomologie étale" operation ended in 1977 with the double publication "SGA 4 - SGA 5", which would be its "culmination" (as I write two paragraphs below). I've been misled here by the deliberate intention (convenient at times, but artificial) of wanting to "split" the "Burial" operation (of the deceased master and his *fi dèle*) into four separate operations - whereas these are in fact indissolubly linked. The real "culmination", or rather **apotheosis**, of the "Cohomologie étale" operation, and at the same time of the whole Burial, took place four years later at the Colloque (known as the "**Colloque Pervers**") de Luminy in June 1981 (which we'll be talking about in particular with "operation IV"). At this colloquium, where all-round cohomological formalism (coherent and sprawling) was the focus of general attention, **my name was no longer mentioned**... ..

<sup>441</sup>(\*\*) This solidarity was expressed, for each of these five ex-students, first of all by omission, by abstaining from any effort to contribute to making available to all a vast body of new ideas and basic techniques, through which they

(apart from Deligne's) which seems to me the most heavily committed, since it was he who assumed responsibility for the publishing-massacre, thus making himself the docile instrument of Deligne<sup>442</sup> (\*). p. 854

There can be no doubt about Deligne's intention to appropriate the "true" authorship of étale cohomology. It is attested by the very spirit of the whole "staggered cohomology" operation, which is without doubt unique in the annals of our science. It is also expressed, discreetly at first in 1975, in Deligne's biographical note (where any allusion to a cohomological tool I might have placed in his hands, and which might have played a role in his demonstration of the last part of Weil's conjectures<sup>443</sup> (\*\*), is absent), and resoundingly eight years later, in the brief but eloquent set of three texts (from 1983) that I have named "Funeral Eulogy" (in three parts)<sup>444</sup> (\*\*\*). They are examined with the care they deserve in the two notes "L' Eloge Funèbre (1) - ou les compliments" and "L' Eloge Funèbre (2) - ou la force et l'auréole" (n° s 104, 105) (and taken up, in a more penetrating light, in the later note "Les obsèques du yin (yang enterre yin (4))", n° 124). As for Deligne's autobiographical (and by no means funereal) "Eulogy", I review it in the two notes "Requiem pour vague squelette" and "La profession de foi - ou le vrai dans le faux".

(n° s 165, 166)<sup>445</sup> (\*\*\*\*)

□ The operation culminated in 1977<sup>446</sup> (\*), with the publication (in no particular order) of <sub>2</sub> (sic) - SGA p. 855  
"APG 4 <sup>1</sup>

5 ". This is the (provisional) culmination of a long, eleven-year **climb** in the burial of my work and my person, each new step of which is emboldened by the tacit encouragement I have found

---

and, after 1976, by their **silence** in the presence of the very large operations of a Verdier (in 1976) and a Deligne (assisted by Illusie, the following year). In addition to Deligne and Illusie, Verdier played an active role in the "Cohomologie étale" operation, giving, with "the right reference" (see "episode 3" below), the "kick-off" to the dismantling of SGA 5, thus showing his friends that the time was definitely ripe for the large-scale operation that followed the year after without a hitch. As for Jouanolou, his active contribution was limited to "**going with the flow**", happily peppering his presentations with the de rigueur references to the pirate-text, and doing his best to gloss over the composer of the themes with variations that he unfolds with mixed conviction... .

<sup>442</sup>(\*) Illusie has also become **Verdier's** accomplice, covering up his deception of the previous year by refraining from alluding, in the introduction to SGA 5 or elsewhere, to my talks on the homological formalism and the homology class associated with a cycle.

<sup>443</sup>(\*\*) (March 12) Nor is there any allusion in this text, or (to my knowledge) in any other by him, to the fact that a substantial part of these conjectures had already been established by someone other than him. On this subject, see the sub-note "'La" Conjecture" (n° 169<sub>4</sub>) to the present note "Les manoeuvres".

<sup>444</sup>(\*\*\*) In my reflection on Burial, the encounter with the Funeral Eulogy, on the very day (May 12 last year) that a certain tableau d'un massacre burst into my investigation, marking an important moment. The long reflection "La clef du yin et du yang" (which gives its name to the second part of L'Enterrement) was triggered five months later by an unusual "association d'idées", which appeared the day after this encounter. It was triggered by a certain deliberate intention (unspoken, admittedly, but nonetheless laid out large. . . ) to "reverse roles" in the two "minute portraits" I'd just looked at a little more closely. . .

<sup>445</sup>(\*\*\*\*) For details of this autobiographical note, see also the last b. de p. note (dated December 29) at the end of the note "Le nerf dans le nerf - ou le nain et le géant" (n° 148). This notice was published by the "Fonds National de la Recherche Scientifique" (Belgian), rue d'Egmont 5, 1050 Brussels, on the occasion of the award of the "Prix Quinquennal" to pierre Deligne, in 1975.

In this two-page autobiographical note, as in the minute portraits that make up the "Funeral Eulogy", the art of thumb-sucking is exercised as much on the theme of "motifs" as on that of *l-adic* cohomology. In both texts, written eight years apart, the neuralgic point around which the reflexes of appropriation are concentrated seems to be Weil's "conjecture".

(March 12) Even more absolutely and defiantly than in the "textes - Eloges" examined in the four notes cited, the intention to appropriate bursts forth and spreads out in the **Colloque de Luminy** of June 1981 (see the b. de p. note of the same day, page 853, above). Or, to put it more accurately, an appropriation that had hitherto been symbolic and by **intention**, and which had previously expressed itself in groping manoeuvres (encouraged by the eager support of some and the indifference of all), became an **accomplished fact** at the brilliant Colloquium (at least in the unanimous consensus of all the brilliant mathematicians assembled on this memorable occasion, and in the general euphoria).

<sup>446</sup>(\*) (March 12) This is a provisional "culmination"! See the first of today's b. de p. notes, in this same note "Les manoeuvres" (p. 853).

in the previous stages, by general indifference and apathy (if not over-enthusiastic acceptance. . . ) towards their dubious nature. I've already mentioned some of these stages, with the "Motifs" operation reviewed earlier. I've identified three more episodes, more directly linked to the "Staggered Cohomology" operation, which I'd now like to review.

**Episode 1.** concerns the fate of a certain conjecture of the "**discrete Riemann-Roch**" type I had introduced in 1966 during the SGA 5 oral seminar, in the final lecture in which I had identified and commented on a number of open problems and unpublished conjectures. This presentation was lost in the Illusie edition, where no allusion is made (and not without reason. . . ) to the conjecture in question, or indeed to any of the many questions raised. Yet, seven years after the seminar, the conjecture reappears in the analytic context under the pen of Mac-Pherson, without any allusion to any seminar whatsoever SGA 5 (or to a schematic context), and under the unusual name of "Deligne-Grothendieck conjecture". This is the well-known article<sup>447</sup> (\*\*) in which Mac-Pherson proves this conjecture in the analytic context.

p. 856

□ During his visit last October, Deligne told me that in 1972 he had confined himself to **communicating** such information as

I told Mac-Pherson about my conjecture (which he had learned, along with the other SGA 5 listeners, during the oral seminar). He told me he was surprised by the name Mac-Pherson had given him, but didn't bother to write to him to have it rectified. On this subject, see the note "Dotting the I's" (n° 164, part II 1), and for further details on the conjecture itself, the long sub-note n° 87<sub>1</sub> to the note "The massacre" (n° 87)<sup>448</sup> (\*).

**Episode 2:** The vicissitudes of the SGA 7 seminar, devoted to questions of **monodromy in stellar cohomology**, which took place between 1967 and 1969 under the joint initiative and direction of Deligne and myself. Deligne made several contributions, the most important being his demonstration of the Picard-Lefschetz formula in the étale context. As with SGA 5, the writing of the oral presentations dragged on for several years - a bit like repeating the (beginning of the) scenario of the (non-)writing of its unfortunate predecessor! Publication finally took place in 1972 and 1973 (in Lecture Notes n° s 288, 340), thanks to Deligne, at a time when I had disappeared from the mathematical scene for three years. On his initiative, the seminar was **split into two parts**, the first presented as directed by me, the second as directed by him and N. Katz (who had simply been one of several lecturers during the second year of the seminar)<sup>449</sup> (\*\*).

In the first volume, SGA 7 I, published under my name, the detailed theory of evanescent cycles, which I had presented in a series of talks opening the seminar, is "slashed" to a twenty-page summary by Deligne (the other talks had been written within a reasonable timeframe, by myself and other seminar participants). As for Volume II, which appeared under the joint Deligne-Katz signature, and in which the part that

I had taken in the development of the main themes and results is no less than in Volume I' □ <sup>this</sup> part, is systematically retracted. I give more details on this subject in the note "Prélude à un massacre" (where I try to pinpoint the meaning of the APG 7 mini-operation) and especially in the note "Dotting the I's" (part II 5), n° s 56, 164.

p. 857

I'll confine myself here to recalling the biggest oversight. It concerns my transposition of the cohomological theory of "Lefschetz brushes" and of the "theorem" into the context of stale cohomology.

<sup>447</sup>(\*\*) Mac Pherson, Chern classes for singular algebraic varieties, Annals of Math. (2) 100, 1974, pp. 423-432.

<sup>448</sup>(\*) This conjecture will thus appear for the first time, in its original and complete form, only in Harvest and Sowing, and this almost **twenty years** after I recommended it to my students... .

<sup>449</sup>(\*\*) For the meaning I discern in this **cut**, which no mathematical reason justifies, see the note "Prélude à un massacre" (n° 56) quoted below, and also the sub-note "L'éviction (2)" (n° 169<sub>1</sub>) to the present note "Les manoeuvres".

irreducibility". This transposition of classical results, proven (when indeed they are proven. . . ) by transcendental means, was (as is often the case) not at all automatic. I remember spending days if not a whole week on it. To my knowledge, there is no other known demonstration of the main facts than the one I came up with at the time, using spectral sequences and the "well-known" structure (which I had determined in 1958) of the "moderated" fundamental group of an algebraic curve<sup>450</sup> (\*). This theory is reproduced in SGA 7 II, in a presentation by Katz (exp. XVIII) and according to the notes I had given him. In the introduction to the volume, Lefschetz's theory of brushes is presented (along with the Picard-Lefschetz formula proved by Deligne) as one of the two "key results" of the seminar, without any hint of a role for me in any of the themes developed in the volume. The only reference I know of in the literature to any such role for Lefschetz's theory is a laconic and ambiguous footnote<sup>451</sup> (\*\*) (after the title ("Pinceaux de Lefschetz") of Katz's talk, and the name of its author) "D'après des notes (succincts) de Grothendieck".

In Deligne's article "La Conjecture de Weil I" (169)<sup>452</sup> (\*\*\*) published in the same year (1973) in "Publications Mathématiques", Lefschetz's brush theory is an important technical ingredient in his demonstration of Weil's conjectures. In this article, Deligne doesn't even pretend to disregard my role in the l-adic trace formula (which is another crucial ingredient of his demonstration, the paternity of which was still all too notorious in well-informed circles)<sup>453</sup> (\*); on the other hand, when he takes care to formulate the results of the Lefschetz theory he is about to use, no allusion is made to my person. He merely refers to the relevant lectures in SGA 7, and it's unlikely that any unfortunate reader will ever unearth there the elusive footnote by his friend Katz. ...

**Episode 3.** The last episode I know of in the "escalation" took place in 1976, a year before the "culmination" of the "SGA 4<sup>1</sup> - SGA 5" operation. It was published in Asterisk (n° 36 (SMF), p. 101-151) of an article by J.L. Verdier entitled "Homology class associated with a cycle". Verdier was one of my five cohomology students, and (like his buddies) he had attended the SGA 5 seminar, wisely taking notes without really knowing what he had gotten himself into there. In the ten years since then, he (like his buddies) has finally figured it all out. The fact remains that in this article he takes up a number of ideas I had developed in the seminar in question, at length and "in front of listeners who begged for mercy", around the biduality theorem and, above all, around the formalism of homology and cohomology classes associated with a cycle<sup>454</sup> (\*\*). In this article, my name is not mentioned (except once,

<sup>450</sup>(\*) In the introduction to Katz's presentation, which will be quoted here, he generously attributes this theorem to my former student Michèle Raynaud, who presented it in the SGA 1 seminar in 1950/61.

<sup>451</sup>(\*\*) This note is ambiguous, in that it is careful not to assert authorship, which could just as well be due (unless otherwise stated) either to the author of this XVIII exposé, or to the other co-author of the volume (as the introduction to the volume implies by omission). Following Grothendieck's ("succinct"! ) notes in no way implies that there aren't several demonstrations (some of them earlier) from which he would have done me the honor of choosing my own. This (as elsewhere in the same volume) is a typical example of the "inch!" style so dear to my friend Deligne, who has obviously set an example... ...

<sup>452</sup>(\*\*\*) see sub-note ""The" "Conjecture"" (n° 169<sub>4</sub>), from a b. note here.

<sup>453</sup>(\*) The following year, however, in his autobiographical note (discussed in the two notes already cited, n° s 165,166) Deligne cannot deny itself the satisfaction, however symbolic, of skirting this role. It's true that this was a text for circulation very limited, which perhaps no mathematician "in the know" has ever held in his hands except me. But three years later, in the volume entitled "APG 4<sup>1</sup>", destined to become a standard reference text, the same trickery (albeit implemented with an even greater dexterity, given the circumstances. . . ) is used, this time for a wide audience of non-specialist "users". ) is set up, this time for a wide audience of "users", non-specialists in stellar cohomology. For a dismantling of this masterfully executed deception, see the sub-notes group

"La Formule" (n° s 169 -169<sub>58</sub>) to the present note, as well as the two sub-notes that precede it, "Le cheval de Troie" and ""La" Conjecture" (n° s 169<sub>3</sub>, 169)<sub>4</sub>.

<sup>454</sup>(\*\*) The idea of defining the **homology** of a scheme (or "space" . . . ) as its hypercohomology with values in a "complex

p. 859 by way of a joke of a very particular kind. . . ), and no allusion □ is made to any SGA 5 seminar the author may have heard of. Details can be found in the two notes "The right references" and "The joke - or 'complex weights'" (always the same weights, no mistake. . . ) n° s 82, 83.

It was from this "memorable article" that the duality formalism on analytic complex spaces, for analytically constructible discrete coefficients, reproducing the one I had developed (as early as 1963 and especially, in SGA 5 in 1965/66) in the étale schematic context, became succinctly the "Verdier duality" - until five years later (in the euphoria of the June 1981 Colloque de Luminy) the same sleight of hand was performed for étale duality too. But here I'm anticipating (as I already did with the episode of the "memorable article" itself) the **third** major operation, this time with Verdier as the main (if not the only) "beneficiary" - an operation that will be discussed below<sup>455</sup> (\*).

## b<sub>4</sub> . Impudence

**Note** 169(iv) Verdier's article shed an unexpected light on the fate of SGA 5 in the hands of some of my former students. It showed me what kind of "benefit" they could find in their exclusive knowledge of the ideas and techniques I had developed in SGA 5, for their benefit above all others. It also showed me, without doubt, the connivance and solidarity of all my cohomology students with this kind of operation. By calling this article

"the right reference", I hadn't thought to name it so well - it did become (as confirmed to me from various quarters) a standard reference text, which none □ of them could certainly ignore. This is what ends up to me in the notes "Silence" and "Solidarity" (n° s 84,85). I knew I shouldn't be surprised that in the Illusie edition of what was once the SGA 5 seminar, no allusion is made, at any point, to a formalism of homology (and homology classes associated with cycles) that I would have developed in that seminar - and indeed there was no need to mention it, since (ten years later) his buddy Verdier had already taken on the task of providing the missing reference to general satisfaction<sup>456</sup> (\*).

p. 860

---

In the course of the SGA 5 seminar, I had taken up the theme of the "dualistic" cycle class in the 1950s (in the coherent framework), in great detail in the staggered framework. The methods I had developed on the theme of the cohomology (first) and homology (second) class associated with a cycle, starting in the second half of the fifties (in the coherent framework), and of which I presented a synthesis (staggered version) in SGA 5, were "all-purpose techniques", applicable to both continuous (De Rham, or Hodge style) and discrete "coefficients", and in the schematic as well as the analytic or differentiable framework (among others). The need for such a theory had, moreover, been one of my main motivations for developing (as early as the 1950s) a formalism of cohomology "with supports" in a closed space (with the very useful spectral sequence "from local to global"), intended to provide an "algebraic" equivalent for the classical (and elusive) "tubular neighborhood" of a closed subspace. It was also on this occasion that I first developed (in both coherent and discrete contexts) cohomological "purity" and "semi-purity" statements.

<sup>455</sup>(\*) See "Sharing" notes, n° s 170 (i) - (iii).

<sup>456</sup>(\*) As for the **cohomology** variant (just touched on in Verdier's article, which Deligne refrains from quoting), it is awarded (as we have seen) to Deligne. As I am duly presented as the author of the presentation hacked by Deligne, there was no major reason to conceal the disappearance of SGA 5 from my presentations on this theme. Illusie mentions it "in passing" in the introduction to his pen, without the matter being deemed worthy of explanation (and nobody before me seems to have been surprised, indeed. . . ). On the contrary, right from the second sentence of this introduction, it is clearly stated that

"the **only significant changes** from the original version concern Lecture II [finitude theorems]), which is not reproduced, and Lecture III [Lefschetz formula]. ... "(emphasis added).

Given the little and given the context, I shouldn't be surprised if my ex-pupil affects not to see any **other** "important changes" in the living, harmonious body that I had once entrusted to his and my other pupils' hands, a body reduced in

The "good reference" provided by Verdier, like the "memorable volume" devoted to Deligne's partial exhumation of the motifs, is for me pure plagiarism. The same cannot be said of the text known as "SGA 4<sup>1</sup>"<sup>457</sup> (\*\*). Certain shapes are still preserved, in the de rigueur "pouce! excels at constantly **suggesting** the false, without ever (or almost. . . (169)<sub>3</sub><sup>458</sup> (\*\*\*) goes so far as to suggest en clair. My first confrontation with "SGA 4<sup>1</sup>" and with the particular form that this style takes there p. 861 (that of disdainful depreciation<sup>459</sup> (\*) is in the note "La table rase" (n° 67).

But the operation in question strikes me above all, more than a banal plagiarism ever could, by a certain dimension of **impudence**. To my mind, none of the other three operations reaches this extreme dimension<sup>460</sup> (\*\*). And it affects me more strongly than any of the other three, perhaps, because even more than that, it affects me like an act of violence, like a massacre "for the pleasure of it" of a fine work that I had brought to completion and into which I had put my whole self - for the sake, before all others, of those who went on to destroy it, to make it the fodder for their own self-importance, and (under the guise of people of high standing and exquisite company) to come and display their discreet insolence and airs of complacent contempt<sup>461</sup> (\*\*\*)).

## . The hoard

**Note** (169(v)) □ (February 28) The two "operations" I have just reviewed, like the fourth p. 862 (known as the "Perverse Colloquium") were carried out with the participation or connivance of many, for the "benefit" (it would seem) of one. This is a striking feature common to all three.

---

the Illusia edition to the state of a deformed corpse! And it's just one "change" among many, not an "important" one, that two inseparable friends have **shared** one of the "packages" of presentations I had developed with infinite care: the part awarded to Verdier having become, already a year since the publication of SGA 5, "the" good reference that everyone was waiting for (Deligne dixit), and the part awarded to Deligne becoming "the" good reason to duly quote the indispensable basic text "SGA 4<sup>1</sup>" at every turn of the page, and moreover, to present their late master as the humble (and confused) collaborator of his most brilliant pupil. . .

<sup>457</sup>(\*\*) (March 21) Further reflection in the series of sub-notes grouped under the name "The Formula" (n° s 169<sub>5</sub> to 169<sub>8</sub>) has shown me that this impression was wrong, despite "certain forms" that are still retained. ...

<sup>458</sup>(\*\*\*) On this subject, see the sub-note "Le cheval de Troie" (n° 169<sub>3</sub>), taken from a b. de p. note here, which was supposed to explain this "or almost. . .".

<sup>459</sup>(\*) It's the "depreciation" that affects to make a clean sweep of the "gangue of nonsense" amassed by a "confused" ("though rigorous". . .) and wishful thinking predecessor. . .

<sup>460</sup>(\*\*) (March 11) This assessment is, of course, entirely subjective. As I wrote this line, I hesitated a little, thinking of the unimaginable "operation" of the Colloque Pervers (or "operation IV", which will be discussed later). This memorable Colloquium was indeed a collective **apotheosis** of the Burial of my person, by that of a reckless continuator (Zoghman Mebkhout) interposed. It was on this occasion that I realized that this apotheosis is at the same time a natural **extension** and ultimate **culmination of the** "Cohomologie étale" operation, of which the "SGA 4<sup>1</sup> - SGA 5<sub>2</sub>" episode was, in fact, only a provisional "culmination". In the latter, my ex-student Deligne can't help referring here and there to my modest person and my work, albeit reluctantly, and to distance himself from it with dismissive epithets. At the Colloque de Luminy in June 1981, on the other hand, where cohomologie étale was the focus of general attention, my name (as well as that of the unknown Zoghman Mebkhout) was never mentioned... ..

<sup>461</sup>(\*\*\*) This sufficiency and contempt can be seen quite clearly in and between the lines of the volume entitled "APG 4<sup>1</sup>" (probably the only one of its kind in the history of our science). They also made their appearance, in the very year of publication

of this volume (albeit in more subdued tones), in Pierre Deligne's personal relationship with me. (See the note "Les deux tournants", n° 66.) I found them in the casualness of this and that other of my students, refraining from answering letters about things that were close to my heart or that had pained me. I found them, in touches

between the lines in the introduction to the "Illusie edition" (or massacre edition) of a work done with love, and also last year, in the paternally condescending airs of yet another student (referred to in the note "The joke - or 'weight complexes'", n° 83).

operations, confirming the thinking behind the note "The Gravedigger - or the whole Congregation" (n° 97).

But I see a more insidious common thread in the first two operations, based on motifs and staggered cohomology, concerning a certain **spirit that** animated them. What we're talking about here is a certain inner attitude towards the **possession of high-level scientific information with** limited circulation, or at the very least, information confined to a group of a few people linked by alliances of interest (or even to a single person), who use their power to **block its circulation for** as long as it seems advantageous to them to reserve the exclusive "benefit" of it for themselves.

Thus, after my "departure" in 1970, Deligne was **the only one** (apart from myself) to have intimately assimilated the "yoga of motives" and to have felt its full significance - to make the use of it that we know. My five cohomology students (including Deligne), and perhaps another two or three ex-SGA 5 listeners who had the perseverance to really assimilate its substance, were **the only ones to** have at their exclusive disposal the ideas and techniques I had developed in that seminar.

In both cases, whether I was speaking to Deligne in countless one-to-ones between 1965 and 1969, or to the select group of SGA 5 listeners in 1965/66, if it is true that it was "for their benefit above all others" that I was explaining and developing at length before them a certain inner vision, it was **not** as representatives of some "interest group" that I was placing in their hands those things which were of value to me. For me, it was self-evident that I was addressing them as people who, like me, were driven by a natural desire to prove themselves and to make a contribution to **knowledge**.

of mathematical things, through a **spirit of service**, towards a "mathematical community" with no boundaries in space or time<sup>462</sup> (\*).  And what I put into their hands, I knew well

p. 863

that these were not "curiosities", museum pieces, but living, burning things, made to grow and swarm - and this was indeed what was immediately sensed by those to whom I was addressing<sup>463</sup> (\*). If I addressed them, it wasn't as a kind of **shareholders** to whom I'd entrusted shares, in the name of some common "interest", but as **people** to whom I was linked by a **common adventure** - people, therefore, who would be keen to act as **relays for** the "information" I was communicating to them (even if it meant putting their own spin on it, passing it on to those around them...), just as I myself would relay it on their behalf<sup>464</sup> (\*\*).

With the benefit of almost twenty years' hindsight, I realize that there was a fundamental misunderstanding between them and me.

- we weren't on the same wavelength. What I had entrusted like living things into hands that I believed to be loving, was hoarded like some kind of **hoard** that we would hasten to bury. Possession of the hoard represented a certain **power** (admittedly derisory, given the price. . .) - if only the power to hold back, to prevent (if only for a while) a living thing, made to blossom and flourish, from being buried.

<sup>462</sup>(\*) On the subject of such a "spirit of service", see in particular the note (also quoted below) "Yin the Servant, and the new masters" (n° 135).

<sup>463</sup>(\*) (April 10) That didn't stop some of them from doing their utmost, after the fact, to debunk what they had hoarded. at length, after having struggled at first (apart from Deligne) to grasp its meaning and scope and to assimilate it. I see in this tone of debunking (which goes hand in hand with the "magot" attitude mentioned below) a double **compensation**. On the one hand, it evacuates a sense of unease (created within them by the misappropriation of something that is not theirs, but **everyone else's**), by pretending to **devalue** what has been misappropriated in their own eyes. On the other hand, there's the compensation for the "father", seen as the embodiment of a creative force that would surpass them (whereas they are unable to assume the same force, which rests in them as in the one they secretly blame... ). My "deceased" state, and the example set by the direct heir, created a favorable conjuncture for "venting" a secret antagonism, the "father" now being felt to be in a **position of weakness, of inferiority**.

<sup>464</sup>(\*\*) So it was to this "mathematical community without frontiers" that I was addressing, at the same time as to them and through them. I've explained elsewhere (see b. de p. (\*) on page 847) why I didn't take it upon myself, at least in the year following this seminar, to rewrite it on line and make it available to everyone.

to blossom and spread.

I've tried to grasp the two attitudes, of different essence, that confront each other in this "misunderstanding"<sup>465</sup> (\*\*\*), in the two notes "Yin the Servant, □ and the new masters", and "Yin the Servant (2) - or generosity" p. 864 (n° s 135, 136). I don't want to seem to be posing here as the exemplary embodiment of the "attitude of service", as opposed to the "attitude of caste": one in which "knowledge" becomes the distinguishing mark of an elite and (at a more advanced stage in the degradation of morals) the means of arbitrary power over others. As the reflections in *Fatuité et Renouvellement* (the first part of *Récoltes et Semailles*) reveal, the reality is more complex. I saw in myself, and in some of my actions in my past as a mathematician, the seeds of the general degradation I see today. And it's just as true that this "**service impulse**" within me has been a powerful driving force in the development of my written mathematical work, and more particularly, in the tireless pursuit of the two series of EGA and SGA foundation texts<sup>466</sup> (\*).

I don't seem to have been able to communicate anything to my students about this impulse, or the attitude that drives it.

reflected. The work undertaken, insofar as it embodied a "service" attitude and disposition of a community, came to a screeching halt after I left<sup>467</sup> (\*\*) - as if by a sudden stroke of □scie (or p. 865 chainsaw...<sup>468</sup>(\*)).

From the echoes that still reach me here and there from the world I left behind, I can see that this spontaneous attitude, which I had in common with the benevolent elders who welcomed me in my early days, has become (like this very benevolence) a **stranger** in the world that had once been mine.

## . Eviction

**Note** 169<sub>1</sub> (March 9)<sup>469</sup> (\*\*) SGA stands for "Séminaire de Géométrie Algébrique du Bois Marie". It designates (or at least, in the sixties, it designated) the seminars in which I developed, between 1950 and 1969 (and in collaboration with students and others, from 1962 onwards) my program of the foundations of new algebraic geometry, in parallel with the (less "advanced") texts,

<sup>465</sup>(\*\*\*) In writing these lines, and this word "misunderstanding", the association came to me with Zoghman Mebkhout's letter (quoted in the note "Echec d'un enseignement - ou création et fatuité", n° 44'), which spoke of a "sort of misunderstanding" between my students and myself (putting aside Deligne. . . ). At the time, I wasn't sure I'd understood what "sort of misunderstanding" I was talking about.

hension" he meant. Could it be the same as this "misunderstanding" I'm talking about here - and that he would have excluded Deligne from it, by his deliberate intention (which surprised me more than once in my friend) to see him only "in pink"?

<sup>466</sup>(\*) This "relentless pursuit" often went against another equally strong impulse in me, that of letting go of all the "tasks" that were holding me back, and launching myself ever further into the unknown before me, which was constantly calling me (and still calling me. . . ).

<sup>467</sup>(\*\*) (April 10) In retyping these lines, I'm struck by a singular irony of the situation, the meaning of which (like that of the Burial as a whole) is not yet fully grasped. It is the man who has invested himself entirely in tasks of "service" for the benefit of a certain "mathematical community", who finds himself ousted from his very work, and with the tacit and unreserved approval of said "community", by the very people who have made the **refusal of service** a caste imperative and a second nature.

The apparent paradox seems to me to be resolved to a large extent, however, by remembering that the "community" to which this "service impulse" in me was addressed was by no means the sociological entity (with its "caste" of notables etc.) that was an unreserved stakeholder in my Burial; but it was that "mathematical community without boundaries in space or time" referred to above. (For comments on the distinction and confusion between those

two "communities", see the first b. de p. note to the subsequent "Respect" note (n° 179).

<sup>468</sup>(\*) On the subject of the "chainsaw" effect, cutting short (especially in almost all of my students) the lively, vigorous impetus of a work that was just beginning, see the two notes "Les cohéritiers... .", ". . and the chainsaw" (n° s 91, 92).

<sup>469</sup>(\*\*) This sub-note is derived from a b. de p. note to the main note "Maneuvers" (see b. de p. note(\*) page 848 )

and in more canonical style) of the EGA series ("Eléments de Géométrie Algébrique")<sup>470</sup> (\*\*\*). These seminars were held at "Bois Marie", the site (in Bures sur Yvette) where the IHES has been based since 1962. In fact, the first two seminars (between 1950 and 1962) were held in a makeshift room in Paris (at the Institut Thiers), in front of an audience of no more than a dozen people, and in front of whom I strictly "went it alone". The acronym SGA dates from those years, when there was no question of "Bois Marie". I later added this pretty name to the original "Séminaire de Géométrie Algébrique", to make it less austere.

It goes without saying that these seminars, from SGA 1 to SGA 7, are numbered in chronological order. It goes without saying that the overall conception of each of these seminars came from me. It was inspired by my overall, long-term goal of laying a broad foundation for algebraic geometry, and increasingly, for a broader "geometry", which I felt very strongly from the outset.

from 1963 onwards, which remained unnamed. (Today, I would call it "geometry".

p. 866 arithmetic", a synthesis of algebraic geometry, topology  $\square$  and arithmetic<sup>471</sup> (\*).). The last of one of these seminars was SGA 7, which (unlike its predecessors) ran for two consecutive years, 1967-69, and was run in collaboration with Deligne.

The volume with the misleading name "SGA 4<sup>1</sup>" is (as explained above, pages 847 and 851) made up of texts dating from after 1973, i.e. after the last of the SGA seminars, apart from those plundered from SGA 5, and the famous "Etat 0" of a "thesis" by Verdier (to be dealt with in Operation III). All questions of dates aside, the heterogeneous nature of the texts making up this volume is in no way in keeping with the spirit in which I had pursued the SGA series, in which each volume presented a **large-scale groundwork** on a part of my program that had not yet been developed elsewhere - to the exclusion, therefore, of volumes of "**digests**", or **compilations** of results already known and well-developed, or even new results of a sporadic nature. At the very least, giving Deligne's volume the name SGA 8 (assuming I agree to this) would have been inappropriate, as it would have suggested the (unfounded) idea of a **continuation** of the work I had pursued in the previous seminars SGA 1 to SGA 7. As for the acronym "SGA 4<sup>1</sup>" chosen by Deligne, it is not only "inappropriate", but in itself constitutes a **deception and a sham**. This is something that should be **obvious** to every one of the many mathematicians who, since 1977, have had occasion to acquaint themselves with this volume, and who, moreover, know the meaning of the acronym SGA, inseparable from my person and my work, and thus also from a certain **spirit**. This does not alter the fact that this imposture, in the very name of a standard reference text, has been tolerated by the "mathematical community" for eight years, without apparently "making any wrinkles". Along with the Colloque Pervers of 1981, which is a natural extension of it, I see in it **the great disgrace of** the mathematical world of the 70s and 80s, a disgrace that seems to me unprecedented in the history of our science.

There was a precursor episode to this **operation-eviction**, designed to give the impression that my person would play only an occasional, scrappy and incidental role in the development of fundamental APG texts. This is the "SGA 7 mini-operation". This operation is mentioned in "episode 3" (of a

p. 867 escalade) in the note  $\square$  "Les manoeuvres" (n° 169), and above all (from the point of view that interests me here) in the note "Prélude à un massacre" (n° 56). This is the publication, in a separate volume SGA 7 II, of part of the original seminar, under the names of Deligne and Katz and to the exclusion of myself (and disregarding the role I played in the development of its main themes and certain key results). I write to

<sup>470</sup>(\*\*\*) Written in collaboration with J. Dieudonné.

<sup>471</sup>(\*) See b. de p. note (\*) on p. 844.

(n° 56):

"This "SGA 7" operation is by no means a **continuation** of the work pursued in the SGAs, but I feel it as a kind of brutal "saw blow" (or chainsaw. . . ), **putting an end to** the SGA series, with a volume that ostentatiously stands apart from my person, even though it is linked to my work and bears its mark just as much as the others."

These volumes, SGA 7 I and SGA 7 II, do not yet display an air of condescension and thinly veiled contempt for the work from which they derive. If this step in the escalation could nevertheless be taken four years later, it's because the previous steps (including this seemingly innocuous SGA 7 mini-operation) had "passed", without ever (to my knowledge at least) eliciting the slightest reaction in the mathematical world. I'd like to end with an edifying (no doubt provisional) epilogue to the operation to evict me from the SGA, an eviction implemented by Deligne with the tacit approval of "the entire Congregation". This is the very "cool" reply I recently received from Mrs. Byrnes, in charge of "Lecture Notes" at Springer Verlag, to whom I had written to ask for clarification concerning a volume entitled SGA 5, published under my name in 1977 in the "Lecture Notes", without Springer having seen fit to ask for my agreement, or even to inform me of this publication carried out by them. I learned from his letter (received a month later) that it was all the more pointless to bother with such a formality, **since I wrongly claim to be listed as the author of the said volume SGA 5, edited by L. Illusie**, given that I **only** appear on the cover **as the director of this seminar!** (And one wonders, in retrospect, what the late director was doing at the seminar... . ) I wrote, just to see, to Mr. K.F. Springer himself, about various strange experiences I've had with Springer Verlag since 1972 (the year SGA 7 I was published under my name in the same way - admittedly, I'm no more an "author" than I am a "publisher").

don't follow SGA 5... . ). I'm still waiting for his reply... <sup>472</sup>(\*).

□(March 16) This sub-note has been given the appropriate name, "Eviction (2)". The (2) sign is a reminder that there are

p. 868

already had another note by the name of "L'éviction" (n° 63), to which I had occasion to refer recently (with the "Motifs" operation). The "eviction" referred to (very discreetly. . . ) in that note was the one that took place in 1970, when I left the IHES, a departure that obviously suited my brilliant young friend, who had recently moved to <sup>473</sup>(\*). The connection between these two "evictions", one from the IHES and the other from the SGA series, seems obvious to me. I note a striking progression, in the nature of yet another "escalation": the first time, it was simply a matter of me being ousted from an **institution**, to which I certainly felt very strongly attached (I could see myself finishing my days there, really!), but from which I very quickly detached myself, without any residue of regret. The second time was when I was ousted from the SGA, which itself represents (symbolically certainly, and even more than symbolically) my work as a mathematician - a work to which I remain attached to this day. It's true that my "eviction" from the IHES has been over for fifteen years now - but I doubt, despite everything, that the same will be true of my eviction from a work to which I had devoted fifteen good, hard years of my life.

I've been thinking about the fact that I once made it easy to oust myself from the SGA, by following my spontaneous impulse to present those of my students and collaborators who had invested full-time, at certain times, in the development of one of its seminars, as "leading" the seminar in the same way as I did. It wasn't customary in my day, and it certainly isn't today. I don't know whether

<sup>472</sup>(\*) (April 9) For the rest of the story, see the note "Les Pompes Funèbres - - im Dienst der Wissenschaft" (n° 175).

<sup>473</sup>(\*) The episode of my departure from the IHES (in 1970) is mentioned in the section "La récolte inachevée" (n° 28) and in the notes "L'arrachement salutaire", "L'éviction", "Frères et époux" (n° s 42, 63, 134), and finally in the sub-note (n° 134<sub>1</sub>) to the last-mentioned note.

I did the right thing. On the one hand, it didn't entirely correspond to reality, in the sense that there was no symmetry in the role I played there, and in that of my collaborators, even if they were brilliant and as committed as I was. This presentation of things is in line with the "ambiguity" (or "complacency" towards brilliant young mathematicians) that I examine in the notes "L'ascension" and especially "L'ambiguïté" (n° s 63', 63"). If this ambiguity introduced by me has encouraged some of those who have intensely collaborated with SGA at one time or another, to "oust" me (more or less partially or more or less completely), I would be wrong to hold it against them! I reap  $\square$  simply what I sow.

But that in no way prevents me from making a public statement about what happened.

On the other hand, it's also true that the relationship I was establishing with certain colleagues could be perceived by them as a mark of esteem and trust (which it was), and at the same time encourage them to invest themselves fully in the task, just as I was investing myself in it. But now I'm thinking that such esteem and trust can be expressed in an equally clear and encouraging way, without being tainted by ambiguity. It was a bit as if I were "**buying**" an investment commensurate with the task, by granting an "**advantage**", an "advantage" moreover which (with hindsight) seems dubious to me. For it's a false advantage to appear to be something you're not. And it's quite clear that in creating an appearance that was (if not entirely false, at least) a little false around the edges, it was **my** responsibility before that of anyone else, of me as the elder, that was engaged.

Decidedly, the reflection is increasingly similar to that of the note "Ambiguity", in the unforeseen light of a "species situation" that I hadn't even thought of when I wrote it. I realize that, just as my relationship with the (by no means unrecognized) "young genius" Deligne was false, because out of false modesty I refrained from assuming the role of elder and "master" that was indeed mine with him, so too was my relationship with other brilliant young people, investing themselves wholeheartedly in a task that seemed "common" to me at the time<sup>474</sup> (\*).

The reflections in l'Enterrement made it quite clear that, if there was a "common" task, it was for the space of a year or two, the time it took for the young man to complete (say) a thesis (which is not bad at all). The very year of my departure in 1970 signaled my immediate and almost total abandonment of this vast and visibly burning set of "tasks", which I was well and truly committed to.

"burned in my hands" the day before still<sup>475</sup> (\*\*). Apart from Deligne's work on Weil's conjecture, this  $\square$  was at the same time the beginning of a long stagnation in each of the major themes that had most interested me.

a stagnation which (apart from the partial "revival" triggered by the philosophy of Mebkhout- the unnamed) continues to this day<sup>476</sup> (\*).

## b<sub>7</sub> . Good Samaritans

<sup>474</sup>(\*) I begin to realize that this was an illusion, at the end of the note "Le feu vert" (n° 68), p. 260.

<sup>475</sup>(\*\*) This immediate abandonment of a program and burning tasks, on the very day after my departure, is evoked in the note "Instinct and fashion - or the law of the strongest" (n° 48), and especially in the double note "Les cohéritiers. ...", ". . . and the chainsaw" (n° s 91, 92), where I try to review (according to the echoes that have come back to me) what has become of the themes that had been taken up by my various "pre-1970" students.

<sup>476</sup>(\*) (March 17) This impression of "stagnation" will perhaps take on a more concrete meaning in a later note, where I intend to make a short annotated enumeration of the most "burning" themes that were on my agenda, and which were left behind, as soon as I left and with perfect ensemble, by those who had been my students.

(April 9) On this subject, see the note "Le tour des chantiers - ou outils et vision", n° 178.

**Note** 169<sub>2</sub> (March 13)<sup>477</sup> (\*\*) In this introduction to SGA, Illusie warmly thanks Deligne for, among other things

"convinced to write... ... a demonstration of the Lefschetz-Verdier formula, **thus removing one of the obstacles to the publication of this seminar.**"

(emphasis mine), in other words: the obstacle of **Illusie's lack of "conviction"** to write what he had been committed to writing for **eleven years** - which lack suddenly ends, as mentioned above, at the precise moment when the good Samaritan Deligne gives the "green light" to the good Samaritan Illusie that he "could go"... .

This is the "**true** within the false". As for the **falsehood** that this passage is obviously trying to suggest, without having to say so clearly (in a tried-and-tested style that has become a textbook . . . ), it's that the SGA 5 seminar **would depend on** the formula in question (which was established at the time of the seminar only on the basis of hypotheses for resolving singularities, since lifted, in the most common cases, by Deligne's finiteness results presented in the "earlier" volume entitled "SGA 4<sup>1</sup>"<sup>478</sup> (\*\*\*)). In fact, as the two friends know just as well

well as I do, the role of this Lefschetz-Verdier formula in SGA 5 (as in my demonstration of the cohomological formula  $\square$   $\ell$ -adic of  $L$  functions) had been purely **heuristic**, providing the **motivation** to look for and prove "explicit" fixed-point formulas (i.e. where the "local terms" could be calculated explicitly). In this way, Illusie joins forces with his friend to create the impression that SGA 5 is indeed (and in a sense that is not clearly explained by him or his friend) **subordinate to** the text, which can therefore only be called "SGA 4<sup>1</sup>".

p. 871

For details, see the note "Le massacre" and its sub-note n° 87<sub>2</sub><sup>2</sup>. In this note and all its sub-notes, I eventually discovered (better late than never) that this entire introduction written by Illusie, and in general, the overall presentation of the edition-Illusie (or edition-massacre), is a model of bad faith, served up casually and with those airs of candor that make his person so charming.

This touching impression that Illusie is striving to create, that it was indeed **thanks to** the good Samaritan Deligne (and the second good Samaritan Illusie, needless to say) that the unfortunate SGA 5 seminar ended up being published (eleven years later, and in the state I know), apparently "passed" without any problems. I found this version in Serre's report on Deligne's work, written in 1977 for the International Committee for the Award of the Fields Medal. I have no doubts about Serre's complete good faith, as he had only followed the intricacies of the oral seminar from a distance - not to mention that a lot of water had passed under the bridge since then... . He surely took at face value (like everyone else, and without question) what was said or suggested in the introduction to Illusie, which he must have read one day, to see (and he saw nothing!) . .

Interestingly, this same de Serre report is also the only place in literature, to my knowledge, where it is stated (in this case, in the very first sentence of the report) that Deligne was my pupil. No publication by Deligne, on the other hand, could lead any reader to suppose that the author might have learned anything from me.

## . The Trojan horse

<sup>477</sup>(\*\*) This sub-note is taken from a b. de p. note to the note "Les manoeuvres" (n° 169) (see note (\*\*) on page 849). For a more detailed dismantling of the "inch!" technique for making a "user" in a hurry believe a lie, see the sub-notes "The Trojan Horse" and "The Formula", n° s 169<sub>3</sub> and 169-169<sub>58</sub>.

<sup>478</sup>(\*\*\*) See b. de p. (\*\*\*) page 841 and (\*) page 850.

**Note** 169<sub>3</sub> (March 10)<sup>479</sup> (\*) In the sub-note (n° 67<sub>1</sub>) to the note "La table rase", I point out two examples where Deligne has disregarded his usual caution, and has indeed "advanced to say in plain language" the wrong thing. For the

p. 872 curious and sufficiently well-informed reader, and who would not have at hand the said note and sub-note, I point out that, apart from the "kindnesses" towards SGA 4 and SGA 5' and the somewhat blatant "omissions" of my humble

The blatant swindles I've identified are concentrated in paragraphs 3 and 4 on page 2 (in "Fil d'Ariane pour SGA 4, SGA 4<sup>1</sup>, SGA 5" - admire the beautiful procession here. . . ). These seventeen lines are a model of the art of "fishing in troubled waters", and would be well worth a detailed analysis<sup>480</sup> (\*).

Suffice it to note here that in the first of the paragraphs quoted, we read that, to establish "in stellar cohomology a duality formalism analogous to that of coherent duality", "Grothendieck used the resolution of singularities and the purity conjecture"<sup>481</sup> (\*\*). We then add that in the present volume (thanks be to Heaven and the brilliant author), these "**key points**" are established by another method" (emphasis mine), valid "for finite-type schemes on a regular scheme of dimension 0 or 1", i.e. in virtually all cases encountered by the user.

□ And so, Deligne strives to create the impression, and even clearly states, that all the formalism of dualité étale that I had developed remained conjectural (at least in non-zero characteristic), and that "these key points" were ultimately established only by him, Deligne, and in the present volume, i.e. by his finitude results (those already mentioned in previous b. de p. notes, results to which, incidentally, he immediately refers). This would indeed, as if by magic, lend credence to the fiction of the famous "**logical dependence**" of SGA 5 on the text entitled "SGA 4<sup>1</sup>" (a dependence<sub>2</sub> posited by this very name, and by the beautiful procession "SGA 4 - SGA 4<sup>1</sup> - SGA 5"), and thereby justify the incredible assertion (already quoted and commented on) in his introduction:

p. 873

"Its existence [of "SGA 4<sup>1</sup>"]<sub>2</sub> will soon make it possible to publish SGA 5 as is.

So here's the **Deligne version**, slipped in here and there in the saw-cut text called "SGA 4<sup>1</sup>", and

2

<sup>479</sup>(\*) This sub-note to the "Maneuvers" note is taken from a b. de p. note to that note, see b. de p. note (\*\*\*) on page 860 .

<sup>480</sup>(\*) For further details and comments on the second of these two paragraphs, see the sub-note "Double entendre - or the art of the con" (n° 169 ).<sub>7</sub>

<sup>481</sup>(\*\*) The text follows on from "conjecture of purity", with: "established in a relative framework [? ?] in SGA 4 XVI, and - modulates the

resolution - in equals characteristic in SGA 4 XIX". The "in a relative setting" (incomprehensible to any reader who isn't already in the know) is a way of hiding the fact that this theorem was acquired for smooth algebraic varieties in any characteristic.

(March 17) I'm only just noticing the charm of the end of the paragraph quoted, which had "fallen by the wayside" in the first readings:

"**Various developments** are given in SGA 5 I. In SGA 5 III, we show how this formalism [??] implies the very general Lefschetz Verdier trace formula." (emphasis added.)

We admire the "various developments" without any further precision, whereupon the author (who on other occasions knows how to be precise) follows up with "this formalism" (= various developments?), which "implies the very general formula of traces"; only to point out immediately, in the very next sentence (in the following paragraph), that the said formula, "in the original version of SGA 5", was "established only conjecturally".

I've just checked in SGA 5 what these "various developments" are in SGA 5 lecture I. The title tells me: "Dualizing complexes", so also biduality theorem. Why "various developments" instead of "theory of dualizing complexes" or "biduality theorem"? It wasn't any longer, and it still sounded less muddy! This reminds me that in the famous "Finitude" lecture, i.e. in the "Trojan Horse", the brilliant author demonstrates a "biduality theorem", without any allusion to my modest person - which theorem is also christened "Deligne's theorem" (in the introduction to the lecture I in question in SGA 5, written by Illusie). It all adds up...

NB. For comments on this biduality theorem (treated with such false nonchalance. . . ), see the long b. de p. note (\*) on page 852.

The reality is that as early as March 1963, I had established the **complete formalism of the six operations** in the étale framework (thus going far beyond the usual "Poincaré duality"), with no restrictive hypothesis other than the (obviously indispensable) one of working with torsion coefficients "prime" to the residual characteristics of the schemes envisaged<sup>482</sup> (\*). It was only for the **biduality theorem** in staggered cohomology that my demonstration made use of the assumptions mentioned by Deligne. The latter theorem, which was of a type unknown in cohomology (of "spaces" of all kinds) before I discovered it, only played in the SGA 5 seminar only an episodic role, for the demonstration of the  $\square$  formula of Lefschetz-Verdier<sup>483</sup> (\*), p. 874 which itself played a purely heuristic role<sup>484</sup> (\*\*). In Deligne's apocryphal text, the role of the aforementioned biduality theorem is **nil** (apart from being demonstrated under helpful hypotheses, and - under Illusie's obsequious pen and with the encouragement of his friend - becoming "Deligne's theorem"). . ).

This is not to minimize the interest of Deligne's finiteness results, which do indeed fill a gap (among many others) in SGA 5, as is the nature of things. No living mathematical theory is complete! But it has to be said that Deligne has exploited this contribution, as useful as it is modest (he's done deeper and more difficult things, and with no trouble yet... . ), by **inflating** it excessively, turning it into the "Trojan horse" of a monumental swindle: the "Stale Cohomology" operation.

This same "Trojan horse" reappears, moreover, in the aforementioned "review" of the volume called "APG 4<sup>1</sup> ", presented by Deligne for the Zentralblatt (see b. de p.(\*\*) page 851.). In the last paragraph of the latter, I read:

"We prove that for schemes of finite type on a regular scheme  $S$  of dimension one, **the usual cohomological operations** [not to say the "six operations", which must definitely not be named!] transform any constructible bundle into a constructible bundle." (Emphasis added.)

$\square$  This is phrased in such a way as to suggest that, prior to the brilliant volume presented by the author, there was no p. 875

a finiteness theorem for any of the famous "usual operations" in scalar cohomology<sup>485</sup> (\*). However, I had the pleasure of proving the first such finiteness theorem, and the most crucial of all, for the functor

<sup>482</sup>(\*) Thus, the "six functors" and the essential formulas concerning them, the most crucial of which is the "duality formula" for a separate morphism of finite type (which can be considered the most general version imaginable to date, of Poincaré's classic duality theorem), were established by me, without at any time having to impose finiteness hypotheses on the coefficients. As a matter of fact, Deligne knows this better than anyone, since it was **none other than he** who made a detailed redaction (based on my 1963 notes) of the SGA 4 lecture in which this duality formalism is developed (centered around the duality formula in question)!

<sup>483</sup>(\*) (March 17) Nevertheless, in the second paragraph quoted, Deligne goes on to point out that this formula "was established only conjecturally", and that "moreover, the local terms were not calculated" ("affirmation" which makes no mathematical sense, but which helps to create the impression of a "gangue of nonsense" about SGA 5, destined to be charitably forgotten. . . ).

I confess that when I first read these passages, a year ago, I was dumbfounded - the meaning of these strangely "off-the-wall" comments, concerning a text that was otherwise recommended to be forgotten, completely escaped me. With hindsight, and the benefit of a careful "work on documents", an **intention of appropriation** finally appears, served by a meticulous and perfectly perfected **method** of concealment ("à l'embrouille"), behind what at first sight had given me the impression of a simple epidermal malice, expressed with the good fortune of a complacent pen. For

For a more detailed examination of the method, see the sub-notes "La Formule" (nos 169<sub>5</sub> - 169<sub>9</sub>) to the note "Les manoeuvres".

<sup>484</sup>(\*\*) As I point out below (in the sub-note "Real maths. . . ." (no 169<sub>5</sub>), this formula has been psychologically important, providing **motivation** for the development of "explicit" fixed point formulae.

<sup>485</sup>(\*) This is very much in line with the "confused state of SGA 5" which (as stated earlier in the same review) the present volume was intended to "remedy".

$Rf_!$  (cohomology with proper support), and this in fact in the very days (if I remember correctly) that followed my discovery of the **definition** of such a functor in stable cohomology (coinciding! with the "banal"  $Rf^*$  when  $f$  is assumed proper). This was in February 1963, before I'd had the honor of meeting my future student, and at a time when nobody except me (and Artin, at a pinch) was yet too sure whether étale cohomology really "existed". It really began to **exist** in those days.

There remained the analogous question for  $Rf_*$ , which proved to be more resistant, and has still not been resolved with all the generality it (doubtless) deserves. As early as that same year (if not the very same month), I had already carried out the necessary "unscrewings" (which today's first-timers can do in a jiffy. . . ) showing that, starting from the finiteness for  $Rf_*$ , we could prove that of  $Lf^!$  and  $RHom(., .)RHom(., .)$ <sup>486</sup> (\*\*). Admittedly, this has since become "basic folklore" in staggered cohomology, and is surely part of the "technical digressions" that my brilliant precursor "SGA 4<sup>1</sup>" is intended to "make people forget". . .

## b<sub>9</sub> . "The conjecture

**Note** 169<sub>4</sub> (March 12)<sup>487</sup> (\*\*\*) More than once since the publication of Deligne's article "La conjecture de Weil I" (in which he establishes the "last part" of the conjectures, which I had left in abeyance), I had noticed as a strange thing, but without dwelling on it until these very last days, that Deligne speaks of Weil's conjecture, where the custom until then had been to say Weil's conjectures. It is indeed in this form, of a series of

p. 876

The conjectures in question in Weil's article (Number of solutions of equations in finite fields, Bull. Amer. Math. Soc. 55 (1949), p. 497-).

508), which is also how I learned them from Serre in the mid-fifties. It's true that in this set of conjectures, heterogeneous at first glance, there is an obvious **unity of** inspiration, stemming in the first place from intuitions linked to cohomological formalism (via Lefschetz's formula), and also (I presume at least) from Hodge's theory.

By creating and developing such a **cohomological tool** for varieties over any basic body, I was able to demonstrate many of these conjectures. I did so, assisted by Artin, Verdier and others, devoting three well-packed years of my life to meticulous piecework, materializing in two thousand "unreadable" pages of "gavage of nonsense" and "technical digressions", which allowed a Deligne to "slash" the last step in twenty tight pages... . Moreover, inspired by a remarkable "kahle-nothing analogue" to Weil's conjectures, discovered by Serre, I was able to derive (along with what I called the "**standard conjectures**" on algebraic cycles) the principle of at least one **transposition of Hodge's theory** onto an arbitrary basic body (or more precisely, a transposition of what, in Hodge theory, is really relevant, from an "algebraic" point of view, to the theory of algebraic cycles on complex algebraic varieties). Even if I were to slightly (and obviously) reformulate these conjectures in their initial (perhaps over-optimistic) form, they are valid at least in characteristic zero, and are "surely true" also in characteristic  $p > 0$  (as long as Weil's conjectures are. . . ).

It's surely no coincidence that the same Deligne who insists on "singling out" Weil's conjectures has also endeavoured to conceal the role played in their demonstration by the man who was his teacher, and that it is he too who has endeavoured (successfully, given the general apathy) to discredit the "conjectures".

<sup>486</sup>(\*\*) As for the remaining two of the six operations, namely  $Lf^*$  and  $\otimes^L$  it is trivial that they transform constructible in constructible coefficients.

<sup>487</sup>(\*\*\*) This sub-note is taken from a b. de p. note to the note "Les manoeuvres" (n° 169); see b. de p. note (\*\*\*) on page 857.

standard" as a dead end, out of reach what's more, and as an **obstacle**, to say the least, now overcome, thanks to God (and his modest self), on the way to proving Weil's conjecture<sup>488</sup> (\*).

## . The Formula

### (a) Real math. ...

**Note 169** □(March 17) The famous "Weil conjectures", for an algebraic variety  $X$  defined over <sup>877</sup> finite field  $k$ , concern the "*L-function*" (known as the "Artin-Weil function") associated with  $X$ . This is defined as a certain formal series with rational coefficients, the knowledge of which is equivalent to that of the number of points of  $X$  rational on the  $k$ -field and all its finite extensions. The first assertion among these conjectures is that this formal series (with constant term 1) is the serial development of a rational **function** on  $\mathbb{Q}$ . All the other assertions concern the particular form and properties of this rational function, in the special case where  $X$  is projective connected and non-singular. At the heart of these conjectures is a certain formula, presumed to be canonical, presenting this rational function in the form

$$L(t) = \frac{P_0(t) P_2(t) \dots P_{2n}(t)}{P_1(t) \dots P_{2n-1}(t)}$$

where the  $P_i$  ( $0 \leq i \leq 2n$ , with  $n = \dim X$ ) are polynomials with integer coefficients and constant term 1. The degree  $b_i$ , of  $P_i$  is supposed to play the role of an "i.th Betti number" for  $X$  (or more precisely, for the variety

corresponding  $\bar{X}$  on the algebraic closure  $\bar{k}$  of the field  $k$ ). Thus, when  $X$  comes from a non-singular projective variety  $X_K$  defined on a body  $K$  of zero characteristic, by "reduction to car.  $p > 0$ ", then  $b_i$  must be equal to the i.th Betti number (defined by transcendental means) of the **complex** algebraic variety, obtained by

from  $X_K$  by any folding of  $K$  into  $\mathbb{C}$ <sup>489</sup> (\*). The rational function must satisfy a **functional equation**, which is equivalent to saying that the roots  $\xi_\alpha$  are exactly  $q^n$ , where  $q = p^f$  is of  $P$

the cardinal of the base field  $k$ , and where  $\xi_\alpha$  traverses the roots of  $P_i$ . (Morally, this had to "come from" the existence of a "Poincaré duality" for the unnamed and undefined "cohomology" of the variety  $\bar{X}$ .) I believe Weil was also to conjecture that for  $i \leq n$ , the zeros of  $P_{2n-i}$  were exactly the  $q^{n-i} \xi_\alpha$ , where  $\xi_\alpha$  still traverses the zeros of  $P_i$  (or, which amounts to the same thing in view of the duality condition, that the zeros of  $P_i$  are grouped in pairs, each with a product equal to  $q^i$ ). The heuristic "reason" here is a another important property of the cohomology of complex □ non-singular projective varieties, expressed p. 878 this time by the "Lefschetz theorem" (the so-called "cow" version). Finally, the last of Weil's conjectures, a "geometric" analogue of Riemann's conjecture, is that the absolute values of the inverses of the zeros of  $P_i$  are all equal to  $q^{-i/2}$  (an assertion that leads to highly accurate estimates on numbers of

<sup>488</sup>(\*) (March 16) For details of this double escamotage-débinage, see the Funeral Eulogy (notes n° s 104,105), and the few words on this Eulogy at the beginning of note n° 171 (x). For a more detailed examination of the art of escamotage, see the set of sub-notes "La Formule" (n° s 169<sub>5</sub> - 169 ).<sub>9</sub>

(x) (May 11) This beginning of the former note "L'apothéose" has been separated from it, to become a separate note "Les joyaux" (n° 170(iii)).

<sup>489</sup>(\*) At the time of Weil's conjecture, it was not even known that the  $b_i$  defined in this way were independent of the plunge of  $K$  in  $\mathbb{C}$ . A few years later, this would result in Serre's theory of the cohomology of coherent bundles, which gave a "purely algebraic" meaning to the more finis  $h^{i,j}$  invariants of Hodge theory.

points of  $X^{490} (*)$ ).

The rationality of the function  $L$  of a general variety  $X$  had been established by Dwork in 1950, using non-cohomological " $p$ -adic" methods. The disadvantage of this method was that it did not provide a cohomological interpretation of the function  $L$ , and consequently does not lend itself to an approach to the other conjectures, for nonsingular projective  $X$ . In the latter case, the existence of a cohomology formalism (on a "coefficient field"  $R$  of zero characteristic), including Poincaré duality for non-singular projective varieties, and a formalism of cohomology classes associated with cycles (transforming intersections into cup-products), makes it possible in an essentially "formal" way to transcribe the classic "Lefschetz fixed-point formula". By applying this formula to the Frobenius endomorphism of  $X$  and its iterates, we would obtain an expression (1) as required by Weil, where the  $P_i$  are polynomials with coefficients in  $R$ . This must have been clear to Weil from the moment he set out these conjectures (1949), and it was certainly clear to Serre and me in the 1950s - hence the initial motivation to develop such a formalism. This was done as early as March 1963, with  $R = \mathbb{Q}_l$ ,  $l \neq p$ . There was just two grains of salt:

a) It was not clear a priori (although we were convinced that it must be true) that the polynomials  $P_i(t)$ , which a priori had coefficients in the ring  $\mathbb{Z}_l$  of  $l$ -adic integers, were in fact **ordinary integers**, and moreover, independent of the considered prime number  $l$  ( $l \neq p = \text{car. } k$ ).

b) From the rationality of the function  $L$  for a non-singular projective  $X$ , we could only deduce that for a general  $X$ , if we had the resolution of singularities.

The problems raised by a) played a crucial role, of course, in the emergence and development of the yoga of **patterns**, and in the subsequent formulation of **standard conjectures**, closely related to this yoga.

p. 879 They have also stimulated thinking to also find a  $\square$   **$p$ -adic cohomological** theory (realized by the The "**crystalline**" theory then offers a possible approach to proving the completeness of the coefficients of  $P_i$ , once we know (e.g. via an affirmative solution to the standard conjectures) that they are rational and independent of  $l$  (**including** for  $l = p$ )).

In any case, by 1963 we already had the expression ( $L$ ) of the function  $L$  (but which a priori depended on the choice of  $l$ ), the functional equation, and the correct behavior of Betti numbers by specialization. All that remained was to solve question a), prove the assertion for the absolute values of the roots of  $P_i$ , and finally (for good measure) the "Lefschetz-like" relation on the zeros of  $P_i$ . This was done ten years later in Deligne's article "La conjecture de Weil I", Pub. Math, de l' IHES n° 43 (1973) p. 273-308.

As ingredients of this Deligne demonstration, there was therefore no need for a fixed-point formula more sophisticated than the "ordinary" one, which was available (without anything "conjectural") as early as 1963. The only other cohomological ingredient in Deligne's article, if I'm not mistaken, is the cohomological theory of Lefschetz brushes (étale version) that I had developed around 1967 or 68, supplemented by the Picard-Lefschetz formula (proved in the étale framework by Deligne), both of which were set out in the aforementioned APG 7 II volume (from which my name, as luck would have it, has all but disappeared. . . ).

On the other hand, the "more sophisticated" fixed-point formula, known as the "**Leschetz-Verdier**" **formula**, played an important **psychological role** in encouraging me to develop the cohomological interpretation ( $L$ ) of  $L$ -functions, valid for any variety  $X$  (not necessarily non-singular projective). Verdier's formula reminded me that there must be fixed-point formulas without non-singularity conditions on  $X$  (as was already well known in the case of the ordinary Lefschetz formula), but above all, it drew my attention to the following

<sup>490</sup>(\*) From this last of Weil's conjectures, it follows at the same time that the writing ( $L$ ) of the function  $L$  is **unique**.

on the fact that there are fixed-point formulas concerning cohomology with **coefficients in a bundle** ("constructible"), interpreting an alternating sum of traces (in spaces of cohomology with coefficients in such a bundle) as a sum of "local terms" corresponding to the fixed points of an endomorphism  $f : X \rightarrow X$  (when these are isolated). In this heuristic motivation, the fact that this Lefschetz-Verdier formula "remained conjectural" in that  $p > 0$  (in the absence of the resolution of singularities,  $\square$  and hence the "biduality theorem"), **was entirely irrelevant**<sup>491</sup> (\*).

p. 880

As so often, the essential step here was to find **"the" right formulation** (in this case for a "cohomological formula of *L-functions*"). Verdier's formula suggested using an arbitrary (constructible) **l-adic bundle**, instead of the usual bundle of coefficients (which until then had remained implicit), namely the constant bundle  $Q_l$ . By copying Weil's definition of the "ordinary" *L-function*, we had to define one "with coefficients in  $F$ ". Once you've thought about it, the definition is self-evident: it's the one given in my Bourbaki lecture of December 1964 (Formule de Lefschetz et rationalité des fonctions  $L$ , Sémin. Bourbaki 279), which need not be repeated here. In addition, the plausible "local terms" of the Lefschetz-Verdier formula (in terms of the given bundle of coefficients, and the Frobenius correspondence) were also essential. Finally (you either have the nerve or you don't!), why not write the formula, here, abandoning even the cleanliness assumption of the "orthodox" Lefschetz-Verdier formula, but working with **clean-support** cohomology?!

So, once again, the essential step was to find the "right statement" (in this case, **the** "right formula"), **sufficiently general** and, by the same token, sufficiently **flexible** to lend itself to a demonstration, "passing" without problems through recurrences and "unscrewings". I wouldn't have known (and no one to this day would) how to **directly** demonstrate "the" formula for "ordinary" *L-functions*, for any  $X$  (or even smooth, but not clean, or vice versa), in terms of l-adic cohomology (with proper supports) with coefficients in the **constant** l-adic bundle  $Q_l$ , without going through the faisceautic generalization. (No more than I would have been able to prove the **ordinary** Riemann-Roch-Hirzebruch formula, in car.  $p > 0$ , if I hadn't first generalized it as a faisceautic formula for a proper **application** of smooth algebraic varieties - and no one, as far as I know, can do this even today. ... )

$\square$  In the Bourbaki paper in question, I confine myself to giving the general statement of the formula for functions  $L$  "with coefficients in an ordinary l-adic bundle, and I show how, by some very simple unscrewings, we're reduced to the case where  $X$  is a smooth projective curve. I knew that once I'd reached this point, **it was a foregone conclusion** - because dimension one is sufficiently "in hand" that proving the formula in question becomes a matter of routine<sup>492</sup> (\*). At this point, I didn't worry about finding a good fixed-point formula in dimension one and proving it. He gave a fixed-point formula, known as "Woodshole's formula", the following year, which was enough to top Frobenius and the application to *L-functions*. I took con birth of his statement, which didn't really satisfy me, as it seemed to me that the conditions he imposed on his cohomological correspondence (for the purposes of a demonstration of which I'm unaware) were a little artificial - I would have liked

p. 881

<sup>491</sup>(\*) (March 20) So much so, in fact, that last year I had long since forgotten this fact entirely, and was stunned to read (in Deligne's column) that the Lefschetz-Verdier formula "was only conjecturally established in the original version of SGA 5". I come back to this point in the reflections of the following day and the day after (March 18 and 19). (In the sub-notes n° 169<sub>6</sub> and 169<sub>7</sub>.)

<sup>492</sup>(\*) When I say "routine work", I don't mean it in a pejorative sense. Nine-tenths, if not many more, of mathematical work is of this type, as much for me as for any other mathematician who happens to have moments that are precisely **something else**, creative moments. After Verdier, I myself spent some time cranking up the delicate, well-oiled techniques available to find and prove a formula for fixed points in dimension one that satisfied me (provisionally at least). This was "routine" work, just as Verdier's had been.

a formula that applies to any endomorphism of an algebraic curve. The SGA 5 seminar was the first good opportunity I had to develop such a formula to my liking (unless I'm mistaken, it's the one that appears in Lecture XII of the Allusie edition, having miraculously survived the vicissitudes that befell that unfortunate seminar). Weil's conjectures had been an initial motivation, and an invaluable thread, to "launch" myself on the development of a complete formalism of étale cohomology (and others). But I sensed that the cohomological theme, which had been at the center of my efforts for eight or nine years and would remain so for the years to come until I left in 1970, had an even wider scope than the Weil conjectures that had led me to it. For me, the Frobenius endomorphism was not an "alpha and omega" for cohomological formalism, but an endomorphism among many others...

p. 882

It seems to me that Deligne's initial motivation for his "SGA 4 operation<sub>2</sub> - SGA 5" was the desire to appropriate the trace formula alone, and thus, as a "corollary", that of  $L$  functions.

In short. I believe that both "pieces" were too big, and that even today and notwithstanding "SGA 4<sup>1</sup>" and Colloque Pervers et tutti quanti, "people" (even those who are not so well informed) "know" that it was not he who created the  $l$ -adic cohomological tool, nor did he single-handedly prove "the" Weil conjecture. Nevertheless, to conclude with the "Cohomologique étale" operation, I'd like to follow the twists and turns of my friend and ex-student Deligne in his presentation of the central theme<sup>493</sup> (\*) of the volume entitled "SGA 4<sup>1</sup>", namely, "la" formule des traces, leading to the cohomological formula of  $L$ -functions. This is the subject of the "Rapport sur la formule des traces" (quoted [rapport] in his book, loc. cit. p. 76-109).

In four places in the volume, Deligne makes comments of a somewhat "historical" nature on the trace formula. Readers of this volume who are not already in the know, and whether or not they read the four passages (which we shall review), will get the impression that a certain Grothendieck (author or director of a rather vague seminar subsequent to the volume "SGA 4<sup>1</sup>", This seminar should not be read) seems to have had some idea about  $L$ -functions, albeit a rather muddled one, before the author of this brilliant volume finally came up with understandable statements and demonstrations. In the whole volume, the only precise reference to this quidam is to a certain Bourbaki exposé (from 1964), in the course of a "Remark 3.7." (loc. cit. p. 88), which comes as the last in a string of three remarks, some more technical than others<sup>494</sup> (\*\*). It reads:

"If we admit the formalism of  $Q_l$ -sheaves. . . **it is easy to reduce the proof** of 3.1, 3.2 to the case where  $X_0$  is a smooth curve and  $F_0$  is smooth. This is clearly explained in [2] §5 (for 3.1; 3.2 is treated similarly)."

p. 883

(emphasis added). In short, this unnamed quidam (except under the flattering sign [2]<sup>495</sup> (\*) has (non

<sup>493</sup>(\*) In fact, nowhere in "SGA 4<sup>1</sup>" is it stated that the "Rapport" forms the "central theme", nor is it stated that the main purpose is to provide the main ingredients of étale cohomology for "the" Weil conjecture. At the time of writing the double introduction to the volume, a purpose of appropriation to the dimensions of all étale and  $l$ -adic cohomology must already have been present.

<sup>494</sup>(\*\*) As I was writing these lines, I was struck by the striking sense of **identity** between the style I'm probing here, and the one deployed four years later, for the appropriation "by contempt" of the "theorem of the good God" (aka Mebkhout). I discover the twirls in question in the note "Le prestidigitateur" (it's worth the capitalization. . . ), n° 75". There the "sore point" was hidden in an even messier note 4.1.9 (instead of 3.7). You can't stop Progress...

(March 22) It had escaped me that there is in fact a second reference in "SGA 4<sup>1</sup>" to the same Bourbaki lecture of 1974, a reference served up with consummate art in "Fil d'Ariane", as we'll see in the sub-note "Les double-sens - ou l'art de l'arnaque" (n° 169).

not **done**, of course, but) **explained the trivial job** - so trivial, in fact, that it's hardly worth mentioning in this closing remark, and still having the kindness to suggest that, trivial for trivial's sake, it is at least clearly explained. (We already know from other comments by the brilliant author that clarity isn't exactly the forte of the confused quidam in question... .) To put it another way: this "Report on the Formula of Traces" chapter is about **doing the real work**, leaving the trivialities to those who are there to do it. ...

While I'm on the subject, I might as well say right away that on this same page is one of the four passages I was alluding to, containing historical comments on "the" trace formula. It's section 3.8 (following, appropriately enough, on from the previous comment 3.7). It explains that there are "two methods" for proving 3.2 (i.e., the trace formula in the only explicit case where it is mentioned in this volume, namely the special case of the Frobenius correspondence). Needless to say, the quidam's name does not appear in either of them. A distinction is made between the "Lefschetz-Verdier" A-method, and the "Nielsen-Wecken" B-method (that name sounds familiar too...). Let's see what he has to say:

B.Nielsen-Wecken. A method inspired by Nielsen-Wecken's work can be used to bring 3-2 [the for-trace mule for Frobenius] to a particular case proved by Weil; this will be explained in the following paragraphs."

□

In fact, par. 5 (pp. 100-106) is appropriately entitled "**The Nielsen-Wecken method**". We have p. 884 said earlier that the method was **inspired** by the work of Nielsen-Wecken - so it's surely out of sheer modesty that the author of the volume calls the method "de Nielsen-Wecken". It's all the more clear that these aren't the guys from now. If the reader happens to look at the bibliography at a certain XII lecture to which he's never referred (and in a seminar, incidentally, that he's advised to forget), he'll know that these are guys who published in the early forties. If he even reads their fine work (which I bet the brilliant author has never held in his hands), they'll know that their methods are triangulation techniques. It's apparently not the one in the text. In the absence of any mention to the contrary, it is indeed the modest author of the volume who is also the author of the method. No date is given for this one, no doubt out of modesty again, so as not to say that it was really he who first did the work to demonstrate this famous trace formula.

Let's take a look at the "Lefschetz-Verdier" A-method and see what they have to say about it. It's not exactly encouraging:

"If  $X_0$  is clean. ... the general Lefschetz-Verdier trace formula allows us to express the second member of 3.2 as a sum of local terms, one for each point of  $X^{p^n}$ . In the **original version of SGA 5**, this formula was only proved modulo the resolution of singularities [we knew we'd only encounter glitches!] Readers will find an unconditional proof in the **final version** [still too modest to recall that it was thanks to him that the bet was saved - in any case we'll be careful not to read that damn SGA 5]. In the case of curves, to which we can reduce (3.7), the ingredients [ ? ? ? - we give up. . . ] were moreover all available."

But then, if they were (a more alert reader, if there is one, may well ask), why all this chatter about a Lefschetz-Verdier formula that had only been proven et patati et patata? Hadn't we just said that the **real work** was done in dimension **one**? Answer: it's the method

<sup>495</sup>(\*) Each to his own - in 1970 (at the International Congress in Nice), it was Serre (in Deligne's paper "La théorie de Hodge I") who, instead of being named, was entitled to the acronym [3], in the cryptic line which alludes for the first and last time) to "sources" for the theory presented. ...

the "cuttlefish method": ejecting ink to fish in troubled waters! At this point, the reader is already fully convinced that this is surely not the right method. It's with an extinguished eye that he scans the next paragraph, which will give him the rest:

p. 885 "To deduce 3.2 from the Lefschetz-Verdier formula, you have to be able to compute its local terms [pity, in what a galley.....!]. For a curve and the Frobenius endomorphism [ah! they are deflate!], this had been done by Artin and Verdier [and they went at it with two again!] (see J.L. Verdier'□the Lefschetz fixed point theorem in étale cohomology, Proc. of a conf. on Local Fields, Driebergen, Springer Verlag 1967) and the **definitive version of SGA 5**) [one wonders what the original version might have looked like, poor us!]" (Here and above, my emphasis, purely out of malice!).

Clearly, it's out of charity that the brilliant author refrains from referring to the relevant lecture from the seminar doomed to oblivion, or from even hinting that "the" formula is indeed to be found there! The inquisitive reader, however, would have found an exposé XII with the unusual name "Formules de Lefschetz et de **Nielsen Wecken** en géométrie algébrique, par A. Grothendieck [toujours le même quidam, ma parole!] rédigé par I. Bucur [connais pas]". Surely the quidam and his acolyte will have copied their brilliant predecessor's presentation, overloading it with superfluous details to their heart's content? .

In this famous "report", there's nothing to make the reader suspect that there exists (apart from the Lefschetz-Verdier formula or rather, should we say, the Lefschetz-Verdier-Deligne formula, in any case uninspiring, as is clear from the author's own disillusioned comments) an explicit trace formula and all and all, for anything **other** than the Frobenius endomorphism alone. Both in the passage quoted, referring to Artin-Verdier, and in another (quoted below) referring to SGA 5 (so as not to name the quidam), it is suggested that the work was done **only** in the case of the Frobenius endomorphism. We're buddies with Verdier (and we're proving it to him), but as for the trace formula, it's a foregone conclusion: thumb-reference to Verdier all right (in a breath with Artin<sup>496</sup> (\*), and drowned in the middle of a technical and uninspiring text, as soon forgotten as read) - but it's well understood and there's no mistake: the trace formula, that's **him, Deligne!**

p. 886 It's true that the aforementioned Deligne has more than one string to his bow, and that it's not for nothing that he's scattered these comments with a historical allure (sic) in□four different places, just to make up in one for what one could reproach him for having omitted (or overdone) in the other. In that case, he can fall back on the introduction to the same chapter - everything has been taken care of! It's a seven-line introduction, worth quoting in full<sup>497</sup> (\*).

## (b). . and nonsense. .

**Note** 169<sub>6</sub> (March 18) I had to stop in mid-stream yesterday, as it was getting prohibitively late, and it had become clear that I wouldn't be finishing with "La Formule" overnight! Before I get into some of the twists and turns surrounding the aforementioned formula, I'd like to take the opportunity to first, in this case

<sup>496</sup>(\*) I'd already come across Deligne's tried-and-tested technique of drowning a fish in order to get rid of so-and-so (in this case, Verdier, who is a good friend of mine and who will be given substantial compensation elsewhere), by naming him in a breath with another - so you can't blame him for not being generous! This is the "**dilution** by assimilation" method. The art in this method is to find a gentleman who is a "pair" with the person you're trying to swindle. As far as I'm concerned, my friend uses Serre every time...

<sup>497</sup>(\*) (March 20) I'll come back to this introduction in yesterday's reflection (Cf. "Les double-sens - ou l'art de l'arnaque", sub-note n° 169<sub>7</sub>.)

of the fine "de Lefschetz-Verdier" formula, to put one's foot in it. This formula perfectly illustrates something that seems essential to me, and to which I have returned insistently on more than one occasion in the course of *Récoltes et Semailles* and as early as the Introduction<sup>498</sup> (\*\*), but in terms that remained perhaps a little too "general".

This formula is a striking example of a statement that is **profound**, and whose demonstration is "trivial" (169<sub>6</sub> bis). When Verdier told me that he had derived and proved a Lefschetz formula for "cohomological correspondences" (which hadn't even been defined yet) on any algebraic varieties ("clean" ones, anyway) and for any constructible "coefficients", I was incredulous at first. Perhaps the idea had occurred to me of a Lefschetz formula with more or less general "coefficients" - I must have written one at least a long time ago for "locally constant" coefficients, i.e. in a local system. But **I didn't believe in it** for general coefficients - it sounded too good to be true! It didn't take Verdier long to convince me. It must have taken him a quarter of an hour to write down the formula and demonstrate it to me - and that's because I'm slow, especially when it comes to making sure of something so unexpected! It's what you might call a "**trivial** demonstration", in terms of what's "well known", I mean. And following the wind that's blowing these days (and of which J.H.C Whitehead has already perceived the first whiffs<sup>499</sup> (\*\*\*)), there is only one step (blithely taken by the many) to classify the theorem itself as □ "trivial" - one formula among ten or . 887 hundred, which "fall" all by themselves from the cohomological formalism - in this case, from the **complete** formalism I had just developed in the étale framework the previous year (1963): the six operations, **and** the biduality theorem.

If I say that the theorem discovered by Verdier (following the path traced by Lefschetz) is "profound", it's not for the reason (however pertinent) that the formalism from which its demonstration derives is itself "profound". In fact, the same fashionable wind has long since (and with the unconditional support of Verdier himself, no less!) classified formalism as "Grothendieck's big toast", which is swept aside with one hand, while tacitly using the aforementioned "toast" at every step (without naming it). The question of whether this theorem "remained conjectural" (as Doe points out with an air of commiseration), or was fully established in every characteristic (as it is now, thanks to the "biduality theorem" bearing Doe's name) is for me just as incidental, when I say that it's a profound theorem, and one that substantially enriches our understanding of the "cohomological theme" of all kinds (discrete or continuous coefficients, and "varieties" or "spaces" of all kinds . . . ). The same could be said of the ordinary Lefschetz formula, in the case, say, of a compact differentiable (or other) variety, and of an endomorphism of it with isolated fixed points: the "formal" demonstration, based on a formalism of duality in cohomology, takes up a page, if not a few lines. In both cases, however, there has been a **creation** - something new and substantial, which had eluded everyone until then, which "didn't exist" (yet), has suddenly appeared... .

Where exactly is "creation" in this case? I believe that more than one mathematician, and more than one of my former students, who once knew what a creation is and have long since forgotten, would do well to meditate on this case, or on any similar one closer to it. I am well aware that if I had proposed to myself, or to one of my students or other colleagues among those who were then well "in the loop" of cohomological formalism<sup>500</sup> (\*), to explain a general formula of Lefschetz's, for the purposes of

<sup>498</sup>(\*\*) See Introduction 4, "A journey in pursuit of the obvious".

<sup>499</sup>(\*\*\*) On this subject, see the note "Youth snobbery - or the defenders of purity" (n° 27).

<sup>500</sup>(\*) There weren't many of them around then to "get in on the act" (nor are there now, given the way things have turned out). events... ) - but there must have been three or four of them, apart from Verdier and myself. As for Deligne, he hadn't yet appeared in the area...

any coefficients and any "cohomological correspondences" (it's up to them to define them ad hoc!) on a compact (sorry, clean)  $\square$ quelconque variety, everyone would have arrived there infallibly, by taking a few hours or days, or if need be a few weeks<sup>501</sup> (\*). Once the problem has been posed (albeit in a vague way, while the main terms are still waiting to be defined. . . ) and seen, "solving" it (in this case, finding the right formulation, suggested by the existing cohomological formalism) becomes a simple task. ) and seen, "**solving**" it (in this case, finding **the** right formulation, suggested by the existing cohomological formalism) becomes a matter of "**routine**" (what Weil calls, in the same sense I believe, an "exercise"). This "routine work" requires flair, a modicum of intelligence and imagination, to be sure, but (as I've written on more than one occasion) it's then "the things themselves that dictate" how we should approach them, provided only that we know how to listen to them. (And if we don't know how to listen to mathematical things, we'd be better off choosing another profession. . . ) It's not in this way that we'll be able to find the right formulation. ) It's not in this kind of work that we find the **spark** I'm talking about, which brings out the new<sup>502</sup> (\*\*).

The creative moment, the spark that triggers a process of discovery, was here when the **problem was seen**, and moreover, "**assumed**" - when the intention was born to really **look, to go all the way to the end** to get to the bottom of it, to "see" **what** exactly is **the** "true" domain of validity of Lefschetz's formula, which everyone claimed was "understood". What ignited the spark was not "virtuosity" or "power" (in the usual sense of brain power, to master difficult techniques or memorize interwoven situations... .). It's an **innocence**: everyone thinks they've understood Lefschetz's formula, but I, poor me, don't feel I've understood it yet, and I'd like to know for sure! In a case like this, once you've got going, you've **got it made**: things tell you what to do, and you do it. Going "all the way" can mean, in one case, proving "the" right theorem (in terms, in this case, of an already existing formalism - that In this case, it's irrelevant whether the formalism itself is "established" or "remains conjectural".) In another case, this

can  $\square$  signify: releasing "the" right conjecture<sup>503</sup> (\*); and that this is often itself provisional, that it is also incidental. This conjecture is one of the steps on the road to a deeper collective knowledge of things (in this case, mathematical things), a step that could not be avoided<sup>504</sup> (\*\*).

Profoundness and fruitfulness are closely linked qualities - the former seems to me to be the tangible sign of the latter. The very first sign of the fruitfulness of the formula discovered by Verdier came in the very same year (if not in the days or weeks that followed, I can no longer say): this formula was **the** main motivation, leading me to write a cohomological formula for *L-functions* "**with coefficients**" in any l-adic bundle. The fact that, **technically**, I didn't have to make any use of the Lefschetz-Verdier formula is irrelevant here. What is certain, however, is that without this formula as a thread, or rather: which

<sup>501</sup>(\*) Of course, what I'm assuming here is that the person in question has "latched on" to the problem posed, so that the "feeling" I would have had (otherwise I wouldn't have suggested it!) has "passed", and that the student or colleague is indeed "triggered". It's by no means a given that "it'll pass" - far from it!

<sup>502</sup>(\*\*) And even less does the "spark" come from some supporting work, done perhaps ten years later, which establishes that the hypotheses that make such and such a demonstration "work" are indeed verified where we expected them to be. ...

<sup>503</sup>(\*) The two cases, where the "spark" (followed "to the end") leads us to a theorem, or on the other hand to a conjecture, are not different in nature. "To the end" means: to make a still diffuse intuition fully concrete, by probing it in all its aspects and by all the means at our disposal. A theorem is by nature no more "finished" than a conjecture. There are theorems that are visibly provisional (even limping and awkward), just as there are conjectures (such as Weil's set of conjectures) that give the impression of an entirely completed, perfect whole. This does not prevent Weil's conjectures from being a point of departure for other, broader developments (conjectural at first, like them) that encompass them. In this sense, it can be said that nothing in mathematics, as long as it is alive and well, is "finished" or "definitive".

<sup>504</sup>(\*\*) On the dynamics of discovery, and the crucial role of "error" in it, see (in the first part of R & S) the section "Error and discovery" (n° 2).

was whispering to me that "there must be something", such a thing as an *L-function* "with coefficients" in a bundle - without this insistent voice, I wouldn't even have thought of finding **the** right notion, and the relevant formula that goes with it; where I would have succeeded, no doubt, in the following years, but **first** having to discover by my own means that other formula of more general scope, which was "on the way", that **had to be** discovered.

Psychologically, the two situations are very similar. Just as Verdier first had to clear the notion of "cohomological correspondence", to clarify the "Lefschetz formula problem" (at beyond the "ordinary" formula), so I had to release the notion of an *L* function "with coefficients", to  $\square$ precise the "*L-function* formula problem" (implied: beyond the case of the "ordinary" *L-function*, associated with a smooth, clean  $X$ . ... ). The "creative moment", the one when a spark flew, was when I **saw this problem**: defining such generalized *L-functions* - and I **took it on**, going right to the end of that problem. Once I'd seen the problem for myself, and assuming I'd managed to "pass it on" to any of the people around me who were "in the know", it was clear that they wouldn't have been able to resist solving it, in "**the** only" natural and reasonable way, by putting in a few days no doubt (as must have been the case for me), definitions, statement, demonstration and all<sup>505</sup> (\*).

It's true, of course, that the "unscrewings" that lead back to dimension one are "easy", and even "trivial" if you insist on it. It's not in this kind of unscrewing, which anyone can do as well as me (or won't deign to do), that there is **discovery**. The discovery lies in a **notion** that no one had thought of, even though it's **obvious**: that of an *L* function "with coefficients". In this notion and in the formula that is inseparable from it, there is the possibility (in the context of finite-type schemes on the prime field  $F_p$ , or more generally, on the absolute base ring  $Z$ ) of interpreting the "six operations" in cohomology, starting with the functor  $Rf_!$ , (operations therefore of a "**geometric**" nature) in terms of operations on "fields of *L-functions*", i.e. in "**arithmetical**" terms. This was a further step in the direction inaugurated by Weil's conjectures in 1949, towards a marriage between geometry and arithmetic, through the cohomological theme.

What becomes of these two discoveries, in this text that presents itself as **the** standard reference book for staggered and l-adic cohomology - this text due to the most gifted and prestigious among those who were my students?

The Lefschetz-Verdier formula, which had inspired me without my ever having to "use" it, became the **scarecrow** wielded aptly, to let the reader (who only wants to believe!) know what a tenuous and uninvolved thread (and "conjectural", what's more, not to mention that the local terms "were not calculated") was suspended a certain seminar  $\square$  auquel to which ("in keeping with the spirit of this volume") one abstains

I'd like to remind you that if the aforementioned formula has ceased to be "conjectural", it's thanks to the modest author of this brilliant volume.

As for the notion of an *L-function* with coefficients, which is the central notion of this Report and constitutes the very heart of the book, it appears without fanfare in par. 1.6 of the Report (loc. cit. p. 80), without the slightest comment to indicate a motivation or provenance. A definition is, after all, a definition; you don't have to justify it. Readers who wonder about the origin of this notion, which is admittedly a bit abracadabra (especially when it's thrown at you like that on an empty stomach. . . ), have a choice between Artin-Weil (but there were no l-adic bundles in their time, obviously introduced

<sup>505</sup>(\*) I'm leaving out the last step of the demonstration, which I had left in abeyance (as not posing any real problem), and which was likely to take longer.

by the author in this same volume. ... ), and (more likely) this same brilliant author, who is leading him swiftly towards a certain formula known as "traces".

This is introduced in par. 3 (loc. cit., p. 86), which begins as follows:

"Grothendieck's **cohomological interpretation** of *L-functions* is the following theorem:..."  
(follows the formula in question 3.1 - NB my emphasis).

Apart from the introduction to the chapter (to which we shall return), this is the only occasion in the entire chapter when a certain name is pronounced<sup>506</sup> (\*). So it's this same quidam again, referred to two pages later by the acronym [2] (as one who knew how to "clearly explain" some "easy reductions") who also gave this abracadabra "interpretation" 3.1, thrown in there without warning. It had no merit whatsoever, as the reader will immediately (and unsurprisingly) realize, for the demonstration takes up barely half a page (on the same page 86) and was, moreover, "classic": it's a simple corollary of the famous "**trace formula**" which gives the Report its name, and which is the subject of what is obviously the "true theorem."

(3.2). No name is put forward to indicate the paternity of the latter - i.e. of "**the**" Formula - still this □

p. 892

modesty, precisely among the most brilliant people! Two pages later (as we saw yesterday) the names of Lefschetz, Verdier, Artin, Nielsen and Wecken are mentioned, a veritable debauchery of modesty for the occasion - all to avoid saying that it's him!

The point I'd like to emphasize here, and which seems to me to go far beyond the case in point and these hints of fraud, is this. Whether it's the so-called (and rightly so) "Lefschetz-Verdier formula", or the "cohomological interpretation" of *L-functions* ("with coefficients"), it's precisely **this** that makes their de-coverage **acts of creation**, which is also, these days, the object of general disdain (if not casual derision), commonly expressed by epithets with pejorative connotations such as: "**trivial**", "**childish**", "**obvious**", "**easy**", "**conjectural**", when it's not "soft math", "dream", "nonsense" and other niceties, left to the improvisation gifts of each individual. This is the part of the work, on the other hand, that I've always known (and above all, it seems to me, never **forgotten**) comes "on top of" and by force of circumstance, like the "housekeeping" that's sure to follow (provided only that you stick with it), the **technical** part therefore, the one that's often reputed to be "**difficult**", I've also referred to it as "routine work" (without attaching any pejorative meaning to it) - it's this part of the job that is valued by today's consensus, and singled out to the exclusion of all others.

For me, the notion of "difficulty" is relative: something seems "difficult" as long as I don't understand it. My job then is not to "overcome" the difficulty by force of will, but to enter into my incomprehension sufficiently to come to understand something, and make it "easy".

what had seemed "difficult"<sup>507</sup> (\*). For example, the unscrewing I did for the "function formula

p. 893

*L*" as in other circumstances, unscrewings which today pass for "trivial", □ have not been more. For me, it was easier to deal with the "easy" cases than with the so-called "intractable", supposedly "difficult" ones. They were different stages of the work, that's all<sup>508</sup> (\*). It's not because one stage comes after another, or because it happens to be

<sup>506</sup>(\*) (April 9) There is one exception (which had initially escaped my attention), with a thumbnail reference (on p. 90) to "one of Grothendieck's essential uses of the theory of derived categories" (to define traces in "unorthodox" cases).

<sup>507</sup>(\*) Readers will note that this is a description of the "yin", "feminine" approach to a difficulty - that of the "rising sea". I don't mean to imply that this is the only possible creative approach - there's also the "hammer and chisel" approach, the "manly" approach - the only one in vogue (not to say, today, the only one tolerated. . . ). See about these two possible approaches the note "The rising sea. . ." (n° 122), and on common attitudes to either approach, the notes "The muscle and the gut (yang buries yin (1))" and "The providential circumstance - or apotheosis" (n° s 106, 151), as well as "The disavowal (1) - or reminder" (n° 152) which follows the latter.

<sup>508</sup>(\*) The cases I'm thinking of, where I've "unscrewed" to bring myself back to situations of dimension (or relative dimension) **one**, apart from the general formula for *L-functions* with coefficients, are above all the two change theorems

be longer, that it's more "difficult". In both cases, we needed **an idea**: in one case, the idea of "unscrewing" (something we'd never thought of doing in this kind of situation, and with good reason when it comes to fixed-point formulas for any correspondence other than Frobenius!); in the other case, an idea that was no doubt trickier to formulate, inspired by a fixed-point formula (due to Nielsen-Wecken<sup>509</sup> (\*\*)).

more sophisticated than Lefschetz's original formula, and implemented by introducing a careful splitting of the bundle of coefficients, expressed in terms of suitable derived categories<sup>510</sup> (\*\*\*). □Lap

. 894

The second stage took longer, as it turned out: when it came to working it out with all its generality<sup>511</sup> (\*) (given that there are other endomorphisms of a curve than the Frobenius one), there was a whole "carpet" of non-commutative traces "à la Stallings" that finally stuck after it, and which I had to develop carefully. It was long and it was "easy" - and it was also something that **had to** be done, that much was clear. But even coming up with the kind of ideas that make a job "easy" (or simply, possible. . . ), is for me part of "routine work". It contributes to the charm of the job, which makes it something more than a simple crank turn.

The **creative** part of the work, on the other hand, is the **child's** idea: the one that everyone should have seen years ago, if not centuries or millennia ago - and yet no one saw it, even though it was staring us in the face the whole time and we had to make a big detour around it, every time, to avoid bumping into it!

When you come across an idea like this, whether you've "stumbled across" it on your own, or someone else has explained it to you (as Verdier once explained to me), you feel like an idiot: it's unbelievable that you hadn't seen it before, when it was the most natural thing in the world!

---

in étale cohomology (for a proper morphism, and by a smooth morphism), which constitute the two key statements that make said cohomology "livable" (as Deligne writes), and the "comparison theorem" for  $Rf_!$ , between étale cohomology and transcendental cohomology (for finite type schemes over the field of complexes). (There's also Lefschetz's (so-called "weak") theorem for affine morphisms.) Psychologically speaking, it was once I'd managed to reduce myself to such "irreducible" situations that I had the impression that it was (more or less) "won", that the expected theorem would indeed "come out", and experience has confirmed on each of these occasions that this feeling hadn't fooled me. Technically speaking, however, it's the unscrewing that represents the "easy" stage. It so happens that, by a kind of "providence" which struck me at the time, the ingredients needed to deal with the two "irreducible" cases, in one and the other, were available.

the other base change theorem, had been developed by me (without suspecting anything), in SGA 1 for the first, in SGA 2 for the second, three and two years before... .

<sup>509</sup>(\*\*) (April 10) It was from me, along with the other SGA 5 listeners, that Deligne learned this "Nielsen-Wecken" formula and its transposition into étale cohomology, which dispensed him from ever having to look at the three fine articles (in German) by these authors (published between 1941 and 1943), and served him in the rather peculiar way that we know

(see sub-note "Real maths..." , n° 169 ).<sup>5</sup>

<sup>510</sup>(\*\*\*) The language of derived categories is indispensable in this demonstration. After my departure, and until about the year with the publication of the volume entitled SGA 4<sup>1</sup> , my cohomological students instituted a tacit and effective boycott against derived categories, which had been the key conceptual tool for developing the duality formalism ("six operations" and biduality), in the context of "coherent" and then "discrete" coefficients. Despite its crucial role in proving the Lefschetz-Verdier formula, as well as the "classical" duality formulas in the étale context, this formalism itself, as a mathematical structure and coherent conceptual whole, was the object of the same boycott, which continues to this day (starting with the very **name** "six operations", which is still anathema).

It is possible that it was the need to demonstrate the trace formula that prompted Deligne, in 1977, to take the first step towards lifting the boycott on derived categories, by exhuming in the pirate-volume a skeletal "Etat zéro" of Verdier's "thesis" (a text in which my name is not mentioned). On this subject, see the note "Le partage" (n° 170) devoted to "Operation III", and for more details on the funny "thesis" affair, the notes "Le compère" and "Thèse à crédit and comprehensive insurance" (n° 63", 81).

<sup>511</sup>(\*) (April 23) A generality rightly described as "superfluous" by Illusie in his Introduction to the SGA murder-edition. 5 (second paragraph), obsequiously echoing his prestigious friend Deligne, who refers (without further clarification) to the "useless details" he would have "pruned". At the same time, this debunking absolves him once and for all from letting the reader suspect that there exists in dimension one an explicit trace formula more general than the one he sets out for Frobenius, where

he repeats step by step the steps of my demonstration, while giving the impression that it is his own. See the following sub-note "Les double-sens - ou l'art de l'arnaque", n° 169<sub>7</sub> .

all of them, the most obvious, the most "stupid", to put it mildly... . We **should have** stumbled upon it long ago, of course, but we didn't. ...

p. 895 It would seem that these days, and increasingly so, in such a situation (and when you're in a position of strength, especially . . . ) you compensate in flexibility'□when it's someone else (an illustrious stranger perhaps, or such a "deceased" long since buried... ) who has the misfortune to stoop (or to have once stooped. . . ) to an idea like that. But my poor fellow, what you're telling me is **trivial**! And to prove to the poor guy just how trivial it is (and to put him in his place . . . ) we're going to spit it back at him in no time - you'll see what it's like to do math! We've got something else up our sleeves than these first-timers (or this left-behind... )! Just pull on it a little, blow, pull again and abracadabra hopplà! And **here's** a statement I'm pulling out of the hat that's got some guts, and here's a whole theory even, and it's no joke, it's hard work, yes! Young man, get dressed, you'll be back when you know how to do the same!

Without even thinking about it, I made a shortcut to the misadventure of my "posthumous pupil" Zoghman Meb- khout, a modest assistant in Lille or God knows where, at the hands of my "occult pupil" Pierre Deligne, the jewel among all of a selective institution (and so on...); a misadventure that occurred in the year of our Lord 1981, and which continues to this very day.... This is "Operation IV", known as the "Service Unknown" (or "Perverse Colloquium", to put it mildly) - the most incredible of the four operations. (See note on "Apotheosis", n° 171.)

But at the same time, as I was writing the previous paragraph, it felt like I was more or less rewriting something I'd already written on another occasion. ...

It didn't take me long to remember - it was in the first part of Récoltes et Semailles, written a year ago now, in the section "**La mathématique sportive**" (the name says it all), n° 40 (p. 105). The difference between the episode I mention and that of the Colloque Pervers is that this time the role of "token stranger" is played by "that young white boy who was stepping on my toes", and that the haughty, "sporty" big boss wasn't a naughty ex-student of mine, but none other than myself. It's true that I don't think I've gone so far as to appropriate (symbolically, in this case) someone else's idea. But I can't swear to it in good faith, and I'd have to ask the person concerned (twenty years later, but better late than never) to let me know how **he** remembers the episode, which is a bit hazy in my memory. He had the misfortune of redoing things I'd known about for ages (among other things, building the Picard diagram of an unreduced diagram by "unscrewing" from the reduced case... . ), and it didn't go down well

p. 896 - that's what en est□resté me; but I wouldn't swear that his approach (in a less general framework than the mine, of course) was really entirely covered by mine<sup>512</sup> (\*).

The fact remains that I must once again point out a **kinship** between an attitude that was mine at certain times at least, in the sixties, and that which I encounter in some of my former students. They reflect back to me an undoubtedly disfigured image of the man I was - an image that

<sup>512</sup>(\*) The opportunity never arose for me to net and publish Picard's "relative" construction in question by "unscrewing" on nilideals, a construction planned for a later chapter of EGA (which never saw the light of day).

In any case, when I speak of the "appropriation" of someone else's idea (big or small), I'm not necessarily talking about plagiarism in the usual sense, when you present this idea (even in a modified and perfected form) without indicating its origin. - which seems to me to be becoming more and more common. But appropriation can be that of casual disdain, whose breath fades the joy of a discovery, as if for the sole pleasure of frustrating it, to the tune of a disillusioned "oh! it's only that ... . "disillusioned. This air implies, without our having to say it, that what we've just been told we've known for as long as we can remember, and if perhaps we hadn't bothered to spell it out again, then it really wasn't worth the trouble... . For these tunes There (or for its ancestor), see (in the first part of R et S,) the section "Le pouvoir de décourager" (n° 31) (repeated in the already quoted note "La mathématique sportive", n° 40); and (in the harsher atmosphere of the 70s and 80s) Burial I, "Appropriation et mépris" (note n° 59).

for years I wanted to deny. But if Harvest and Sowing, which was above all a reflection on my past as a mathematician, had **a meaning**, it was to make me understand, among other things, that even though some of my students have disowned me, it's not up to me to disown any of them. What comes back to me through them is part of the harvest of what I helped sow, just as they themselves contributed. And this observation, which I have been making with an uncompromising pen for nearly three weeks now, is not an indictment of anyone, but an **observation** that involves me as much as any of them.

### (c) Heritage - or trickery and creation

**Note 169<sub>6</sub> bis** (April 10)<sup>513</sup> (\*\*) As everyone knows, the meaning of the word "trivial" in mathematics is highly relative. Here, by "trivial" I mean: in terms of what was supposed to be "known", i.e. (in this case): the formalism of the six operations, and the biduality theorem (the latter remaining conjectural because  $p > 0$  in the discrete context, before Deligne found a demonstration... .). In terms of this formalism, the principle of demonstration is explained ☐ completely convincingly in a few minutes (at the same time time than the statement). It's true that this doesn't dispense with the need for a formal demonstration, which meant checking a few tedious compatibilities.

p. 897

It was customary in such cases for the author of a theorem (especially an important one) to take the trouble to write a proof. In Verdier's case, there's no doubt in my mind that this is the most profound and far-reaching result of all those whose names he has the honor (and rightly so) to bear (in Weil's words). However, he did the same for this theorem as he did for the theory of derived categories: as long as he had the credit for it anyway, he didn't think it worth doing the work, and making it available to everyone with a complete demonstration.

This is an eloquent sign of a certain state of mind, which I've had occasion to mention here and there, most recently at the end (dated February 28) of the note "Les manoeuvres" (n° 169). I've been able to see that it has set a trend. While the "Lefschetz-Verdier" formula (with the above reservation) was indeed an act of creation by Verdier, at a time when he was still working with me and was passionate about his work, I see a direct relationship between the fact that he never had the respect to demonstrate "his" theorem, and the fact that **his life as a mathematician never saw another similar act of creation**. Creative moments come to us only when "we are worthy of them", i.e.: in a state to welcome them. ...

This beautiful formula, left behind by a father on the run, has had some strange vicissitudes. First, it was the theme of one of my first lectures (exp. III) at SGA 5, in 1965. Illusie took on the task of writing it, without bothering to do so for twelve years. Then, in perfect connivance with him and Deligne (and I imagine, with the at least tacit agreement of Verdier, to whom Deligne would grant substantial compensation), she became the head of the "Trojan horse" (or "scarecrow", as I write below), deftly maneuvered to lend credibility to the incredible imposture called "SGA 4<sup>1</sup>". This was set up from scratch to bury<sub>2</sub> the master common to all three of us, i.e. also, in short, the "**grandfather**" of the aforementioned formula (which, were it not for my modest self and the six operations buried with me, would probably still not be written for another hundred years... .). For a picture of morals, here's a picture of morals!

If my dear ex-student cohomologists, instead of wasting themselves in such shenanigans playing the dwarf (which they are not) perching on the ☐shoulders of a giant (which I am no more. . . ), had during thesep

. 898

<sup>513</sup>This sub-note is taken from a b. de p. note to the previous sub-note ". . . and 'non-sense'" (n° 169<sub>6</sub>); see reference page 886.

I'm sure that De Rham-Mebkhout's and Hodge-Deligne's theories of crystalline coefficients, with the "mysterious functor" at their heart, have long since reached the "fully mature" stage of the formalism of the six operations. And even (as I've suspected for the last week or two. . . ), the great dream of their teacher, that "**motif**" made to be melody and which (in these same hands) has become a fiefdom, a hoard and a "vague skeleton", has already been embodied in a vast symphony (by no means "conjectural", but "fully mature" too), and is now **everyone's heritage**.

#### (d) Double entendres - or the art of the con

**Note** 169<sub>7</sub> (March 19) But I must return to the "twists and turns" of my friend Pierre Deligne, in his presentation of the famous "Formule des traces". Remarkably, nowhere does he specify that, for the application to Weil's conjectures proper (which were undoubtedly aimed primarily, if not exclusively, from a practical point of view), there is no need for a formula and a sophisticated demonstration - Lefschetz's "ordinary" formula (étale version) suffices<sup>514</sup> (\*). And it's no coincidence, of course, that it's precisely the lecture on the cohomology class associated with a cycle that he chose to "borrow" from SGA 5, and incorporate into his digest without further ado - the very lecture that contains the key ingredient (apart from the "ordinary" Poincaré duality, étale version) for establishing the "ordinary" Lefschetz formula in four spoonfuls. One wonders, then, if he hadn't included this "Report", which establishes a trace formula for the Frobenius endomorphism alone (while stubbornly concealing from the reader that he could find much more general and equally "explicit" ones elsewhere (!)). There are two related reasons why he took the trouble to write this "Report". On the one hand, it was quite clear by the 1960s that Weil's conjectures, suitably reformulated in terms of "weights", still made sense for singular varieties and for non-constant "coefficients".

It is true that we can then formulate them in entirely geometrical terms, without explicit reference to the formalism of the *L-functions*.

p. 899

de Weil II" (in which, of course, there is no allusion to any role I might have played in deriving the main statement he proves). But nevertheless, the arithmetical interpretation (in terms of *L-functions* "with coefficients") of geometrico-cohomological operations was bound to have a role to play, in which the formula of **general *L-functions***, in the form in which I had developed it, would take a crucial place. With a view to the long term, it was therefore necessary to provide a reference in the volume entitled "APG 4<sup>1</sup>". At the same time, while it had become clear that general trace formulas (Lefschetz-Verdier style) form an important ingredient of the cohomological panoply, this contributed to the illusion that this volume (as it advertised) did indeed present an essentially complete cohomological arsenal, for the needs of the "non-expert user" of *l-adic* cohomology.

It remains for me to review the three remaining passages, among the four in "SGA 4<sup>1</sup>", which pretend to give historical details about the trace formula. I'll quote them in the order in which they appear in the volume. The first two are at the very beginning of the volume (page 1 of the Introduction, and page 2 of the "Breadcrumb trail"), and are obviously intended to "announce the color". They're probably the most widely read, too. The third is the short introduction to the "Report on the Trace Formula" chapter. (The fourth

<sup>514</sup>(\*) (April 25) It's possible that I'm making a mistake here, as I haven't really taken note yet of Deligne's demonstration of the last part of Weil's conjectures, concerning the absolute values of Frobenius eigenvalues. It would seem that the use of Lefschetz brushes leads him to introduce more general *L-functions* than the  $\zeta$ -function (i.e. the "ordinary" *L-function*).

passage, mentioned the day before yesterday, is part of the body of this same report, and is surely the least read of all).

In the bibliography after the "Breadcrumb trail for SGA 4, SGA 4<sup>1</sup>, SGA 5", the acronym SGA is explained as "Séminaire de géométrie algébrique du Bois-Marie", with no reference (needless to say) to me personally. However, I am one of the directors of SGA 4 and SGA 5. This function of director must have been quite platonic: reviewing the main presentations of SGA 4 and SGA 5 (and let there be no more talk about it. . . ), there is mention of presentations by Artin, Jouanolou, Houzel, Bucur, but none by me. In the reference to SGA 4 and SGA 5, there's no indication of a date - and I've found no hint in the entire volume that would lead the uninformed reader to doubt that SGA 5 ("to be published in Lecture Notes") is not a publication of my own.

which, as its name suggests, is well **after** the volume known as "SGA 4<sup>1</sup>"<sup>515</sup> (\*). When an allusion is made to a presentation in SGA 5 (generally unspecified), it is clearly specified that it is a "zero state" or the "original version" (implied: thick and unbuildable, one suspects. . . ). These references to SGA 5 (for the uninformed reader, who is advised not to consult SGA 4 nor especially SGA 5) are therefore (in the mind of this same reader) references to a text **subsequent to** the one he is currently reading. I suspect, moreover, that these uninformed readers are by far the vast majority, and (as I've written elsewhere) the others are getting old and are going to die their own deaths... ..

I quote from the first page of the Introduction, paragraph 3:

"The "Report on the Trace Formula" contains a complete demonstration of the trace formula for the Frobenius endomorphism. The demonstration is that given by Grothendieck in SGA 5, pruned of all unnecessary detail. This report should enable the user to forget SGA 5, which can be considered as a series of digressions, some of them very interesting. **Its existence will make it possible to publish SGA 5 as is in the near future.**" (Emphasis added.)

This text has two **opposite** meanings, served up **simultaneously** with consummate artistry. For the informed reader of the history of the formula in question for Frobenius, he may be surprised by the flippancy of the presentation (and all the more so, if he is well informed of the ins and outs of the SGA 5 seminar and the role it played in the formation of the brilliant and flippant author); but he will think that the author at least has indicated the source of his demonstration. As for the uninformed reader, he'll learn that the demonstration in the volume he's holding in his hands is also to be found in a certain later SGA 5 text, a text due to Grothendieck, and cluttered with useless details, which this quidam must have added for fun to the original demonstration. The passage quoted remains vague as to the latter. As we saw the day before yesterday, reading the demonstration itself, in the "Rapport" in question, leaves little doubt that it is indeed the brilliant author of the volume "SGA 4<sup>1</sup>" who is its father. Of course, nowhere does it deign to specify whose idea it was **to write** the trace formula; after all, it costs nothing to write something, as long as you don't bother to demonstrate it! Nor is there any mention of Verdier (who was the first to demonstrate the "crucial case" I'd left hanging). It's no coincidence, surely, that it was at the very moment when he is the question of the trace formula, at the heart of **"the"** Conjecture, that the author uses "kindnesses" to assail like "useless details", "digressions" (very interesting indeed, one is either a good sport or one isn't!) that one recommends forgetting(\*), and finally this discreet yet peremptory reminder that "its existence will enable SGA 5 to be published in the near future as it stands", as if SGA 5 is only "standing" and publishable thanks to the "existence" of the text called "SGA 4<sup>1</sup>" - which surely provided the quidam in question with what he needed.

<sup>515</sup>(\*) Nor the slightest hint that might lead the reader to guess what this unread seminar was about, whose very title ("L-adic cohomology and L functions") remains unknown!

need to present in a complicated way what is simply done in the original text here.

In the Ariadne thread, I've already mentioned (in the sub-note "Le cheval de Troie" (n° 169<sub>3</sub>) to the note "Les manoeuvres") the seventeen lines of the two consecutive paragraphs 2 and 3 on page 2, as "models in the art of 'fishing in troubled waters'". The second concerns the famous trace formula. Both paragraphs deserve to be reproduced here in extenso:

"A duality formalism analogous to that of cohesive duality exists in stellar cohomology. To establish this, Grothendieck used the resolution of singularities and the purity conjecture (for the statement, see [Cycle] 2.1.4), established in a relative framework in SGA 4 XVI, and - modulo the resolution - in equal characteristic in SGA 4 XIX. Key-points are established by another method in [Th. finitude], for finite-type schemes over a regular scheme of dimension 0 or 1. Various developments are given in SGA 5 I. In SGA 5 III, we show how this formalism implies the very general Lefschetz-Verdier formula.

As we can see, in the original version of SGA 5, the Lefschetz-Verdier formula was established only conjecturally. What's more, the local terms were not calculated. For the application to *L-functions*, this seminar contains **another** complete proof, in the particular case of the Frobenius morphism. It appears in [Rapport]. Other references: for the statement and the unscrewing scheme: Grothendieck's Bourbaki exposé [5]; for a brief description of the reduction (due to Grothendieck) of the crucial case to a case already treated by Weil, [2] par. 10; for a *l*-adic treatment of the latter case, [Cycle] par. 3."

I have already commented on the first paragraph in the note quoted (see also the b. de p.(\*\*) note on page 872 to this one, on the unpayable "various developments are given in SGA I"). It remains for me to follow the twists and turns

516□

p. 902 (or at least some of them - there are too many!) in the second paragraph. The first two sentences, The same is true of the Lefschetz-Verdier formula, as if the whole of SGA 5 (and a certain never-before-clearly-named demonstration of a certain trace formula... ) depended on it for life and death, are clearly part of the "cuttlefish method": confusing what is clear, to fish in troubled waters<sup>517</sup> (\*).

The key double-entendre phrase, however, is the one that immediately follows the drowning of the fish:

". . . this seminar contains **another** demonstration, this one complete, in the particular case of the Frobenius morphism".

The informed but hurried reader (and what reader isn't in a hurry. . . ) is taken aback for a second by the ambiguity of the expression "this seminar" - is it SGA 5, is it "SGA 4<sup>1</sup>"? - and since he knows that SGA 5 contained a complete demonstration, it's awarded once again: the author has indeed referred (somewhat vaguely,

<sup>516</sup>(\*) More precisely, it clearly implies that this 34-page "Report" alone contains (for the better) everything that could be useful in SGA 5 (which, even in the massacre edition, is still almost 500 pages long). That's a lot of "digressions" for nothing!

<sup>517</sup>(\*) It's a misnomer to say that the Lefschetz-Verdier formula was "conjectural" - it was established on the assumption that we have a duality formalism ("six operations" and "biduality theorem"), and it was indeed proved in this form in 1964 by Verdier. This demonstration had of course been given in the oral seminar, and it's complete. It was the validity of the biduality theorem for  $p > 0$  that remained "conjectural", and this is established (as we said) in the "Finitude" chapter of "SGA 4<sup>1</sup>".

As for the local terms in the Lefschetz-Verdier formula, they were "calculated" no more, no less, than in the ordinary Lefschetz formula (with isolated fixed points not necessarily "transverse"), and generalized the classical "intersection multiplicities" that figure in the latter. To say that these terms "were not computed" makes no more or less sense than saying that the dimension of an **unspecified** vector space, or the roots of a polynomial with indeterminate coefficients, are "not computed". To "compute", in these cases as elsewhere, means: to establish in a specified **"case in point"** (e.g., in dimension 1, for the Lefschetz-Verdier formula) an **equality** between two terms, neither of which is any longer "computed" or known true the other (e.g., between the local terms defined by Verdier, and certain local invariants related to the Artin conductor. . . ).

certainly... ) where one would expect it to refer. I came close to doing this on the first reading, in April last year (see the note "La table rase", n° 67), but it didn't fit. I was well aware that my demonstration of an explicit trace formula was by no means restricted to the "special case of the Frobenius morphism". What struck me, moreover, was the fact that someone had just insisted heavily (with "arguments") on the very fact that a certain SGA 5 presentation (in its "original version", my goodness!) was **not** "complete": conjectural here, non-calculated terms there... . With this "it completes" well framed by two commas, this categorical opposition irresistibly suggests to the uninformed reader, without he even has to question, that "this seminar" is obviously  $\square$  the volume "SGA 4<sup>1</sup>"<sub>2</sub> that he holds in hands - and in the next sentence, the reader is immediately told where to find it: "It's the one in [Rapport]". And it's certainly not the reading of the aforementioned demonstration in the chapter quoted, which could afterwards arouse in this same reader the slightest doubt<sup>518</sup> (\*)!

p. 903

The word "**other**" in the crucial sentence is **underlined**, **which is** not at all my friend's style. It's the only word underlined in the two introductory texts, and unless I'm mistaken, the only one in the entire volume (apart from the titles, statements and new terms introduced). If he's so keen to highlight this word, it must be for a good reason. (It's only just caught my attention.) The effect of this "**other**" term, and even more so when it's featured in this way, is to emphasize that there were **two** demonstrations of "the" Formula: one **incomplete**, and we've just said a few words about the less-than-engaging situation, with this "Lefschetz-Verdier" formula that's decidedly not sortable! (And in the more technical text of the famous Report, viewed the day before yesterday, we duly come back to this distressing subject... .). As for guessing whether or not, thanks to the brilliant author's finitude results, this lame method ended up working after all, well, who'll ever know. But after this push-back effect (the same, after all, as the one examined the day before yesterday), the psychological reflex in the docile reader is all the more peremptory: instead of the **incomplete** method of a certain muddy SGA 5 seminar (so incomplete that there's no question of even giving a precise reference to it<sup>519</sup> (\*\*)), a method we'll certainly never have to bother with, we'll be entitled, in this **seminar** of good, solid stuff, to the good, **complete** demonstration, which **is** already holding out its arms to us in the presentation specially designed for this purpose, the "Rapport sur la formule des traces", no mistake we'll have no trouble finding it there. . . .<sup>520</sup> (\*\*\*)).

The "**this seminar**" is simply brilliant - my thumb-friend is incoincible on that term there. Still, both in the paragraph quoted, and  $\square$  in the more technical context of the "Report" extending on the method (doomed to oblivion) known as "Lefschetz-Verdier" (p. 88), he has once again ventured<sup>521</sup> (\*) to say "in plain English" (or at least, in chiaroscuro) **the wrong thing**. In both passages, in fact, he stresses (it's a case of saying it) that there is a method (which we can guess is the one misguidedly followed in SGA 5, God knows in which of his "bushy" exposés . . .) for **demonstrating** the trace formula for Frobenius, which would consist in **using the Lefschetz-Verdier formula**. However, only two demonstrations of the "crucial" case existed (before Alibert's 1982 thesis, giving the calculation of local terms in dimension 1 for any cohomological correspondence with isolated fixed points), Verdier's and mine, neither of which (any more than Alibert's) makes use of the Lefschetz-Verdier formula! It was a

p. 904

<sup>518</sup>(\*) See the sub-note from the day before yesterday "Real maths. . . " (n° 168 ).<sub>5</sub>

<sup>519</sup>(\*\*) Nowhere in the volume entitled "SGA 4<sup>1</sup>" did I find a reference to one of the SGA 5 presentations containing either the demonstration of a fixed point formula, i.e. the famous "cohomological theory of *L-functions*". In fact, it has been clearly stated (see below) that "in keeping with the spirit of this volume, no use will be made of SGA 5 ... . " !

<sup>520</sup>(\*\*\*) The best part is that, in reality, Deligne's demonstration is a faithful reproduction of the one he and his fellow listeners learned at the SGA 5 seminar in 1966.

<sup>521</sup>(\*) "Again", since he had already (even more clearly) advanced to "tell the false" in the previous paragraph, as we saw in the sub-note "The Trojan Horse" (n° 169 ).<sub>3</sub>

a delicate and long-unresolved issue (and one that seemed somewhat incidental), of proving that the local terms in the explicit formula in SGA 5 (for correspondences far more general than Frobenius') are indeed those in the Lefschetz-Verdier formula. Illusie eventually verified this, as he announces in the introduction to the massacre edition of SGA 5 (p. VI), and also in the introduction to his paper III<sub>B</sub> "Calculations of local terms" (p. 139)<sup>522</sup> (\*\*).

If Deligne nevertheless goes to such lengths to create this false impression, it's not without reason. In fact, he creates the impression that SGA 5 (the seminar of "technical digressions" "to which no reference will be made, in the spirit of this volume", intended to make it "forgotten") depended on this "conjectural" formula, moreover unusable as it stands (local terms not calculated sic. . .), which was finally established only thanks to Deligne in the eloquently-named volume "SGA 4<sup>1</sup>" that the reader holds in his hands, and on which (if only because of this fact) the later and "confused" seminar SGA 5 depends. . .

p. 905 As for the last sentence of the passage quoted, beginning with "Other references" (sic), it too is a model of its kind, to avoid saying that the vague quidam Grothendieck had given a complete demonstration eleven years earlier (in the "later" seminar doomed to oblivion. . .), and that this is faithfully reproduced

in "Rapport". The impression that had to be created was that the quidam had made some preliminary reductions, whereas the difficult case is due to Weil, and brilliantly taken up (by a "l-adic treatment") by the author. The reference to a prestigious book by Weil that the reader will have heard of, in addition to an internal reference, really gets the juices flowing - either you're serious and know your classics, or you don't! As luck would have it, there's no indication of date in the reference to Weil's book, nor of chapter or page - it doesn't seem that the brilliant author wants to encourage the reader to look elsewhere than in the brilliant volume itself, where the reference suddenly becomes quite precise (chapter, paragraph).

The famous "result already treated by Weil" is, in fact, nothing other than the **ordinary** Lefschetz formula in the case of an algebraic **curve** (projective smooth connected over a closed algebraic field), which Weil managed to formulate and prove by means of the edge in the 1940s, without yet having the cohomological tool (but using the Jacobian to define the missing  $H^1$  l-adic). It was an important new idea to derive this formula in the case of "abstract" algebraic geometry, and must have set Weil on the path to his famous conjectures. Once we have the cohomological formalism, the Lefschetz formula in question becomes essentially trivial. But if we had said in plain English that the quidam's reduction was a reduction to the ordinary Lefschetz formula (for which we proudly refer, without naming it, to the "Cycle" chapter of the brilliant volume - the chapter pirated from SGA 5 precisely. . .)

- it could have given the impression that the said "reduction" was even a **demonstration of** the sacrosanct Formula. You wouldn't!(\*)

I can't wait to get this over with! There remains this introduction to the chapter "Rapport sur la formule des traces", loc. cit. p. 76, which is as follows (amputated from these last two lines, referring to an expository article by the volume's author):

"In this text, I have tried to set out as directly as possible Grothendieck's cohomological theory of *L-functions*. I follow very closely some of the talks given by Grothendieck at the IHES in the spring of 1966. In the spirit of this volume, I won't be using SGA 5.

- except for two references to passages in Lecture XV, independent of the rest of this seminar."

p. 906 At first glance, it seems as if the author is not being secretive about his sources, referring to a "coho theory". mology of **Grothendieck** of *L* functions", and even adding that he "follows very closely" some of my

<sup>522</sup>(\*\*) For the motivation behind Illusie's sudden efforts, see the sub-note "Les félicitations - ou le nouveau style" (n° 169), especially pages 916-918.

<sup>523</sup>(\*) (May 11) Thus, the whole art-"thumb!" here was to refer in two places far from each other (p. 2 and p. 88) to **two** "re-

exposed. In a **normal** volume, there would be nothing to say. But it's also true that **context** is part of the meaning of any text. The context of the unusual volume entitled "SGA 4<sup>1</sup>" profoundly alters the meaning of this passage, for a naïve reader already warned by what he has read before, and who will be edified a little more, moreover, in the course of reading the "Report" itself. Afterwards, he'll have the impression that it's really a kindness of the generous author towards the confused quidam named Grothendieck, to credit him with a "cohomological theory of *L-functions*", which in the end seems to be reduced to a somewhat abracadabrat, but after all **trivial**, cohomological "interpretation". It is demonstrated in just half a page, as an immediate **corollary** of a "trace formula", which is not pricked by worms, and is of course due to none other than the all-too-modest author of the volume.

It is true that in his "report", the author "closely follows" some of the lectures given by this quidam at the IHES in the spring of 1966. Nothing more is said about these undoubtedly lengthy talks, which must have been lost in the shuffle, except what the author of the volume was willing to retain for his report. Is it sorites about Frobenius (for which we will generously refer to SGA 5 "directed" by the same quidam), or generalities about  $\ell$ -adic bundles, or certain "easy reductions" that will be discussed elsewhere - we're in complete vagueness. In any case, these must have been mostly "useless details", which, thank God, we'll be spared by reading the Report - that's all we ask. So, let's put a veil over the quidam and get down to **business**!

While my friend likes to remain vague when it comes to references to a certain person (when he doesn't pass them over in silence), this time we get the impression that he can't be blamed for not being precise: lectures given at the IHES, spring 1966. If he had been just a hair more precise, he would have added: lectures **at the SGA 5 seminar**.

SGA 5? Isn't this precisely the seminar that appears (**undated**) in the bibliography at "Fil d'Ariane", with the mention "to be published in Lecture Notes"? The seminar which consisted (as we understand it) in adding "digressions" (some of them very interesting, all right) and "useless details".  
to the SGA 4 seminar<sup>1</sup> (a really good one) that preceded it? Don't kid yourself, SGA 5 wasn't in the spring!

1966, you want to laugh! And the best proof is right there in front of you, in black and white in the introduction just quoted in the "Rapport sur la formule des traces" (by Pierre Deligne):

"In the spirit of this volume, SGA 5 **will not be used**".

Then it's clear, isn't it? !

## (e) Les prestidigitateurs - or the soaring formula

**Note** 169<sub>8</sub> (March 20) I'm beginning to feel a little tired, not to say exhausted, by the work I've been doing, for more than three weeks and especially (in detail) over the last few days, to patiently "dismantle", in the "little things" that make **everything**, the brilliant scam set up by my most brilliant pupil, emberlificotating in the public square those who only want to be emberlificotated (and there are legions of them, are there not. . . ). I can't wait to get it over with, yes, and yet I don't regret the time I've spent on it, even though I'm about to turn fifty-seven and there's no shortage of more interesting (or more "enjoyable", at least) things to do. It's a bit like the maths work I called (three days ago) "routine work" - you eat your heart out doing it, you know it's all just routine, and yet you know it's routine too.

---

ductions" (!) (easy, it's understood) made by this quidam (named once, and not the second. . . ), without a candid reader ever suspecting that this same quidam had **found** and **proved** a formula for the traces; and that his demonstration (doomed to oblivion) is faithfully reproduced in the brilliant "Rapport". . . .

that it **has to be** done! Not out of some austere "obligation" or self-imposed duty, but because you can't (or at least, I can't) do without it, if I want to establish an intimate contact with the thing being probed, to "penetrate" it. It's through this work, by "rubbing shoulders" with the things we want to know, over a period of days, weeks or even years, that we actually "know" them - and it's from this knowledge alone, the fruit of often arduous and unassuming **work**, that **something else** sometimes springs forth, that "spark" I was talking about the day before yesterday, which suddenly renews our apprehension of things and the very work that leads us into them.

It's through this fatigue (which is not yet weariness), a sign of energy that has been expended, that I can I can also fully appreciate the prodigious energy my friend Pierre must have expended in this delicate staging operation called "SGA 4<sup>1</sup>", or "SGA 4<sup>1</sup> - SGA 5". I can't say to what extent this artist's work, oh so much more subtle than that of a mathematician and involving faculties of an entirely different order, is conscious, or the work of entirely unconscious forces. And that's an incidental point, which concerns him alone. In any case, the diversion of energy, and the intensity of investment in a task at the antipodes of the discovery drive - the task of gravedigger-prestidigitator - must have been outrageous,

p. 908 □ and (there's no doubt in my mind) still is today <sup>524</sup>(\*). Appropriation-escamotage reflexes,  
p. 909 in his relationship to my work at least, and to any other work that openly bears its mark, ended up (in the course of the long "escalation" that was the Burial of the late Master) acquiring such an empire over his being, that they became like a second nature, invading and covering over his original nature, that of the "child" in him, setting out to discover the world. ... More than once, I've been able to see at close quarters, in

<sup>524</sup>(\*) This obsession with appropriation that has focused on "the formula" is truly insane, in simple rational terms. On the one hand, this appropriation, by necessity, must remain to a large extent, if not totally, symbolic: a satisfaction that we grant ourselves, by playing as if we **were** indeed "the father", or as if we **could** indeed make the whole world believe it. The fictive, symbolic character is already apparent, if we recall that Deligne himself, in the article "La Conjecture de Weil I", published four years before the "SGA 4<sup>1</sup> - SGA 5" montage, writes (p. 278) "Grothendieck has demonstrated Lefschetz's formula" (for Frobenius's correspondence). It's true that just a few months later, in

In the February 1974 Bourbaki exposé (no. 446), in which Serre discusses this article by Deligne, the author is astonished (and rightly so) at the absence of any published demonstration of Lefschetz's formula ("we have been waiting since 1966 for the definitive version of SGA 5, which should

be more convincing than existing mimeographed presentations"), and he takes this opportunity to ironize on the 1583 pages of SGA 4 that set out ("with all the necessary details, as well as many others") the formalism of staggered cohomology. Surely Serre had no idea that these sarcasms directed at an absentee would fall on deaf ears. I'm convinced that they must have played their part in germinating the brilliant idea of "making people forget" this "ganguel of nonsense" etc. SGA 4 and SGA 5, as the public voice seemed to be demanding through Serre's own mouth... But apart from even Weil I, in terms of published texts (including the murder-edition of SGA 5, which remains a convincing if mutilated testimony. . . ) the claim of authorship simply doesn't hold water, in terms of the most elementary mathematical common sense.

Added to this, as I've already pointed out, is the fact that perfecting the famous formula is **purely routine** work, once you know what you want to achieve. It took me a few days to work out the essential features - which led me to some precise questions of divisibility linked to the Artin conductor, for which Serre had the answers ready, elegantly expressed in terms of the Serre-Swan modulus. The slightly time-consuming (but also routine) work was the careful fine-tuning of the non-commutative trace formalism inspired by Stallings' work (which, as luck would have it, had just reached me). All this is the sort of thing that someone with the felling of a Deligne (or only the more modest felling that is mine) deals with by the dozen in the course of a single year!

It's true that in Deligne's words, "trace formula" means trace formula **in any dimension** for the **Frobenius** correspondence, a formula that he takes care (in "SGA 4<sup>1</sup>") to distinguish from what he calls the "cohomological interpretation" ("de Grothendieck", thank you!) of L functions. He presents the latter as a simple **corollary** of the trace formula. (In fact, in the spirit of my talk at the 1964 Bourbaki seminar, the two formulas were for me **synonymous**, as equivalent expressions, one additive the other multiplicative, of the same relationship between "the arithmetic" and "the geometric").

So the real motivation (albeit superficial) behind this obsession with "the formula" is not at all to do with the cohomological arsenal, but to minimize as much as possible, if not entirely erase, the fact that I played a role in demonstrating "the" Conjecture. It is Ellefi nally, who appears to me (up to the moment of the Colloque Pervers in June 1981) as **the** great point of fixation of the conflict that has been woven in my ex-student around the disavowed master.

seemingly innocuous situations (no match for the scale of an "operation" like the "Spread Cohomology" operation I've just looked at a little more closely), the silent effectiveness of these reflexes, working with perfect ease beneath that air of affable candor. Before you've even realized what's happened (if you ever do. . . ), he's already appropriated what you've joyfully created, first by withering it with the breath of discreet, insidious disdain. (It's also true that he's far from the only one in whom I've perceived this breath, which today seems to be part of the zeitgeist. . . ). )

But this breath that fades the beauty of what someone else has created and fades his joy, also fades the beauty of **everything** and the very creative power that is in him, as in each of us, to commune with the thing and know it deeply. Of course, this doesn't prevent him from doing "difficult" things and being admired, envied and feared. But the work he carried within him, of which I was able to see the first signs, is still waiting to be born. It will be born on the day (if ever) when something will have collapsed, and the master-slave will have become, as his disowned master was, a **servant**.

That's sixty well-packed pages now (not to mention a proud bunch of footnotes!), and nearly three weeks' work, that I've just devoted to the single "Cohomologie étale" operation. It's the most voluminous of them all, if not the "biggest" (this one will be reviewed at the end of last year, in the note with the well-deserved name "L'Apothéose"). . . ). I realize that with all this, I haven't even quite finished going through it all. One thing leading to another, this planned "tidying up" of the "facts uncovered" in a certain "investigation" has set the investigation in motion again, making me take a closer look at the rather ordinary volume called "SGA 4<sup>1</sup>", which I had previously only looked at on the run.

It was also an opportunity to revisit, with a more informed eye, the Allusie edition of SGA 5, from sad memory. I'm now aware of a meticulous agreement between the two thieves, Illusie putting herself at Deligne's entire disposal to present an edition of SGA 5 entirely ☐ment to the wishes of his prestigious protector and friend. This presentation of SGA 5 echoes, in a muted way, the spirit of debasement and contempt that runs through the coup-de-scie text, and lends discreet, effective support to the imposture set up in it.

p. 910

The introduction to the edition-massacre is written from beginning to end in such a way as to create in the uninformed reader the impression of a volume of "technical digressions", on the "SGA 4<sup>1</sup>" text which presents itself as central and prior (!). This impression is further reinforced, in Illusie's presentations, by the abundance of references to the pirate text, to which he generously refers every time he uses a result that his friend had seen fit to include in his digest, even when there are "tailor-made" references in the same SGA 5 volume, or even already in SGA 4<sup>525</sup> (\*).

I discovered the reality of a massacre in the course of reflection in the note of the same name (n° 87), dated May 12 last year, and in the sub-notes to it. In this set of notes, I finally give a detailed (if not yet exhaustive) description of the dismantling that had gradually appeared to me over the past two weeks. Having failed to dismantle in detail, as I have been doing for nearly three weeks now, the meticulous scam set up in the so-called "SGA 4<sup>1</sup>" around "la Formule", I still failed to grasp this aspect of meticulous concertation in last year's presentation of the Allusie edition of SGA 5. To conclude with the "Cohomologie étale" operation aka "SGA 4<sup>1</sup>

2

<sup>525</sup>(\*) Thus, Künneth's formula with proper supports (over any basis scheme) is an immediate corollary of the basis change theorem for a proper morphism (derived categories version), which was the first great "break through" in stale cohomology, in February 1963. As such, it figures in the "nonsense gangue" of SGA 4 - we wouldn't want Illusie to refer to it, when there's the central text (intended to make us forget, precisely, those confusing predecessors) holding out its arms... ..

- SGA 5", it remains for me to give a few details on how this consultation manifested itself, in the presentation of "the formula" (the fixed points) in the Illusie edition.

I've already noted (in the sub-note "Les bons samaritains", n° 169<sub>2</sub> ) how Illusie, in his introduction, chimes in with his friend to give the impression that the publication of SGA 5 was dependent on the demonstration of the age-old Lefschetz-Verdier formula. (This demonstration had been available since 1964, and I had of course developed it in the oral seminar, without Illusie, who had taken on the task of drafted in 1965, found it useful to keep his promise for twelve years. ... ).

p. 911

□ I also recall that last year (in the note quoted "The Massacre", n° 87) I had already discovered cer-  
I'd like to point out the vicissitudes of Lecture XI of the original seminar. This lecture, inseparable from the following lecture XII which developed my version (the best known until 1981) of Lefschetz's formula in dimension 1, had completely disappeared from the Illusie edition. According to Illusie's introduction, this paper consisted of "Grothendieck's theory of commutative traces" (a providential slip of the tongue for "non-commutative"! ) "generating Stallings' theory" (of non-commutative traces), and disappeared (just as providentially) in a move (!). In reality, this talk developed the algebraic preliminaries essential for the description of local terms in the following talk, in which I developed a general method for calculating (or better, **defining**) local terms (via a "Nielsen-Wecken"-type formula<sup>526</sup> (\*) ) and its explicit application in dimension one (using Serre-Swan modules, if I remember correctly). In any case, Illusie "replaces" the original "disappeared" paper XI with a "new" paper III<sub>B</sub> , called "Calculations of local terms" (which, unless I'm mistaken and as if by chance, was also the title of the retracted paper!), of **which he presents himself as the author**. In this way, he kills two birds with one stone. On the one hand, it's an act of **mutilation, which** may seem gratuitous at first glance, making a mess of<sup>527</sup> (\*\*) by this brutal **cut**, snatching a presentation from its natural context, leaving a gaping hole in its place, for the pleasure of stuffing it somewhere else. Of all the mutilations that the delicate and meticulous Illusie has inflicted on what was once a splendid seminar (of which he suddenly saw himself as absolute master. . . ), this is perhaps the one that in retrospect strikes me as the most violent, the most brutally ostentatious: I can slaughter for free, and I do slaughter - with all the delicacy befitting my good breeding. Congratulations, Illusie, on this kind of work, which you didn't learn from me, but from someone else, whom you've taken as your model and master... .

p. 912

□ And one. And as a second blow by the same stone, masterfully struck, Illusie manages to **retract the paternity of** this formula of fixed points that I had worked out in 1965, at the same time (and above all) as he succeeded in **concealing this formula itself**. Since 1965/66, this had been "**the**" **correct formula for fixed points in dimension one**, much more general than the one developed by Verdier at Woodshole the previous year (otherwise there was no point in tiring me) and a fortiori, than that of Deligne's famous "Rapport" (which confines itself to the Frobenius correspondence alone, while following step by step the demonstration I had worked out in the general case). It was improved only a few years ago (almost twenty years later) in Alibert's thesis<sup>528</sup> (\*), which for the first time dealt with the case of a cohomological correspondence.

<sup>526</sup>(\*) This formula was appropriated by Deligne (without mentioning myself), with the method of passing from the Nielsen-Wecken formula with constant coefficients (therefore "ordinary"), to a formula of fixed points with quel-conque constructible coefficients. On this subject, see the sub-note "Les vraies maths. . ." (n° 169<sub>5</sub> , page 883-884). As a result (noblesse oblige. . . ) this same Deligne carefully avoids any mention of Lecture XII of the "later" SGA 5 seminar, where the name "Nielsen-Wecken" Nielsen-Wecken and Lefschetz formulas in algebraic geometry").

<sup>527</sup>(\*\*) This mutilation and this mess, among many others sown by the care of my ex-student Illusie at the orders of my ex-student Deligne, allows the latter to express himself condescendingly on the "confused state" ("albeit rigorous", because we're good players. . . ) of SGA 5, to which "SGA<sub>5</sub>4<sup>1</sup>" (however earlier it may be) is supposed to "remedy". . . All this under the watchful eye of the Congrégation des fidèles. Congratulations!

<sup>528</sup>(\*) This thesis was prepared under the supervision of Verdier (no mistake, always the same Verdier), who wrote it in Montpellier in 1981 or 1982 (I don't have the reference to hand). It represents the culmination of ten years of visibly gloomy work... ..

whatever. Illusie has managed to present the text in such a way that **the formula in question is practically impossible to find**: in the technical magma of the lectures (torn from each other) III<sub>B</sub> (sic) and XII, there is nothing (in the introductions to either of them, or elsewhere) to draw the reader's attention to this central result of the two lectures as a whole, and one of the most important of the entire seminar<sup>529</sup> (\*\*)! I confess that I have been unable to ascertain with absolute certainty whether this formula is to be found in SGA 5. Given the deliberate confusion of the text, and my remoteness from the subject, it would take me hours, even days, to find my way around. My problem is the absence of any reference to the Serre-Swan modules, which (if I remember correctly) gave the formula I had devised its elegance and conceptual simplicity<sup>530</sup> (\*\*\*) . It was precisely for the purposes of this formula that Serre had made some beautiful presentations on the Galoisian modules associated with the Artin conductor, which were of course to be included in the the published seminar, and which ended up □passed off (along with five or six other packets of expo- sés du séminaire originel - qu'à cela n'tienne pour les Illusie, Deligne et consorts... ). It's possible that the fixed-point formula in question is formula (6.3.1) in Lecture XII (p. 431). At a glance, there's nothing to distinguish it from the dozens of other copiously numbered formulas, among which this one is drowned. Clearly, the editor (Bucur) was overwhelmed by the task - and it wasn't the brilliant editor-sic Illusie, with fifteen years' experience in the limpid and impeccable tasks of editing, who would have lifted a finger to repair the blunders of his friend Bucur<sup>531</sup> (\*), which suited him perfectly. On the contrary, he manages to increase the confusion, by making the key formula, already untraceable, **indistinguishable from that of Lefschetz-Verdier**, or his particular case in "Rapport". In the introduction to the famous exposé III<sub>B</sub> -sic, by the improvised "father" Illusie, we read:

p. 913

"The second part of this talk (III<sub>B</sub> ), which is **much more technical in nature** [so don't go looking for it!], is **inspired** [!] by the method [!] used by Grothendieck to establish the Lefschetz formula for **certain cohomological correspondences** on curves [so don't go looking for which ones!] (see XII [but it's a fine thing to know where to find "the" formula!] and (SGA<sub>2</sub> 4<sup>1</sup> Rapport) [where the reader will have no trouble finding the formula, and being informed of the identity of its **real father**. . . (emphasis added).

Later in the same introduction, it is said that we (i.e. Illusie, of course) apply the techniques of n° 5<sup>532</sup> (\*\*)

□ "to define, at n° 6, **local Lefschetz-Verdier terms** for coho- correspondences. mological complexes of modules on rings that are not necessarily commutative."

p. 914

The name surreptitiously given to these "local terms" that I had introduced in 1965 for the purpose of writing the formula

<sup>529</sup>(\*\*) Technically, it's **the** crucial formula ("irreducible case") that enables us to prove the famous "*L-function* formula", equivalent to the trace formula (in any dimension) for the Frobenius correspondence. The crucial role of this formula is already attested by the very name of the SGA 5 seminar (a name that is never mentioned in the "previous" text "SGA 4<sup>1</sup> ": "*L-adic cohomology and L-functions*".

<sup>530</sup>(\*\*\*) It's possible that here, and in the following sentence, I'm confusing the structure of the Euler-Poincaré formula (in Lecture X) with that of Lefschetz (in Lecture XII). In the Euler-Poincaré formula, in the form in which it is figured in Bucur's presentation (based on my oral presentation), the Serre-Swan modules are indeed explicitly involved.

<sup>531</sup>(\*) The last lines of the Introduction (by Illusie) to the murder-edition of SGA 5, pretend to "pay tribute to the memory of I. Bucur, who died of cancer in 1976". - a year before the edition-massacre. I don't know if there's a cause-and-effect relationship - I have no doubts about Bucur's fundamental honesty and loyalty, who wouldn't have let an enormity like this go through without at least informing me. Still, the spirit of the operation in which the posthumous tribute is inserted gives it a suspicious flavour. In my opinion, "this was just paying lip service, when there was a better way of honouring Ionel Bucur's memory, by mitigating his blunders rather than shamelessly exploiting them.

<sup>532</sup>(\*\*) In non-commutative footsteps this time - lapsus-persiflage is strictly reserved for the deceased, at least as long as he or she isn't there to respond. ...

formula ("de Lefschetz-Grothendieck"), without having to refer to the local terms of the general Lefschetz-Verdier formula - this name is obviously chosen to maintain the confusion intended and maintained by Deligne - that the explicit formula in question **is** technically **dependent** on the Lefschetz-Verdier formula. A few lines further on, to add to the joy, we learn that "the local terms defined by Grothendieck in Lefschetz's formula of (XII 4.5)"<sup>533</sup> (\*) (which we don't mention are the very ones we've just generously christened "local Lefschetz-Verdier terms") "are indeed local Lefschetz-Verdier terms" (but this time in **another sense**, of course: those of the **general**, "non-explicit" Lefschetz-Verdier formula).

For the art of fishing in muddy water, in a style that I recognize all too well, it's good stuff! The same confusionist technique is used in the introduction to the volume, which reads (page VI, line 5):

"Applications to Lefschetz formulas are given in lectures XII and III<sub>B</sub> ." (emphasis added),

history, especially since the reader is hopelessly lost and has no chance of finding, or even trying to find, **the** only explicit Lefschetz formula known in dimension 1 (until 1981 at least), due (not to Illusie, nor even to his boss Deligne, but) to the late ex-"director" (sic), unnamed as de just<sup>534</sup> (\*\*), from the seminary gaily massacred by his "publisher"-fossilizer Illusie.

p. 915 In the original seminar, the retracted exposé XI, renamed III<sub>B</sub> (with □ a brand-new father), was inserted in a series of six lectures VIII a XIII, centered around the two closely related themes of Euler-Poincaré's and Lefschetz's ex- plicite formulas, treated in the same spirit, following common methods that I had identified during the seminar. In this part of the seminar, as in the others, there was an obvious unity of purpose and vision. This was meticulously massacred by my ex-student, taking advantage of his role as "editor"-sic-of a seminar wrecked by him and my other cohomology students (as a posthumous thank-you to their teacher). With a regularity worthy of the meticulous Illusie, every other lecture of the six, namely lectures IX, XI and XIII, disappeared from the massacre edition. Lecture IX was by Serre and presented the Serre-Swan theory of modules - seeing the turn of events, Serre preferred to withdraw his marbles and see to it himself that his beautiful lecture was made available to all. Lecture XIII was, as the "editor" explains in the introduction to the volume, overstocked - apparently the unnamed "director" couldn't count to thirteen - so it went down the trapdoor! As we've seen, by some brilliant sleight of hand, Expository XI ends up as Expository III<sub>B</sub> , in the appendix to Expository III (as luck would have it), which was originally entitled "Formule de Lefschetz-Verdier" (Lefschetz-Verdier Formula) and has now been renamed, for the sake of confusion, "Formule de Lefschetz" (Lefschetz Formula). In any case, this "move" was not made at random - it always goes in the same direction, that of the confusion tirelessly maintained by the perfect Deligne-Illusie tandem between the Lefschetz-Verdier formula (the one that is "conjectural", "local terms not calculated", but finally proved anyway by the combined efforts of Deligne and Illusie. . . ), and another, explicit formula that must remain rigorously hidden, carefully embedded in a magma of formulas numbered with

<sup>533</sup>(\*) (May 12) Puzzled by this unusual clarification (XII 4-5) concerning "my" formula, I've just looked at the cited reference. I find a "**Conjecture 4.5**" (p. 415), which seems to concern the possibility of defining local terms. We had a feeling that this impayable quidam was going to come up with another one of his conjectures, instead of a real défi nition... ..

<sup>534</sup>(\*\*) While all the essential results of the SGA 5 seminar, with the exception of the Lefschetz-Verdier formula and the Serre-Swan theory of modules (which does not appear in the massacre edition), are due to me, Illusie presents the texts in such a way that for **none of** these results (not only the so-called "Lefschetz formula" lost somewhere in an exposé XII. . . ) does it appear that my modest person had anything to do with it. ) it appears that my modest self had nothing to do with it. As a result, he played a leading role in the operation

**the eviction** of my person from the SGA, prepared for a long time by his friend Deligne, an eviction which finds its epilogue in the note "Les Pompes Funèbres - "im Dienst der wissenschaft"" (n° 175). (See also the sub-note "L'éviction (2)", n° 169<sub>1</sub> .)

four decimal places, insinuations that never said anything, carefully calculated ambiguities. Congratulations again, dear ex-student! As a result, paper X, entitled "Euler-Poincaré formula in staggered cohomology"<sup>535</sup> (\*), deprived of the one that preceded it and the one that followed it, hangs pitifully in the void. Good work, you haven't wasted your time... .

## (f) Congratulations or the new style

**Note** 169<sub>9</sub> (March 22 and April 29) I would like to come back to the confusion between the formula de Lefschetz-Verdier and the **occult** formula,  $\square$ . I have just discovered a rather copious "Terminology index" in SGA 5 - either you're careful, or you're not! Out of curiosity, I looked under "Lefschetz", in case "my" formula was there... . The only reference is to a "Lefschetz-Verdier formula (exposé III)". - which, as we've seen, has been renamed "Lefschetz formula". So the reader is well warned that there is no other "Lefschetz" formula (at least not in this volume) than the so-called "Lefschetz-Verdier formula" (the very one that he has learned is conjectural etc., that SGA 5 depended on it for life and death, and that "SGA 4<sup>1</sup>" as its name suggests saves the day here. . . ) Beautiful work, yes!

p. 916

I'm continuing my tour of my ex-pupil Illusie's prowess, under the tutelage of my other ex-pupil Deligne. I take up again the quotation from the introduction to the volume-massacre<sup>536</sup> (\*), where "the" Lefschetz-Verdier formula, always the same, had suddenly multiplied (by virtue of the art of mathematical prestidigitation) into "Lefschetz formulas", but nobody had ever been able to say which ones. He continues (page VI, line 6):

**"The trace formula in Lecture XII [which we hope no reader will ever think of unearthing. . . ] is demonstrated independently of the general formula of Lecture III, but it is shown in (III B 6) that the local terms that appear there are indeed those of the general formula, and that the latter implies it."** (Emphasis added.)

Nothing in her hands, nothing in her pockets - untraceable Illusie, just as untraceable as her brilliant prestidigitator-in-chief! Having tracked down one ambiguous trompe-oel after another, all pointing in the same direction, I've only just noticed that here, in an innocuous turn of phrase that had escaped me until now (as it will have escaped any other reader of this introduction more than four pages<sup>537</sup> (\*\*)),

$\square$  it is said in chiaroscuro that a certain formula in the traces of Lecture XII (which the reader must work out for himself

p. 917

<sup>535</sup>(\*) Unless otherwise stated, the reader will guess that this famous "Euler-Poincaré" formula is due to the two illustrious geometers whose name it bears. Compare with previous b. de p. note.

<sup>536</sup>(\*) See the beginning of the quotation in the previous sub-note "Les prestidigitateurs - ou la formule envolée" (n° 169<sub>8</sub>), page.

<sup>537</sup>(\*\*) Zoghman Mebkhout, who is an attentive reader but who arrived a little late, tells me that he himself has been deceived, convinced that he's not the only one.

that the explicit fixed-point formula (for Frobenius in any dimension, or for general correspondences in dimension one) did indeed depend on the general (non-explicit) Lefschetz-Verdier formula. So Illusie's thumb-affirmation had escaped his attention as well as mine - which was indeed the intended effect... ..

The confusion is reinforced by the fact that my 1974 Bourbaki lecture, presenting the formula for *L-functions* "with coefficients" in a constructible *l*-adic bundle (or, what amounts to the same thing, the explicit fixed-point formula for the Frobenius correspondence in such a bundle), was written **before** an **explicit** formula in dimension one had been made explicit. At the time, I assumed that proving the explicit formula for Frobenius, in dimension one, would appear as a corollary of the general Lefschetz-Verdier formula - that "all we had to do was make the local terms explicit". So, anticipating work that remained to be done, by Verdier in this case, I named this **explicit** formula the "Lefschetz-Verdier theorem" in this Bourbaki presentation. In what follows, both Verdier's "woodshole" demonstration and my own, covering a much more general case, do not make use of the general Lefschetz-Verdier formula. The situation was perfectly clear to all SGA 5 listeners, at least. But for those who only knew about my Bourbaki presentation to the exclusion of SGA 5

as he can to find out which one!) is demonstrated independently of "the general formula of exposé III" (which, for the occasion, is also not entitled to a name, in accordance with the method known as "deliberate vagueness". . . ) - only to follow up in the same breath and in the same sentence (as if to "**make up for**", as it were, a statement that was not in line with the rules of prudence. . . ) with a "but one shows... ". This "but" refers to that "platonic" complement that no one, starting with Illusie and Verdier, had bothered with for twelve years, namely that "my" local terms - sorry, I meant "the ones that appear in them" - were "my" local terms.

(in this formula, traces of exposé XII, the author of which will never be clearly named<sup>538</sup> (\*))

□ - that these terms are those of the endless "general formula" - and the vagueness about the names given to formulas and where to find them, suddenly gives way to exemplary precision, worthy of the meticulous Illusie: this demonstration of a "rabit" can be found in III B 6 - if a reader wants to make sure it's there, he'll have no trouble finding it!

And why this sudden interest in this identity, when the fate of the SGA 5 seminar in its entirety had left Illusie (like my other cohomology students) perfectly indifferent for eleven years? It's so that I can brilliantly follow up, in the same sentence again (it's from the envoy or I don't know my stuff!) that "the general formula" (by Lefschetz-Verdier, not to name it) **implies** "that of exposé XII" (by an equally unnamed defunct).

It's a truly brilliant trick! My brilliant ex-student sweated blood and water, including mathematical piecework, but yes, to arrive at the brilliant result of this seemingly innocuous - and yet, in the eyes of a Deligne and those of his servant, momentous - end of sentence: the Lefschetz-Verdier formula "implies" that of "exposé XII" (which we've just said was demonstrated independently, but never mind for the sake of the all-symbolic satisfactions of the unconscious!).

This "**implication**" is of a very particular nature, mathematically speaking - and I bet I'm the only mathematician in the world, apart from the brilliant inventor of the gag (and perhaps his master Deligne), who could appreciate its flavor. To understand it, however, you don't need to be a specialist, or even a mathematician. The two formulas, the "general" one (a.k.a. Lefschetz-Verdier) and "that of exposé XII" (a.k.a. the unnamed deceased), are expressed respectively as follows

$$T = L, \quad T = L',$$

where the term  $T$  (alternating sum of traces) is the same in both formulas, while the terms  $L, L'$  (sums of local terms) have been defined ad-hoc (one by Verdier in the spirit of Lefschetz, the other by the deceased in the spirit of Nielsen-Wecken-Grothendieck). Eleven years later, Illusie (whose editorial zeal was suddenly awakened at a sign from the chief) makes a sudden effort, worthy of a better cause, to prove

---

(remaining sequestered until 1977), there was a misunderstanding, which was exploited to the full by Deligne and Illusie, in mutual agreement, to set up the deception (sewn in thick white thread) "SGA 4<sup>1</sup> - SGA 5".

From the point of view of the imposture of SGA 5's "logical dependence" on the misleadingly-named pirate-text, this doesn't hold water anyway, even if the explicit formula did indeed depend on Lefschetz-Verdier's "conjectural" formula. Indeed, as Deligne himself notes in passing in the famous "Méthode A" (for a reader who asks grâce - see "Les vraies maths. . . " n° 169, page 884), the "easy reductions" of the unnamed quidam brought us back to the case of dimension one, where "the ingredients of the demonstration were moreover all available".

All these deceptions work, as long as they're served up to a reader who's either asleep, in a hurry, or who wants nothing more than to be emberlifi coté. To an attentive and critical reader, the whole clever set-up appears for what it is: a shameless swindle. But I seem to be the first attentive and critical reader, in the eight years since this scam appeared on the mathematical market. ...

<sup>538</sup>(\*) For the reader of SGA 5, it's Illusie, author of the brilliant exposé III<sub>B</sub> on "local terms", who must appear as the modest father of the never-named formula. For a reader of the volume entitled "SGA 4<sup>1</sup>", who hasn't heard of another formula than "Rapport", the father is obviously the brilliant author of the volume, for a reader of the two (if there is one), he'll just have to flip a coin, or give his tongue to the cat... .

directly (?)

$L = L'$  (and the same applies to local one-to-one terms),

so that we can say that the formula  $T = L$  "implies"  $T = L'$  (and thus, implicitly, that the formula  $T = L'$  of the seminar to be massacred, crucial for the theory of  $L$  functions, "depends" on the formula  $T = L$ , which remained "conjectural" before the appearance of Deligne and his providential "SGA 4<sup>1</sup>" - sic. . . ).

□ The situation becomes even more grotesque for those in the know, who realize that p. 919 nobody in the world would have had the idea of the abracadabra definition of the local terms that enter into  $L'$  (those of the unnamed deceased), if this definition hadn't been directly "blown" by the very process of demonstrating the formula  $T = L'$ . To tell the truth, I can say that I found a "demonstration" of the formula  $T = L'$  **even before** I had defined the second member  $L'$  and its local terms: the latter "came out" of the demonstration, no more and no less<sup>539</sup> (\*).

Congratulations, a third time, Illusie, and to you just as much, Deligne, who served as her model. Together, you have pioneered a **new style** in mathematics. A style that has already set an example. It has already become known as the "1980 style", with a visibly bright future<sup>540</sup> (\*\*). It's a style of prestidigitation, aka "the gravedigger's style", where the art lies in constantly **deceiving the reader**; not only on the **authorship** of the main ideas, but also (in the process) on their filiations and mutual relationships, on the significance of each, on what is essential and what is accessory - and all this for the laudable purpose of magnifying that which is to be magnified, of debunking (or burying with a nonchalant gesture and the bend of an anodyne sentence . . . ) those who are to be debased (or buried. . . ); and **above all**, to have the sensation that

**power**: to lead the reader around by the nose, to make and unmake the history of the company.

his science **according to his good** □ **pleasure**, and decide what "are" the mathematical things he claims to expose,

p. 920

and what they are not. It's the art of always "**ruling**" by delicately pulling invisible (?) threads, without ever, ever stooping to serve. And all this, so as to be always and totally "inch!" So that if, by any chance, a cleverer-than-thou reader were to go and have a look for himself, and have the unusual idea of using (you never know...) his own lights and faculties (it's rare, but after all, it could happen...), he'd never be able to catch you in the act of saying something which, **taken literally** and with no escape from ambiguity or double entendre, is well and truly and irremediably **false**.

The art of art lies in this style clause, which may seem a challenge, and yet... . With the Colloque pervers d'étrange mémoire, barely four years after the virtuoso displays of prestidigitation of the dazzling "SGA 4<sup>1</sup> - SGA 5" operation, we have seen just how far this new, innocent technique can go.

<sup>539</sup>(\*) I should point out, as is self-evident, that in all conceivable applications (not just to the  $L$ -function formula, concerning the Frobenius correspondence alone), it is the **explicit formula**  $T = L'$  that is **the** relevant formula. From a practical point of view, and as far as one-dimensional phenomena are concerned, the Lefschetz-Verdier formula  $T = L$  is only of historical (or heuristic) interest, and the same applies a fortiori (at least until further notice) to Illusie's result  $L = L'$

(or, more precisely, that the two types of local terms, those figuring in  $L$  and those figuring in  $L'$ , are the same).

These are all very obvious things, but they're the kind of things that these two guys manage to do (and succeed at, these days) to blur. It's a sobering thought as to what sense the unbridled scientific production we're witnessing can have, when such crude breaches of simple mathematical common sense (and this on issues that closely touch on crucial progress made over the last twenty-five years in our knowledge of the relationship between geometry and arithmetic) go unnoticed by one and all. . .

<sup>540</sup>(\*\*) For eloquent examples in this vein, see the few samples of the "1980" style that appear in the note "La maffi a" (n° 171<sub>2</sub>), written by our great authors Brylinski, Kashiwara, Beilinson and Bernstein. Clearly, we have every reason to hope!

(May 12) As other occasional adepts of the "new style", who have distinguished themselves in the wake of the work of an obscure posthumous pupil never named, I can now add Malgrange, Laumon, Katz. (See note "Carte blanche pour le pillage", n° 171<sub>4</sub>.)

to go, in the concealment of an innovative work, and in the shameless despoiling of the man who had long carried this work and matured it in solitude... .

Hats off to the master and the pupil, to Deligne and Illusie! An artist's work! You both deserve the unanimous recognition of the entire Congregation.

## 18.5.3. (2) Sharing ("Duality - Crystals")

### 18.5.3.1. a. The last man in - or deaf ears

**Note** 170(i) (February 28) I've come to the third of the "four operations" around my mathematical work (pending the fourth in the next note, skipping Zoghman Mebkhout's work).

III The "Duality - Crystals" operation (or: "Les Beaux Restes. . .").

As I see it now, it's roughly a question of **sharing** the part of my work concerning cohomology that hadn't yet been appropriated (de facto, or symbolically) by **P. Deligne**<sup>541</sup> (\*). The latter has obviously reserved the lion's share for himself, with the motifs and staggered cohomology, and more specifically- the  $\ell$ -adic cohomological tool. The remainder(\*) is shared between two other of my co-students.

p. 921 homo □ logistes, **J-L. Verdier and P. Berthelot**<sup>542</sup> (\*). The consensus that has emerged, I cannot say when and how, seems to be as follows: to Berthelot all crystalline cohomology, and the rest to Verdier, who essentially annexes everything that revolves around the yoga of duality<sup>543</sup> (\*\*), and the yoga of derived and triangulated categories that constitutes its algebraic prerequisite.

Concerning Berthelot's participation in the sharing of my remains, I have only one fact, albeit a small one. I came across it by chance last year, in the course of reflection in the note "Les co- héritiers... . "(n° 91), and I devoted a small sub-note to it (n° 91<sub>1</sub> ). This is Berthelot's article-survey, which I quote there<sup>544</sup> (\*\*\*), presenting the main ideas for a "synthesis" (he says) of Dwork-Monsky-Washnitzer cohomology and crystalline cohomology, at the September 1982 Colloque de Luminy entitled "Analyse *p*-adique et ses applications". In the introduction, part b), he gives a short history of crystalline co- homology, in a narrow-minded way that in no way corresponds to the much broader vision I had of crystalline yoga<sup>545</sup> (\*\*\*\*).

My name is omitted from both the text of the article and the bibliography. I refer to the sub-note quoted for a few comments and clarifications, which need not be repeated here. I'd just like to add that, once I'm out of the picture, it's none other than Berthelot who is considered to be the father of crystalline cohomology, without him even bothering to say so in plain English - a certain style of appropriation has obviously become the norm... . In fact, it was his thesis, which he prepared with me based on my initial ideas, that was the first published work on the subject of crystalline cohomology (apart from the very brief sketch that I myself had prepared).

<sup>541</sup>(\*) (May 1) It is nevertheless worth setting aside the formalism of duality in **coherent** context, which (contrary to an impression that has turned out to be hasty) has apparently not yet been appropriated by any of my cohomology students, nor by anyone else to my knowledge. It's true that the only reference text, setting out the bulk of my ideas and results on this theme, is R. Hartshorne's "Residues and Duality", which makes it possible to refer to it without at any time having to pronounce an undesirable name. ...

<sup>542</sup>(\*) (May 1) It has since become clear that we need to add a "fourth thief" in the person of Neantro Saavedra Rivano, who appropriates the philosophy of the Galois motivic group, via the categories christened "Tannakian" for the occasion. But he simply acted as a "straw father" on behalf of Deligne, who "recovered" the paternity ten years later.

For a detailed history, see "The sixth nail in the coffin", n° s 176<sub>1</sub> to 176<sub>7</sub> .

<sup>543</sup>(\*\*) See footnote on previous page.

<sup>544</sup>(\*\*\*) Géométrie rigide et cohomologie des variétés algébriques de caractéristique  $p$ , Pierre Berthelot, in Colloque de Luminy 6-10 septembre (CIRM) "Analyse *p*-adique et ses applications".

<sup>545</sup>(\*\*\*\*) on this subject, see the sub-note "Deaf ears" (n° 170(i)bis ) which follows this note.

made of some of the ideas of  $\square$ départ<sup>546</sup> (\*)). His thesis presents a large-scale groundwork for a p . 922 first part (170(i)bis) at least to the program I had proposed.

This memorable "survey" took place in 1982, a year after the "Colloque Pervers" (Luminy June 1982), which we'll be talking about with "Operation IV". I haven't bothered to go back through the Berthelot prints in my possession, to find out whether this participation in my Burial represents a late turning point in his relationship to me and my work, or whether it's the continuation of an earlier attitude. If the former, it's a safe bet that this turnaround comes in response, as it were, to the sudden and unbridled self-escalation in the general degradation of scientific ethics, accomplished the previous year with the Colloquium. Let me remind you that 1982 also saw the publication of the "memorable volume" LN 900, exhuming the motifs<sup>547</sup> (\*\*), in which the person who bore the brunt of the operation was no longer a vague "service unknown" (as at the brilliant Colloquium), but a "deceased" whose name, in spite of everything, is still remembered (albeit reluctantly. . . ). The previous year's operation had shown clearly enough that no restraint was to be expected - and "operation Motifs" did indeed pass, just like "operation Cristaux" and all those that had preceded it, without the slightest wrinkle. ...

**Note** 170(i)bis (170(i)bis) (February 28 and April 30)<sup>548</sup> (\*\*\*) here I mean by the "first part" of crystal theory (in car.  $p > 0$ ) that which concerns the crystal cohomology, with constant coefficients (or "twisted constants"), of **clean and smooth** schemes on a basic scheme of car.  $p$ . It is then sufficient to work with the "ordinary" or "infinitesimal" crystal site, which I had introduced (provisionally) towards the end of the years sixty<sup>549</sup> (\*\*\*\*). In fact, contrary to the restricted meaning Berthelot likes to give to the term "cohomologie cristalline", this one had for me from the beginning a much  $\square$  broader meaning, which I did not hide from p . 923 him or anyone else, and which my students apparently forgot - only to "reinvent" a little piece of it ten or fifteen years later. ...

On the one hand, from the outset, my crystal ideas were by no means confined to the case of schemes of a given characteristic  $p > 0$ . My first crystal reflections, before I came up with the new idea of introducing "power-divided thickenings", focused on schemes of **zero characteristic**, where the divided powers are automatically present (and therefore tend to go unnoticed. . . ). The natural outcome of this direction of research, renewed thanks to the ideas of Zoghman Mebkhout, would be the formalism of the six operations for "De Rham-Mebkhout crystalline coefficients" on zero characteristic schemes (to begin with), a formalism to which I had already alluded in the note "Melody at the tomb - or sufficiency" (n° 167). As early as the 1960s, I foresaw a cris- talline cohomology without characteristic distinctions, in the form of a crystalline "six operations" formalism in the context of (for example) finite-type schemes on the absolute basis  $Z$ . It was to encompass the "ordinary" crystalline theory (which was still being sought - and is still being sought) for finite-type schemes on the  $p$ -element  $F$ -body $_p$ . I'm convinced that forgetting and burying this vision of the late master (however simple and inspiring it may have been) is the cause of the sorry stagnation of crystalline theory, almost twenty years after its vigorous beginnings.

<sup>546</sup>(\*) The only published sketch of these ideas, based on five lectures I gave at IHES in November and December 1966, written by I. Coates and O. Jussila, is "Crystals and the De Rham Cohomology of Schemes", in Dix exposés sur la Cohomologie des Schémas (North Holland, Amsterdam 1968) pp. 306-358. All the essential starting ideas are outlined, including the need to introduce local thickenings à la Monsky-washnitzer (pp. 355-356).

<sup>547</sup>(\*\*) See "Silence" (n° 168), especially ". . . and exhumation" (n° 168(iii)).

<sup>548</sup>(\*\*\*) This sub-note is taken from a footnote to the previous note "La part du dernier". (\*\*\*\*) (May 12) In fact, already in 1966, see b. de p. (\*) above.

<sup>549</sup>(\*\*\*\*) (May 12) In fact, this was already in 1966, see b. de p. note (\*) above.

On the other hand, and to return to the Monsky-Washnitzer approach, which had helped "trigger" my interest in crystal cohomology, I had in mind from the outset the need to introduce (for the purposes of a theory that would not apply only to clean, smooth schemes) a crystal site larger than the "infinitesimal" site, where the "thickenings" envisaged would be spectra of **topological** algebras. (with power-divided ideal), perhaps those used by Monsky-Washnitzer (freed of

unnecessary assumptions such as smoothness)(\*). Identifying "the right site" and "the right coefficients" is part of the program that I had bequeathed (to no avail, it now appears) to my cohomology students, starting with Berthelot. Having thought about the matter recently "in passing" (while writing *Récoltes et Semailles*), and remembering the imperative of a crystalline theory encompassing all features at once, I've come to wonder whether these topological algebras (à la Monsky-Washnitzer, or any other reasonable variant) aren't too "coarse" (in the same way as restricted formal series), because they're too "far removed from the algebraic", and if they shouldn't be replaced by "thickenings" that are (in a proper sense) "étale neighborhoods". I plan to return to these questions in the part of *Reflections* following on from *Harvest and Sowing* (volume 3, I presume), with the exposition of the yoga of the six operations and the "problem of coefficients", and in particular crystalline coefficients of the "De Rham-Mebkhout" type.

Mebkhout had already sensed that his D-Module philosophy would provide a new point of view for crystalline theory. But his suggestions in this direction, notably to Berthelot in 1978, coming from a vague unknown and unrepentant Grothendieckian, fell on deaf ears<sup>551</sup> (\*). . .

<sup>550</sup>(\*) As I pointed out in a previous b. de p. note (see page 922), such Monsky-Washnitzer thickenings are mentioned in my first and only published talk on crystalline yoga, from fi n 1966. From that moment on, it was clear to me that crystalline cohomology of characteristic  $p > 0$  was going to be played out for the most part on rigid-analytic spaces of zero characteristic. Of course, I didn't fail to make this clear to anyone who might be interested, and certainly first and foremost to my pupil Berthelot, once he had chosen to take up the crystalline theme. In the article quoted, in a style that I recognize well and that Berthelot did not invent, it seems as if he had just discovered (fifteen years later) the unsuspected link with rigid-analytic(x) geometry. Here, he poses as the brilliant inventor of a "common generalization" (of Monsky-Washnitzer and crystalline theory), which he pompously christens "rigid cohomology" (and which will soon be called, appropriately enough, "Berthelot cohomology"). I should also point out that Berthelot's work is "the continuation of a reflection carried out with Ogus" - the same Ogus who distinguished himself the same year (1982) by his participation in the "Motifs" scam, as co-author of the LN 900 volume.

The systematic burial continues in a later article by Berthelot (of which I have a preprint) "Rigid cohomology and Dwork theory: the case of exponential sums" (undated). No reference to the deceased for the crucial notion of  $F$ -crystal, or that of cohomology with proper support (which I have the honor of introducing into algebraic geometry in February 1963, twenty years before. . . ). These notions are so natural that there's really no need to bother. . . . The notion of a generic fi bre of a formal scheme (above a discrete valuation ring), as a rigid-analytic space, is generously attributed to my ex-student Raynaud. This notion was known to me before Berthelot, Raynaud or anyone else had even heard the word "rigid-analytic space", since it was the need to be able to define such a generic fi ber that was one of my two motivations for foreseeing the existence of a "rigid-analytic geometry", and it was also he who was subsequently one of the two driving fi les for Tate, setting up a formal construction of such a geometry: its defi nition had to be such that the notion of "generic fi bre" became tautological. . .

(x) (September 1985) In fact, the first to foresee the existence of such a theory was J. Tate, in August 1959. On this subject, see note n° 173 d) ("L'Enterrement - ou la pente naturelle"), and more particularly the footnote on page 1132.

<sup>551</sup>(\*) Having deaf ears doesn't stop the same Berthelot, in the article I quoted in the previous b. de p. note, to refer nonchalantly (at the end of par. 3 A) to "an analogue of the theory of  $D_X$ -Modules on a complex variety", which "for the moment" is not yet available in the rigid-analytic framework. There's no question, of course, of mentioning the name of a certain vague stranger who had come to him with outlandish suggestions four or five years earlier, and all the more so as a certain Colloquium the previous year (discussed in the following note "The Apotheosis", n° 171) had clearly set the tone with regard to the vague unknown in question, surely, within a few years, and with the blessing of the true father of the well-known "Riemann-Hilbert-Deligne" philosophy, Berthelot was to become the brilliant inventor of  $D$ -Module philosophy in the context of "rigid-analytic cohomology", also known as (although he himself refrained from calling it this) "Berthelot cohomology". Which just goes to show that, these days, you don't need a sharp ear to go that far... ..

### 18.5.3.2. b. Glory galore - or ambiguity

**Note** 170(ii) □ (February 28)<sup>552</sup> (\*) To situate "Operation Duality", to the dubious benefit of J.L. Verdier, there are p. 925

should first say a few words about the yoga of duality (called "of the six operations" - but the name sank without trace) that I had developed from the second half of the fifties onwards, and that of derived categories, which is in truth inseparable from it. I expressed myself in some detail on this subject in the note "Mes orphelins" (n° 46, in particular pages 177-178) and in the sub-note n° 46<sub>2</sub> to this one (pages 186-187), and finally (in a beginning of reflection on the role of Verdier in the burial of my point of view in homological algebra) in the note "L'instinct et la mode - ou la loi du plus fort" (n° 48). I don't think it's necessary to return to this, and suggest that readers refer to it if necessary, before continuing with the account of the "Duality" operation<sup>553</sup> (\*\*).

Verdier's attitude to the sharing operation appears more ambiguous than that of his two friends, in that **he played**, sometimes simultaneously, **on two** seemingly contradictory **fronts**. At first, it was hard for me to identify with them, as the situation seemed so confusing. On the one hand, after he defended his thesis in 1967 and especially after I left in 1970, he tried (for reasons that escape me) **to bury and discredit** the yoga of cohomological algebra and duality that he had inherited from me, even though he had devoted most of his energy, throughout the sixties and up to the defense of his thesis, to developing these ideas and enriching them with his own contributions. On the other hand, from at least 1976 onwards (nine years after he had defended his thesis-sic), and with the encouragement and effective support of Deligne, he pretended to claim authorship of both the original ideas (insofar as they were not boycotted), as well as all the methods and results I had developed □ around the theme, methods that apply mutatis mutandis to all kinds of other contexts<sup>554</sup> (\*), such as topological spaces, or complex analytic spaces. p. 926

Regarding Verdier's attitude towards derived categories alone, I have tried to put my finger on the meaning of this ambiguity in the note "Thèse à crédit et assurance tous risques" (n° 81)<sup>555</sup> (\*\*). It also contains a number of material facts, notably about the strange circumstances surrounding his thesis work (still unpublished today) and defense. With the benefit of a year's hindsight, the vision of things that emerges in the course of this reflection seems to me probably correct (perhaps with a few tweaks), but superficial nonetheless. It's quite clear to me that Verdier's **real** motivations lie not at the level of some paltry "calculation of returns", but are of an entirely different nature, and essentially involve his ambivalent relationship with me. Even to a superficial observer, it seems to me, it's particularly obvious in his case that, in believing he was burying the man who was his master, it was none other than **himself** and the creative force within him that he was burying, day after day and right up to the present day.

<sup>552</sup>(\*) The text of this note was edited and corrected on certain points on May 1 (Lily of the Valley Day).

<sup>553</sup>(\*\*) (May 12) See also the note "L'ancêtre" (n° 171(i)) and "Le tour des chantiers - ou outils et vision" (n° 178), in particular the "Six opérations" and "Coefficients" chantiers (n° s 3,4).

<sup>554</sup>(\*) Of course, in the "other contexts" in question, the original difficulty of the slab context, i.e. the need for a "breakthrough", is still present. which gives a minimum grip on the stale cohomology (in the absence of the well-known transcendental constructions using singular simplexes, retraction methods etc.) don't arise. My students have all found situations where the big preliminary "breakthrough" work had already been done by someone else - all they had to do was bring in their furniture, which the "other" often provided on top of everything else. As soon as the opportunity arose, they hurried to bury it, to take advantage of what they saw fit to appropriate, and to make fun of the rest... ...

<sup>555</sup>(\*\*) When writing this note, I was not yet aware of how Verdier had distinguished himself, with the "good reference" he provided in 1976 - see "step 2" below.

To round off the "Dualité" operation, I'm now going to give a brief retrospective of the various stages of this operation that I know of, and more generally, of Verdier's participation in the Enter- rement.

**Stage 1** (1966-1976). It was after I left in 1970 - I can't say exactly when - that Verdier informed me that he no longer intended to publish his thesis. The thesis was supposed to present the new foundations of homological algebra, from the point of view of derived categories. In my view, the *raison d'être* of his thesis work was to be made available to all, to provide a reference text. comparable in scope to the Cartan-Eilenberg book, directly adapted to the new needs that have arisen in the past few years.

p. 927 □courses <sup>of</sup> the fifties and sixties in the wake of my work and that of my students. Looking back,

I realized that this new cohomological language had only been fully assimilated by my cohomology students, and that Verdier's decision was tantamount to drawing a line under this new vision of homological algebra. As a result, his twenty-five-page "thesis", which merely presented a convincing sketch of ideas that he himself said were not his own, lost its meaning and became, strictly speaking, a "thesis-bidon". But in the early 1970s, when I learned (with surprise) of Verdier's decision, I was so intensely absorbed in tasks that were the antithesis of my former mathematical interests, that these questions were infinitely remote to me. It never occurred to me to write about the subject, learned in a draught (I can imagine) between a public discussion on the scandal of the cracked drums of atomic waste at Saclay, and a work session for the *Survivre et Vivre* newsletter! And even less would I have thought of reacting. The first time I finally "posed" on the meaning of Verdier's act, and its nature as deliberate sabotage timidly began to emerge, was in the aforementioned note "L'instinct et la mode - ou la loi du plus fort" (n° 48), taken up a few weeks later, after the discovery of l'Enterrement "dans toute sa splendeur", in the much more detailed and in-depth note "Thèse à crédit et assurances tous risques" (n° 81).

In retrospect, it becomes clear that Verdier's division in the work he had assigned himself, and which formed part of the "contract of good faith" he had entered into with his thesis jury (see note cited n° 81), must date back at least to 1968 or 1969; otherwise the writing and publication of his "thesis" would have been a done deal long before I left in 1970. I would remind you that I had already submitted the work program for his thesis to him in 1950, and that for a gifted and motivated researcher such as he was at the time, this program, with its extensive drafting of new foundations, could hardly have represented more than three or four years' work at the most, updating and all. It's also true that a certain mentality, which consists in arranging to withdraw credit in advance for a planned "job", which one then has no reason to bother doing, has become the norm.

- such a mentality is now becoming apparent to me as early as 1964, with the vicissitudes of the formula Lefschetz-Verdier" duality, and later, with the "Verdier" duality of

p. 928 locally compact spaces, in the spirit of the six operations □ (which always remain unnamed)<sup>556</sup> (\*). But

Throughout the sixties, locked up as I was in my tasks and in the vision I tirelessly pursued through them, like Ahab's elusive and omnipresent white whale, I had no idea that something was "wrong" with the man who was for me like a close companion in tasks I believed to be "common" - any more than I would have suspected it for any other of my cohomological students. And with twenty years' hindsight, I am now struck by the extent to which, for ten years of my life (if not fifteen or twenty), I lived completely **out of step** with the reality around me, not only in my family life (where I came to realize this a long time ago), but also in my professional life.

<sup>556</sup>(\*) On the subject of this rather unusual spirit, see the sub-note "Le patrimoine - ou magouilles et création" (n° 169<sub>6</sub> bis), and also last year's sub-notes (n° s 81<sub>2</sub>, 81<sub>3</sub>) to the aforementioned note "Thèse à crédit et assurance tous risques".

in my professional life, in which I invested myself with passion... .

But I return to "stage 1". In any case, Verdier's ambiguous relationship with me and my work became apparent as soon as the SGA 5 seminar was completed in 1966: he, like none of my other cohomologist students, was not concerned with the editing of this seminar<sup>557</sup> (\*\*), which remained in the hands of "volunteers" - sic - who were overwhelmed by the task, or who had little concern for keeping their commitments. Clearly, even then, the situation among my cohomology students was rotten, although I didn't notice anything, preferring to live in a world where everything is order and beauty. . . It's eighteen years later that I'm beginning to take a first, tentative look at what really happened, in times that (just a year ago) seemed idyllic<sup>558</sup> (\*\*\*)).

After I left in 1970, and even before he announced his "official" decision to scuttle his work Verdier's ambiguity in the sixties was confirmed by his complicity with various mini-escroqueries of his friend Deligne's vintage, which he couldn't fail to notice :□|' escamotage de my person in the Hodge I, II, III articles<sup>559</sup> (\*), then in the published version of the SGA 7 II monodromy seminar (presented under the names of Deligne and Katz, the latter unexpectedly taking the still-warm place of a deceased... .). In the same year (1973), he also came across Mac Pherson's paper, which solved a "Deligne-Grothendieck conjecture" for which he knew Deligne had nothing to do with it.

Until 1976, Verdier's role in L'Enterrement seems to have been mainly passive, at least as far as tacit annexation operations are concerned. On the other hand, by refraining from publishing what was supposed to be his thesis (which had been granted to him "on credit"<sup>560</sup> (\*\*)), he played a crucial role in the enterrement of my point of view in commutative homological algebra (which he had made his own for a while), and of its use as an "everyday" technique in algebraic geometry, topology and algebra. Like his friends Illusie and Deligne, by thus scuttling the work of his own hands, for the pleasure of burying the one who had inspired him, he has well deserved the unreserved recognition of the unanimous Congregation... ..

This deliberate intention to bury was also clearly expressed in his discouraging attitude towards Zoghman Mebkhout, after 1975, when he pretended to be inspired by my yoga of duality, and that of derived categories. On this subject again, I refer the reader to the more detailed notes already quoted, "My orphans", "Instinct and fashion - or the law of the strongest", "Thesis on credit and all-risk insurance" (n° 46, 48, 81), as well as the note "L'inconnu de service et le théorème du bon Dieu" (n° 48)<sup>561</sup> (\*\*\*)).

**Stage 2** (1976). 1976 saw the publication of the "memorable article" □de Verdier in Asterisk<sup>562</sup> (\*), already referred to as "episode 3 of an escalation" with the operation "Cohomologie étale" (see note "Les manoeuvres", n° 169). Let me remind you that this fifty-page article consists (apart from a few pages of its own) in repeating verbatim a certain number of notions and techniques I had developed.

<sup>557</sup>(\*\*) In retrospect, I wonder what Verdier could have been doing with his time between 1964 (when, thanks to my contact, he had managed to get to grips with the new cohomological techniques) and 1970, when he didn't deign to take on and complete any editorial tasks, not even the theories he was to present himself as the author of. For a list of his contributions, valid but none of which were completed, see sub-note n° 81<sub>1</sub> to the much-quoted note.

<sup>558</sup>(\*\*\*) see in particular, in "Fatuity and Renewal", the section "A world without conflict?" (n° 20), where only the question mark is used. gation in the section name may suggest some doubt about the "idyll".

<sup>559</sup>(\*) In the joke about "weight complexes" (see note of the same name, n° 83), I thought I discerned an allusion, in a defiant tone, to the oldest patent fraud of which I am aware in one of my cohomology students, namely that of Deligne in his 1968 article on the degeneracy of spectral suites. Although I didn't see the light at the time, the example set by my most brilliant pupil was not lost on everyone!

<sup>560</sup>(\*\*) See note n° 81.

<sup>561</sup>(\*\*\*) (May 1) See also the sub-note "Ecllosion d'une vision - ou l'intrus" (n° 171<sub>1</sub>) to the note "L'Apothéose".

<sup>562</sup>(\*) J.L. Verdier, "Classe d'homologie associée à un cycle", Astérisque n° 36 (SMF) p. 101-151 (1976).

ten years earlier in SGA 5, without any reference to myself or to a seminar on the subject. This publication, which I discovered a year ago in the wake of the Colloque Pervers (in the note "La bonne référence", n° 82), shed a whole new light on why he and my other cohomology students were so reluctant to make the SGA 5 seminar (under this name, and with his authorship) available to the mathematical public.

There's no need to go back over the comments I made on this article in yesterday's note (n° 169). As an amusing detail, I'll just add that it was the manuscript of this "work" (sic) by Verdier, which the latter had been kind enough to send to Zoghman Mebkhout the previous year (1975), that was for the latter the Sesame-Ouvre-Toi of the cohomology of varieties, and the foundation of an unreserved admiration for the man who, from then on, appeared to be his "benefactor". This admiration was, moreover, long-lasting, and only disintegrated completely, I believe, following Zoghman's misadventures at the Colloque Pervers.

Deligne tells me<sup>563</sup> (\*\*) that he only became aware of Verdier's article after the publication of "SGA 4<sup>1</sup>/<sub>2</sub>" (sic) and SGA 5, the following year (1977) - which would run counter to my conviction that the publication of Verdier's "good reference" marked an essential last step in the "escalation" of scams, which eventually culminated in the totally different "SGA 4<sup>1</sup>/<sub>2</sub> - SGA 5" operation the following year. On reflection, I find Deligne's version hard to believe. As one of the best-informed mathematicians I know, and one who has remained in close contact with Verdier throughout his life, it's hardly possible that he wasn't already aware of Verdier's project, that he didn't receive a preprint of it (even before Mebkhout), and that he wasn't one of the very first to be served for the separate printings, in 1976. This article (as confirmed by Deligne himself) a gaping hole in the literature (failing publication of the SGA 5 seminar after 1966), and it's hardly possible either that Deligne didn't take the peine at least to go through it - question of a quarter hour at the most for someone "in the know" like him<sup>564</sup> (\*). In any case, the fact that this blatant plagiarism elicited no reaction from any of the other six or seven ex-SGA 5 auditors who were "in the loop", was a sure sign of the smooth connivance between all concerned. The time was ripe for a massacre of the SGA 5 mother seminar, and for shattering my work on staggered cohomology... .

p. 931

**Stage 3** (1977). In this "SGA 4<sup>1</sup>/<sub>2</sub> - SGA 5" operation which took place in 1977, on Deligne's initiative and with Illusie's eager participation, Verdier this time played a supporting role, contributing to the meagre fascicule with the misleading name "SGA 4<sup>1</sup>/<sub>2</sub>", a certain "Etat 0" of his thesis-sic (which had disappeared, body and all. . . ), exhumed especially for the occasion after a fourteen-year slumber! Nowhere in the volume, whether in the introduction where this text-rabiot (' "no longer available" - and for good reason!) is duly highlighted, or in the text itself, is there any allusion to any role I might have played in the ideas developed therein; nor, for that matter, to the fact that this text was one day destined to become a thesis. Neither Verdier nor Deligne saw fit to inform me of this publication (and with good reason, too), nor to send me a copy of the trompe-oeil volume. For details, I refer you to the note "Le compère" (n° 63)", written under the emotion of discovering this exhumation on the sly), and to the more in-depth reflection in the already oft-quoted note, "Thèse à crédit et assurance tous risques" (n° 81).

So, ten years after his unusual thesis defense, Verdier seized the opportunity offered by Deligne

---

<sup>563</sup>(\*\*) See "Dotting the i's" (n° 164), part IV 1.

<sup>564</sup>(\*) I can imagine, moreover, that much stronger than the mathematical interest (although this article had nothing to teach to Deligne, whom he did not already know as a listener of SGA 5), must have been that of being able to take note first hand and in black and white, of the deceased master's smooth escamotage, following the tradition he had himself inaugurated eight years ago!

to take, in short, an "**option**" on an undisputed and undivided paternity of the "derived categories" point of view in homological algebra, with the full backing of his prestigious friend; and this at a time when both were still maintaining a de facto **boycott** on the use of this same point of view<sup>565</sup> (\*\*). This boycott, which weighed heavily on Zoghman Mebkhout's work, condemning him to complete solitude, remained in force until the "Colloque Pervers" in 1981.

□ And so, in 1977 Verdier emerged as the father-in-residence of a cohomology yoga that, for the time being, remained the object of a good-natured tacit disdain - but you never knew. ... Moreover, since the previous year, with the publication of "the right reference", he had been the father of part of the duality formalism developed by me (on the "discrete" homology and cohomology classes associated with cycles, the biduality formalism, constructibility version finiteness theorems etc.) - not to mention the duality of locally compact spaces, which also remained in an ambiguous, waiting status - just like the yoga of derived categories that gives it its meaning. p. 932

**Stage 4 (Colloque Pervers, June 1981).** This is by far the culmination of Verdier's participation in l'Enterrement. This Colloquium consecrates the shameless spoliation of Zoghman Mebkhout, pioneer of the unifying and fertile point of view of D-Modules in the cohomology of algebraic varieties. As official organizer of the Colloquium, along with B. Teissier, Verdier plays a leading role. I'll come back to this in the following note, with "Operation IV" (known as the "Pervers Colloquium" or "the unknown on duty"). Here, I shall confine myself to the direct repercussions for Verdier, in terms of the "sharing" of an inheritance (where the deceased bequeather remains carefully ignored. . . ).

This Colloquium marks the triumphant "re-entry" of derived and triangulated categories into the mathematical arena. As the "father" of these categories (which he had done everything in his power for fifteen years to bury), it is Verdier, after Deligne, who emerges as the main hero of the happening. This, at least, is the impression one gets from the Colloquium's main article, written by Deligne, which alone constitutes Volume I and the centerpiece of the Colloquium Proceedings<sup>566</sup> (\*). As luck would have it, it's the skeletal and providential

"Etat 0" of a thesis (which I would never have dreamed of accepting as a doctoral thesis, and which had come to bail out

the pirate text "SGA 4<sup>1</sup>" □ un peu maigre aux entournures) - here it becomes the brilliant piece à conviction, allowing the father-to-the-lark Verdier, in a cloud of references to "SGA 4<sup>1</sup>", to modestly swagger as the far-sighted precursor of the great rush known as "perverse beams" (which have nothing to do with it, though) and of a new and belated re-start of the cohomology of algebraic varieties (on the shores of a vague unknown whose name nobody dares to pronounce. . . ). p. 933

This same article (signed Beilinson-Bernstein-Deligne) also marks the return in force of the six-operations formalism (never named, of course) in the spread context, with the now concerned notations I had introduced in the fifties. As I wrote elsewhere<sup>567</sup> (\*) "there's not a page in the article quoted. . . that is not deeply rooted in my work and bears its mark, right down to the notations I had introduced, and the names used for the notions that come into play at every step - which are the names I had given them when I got to know them before they were named".

<sup>565</sup>(\*\*) As I explained in a previous b. de p. note (note on page ), in the text-compendium entitled "SGA 4<sup>1</sup>" Deligne was unable to avoid recourse to derived categories in the demonstration of "the" formula. This is undoubtedly what suggested to him the idea of expanding his volume with the "state 0" of a wrecked thesis. In fact, this did not alter the boycott on derived categories until 1981.

<sup>566</sup>(\*) Proceedings published in Astérisque n° 100 (1982) - under the title "Analyse et topologie sur les espaces singuliers". In fact, the Proceedings in question, dated 1982, were only completed in December 1983, and Mebkhout read them in January 1984.

<sup>567</sup>(\*) See the note "L'Iniquité" (n° 75), p. 288.

The formalism of étale duality, which I had developed eighteen years earlier, when my pupil Verdier was still learning the ABCs of cohomological language, has been renamed "Verdier duality" in the general euphorie<sup>568</sup> (\*\*). His prestigious patron was not going to skimp on the little, on such jubilant days! The name of the deceased does not appear in the article<sup>569</sup> (\*\*\*), nor in the introduction to the volume, signed by Teissier-Verdier. Nor that of the vague unknown (Zoghman Mebkhout, not to name him), without whom the article, and the whole brilliant Colloquium, would never have seen the light of day... ..

For the slaughter, it was slaughter! Apart from the motives, which would soon follow (from the following year), and perhaps the crystalline yoga, the uneventful sharing of the cohomological legacy of an unnamed deceased was now a done deal, and this **to** unanimous agreement and **general satisfaction**.

### 18.5.3.3. c.Jewels

p. 934

**Note 170(iii)** □(March 1) The three "operations" I reviewed in the previous notes concern the "sharing" of the "legacy" I left behind, in the form of my written and unwritten work on schematic cohomology. The direct "beneficiaries" of this sharing were three of my five cohomology students, namely Pierre Deligne, Jean-Louis Verdier, and Pierre Berthelot<sup>570</sup> (\*). But each of these three operations (like the one that follows) could only be carried out with the connivance (and sometimes the active support) of a large number of colleagues more or less "plugged in" to schema cohomology, among whom figure in first place my five cohomology students, including, in addition to those I have just named, Luc Illusie and Jean-Pierre Jouanolou(\*).

These three operations, and the fourth to be discussed, seem to me to be indissolubly linked, both in their deepest motivations and in their most tangible events. The first discrete signs date back to the years 1966 to 1968, but the most flagrant manifestations came after my "departure" in 1970. This departure, and a certain general state of morality in the mathematical "big world"<sup>571</sup> (\*\*), created the right external conditions for such a large-scale operation, undoubtedly the only one of its kind in the annals of our science.

This operation was aimed firstly at **discrediting** most of the **key ideas** I had introduced into mathematics<sup>572</sup> (\*\*\*), and burying the unifying **vision** in which they were embedded; then, to discredit or obscure the **role of the worker** in the creation of those of the tools I had fashioned under the dictation of these ideas and inspired by the overall vision, which served as the basic tools in the work of Deligne and my other cohomology students; and finally, in a final stage, to appropriate the authorship of these tools for myself.

<sup>568</sup>(\*\*) In the notation index, the dualizing functor (which I introduced in the stellar context in 1963, and which is the subject of Lecture I of the Allusie edition of SGA 5, where it has managed to survive) is called "Verdier duality". This name reappears throughout the text (e.g. on pages 62, 103 - looking at happiness-luck. . . ). I swear I'm not making this up!

<sup>569</sup>(\*\*\*) My name does appear in the bibliography, along with the acronym EGA (which will have to be replaced by an ad hoc text one of these days. . . ). Mebkhout's name is absent from both the text and the bibliography. There is no trace of it in the entire volume.

<sup>570</sup>(\*) (May 2) In fact, a fourth "beneficiary" should be added, whom I discovered only recently, namely Neantro Saavedra, mentioned in a previous b. de p. note (note (\*) page 921).

<sup>571</sup>(\*\*) (May 2) There must have been a two-way street: a certain state of degradation of mentalities (in which I myself had participated before my departure) encouraged the escalation of the plundering and debunking of my work by a group of my former students, whose growing cynicism surely contributed in turn to creating the more or less generalized state of corruption I see today.

<sup>572</sup>(\*\*\*) (May 2) for further details, see the note "My orphans" (n° 45) and above all "The building site tour - or tools and vision" (n° 178).

ideas and tools that have been successfully adopted by my students, or have come to the fore despite the □boycott p.

935

that they had to bear<sup>573</sup> (\*).

This operation came to an end in 1982, with the publication of the volume Lecture Notes 900, consecrating the re-ap- parition of motifs in the mathematical public arena, in a narrowed form (compared to the vision that had emerged for me during the sixties) and under the paternity (implicit and obvious) of Deligne. It finally found its epilogue the following year, in the three-part "Funeral Eulogy" served up in the IHES jubilee booklet, published to mark the twenty-fifth anniversary of its existence.

The "mine" of these texts was first discovered on May 12 last year<sup>574</sup> (\*\*), in the note "L' Eloge Funèbre (1) - ou les compliments" (n° 104). It continues almost five months later in the note (n° 105) that follows it, "L' Eloge Funèbre (2) - ou la force et l'auréole"<sup>575</sup> (\*\*\*). I'll confine myself here to recalling in a few words the spirit and salt of this unusual "Eulogy".

The brochure presents (among other things) a "portrait gallery" of short topos on the various past and present professors of the institution celebrating its jubilee. In the text (by Deligne) dedicated to me, which is supposed to evoke a work of art, the word "cohomology" or "motif" is not mentioned. Nor is the word "schema", or any other that might suggest a theory I've developed or a theorem I've demonstrated that could perhaps have been useful. On the other hand, I'm generously saddled with superlatives and other niceties: "gigantic work... .", "twenty volumes... .", "greatest natural generality. ... "<sup>576</sup> (\*\*\*\*) "great □attention terminology. . .", "problems. ... in the line he tra- p .<sup>936</sup> . . became too difficult... ". It's burial with great fanfare and in the limelight, with a well-sent "compliment", enormous and plethoric like the deceased whose memory is being "honored", and at the same time with a finesse in comical insinuation, which was decidedly lacking in the clumsy ancestor... .

There's nothing to suggest that I had anything to do with "demonstrating" Weil's conjectures ("of proverbial difficulty"), duly highlighted in Deligne's topo. On the contrary, it is stressed that "this result seemed all the more surprising" as it had to be demonstrated, so to speak, against a "series of conjectures" of my own making (Grothendieck never makes any others!), which (he adds, to leave no doubt as to what is to be thought of them) "are as unapproachable today as they were then" (read: when I had the unfortunate idea of stating them...).

These two minute portraits, and a third part which completes them remarkably well (in a single lapidary sentence of three lines<sup>577</sup> (\*)), are real gems, no doubt unique in their genre too, among the eulogies deftly served in honor of a "deceased" (still not deceased in this case!). They are explored, with all the care they deserve, in the three consecutive notes already cited (n° s 104-106), and,

<sup>573</sup>(\*) (May 2) Among the ideas and tools that I had introduced, which were buried and which have come to the fore despite the boycott instituted by Deligne and my other cohomology students, I'd like to mention the following: derived categories, motives (admittedly a narrow version) and the yoga of Galois-Poincaré-Grothendieck categories (renamed "Tannakian" for the purposes of the Burial), the formalism of non-commutative cohomology around the notions of fields, sheaves and links (developed by Giraud after the initial ideas introduced by me from 1955 onwards).

<sup>574</sup>(\*\*) It was on the very same day that the shameless massacre of the original SGA 5 seminary had already been revealed to me, at the hands of Illusie and with the active support or eager connivance of all my cohomology students, under the tenderized eye of the "entire Congregation"... .

<sup>575</sup>(\*\*\*) For an unexpected extension of the Funeral Eulogy, see also the following note "The muscle and the gut (yang buries yin (1))" (n° 106), which at the same time opens the long reflection "The key to yin and yang".

<sup>576</sup>(\*\*\*\*) This Frenchman-petit-nègre is a truly impayable find, to evoke in a comical way (and mine de rien. . . ) the plethoric and gratuitous bombardment of a gigantic chatterbox. ...

<sup>577</sup>(\*) I discovered this third part in the course of reflection in the aforementioned note "L'Eloge Funèbre (2) - ou la force et l'auréole". - and it immediately strikes me as more significant than the other two combined! It's the one that inspired the name "La force et l'auréole" given to this note.

under the more penetrating light of the dynamics of the "reversal of yin and yang", in the note (a few weeks later) "Les obsèques du yin (yang enterre yin (4))" (n° 124).

## 18.5.4. (3) APOTHEOSIS ("Coefficients de De Rham et $D$ -Modules")

### 18.5.4.1. a. The ancestor

**Note** 171(i) (March 1 and May 2-8<sup>578</sup> (\*\*)) In each of these four partial "operations" that I have distinguished- my early burial, it's Deligne who visibly plays the role of conductor (or rather, Grand Officiant at the  $\square$ Obsèques), with the more or less active participation of my other four coho- students.

p. 937

mologists, and with the connivance of a considerably larger group of mathematicians, all of whom are well aware of the situation (which is obviously not to their displeasure. . . ). This "group of connivance" takes on impressive and almost unbelievable proportions in the fourth of partial operations, which I shall now review.

IV Operation "L'inconnu de service" (or "du Colloque Pervers").

It's the operation of **appropriating the work of Zoghman Mebkhout** - the only mathematician (to my knowledge) who took the risk, after my departure from the mathematical scene, of appearing as "Grothendieck's continuator".

This operation continued over a period of ten years, from 1975 to the present day. At the risk of repeating myself, I'll start by recalling the historical context.

In the second half of the 1950s, I had developed a form of "coherent duality" in the context of diagrams. These reflections, motivated by the desire to understand the meaning and exact scope of Serre's duality theorem in analytic geometry and especially in algebraic geometry<sup>579</sup> (\*), had a major impact on my work.

were pursued in near-complete solitude, having failed to interest anyone but myself<sup>580</sup> (\*\*). It was these reflections that  $\square$  lead me to gradually draw out the notion of the derived category,

p. 938

<sup>578</sup>(\*\*) (May 13) This and the following four notes originally formed a single note, "L'Apothéose" (n° 171), dated March 1. It also included the previous note "Les joyaux" (n° 170(iii)). It was taken up again and considerably expanded between May 2 and May 8, especially the mathematical part, and split into the four separate notes "L'ancêtre", "L'oeuvre. . . ", ". . . et l'aubaine", "Le jour de gloire" (n° s 171 (i) to (iv)), in addition to the note "Les joyaux" already mentioned. Added to this are the eight sub-notes (n° 171 (v) to (xii)) relating to the four notes in question, and the four sub-notes (n° 171<sub>1</sub> to 171<sub>4</sub>) from the month of April, recounting my friend Zoghman's strange misadventures with the "law of the middle", as he himself told me. It is these sixteen notes (n° s 171 (i) to (xii) and 171<sub>1</sub> to 171<sub>4</sub>) which now form the part "L'Apothéose" in "Les Quatre Opérations" (of which the aforementioned Apothéose is the fourth and - until further notice - the last).

<sup>579</sup>(\*) My first thoughts on duality were in the context of analytic spaces, and predate those of Serre. Using "evetisque" duality techniques and the Poincaré-Grothendieck lemma on the  $\delta^-$ -operation (which I had just proved), I proved that if  $X$  is a Stein variety, the  $H^i(X, \underline{Q}_X)$  (resp.  $H^i(X, \underline{\omega}_X)$ ) are Fréchet spaces.

nuclear, in perfect duality with the  $H^{n-i}_c(X, \omega)$  (resp. the  $H^{n-i}_c(X, \underline{\omega})$ ). At the time, I didn't think of applying the same method to the case of vector fibres (not having realized the very simple algebraic fact that the operator  $\delta^-$  being  $\underline{Q}_X$ -linear, extends to differentiable differential forms with values in a holomorphic vector fibre), nor to complex varieties other than Stein's (the only ones I was familiar with at the time). Serre's proof of his analytic duality theorem in the general case is practically the same as the one I had found in a particular case.

<sup>580</sup>(\*\*) Of course, the mathematician of all people in whom I would have expected an interest in my thoughts on coherent duality was Serre. He was interested, I seem to recall, in the generalization of his duality result to a coherent bundle  $F$  (not necessarily locally free) on  $X$  projective and smooth over a  $k$ -field, identifying the dual of  $H^i(X, F)$  with  $E_X^{n-i}(X; F, \underline{\omega})$ .

This gave intrinsic geometrical meaning to a "calculatory" FCC result (which had intrigued and inspired me, of course), in the case where  $X$  is projective space. But apart from this result, one of the first in my journey to discover duality, and still close to what was familiar to him, Serre always refused to listen, when I felt like talking to him about duality. I don't think I ever tried to talk to anyone else about it, apart from (much later) Hartshorne, who made a

whose objects were presented as natural "coefficients" in the homological and cohomological formalism of spaces and varieties of all kinds, forming part of a first embryo of a formalism of "six operations" on ringed spaces (while waiting for ringed topos). Four of these operations had already been more or less familiar to me since my 1955 work "Sur quelques points d'algèbres homologiques"<sup>581</sup> (\*), albeit in the language of derived categories.

L

vantes (along with the point of view of derived categories), these are the "internal" operations  $\otimes$  and  $RHom$  ("total derived functor" version of the bundle formalism  $For_i$  and  $Ext^i$  introduced in "Tohoku"), and "external"  $Lf^*$  and  $Rf_*$  (inverse images, and direct "à la Leray"), forming two pairs of adjoint functors (or bifunctors). In the case where  $f$  is an "immersion" morphism  $i : X \rightarrow Y$ , we can add the pair of adjoint functors  $Ri_!$ ,  $Ri^!$ , embodying respectively the "extension by zero" and "bifunction" operations.

"local cohomology with supports in  $X$ ". The common thread in my reflections is to arrive at a **duality theorem** (global, at a time when there was no question of a local version. . . ), generalizing that proved by Serre for a locally free coherent bundle on a smooth projective variety over a body. ), generalizing the one proved by Serre for a locally free coherent bundle on a smooth projective variety over a body. The aim was to give a formulation that would apply to any coherent bundle (or complex of such), or even a quasi-coherent bundle, without any smoothness or projectivity assumption on  $X$  (keeping only cleanliness, which then seemed essential<sup>582</sup> (\*\*)). What's more, in analogy with my reflections on Theorem of Riemann-Roch, I felt that the right statement had to concern, not a variety over a body, but a proper morphism

$f : X \rightarrow Y$  of otherwise arbitrary schemes. It was by means of  $\square$  successful approximations, on p. 939 in the course of several years' work<sup>583</sup> (\*), that the global duality theorem is gradually being decanted from

At the same time, the notion of derived category also emerges from the limbo of the prescient to take concrete form, and give the formalism and the statements an **intrinsic meaning**, without which I would have felt incapable of working! It was first of all to arrive at a fully satisfying statement of global duality that I introduced the formalism of **dualistic complexes** and derived the **biduality theorem**, and that I discovered (under suitable Noetherian hypotheses) the existence of an injective, essentially canonical dualistic complex, which I call the "**residual complex**", and a theory of variance for it. An early formulation of the global duality theorem, which at one time seemed to me to be "the right one", was that the functor  $Rf_*$  commutated to dualistic functors on  $X$  and  $Y$  (for two dualistic complexes that "correspond" to each other). It was only later that I discovered that the theory of variance for dualistic complexes alone (via residual complexes) generalizes to a functor of an entirely new nature, the  $Rf$  functor<sup>1</sup> or "unusual inverse image", of local nature on  $X$ . From this point on, the duality theorem for the proper morphism  $f$  is definitively formulated: this new functor is a **right adjoint** of  $Rf_*$ , and thus forms part of a sequence of three adjoint functors

$$Lf^*, Rf_*, Rf^!.$$

To have a fully completed formalism, all that was missing was the description of an  $Rf$  functor<sup>1</sup>,

---

Harvard seminar, published in 1966 ("Residues and duality" by R. Hartshorne, Lecture Notes in Mathematics, n° 20, Springer Verlag).

<sup>581</sup>(\*) In Tohoku Mathematical Journal, 9 (1957), p. 119-221.

<sup>582</sup>(\*\*) See b. de p. (\*) page 940, below.

<sup>583</sup>(\*) Needless to say, during these "several years of work", I had many more irons in the fire than just questions of coherent duality! I familiarized myself with the then-known foundations of algebraic geometry (with FAC de Serre's point of view as my main reference), with the problematic of Weil's conjectures, and with the formalism of intersection multiplicities learned in one of Serre's lectures, where he developed his idea of "alternating tor sums"). This was to trigger my interest in the formalism of  $K$ -theory and the Riemann-Roch-Grothendieck theorem in 1957, which was very close (in spirit) to my thoughts on duality.

functor already known when  $f$  is an immersion, reducing to  $Rf_*$  for  $f$  proper, and forming with  $Rf^!$  a pair of adjoint functors  $Rf_! , Rf^!$ . I don't remember being distressed in the 1950s by this imperfection of a formalism whose general scope, beyond schematic coherent duality or analytical' still eluded me<sup>584</sup> (\*).

This shortcoming only became fully apparent to me in 1963, when I discovered that, in the context of the just-arrived co-equal homology (with "discrete" coefficients), there existed a formalism analogous in every respect to the coherent formalism, with the addition, precisely, of a functor  $Rf_!$  ((of direct image with proper supports) defined for **any** separate morphism of finite type. In fact, I was guided step by step by the work I'd done in the coherent case years before (with no one else interested but myself), and in the space of a week or two, at the very least, I was able to establish the complete "six operations" formalism, based on the two key theorems of base change. This duality formalism is incomparably more sophisticated and powerful than the one previously available in the transcendental context, for topological varieties only (and local systems on them), and even more satisfactory than the formalism I had arrived at in coherent duality.

My work on coherent duality is set out in R. Hartshorne's well-known seminar "Residues and Duality" (published only in 1966)<sup>585</sup> (\*\*), those sur la dualité étale in one or two chapters of SGA

4, and especially in the SGA 5 seminar, which was entirely devoted to it. And it's only as I write these lines that I suddenly realize that, apart from a few sporadic precursor-texts (in the Cartan and Bourbaki seminars of the 1950s), there is no systematic **published** text: and from my pen, expounding the formalism and yoga of duality, either in the coherent context, or in the slack context. The SGA 4 lectures devoted to this theme, centered around the only "global duality theorem" for a separated morphism of finite type (establishing that  $Rf_! , Rf^!$  are adjoint), were written

<sup>584</sup>(\*) Of course, I had realized that already in the case of an open immersion  $f: X \hookrightarrow Y$ , where the functor  $Rf^!$  coincides with the "restriction to  $X$ " functor  $Lf^*$ , which (in the context of quasi-coherent bundles) admits **no** left adjoint. The usual left adjoint  $Rf_!$  ("extension by zero outside  $X$ ") does not preserve quasi-coherence. On the other hand, I had also verified that, apart from quasi-coherence hypotheses and even for a proper one-point base morphism, there is no "duality theorem". Thus, the impossibility of defining an  $Rf_!$  under general hypotheses seemed to me to be a given and in the nature of things.

It was Deligne who realized in 1965 or '66 (as soon as he arrived!) that it was possible to make sense of  $Rf_!$  and to recover the coherent duality theorem for a separate morphism of type fini not proper, provided we worked with coefficients that are (complexes of) quasicoherent **pro-beams**. However, this beautiful idea did not have the fortune one might have expected - nor did the initial formalism of coherent duality, which it allowed to perfect.

Deligne successfully took up this idea in his attempt to construct "De Rham coefficients" on algebraic schemes of zero characteristic, a promising attempt that he nonetheless jettisoned with profit and loss as soon as I left in 1970. Six years later, it was left to Mebkhout to find "the" right category of (crystalline) "De Rham coefficients" that I had been anticipating for ten years. ...

<sup>585</sup>(\*\*) The seminar in question (published in Lecture Notes in Mathematics, n° 20, Springer Verlag) sets out the essence of my ideas on coherent duality formalism, centred on the six-operation formalism, biduality, and a theory of "residual complexes" (which are canonical injective representatives of dualistic complexes). These ideas were taken up in the analytical framework by Verdier and, above all, by Ramis and Ruguet. The Hartshorne seminar does not, however, contain a number of more fine developments intimately linked to this formalism: a residue theory (for finite and flat schemes on any basis), and a cohomological theory of difference, which have never been published (as far as I know). In the '50s, I had also developed the formalism of the "determinant module" of perfect complexes, which was finally to be included in SGA 7 and whose editor (following the example already well established by certain "editors" of SGA 5) withdrew after two years.

Finally, I'd like to point out that in the wake of my reflections on coherent duality in the 1950s, I was led to introduce and develop the purely algebraic version of **Hodge's** and **De Rham's cohomology**, and in particular the formalism of cohomology classes associated with an algebraic cycle (initially assumed to be smooth), and a theory of Chern classes, modelled on the one I had developed in Chow theory.

by Deligne two or three years after the seminar, according to my handwritten notes<sup>586</sup> (\*). As for the SGA 5 seminar, it was practically sequestered for eleven years by my cohomology students, only to be published (after Deligne's 1977 saw-cut text), copiously plundered and unrecognizable, ransacked by the care of the "publisher"-sic Illusie, to the complete devotion of his prestigious friend<sup>587</sup> (\*\*). It is here, in this ruin of what was one of the most beautiful seminars I've developed and, along with SGA 4, the most crucial of all p.

942

in my work as a geometer - this is the only trace written by my hand, or at least from notes written by my hand, that evokes in any way formalism and the yoga of spread duality, and, beyond this still partial yoga, and irresistibly suggested by it, that of the six operations. My students were careful to erase all traces of this last yoga<sup>588</sup> (\*), of exceptional suggestive force, which had inspired my work on cohomology throughout the sixties. It was really the "nerve" in the idea-force of the "coefficient types"<sup>589</sup> (\*\*), of which the yoga of patterns is the soul. ...

Such an aberrant situation, in which an important advance in a science, embodied in a new vision, was eradicated by the very people who had been its first beneficiaries and repositories, could not have arisen without this other situation, also highly exceptional, created by my sudden departure and the conditions surrounding it. Moreover, the turn events were to take had already been prepared before my departure and throughout the sixties by the divided situation in which I found myself, preoccupied on the one hand by interminable fundamental tasks that only I was able or willing to take on<sup>590</sup> (\*), and on the other hand constantly solicited by questions on themes often far removed from my own.

<sup>586</sup>(\*) Deligne's paper was written **after** the SGA 5 seminar. In fact, Deligne did not follow my notes to the letter, but a variant of my method, which Verdier had introduced in the context of locally compact spaces in 1965 (essentially using the étale model). At that time, there was no ambiguity in anyone's mind about the authorship of all the main ideas in duality, and a fortiori, about the authorship of the étale duality; it wouldn't have occurred to anyone (surely not even to Deligne!) that the fact of following a variance of my initial method could, over the following two decades, be used to fish in troubled waters, and attribute staggered duality to Verdier (while Deligne pockets the rest of the staggered cohomology "package"... ).

<sup>587</sup>(\*\*) On this subject, see the note "The four maneuvers" (n° 169 (ii)), and the sub-notes that follow.

<sup>588</sup>(\*) (May 8) I've just gone through my handwritten notes for the first three presentations of SGA 5, notes that Illusie has last year at my request. (He was the only one of the former editors who took the trouble to return the notes I had entrusted to them. . . ) The first talk consisted of a wide-ranging "tour d'horizon" of what had been accomplished in the previous SGA 4 seminar, with regard to stale cohomological formalism and its relations to various other contexts. The second presentation develops at length the "abstract" formalism of the six variances. There is an essentially complete form, but no effort yet to pin down compatibilities between canonical isomorphisms. (This was a task of a more technical nature, unnecessary at a time when my main concern was to "get across" this yoga of duality, the strength of which I could feel). Needless to say, there is no trace of either presentation in the Illusie edition. I'd come to believe that (preoccupied with the more technical aspects of the seminar) I'd probably omitted the unifying vision. In retrospect, and almost a year to the day after the discovery of the SGA 5 seminar "massacre", I seem to have put my finger on what was at the very **heart of** this operation-massacre. It's not the disappearance of one presentation or another, annexed by a Deligne, plundered by a Verdier, saved from disaster by Serre or torn from a harmonious "whole", for the sheer pleasure of it, as one might say, by an Illusie. But it is the very soul and nerve of this seminar, the constant and omnipresent guiding thread throughout this vast work done by one - it is this that Illusie set about eradicating from SGA 5 without leaving (almost) a trace. The very name "six operations" is absent from this seminar, just as it is absent from the work of my students, who have had to make a tacit pact not to utter these words except on the very rare occasions when one or other is still confronted with the worker.

declared deceased, to whom (however deceased he may be) it is nevertheless advisable to give the change. ...

<sup>589</sup>(\*\*) This key idea, too, was eradicated, then forgotten, by my cohomology students. It was one of the first ideas to come back to me, when I did my first retrospective on my work and its vicissitudes "fifteen years on", in the note "Mes orphelins" (n° 45). This note, whose name is more apt and profound than I would have dreamed at the time, was written even before the discovery of "L'Enterrement" (in the literal and strong sense of the word). The same key idea of the six

operations and "cohomological coefficients" recur here and there, almost as a leitmotif, when the reflections in Récoltes et semailles bring us back into contact with the fate of my work by those who were my students. See, in particular, the notes "La mélodie au tombeau - ou la suffisance" (developing the "melody", or the theme with variations, types of coefficients), and "Le tour des chantiers - ou outils et vision" (notes n° s 167, 178).

<sup>590</sup>(\*) I would remind you that this far-reaching groundwork began abruptly and continues to this day, from the very day of my departure. This is an eloquent sign of the "misunderstanding" I referred to in the note "Le magot" (n° 169 (v)). All

of the primary bases that absorbed me in the moment, and thus, very often, more intensely and directly fascinating<sup>591</sup> (\*\*). Rarely, among the very themes I had given myself the leisure to explore and develop (such as duality), did I also find the leisure to write up the results of my work in a form suitable for publication (in accordance with my own exacting criteria). This is how I often came to leave it to others (in whom I had complete confidence, of course) to write (as was the case for the "duality" theme, in both the coherent and discrete frameworks), or to develop certain initial ideas that I knew to be fruitful (such as the derived category, or crystalline cohomology, to name but a few of many). In a "normal" situation of a good faith responding to the confidence I had in addressing motivated students, learning from me their trade and a broad basis for their future work, everything was for the best'  $\square$  and for the most to the great benefit of all concerned, including the scientific community. But it's true that this unusual situation put considerable **power** in their hands (the idea never having occurred to me before last year . . . ), especially after my departure. From the moment I left (or even before . . . ), some of them were quick to abuse this power, to obscure the work and the vision, to undermine the craftsman, and to take advantage of the tools he had fashioned, which they thought they could use.

My coherent duality works have never been very popular, it seems to me<sup>592</sup> (\*). On the other hand, my work on flat duality attracts immediate attention. But I think it would be more accurate to say that what attracted attention was the fact that someone had "managed", however, to demonstrate in the stale context the analogue of Poincaré's duality, the one that had been well known to everyone for nearly a hundred years, in the familiar context of oriented topological varieties. This was therefore "a good point" for stale cohomology (there was little doubt that it was "the right one" for Weil's conjectures ("of proverbial difficulty". . . ). In other words, the mathematical public, on the lookout for the famous conjectures, reacted like a "consumer", reluctant to recognize and assimilate a new and profound vision of things, and retaining only a familiar-looking "result". More than twenty years on, I note that this powerful vision of the six operations and types of coefficients, expressed in a disconcertingly simple formalism, remains ignored by all (with the sole exception of the solitary worker), when it is not the subject (when someone dares to allude to it) of wry or ironic comments<sup>593</sup> (\*\*). Such scattered ingredients of my panoply are used here and there without reference to myself (and with ready-made spare fathers), and especially the biduality formalism, since the great rush on intersection cohomology, after the memorable Colloquium (in 1981) about to be discussed. But the  $\square$  vision, childlike in its simplicity and perfect elegance, which has nonetheless given eloquent proof of its power<sup>594</sup> (\*), remains ignored, the object of the

---

the world was ready to bring in its furniture and settle down permanently in the houses I'd built - but there was no one left to stir and wield trowel and plumb bob to build and fit out, even if only under the peremptory pressure of need... ..

<sup>591</sup>(\*\*) If I'd listened to myself, how many times would I have left the interminable groundwork I had to do in the service of all, and embarked on the unknown adventure that was constantly calling me, the real one - instead of leaving to others the pleasure of surveying the new lands I'd discovered. Today, I see that these lands are still virgin, or very nearly so, and that those in whom I thought I saw pioneers, had already chosen to be comfortable rentiers before I left... ..

<sup>592</sup>(\*) As I pointed out in a previous note by b, de p., these works inspired those of Verdier, Ramis and Ruguet in the coherent theory of analytic spaces. It has always been clear (to me, at least) that the same formalism can only be found in the rigid-analytic context (which, too, is still in its infancy, from the echoes that come back to me). On the other hand, Mebkhout tells me that the Japanese school of analysis drew a great deal of inspiration from "Residues and Duality", refraining, incidentally, from ever naming the worker. These days, the opposite would have been surprising... ..

<sup>593</sup>(\*\*) For further details and comments, see the sub-note "Unnecessary details", n° 171 (v): in particular part (a), "Packages of a thousand pages. . . ".

disdain of those who prefer to scorn (and plunder. . . ), rather than understand.

If what I've done with my hands and my heart has been twenty or maybe fifty years ahead of its time, it's not because of the immaturity of the **mathematics** I found when I put my hand to the dough thirty years ago. It's the immaturity of men<sup>595</sup> (\*\*). And it was this same immaturity that confronted my posthumous pupil and sole continuator, Zoghman Mebkhout. I had had the great good fortune, before I left in 1970, to be confronted with it only in the form of incomprehension, which never departed from a disposition that remained friendly. Zoghman Mebkhout, who arrived on the mathematical scene at a different time from the one whose work he was recklessly continuing, was entitled, after the incomprehension and disdain, and when the tool value of **one** of his results was finally recognized, to the malice of his elders and to the full weight of the iniquity of an era - but I anticipate... .

One of the most important discoveries I've made in mathematics," and one that remains virtually unknown to everyone, was that of the **ubiquity** of the duality formalism I'd begun to develop in the 1950s: the "formalism of six variances and biduality" applies both to the "continuous" coefficients initially envisaged ("coherent" theory), and to the "discrete" coefficients. This ubiquity appeared, as a scarcely believable surprise, in the spring of 1963 - it was thanks to it, and to nothing else, that I was able to develop a formalism of staggered duality and achieve what I call the "mastery" of staggered cohomology. Even then, I was intrigued by the question of a theory that would be "common", whether in the schematic, complex analytic or even topological framework - a theory that would "cap" both types of coefficients. De Rham's cohomology (an old friend of mine. . . ) gave a first indication in this direction, suggesting to look for a "common principle" in the direction of "integrable connection modules" (or "stratified modules", perhaps. . . ). These give

to give rise to a "De Rham cohomology" (with discrete coefficients, morally speaking), which is then put into practice.

□ in connection with coherent cohomology. This approach later suggested to me the idea of "crystal" and of "crystalline cohomology", without yet (it seemed) being sufficient to provide the key to the description of a complete formalism of the six variances for types of "coefficients" which, in a suitable sense, would encompass both discrete ("constructible") coefficients, and continuous coefficients<sup>596</sup> (\*). It doesn't seem not that any of my students could sense this problem<sup>597</sup> (\*\*)' □ with the sole exception of Deligne. He devotes a

947

<sup>595</sup>(\*\*) For some initial thoughts on this subject, see the sub-note "Freedom. . ." (n° 171(vii)).

<sup>596</sup>(\*) At the time of writing, my memory on this subject was still hazy. It has since been revived, and I come back to it in more detail in the sub-note "Wacky questions" (n° 171 (vi)).

<sup>597</sup>(\*\*) I had mentioned this problem to Verdier, after he had developed (as I had suggested) the theory of duality of the topological spaces (or at least, an embryonic theory), along the lines of the one I had developed in the étale context (see sub-notes n° s 81, 81 ). This must have been around the mid-sixties. Obviously it didn't "click" then - the very meaning of the question (a little vague perhaps, it's true) seems to have escaped him. Yet, surely I must have mention De Rham's cohomology, both differentiable and complex analytic, which brings together Serre's duality and Poincaré's duality, concerning both types of coefficient.

(May 14) In fact, as early as the 1950s, I knew that Serre's duality theorem could be generalized to the case of a complex of differential operators between locally free bundles on a clean and smooth relative scheme, so as to also encompass De Rham cohomology (i.e., morally, a cohomology with discrete coefficients). This is a duality result very close to Mebkhout's in the analytic framework, which will be discussed in the following note. I didn't pursue this line of thought at the time, mainly, I think, because I couldn't see how to make a suitable "derived category" with complexes of differential operators, in the absence of a good notion of "quasi-isomorphism". It's also true that the isolation in which I was working, on questions (coherent cohomology) that obviously didn't interest anyone else in the world but me, was hardly stimulating to pile a further generalization (with differential operators replacing linear morphisms) on top of those I'd already worked out in my own corner, over the previous years. I was, however, very close to Mebkhout's point of view, where the passage to the corresponding  $D$ -Modules (to the components of a complex of differential operators) gives a perfectly simple key to constructing the derived category we need. As early as 1966 (but without realizing it at the time), I had a dual point of view, which would have enabled me to make

a category derived from "stratified pro-Modules" (an idea later developed by Deligne, in his sketch of a theory of De Rham coefficients, which will be discussed shortly). Indeed, by associating with any coherent Module the pro-Module of

He spent a whole year at a seminar (at the IHES, in 1969/70, as I recall) developing a formalism that enabled him, at least for a finite-type scheme  $X$  over a field of zero characteristic  $k$ , to describe cohomology spaces (known as "de Rham" spaces) which, in the case where  $k = \mathbb{C}$ , give back the ordinary complex "Betti cohomology" (defined by transcendental means). The coefficients he worked with were "stratified promodules" and complexes of such promodules. It wasn't clear, however, whether these coefficients would fit into a formalism of the six operations<sup>598</sup> (\*), and Deligne gave up pursuing this path. As I recall, what was lacking above all(\*) to give confidence was a description in purely algebraic terms (using coherent or procoherent Modules and stratifications), valid therefore on any base field of zero characteristic, of the category of "algebraically constructible"  $\mathbb{C}$ -vector bundles on  $X$ <sup>599</sup> (\*\*), which is defined by transcendental means when the base field is the  $\mathbb{C}$ -field of complexes.

#### 18.5.4.2. b. The work...

**Note** 171(ii) Mebkhout's work, which began in 1972, is set in the transcendental (and technically more arduous) context of analytic spaces. It is in almost complete isolation that he

over the next few years becomes familiar with my work on cohomology and with the formalism of derived categories<sup>600</sup> (\*\*\*), left behind by those who were my students. □ A common thread, which

p. 948

The striking parallelism between continuous duality and discrete duality was gradually taking on a prominent role in his thinking. The latter had in the meantime taken on the name of "Poincaré-Verdier duality", without anyone in the wider world (and especially not the new "father" Verdier) even pretending to question the deeper reason for this parallelism. It's the reign of the "utilitarian", short-sighted point of view, content to use the ready-made tools I'd created, without asking any questions - and especially not such vague, not to say preposterous questions. The question isn't mentioned in any published text, not even (and I realize I'm to blame here. . . ) in those from my pen<sup>601</sup> (\*).

---

a complex of such stratified promodules, whose crystalline hypercohomology is identified with the Zariskian hypercohomology of the differential operator complex under consideration. (See my lectures "Crystals and the De Rham Cohomology of schemes" (notes by I. Coates and O. Jussila, in Dix exposés sur la cohomologie des schémas (p. 306- 358), North Holland - especially par. 6). We can then define the notion of "quasi-isomorphism" for a (differential) morphism between complexes of differential operators, in the usual way, in terms of the associated complexes of stratified promodules.

<sup>598</sup>(\*) Here again, my memory was hazy, and there's an error - it was clear a priori here, for heuristic reasons of a transcendental nature, that there **must** be a formalism of the six operations. (For further details, see the sub-note ". . . and hindrance", n° 171(viii).) My error is obviously due to a deliberate (conscientious) attempt to rationalize, to make intelligible something that might have seemed inexplicable, namely Deligne's abandonment of a "safe" research direction rich in promise. The reason, after all, is by no means mathematical!

<sup>599</sup>(\*\*) I would remind you that this notion of constructibility was introduced by me, among many variants (algebraic, real analytic, etc.) as early as the 1950s, at a time when I was strictly alone in my interest in these matters. (See my comments of last year, in sub-note n° 46<sub>3</sub> ).

<sup>600</sup>(\*\*\*) (May 14) Mebkhout has since told me that those first readings of mathematical literature, around 1972, were works by Japanese authors of the Sato school. He had great difficulty, he tells me, getting his head around it; it all seemed terribly complicated. That's when he came across a reference to Hartshorne's book Residues and Duality, which was a real delight to read. It's true that this book is superbly written! The few introductory words I had written for this book, evoking the ubiquity of the formalism it develops, inspired him greatly. It was then that he began to familiarize himself with my work, which subsequently became his main source of inspiration. In all his works and presentations, he takes care to clearly indicate this source.

<sup>601</sup>(\*) (May 14) I remember, however, that during the SGA 5 seminar, I was constantly reminded of the ubiquity of the formalism I was developing, and I never missed an opportunity to point out possible variants in such and such other contexts,

The very formulation of common formalism makes essential use of derived categories. Mebkhout makes them his constant working tool, against the winds of fashion and the disdain of his elders, starting with the one who (we don't know whether willingly or reluctantly. . . ) is now the "father" of the said categories, namely Verdier. Compared to the arsenal I had introduced, Mebkhout's essential new ingredient is the microlocal analysis of Sato and his school. More precisely, Mebkhout borrows from them the notion of D-module on a smooth complex analytic variety (equivalent to the notion of "crystal of modules" that I had introduced around 1965-66, which retains a meaning in broader contexts, and in particular on singular varieties), and above all the notion of D-coherence and the delicate condition of holonomy on a coherent D-Module. In addition, he makes essential use of a 1975 theorem of Kashiwara, according to which the cohomology bundles of the complex of differential operators associated with a D-Module  $\square$  holonomous are p . 949 analytically constructible. This was a point of view and results that I was totally unaware of until Mebkhout told me about them two years ago, and Deligne must have been equally unaware of them in 1969/70, when he was thinking about a formalism for De Rham coefficients, which he never followed up on. It was **by putting the two currents of ideas together** that Mebkhout arrived at a common apprehension of the two types of coefficients on a smooth complex analytic variety  $X$ , in terms of complexes of differential operators, or (better and more precisely, in the more flexible language of D-Modules) in terms of complexes of D-Modules with coherent cohomology<sup>602</sup> (\*). This is his great contribution to contemporary mathematics.

More precisely, if  $X$  is a smooth complex analytic space, let us denote by  $\underline{Cris}^*_{coh}(X)$  the sub full category of the derived category  $D^*(X, D_X)$  formed by the complexes of  $D_X$ -Modules with D-cohesive cohomology, by  $\underline{Cons}^*(X, C)$  the full subcategory of the derived category  $D^*(X, C_X)$  formed by the complexes of  $C$ -vector bundles on  $X$  with analytically constructible cohomology, and finally by  $\underline{Coh}^*(X) = D^*_{coh}(X, \underline{O}_X)$  the full subcategory of the derived category  $D^*(X, \underline{O}_X)$ , formed by the complexes of  $\underline{O}_X$ -Modules with coherent cohomology. Mebkhout highlights fundamental functions

$$\begin{array}{ccc} \underline{Cons}^*_{coh}(X, \underline{O}_X) & & \underline{Coh}^*(X) \\ \downarrow M & \searrow N & \downarrow \\ & \underline{Cris}^*(X) & \end{array} \quad (Meb)$$

where the right functor  $N$  is the "tautological" functor, totally derived from the scalar extension functor by the obvious inclusion  $\underline{O}_X \rightarrow D_X$ . The left functor  $M$ , or "**Mebkhout functor**", is much deeper in nature<sup>603</sup> (\*\*). It is **fully faithful**, and its essential image is the full subcategory

by  $\underline{Cris}^*_{coh}$  complexes of  $D_X$ -Modules with bundles of not only coherent cohomology, but also "holonomic" and "regular". These are subtle local conditions, the first introduced

by the Sato school, the second defined ad-hoc  $\square$  by Mebkhout<sup>604</sup> (\*), drawing inspiration above all (he tells me) from my p . 950

comparison theorem between algebraic De Rham cohomology and analytic De Rham cohomology

---

for the ideas and techniques I was developing within the framework of discrete cohomology. I find it hard to believe that I didn't mention the problem of synthesizing the two types of coefficients during the oral seminar, if only in the final presentation on open problems, which also disappeared from the massacre edition. Needless to say, there is no hint of such a problem in this edition, which has been carefully purged of anything that wouldn't fit in with the de rigueur label: "volume of technical digressions" . .

(May 19) See also the sub-note "Dead pages" (n° 171(xii)).

<sup>602</sup>(\*) For details of the language of  $D$ -Modules, its relationship to that of differential operator complexes and that of crystals, see sub-note "Five pictures ( $D$ -Modules and crystals)", n° 171 (ix), part (a).

<sup>603</sup>(\*\*) For an "explicit" description of a closely related functor  $M_\infty$ , in the context of  $D^\infty$ -Modules, see sub-note already quoted n° 171 (ix), part (b); "La formule du bon Dieu".

<sup>604</sup>(\*) The name "regular" is taken, of course, from the classical terminology for "regular critical points" of differential equations

of functions of a complex variable. If  $i : U \rightarrow X$  is the inclusion of the complementary  $U = X - Y$  of a

interest) are in fact "purely algebraic", making sense especially in the case where  $X$  is replaced by a finite-type scheme (smooth if you like, but it's not necessary) over a body of any zero characteristic.

The Mebkhout functor  $M$  (or "God's functor"<sup>605</sup> (\*\*)) is described as a quasi-inverse functor of the functor

$$m : \underline{Cris}^*(X)_{\text{hol.rég.}} \dashrightarrow \underline{Cons}^*(X, C),$$

defined by

$$m : F \dashrightarrow DR(F) = \overset{\text{dfn}}{RHom_D}(\underline{O}_X, F),$$

p. 951  $\square$  restriction of the functor (defined on  $\underline{Cris}_{coh}^*(X)$  as a whole) associating to each complex of  $D_X$ -Modules (with coherent cohomology) the associated complex of differential operators (or "De Rham complex")<sup>606</sup> (\*). Kashiwara's constructibility theorem implies that when  $F$  is holonomous (and a fortiori, when it is regular holonomous),  $DR(F)$  is indeed in  $\underline{Cons}^*(X, C)$ , which makes it possible to define the functor  $m$  - an obvious, childish definition, but one that nobody except Mebkhout (and up until the "big rush" five years later. . . ) had even thought of<sup>607</sup> (\*\*)! (To do so, we would have had to remember a

p. 952 certain yoga, that of the derived categories, which everyone by common consent had decided to bury, alongside the deceased who had introduced it among other bombast of the same style... .<sup>608</sup> (\*\*\*)'  $\square$  Moreover, the

---

divisor  $Y$  in  $X$ , regularity in Mebkhout's sense (for a complex of  $D$ -Modules  $C$  on  $X$ ), "along  $Y$ " can be written as the canonical morphism

$$Ri^{\text{mér}}(C_U) \rightarrow Ri_*(C_U)$$

of the "meromorphic direct image" of the restriction  $C_U$  from  $C$  to  $U$ , to the ordinary direct image, induces a quasi-isomorphism for the associated De Rham complexes.

In the case where  $F_U$  can be reduced to a "local system", i.e. to an  $\underline{O}_U$ -cohesive bundle with integrable connection, this notion is equivalent to Deligne's notion. It too is obviously inspired by my comparison theorem (with the difference that Deligne is careful not to point this out, whereas Mebkhout is constantly careful to clearly indicate his sources). Mebkhout only became aware of Deligne's notion after introducing his own transcendental challenge. He had not previously sought a purely algebraic description of his condition. Deligne's work showed that in the particular case under consideration, Deligne's algebraic condition implied Mebkhout's, and Mebkhout verified that the converse is also true. This provides the key to a purely algebraic description of Mebkhout's regularity condition, for any complex of  $D$ -Modules with coherent and holonomic cohomology.

Mebkhout told me that the Japanese had a notion of "micro-differential system with regular singularities", which they used in a completely different spirit (for analytical, not geometrical, purposes). After the rush on the "God's Theorem", this was just one of many ways to muddy the waters and obscure Mebkhout's pioneering work. It would seem that the two notions are equivalent - and chances are, given the deliberate messiness of the subject, nobody has ever bothered to check. Mebkhout only ever worked with the notion of regularity as he introduced it in 1976 (and as it appears in his thesis, submitted two years later).

<sup>605</sup>(\*\*) For the origin and meaning of the name "théorème (ou foncteur) du bon Dieu", see the note "L'inconnu de service et le théorème du bon Dieu" (n° 68'), written before I knew of the mystification of the Colloque Pervers, or even of "L'Enterrement dans toute sa splendeur".

<sup>606</sup>(\*) On this subject, see the aforementioned note "Les cinq photos (cristaux et  $D$ -Modules)" n° 171 (ix), part (a), "L'album "coefficients de De Rham"".

<sup>607</sup>(\*\*) (May 7) The **two** functors  $m, M$ , establishing the equivalence of crucial categories in one direction and in the other, must be called **Mebkhout functors**, and similarly for the functors  $m_\infty, M_\infty$  relating to  $D^\infty$ -Modules. (For these, see the cited note "The five pictures" (n° 171 (ix), part (b).) By composing these functors with the natural dualizing functors, we can find two other pairs of functors quasi-inverses of each other,  $(\delta, \Delta)$  and  $(\delta_\infty, \Delta_\infty)$ , countervariant themselves, and more convenient in certain respects (cf. note cited above). These are the four "**Meckbhout contractors**".

<sup>608</sup>(\*\*\*) (May 7) More than once Mebkhout has been treated like a joker, who thinks that writing arrows between derived categories (we're asking you for a bit!) and  $RHom$  is doing maths... . He didn't let it shake him, any more than I did when I introduced (in 1955) the  $Ext^i$  global and local bundles of Modules (while waiting for  $RHom$  with or without underlining), which made everyone seasick and justified the most express reservations about me (at least

condition of **regularity**, beyond that of holonomy, was established by Mebkhout "to measure", precisely in such a way that it becomes reasonable to expect that the functor  $m$ , thus restricted, is fully faithful and even, an **equivalence of categories**. He arrived at this conviction as early as 1976. He eventually proved it, under a very similar form, at least<sup>609</sup> (\*), in his thesis in early 1978.

□ This is above all **the** great new theorem contributed by Mebkhout, representing the crowning of eight years of stubborn work, pursued in complete solitude. It contains, in a single lapidary statement, a whole range of profound results of increasing generality, patiently worked out and proved one by one, between 1972 and 1980. For some of the major milestones in this solitary voyage of discovery of a new "philosophy" in the cohomology of varieties, I refer to the sub-note "The three milestones - or innocence" (n° 171 (x)). In the present note, my main aim will be to describe in a few words the new panorama that presents itself, at the end of this first long stage in the labours of the solitary worker, Zoghman Mebkhout.

The crucial fact (clearly recognized by Mebkhout as early as 1976) is that the Cons category\*  $(X, C)$  (of "topological" nature) can be interpreted, thanks to the Mebkhout functor  $M$ , as a subcategory full Cris category\*  $_{coh}(X, C)$ , which makes sense in the context of "abs-" algebraic geometry. treats"; it can also be interpreted, "morally", as a kind of "derived category" formed with complexes of differential operators in the ordinary sense<sup>610</sup> (\*) The full sub-category in question, defined by

---

until 1957, the year of Riemann-Roch-Grothendieck. ... ).

All this didn't stop Mebkhout from trusting his own flair, and following it wherever it led him. He set to work with his bare hands, no experience, no help from anyone. He was **sure** that the theorem he sensed had to be true - all the indications he had in his hands were consistent. With a little experience, it would even have been obvious that he already had everything in hand to prove it, with the now-standard means that the first of my students would apply in a jiffy. But reduced to his own resources, the theorem seemed vertiginously remote and inaccessible - he hardly dared hope that he'd ever prove it!

If he struggled to prove it, for almost two years, it was because he hadn't had the advantage, as my students had, of being supported by a benevolent elder, and of learning from me a certain standard technique for unscrewing constructible beams, combined with the resolution of singularities à la Hironaka. The statement he came up with is certainly a profound one, and the demonstration is also profound, but today of a standard nature. In retrospect, it appears that the difficulty he had to overcome was above all psychological, rather than technical: working against the grain, and entirely reduced to his lights alone... ..

<sup>609</sup>(\*) (May 5) In his thesis, Mebkhout states and proves the corresponding equivalence theorem for  $D^\infty$ -Modules, and gives a remarkable explicit expression of the quasi-inverse functor  $M$ . On this subject, see sub-note 171(ix) (part (b)), and also the sub-note "Ecllosion d'une vision - ou l'intrus" (n° 171<sub>1</sub>). By 1976, Mebkhout had come to the conviction that the two functors  $m$ ,  $m_\infty$  (thus also the scalar extension function  $i$ , discussed in the last quoted sub-note) are equivalences, and to the explicit form of the quasi-inverse functor of  $m_\infty$ . The result that figures in his thesis, concerning  $m_\infty$ , is from 1978. By this time, he had all the ingredients for the demonstration (analogous, but with difficulty additional techniques) in the case of  $m$ .

Given the general indifference that greeted his thesis, passed in February 1979, he made no effort to write a formal demonstration for the case of  $m$  as well. The ingredients are the same as for  $m_\infty$ , and are inspired by the proof of my comparison theorem for the De Rham cohomology of complex algebraic varieties (of which he had taken knowledge in 1975), and SGA 5's unscrewing techniques (which he learned from Verdier's "good reference", while the SGA 5 seminar continued to be carefully sequestered in the care of my dear cohomology students). It wasn't until the end of 1980, given the importance of his ideas for proving the Kazhdan-Lusztig conjecture, that he took the trouble to write a circumstantial demonstration in the case of  $m$  (where a quasi-inverse functor was not available in advance). This demonstration is published in "Une autre équivalence de catégories", *Compositio Mathematica* 51 (1984), pp. 63-88 (manuscript received 10.6.81).

I would like to point out that between 1975 and 1980 (apart from a few lines by Kashiwara in 1980, which will be discussed in the sub-note "La maffia" n° 171<sub>2</sub>), nowhere in the literature, apart from Zoghman Mebkhout's work alone, is there any mention of the  $m$  or  $m_\infty$  functor or of a duality "philosophy", relating discrete coefficients precisely.

analytically constructible, and regular holonomous  $D$ -complexes, or holonomous  $D$ -complexes<sup>∞</sup>.

As we shall see, when the importance of this relationship is recognized, with "Kazhdan-Lusztig" and the rush to cohomology d'intersection (under Deligne's leadership), Zoghman Mebkhout's name is eliminated without fanfare, by a hushed, smiling and discreet agreement, with implacable efficiency. ...

<sup>610</sup>(\*) For the precise relationship between the two points of view, I refer you to the much-quoted sub-note "The five photos" (no.° 171(ix)), part (a).

This is the category of "De Rham coefficients" that I had already envisaged in the sixties, and which was still missing from my panoply of zero characteristic coefficients, to complete and link together, as if in a single large fan, the "*l*-adic coefficients" that I had identified in 1963; it is also the category that Deligne had tried to grasp at the end of the sixties, without succeeding (it seemed) in a way that satisfied him. This category will obviously have an essential role to play in algebraic geometry (and in particular in the description of the category of patterns on a basic scheme  $X$ . . .). The obvious name for this category, for me at least, is

p. 954 the "**De Rham - Mebkhout coefficient category**"<sup>611</sup> (\*\*), denoted by  $DRM^*(X)$  (or  $Meb^*(X)$ ), or  $DRM^*(X/k)$  (or  $Meb^*(X/k)$ )  $\square$  in the schematic framework, when  $X$  is a finite-type scheme over a body  $k$  with zero characteristic<sup>612</sup> (\*).

It is via the functor diagram (Meb) above, which summarizes Mebkhout's philosophy (dating back to 1976, and established by him over the following years), that the **coherent crystalline coefficients** (i.e. the ob-  
Cris-jets\*<sub>coh</sub>( $X$ )) can be viewed as a "common generalization" of the "discrete" coefficients (constructible) and "continuous" (coherent). The category formed by the former is in any case identified, by the Mebkhout functor  $M$  (a functor of deep nature), with the **full subcategory** of the coherent crystal-line category formed by the De Rham-Mebkhout coefficients. The situation is not so good for the tautological functor  $N$ , which has nothing fully faithful about it. But to console us and to complete the picture, we can add that in each of the categories in question, we have a natural **dualistic functor**, giving rise to a biduality theorem ("trivial" for  $Q_X$ -Modules and  $D_X$ -Modules, and using all the force of resolution of Hironaka singularities in the case of constructible  $C$ -vector bundles), on the model that I had identified in the coherent (commutative) framework first, then in the discrete-spread framework (in

p. 955 1963)<sup>613</sup> (\*\*). That said, the two functors  $\square M$  and  $N$  are compatible with natural dualistic functors<sup>614</sup> (\*).

<sup>611</sup>(\*\*) The general lack of understanding of the crucial role and significance of this category is already evident in the fact that it has still not been given a name or a lapidary notation. Instead (in the texts I've looked at), the authors confine themselves to vague references to "regular holonomic differential systems" (well fi n who's going to get it right!), of "construction" or "correspondence" or "relation" (supposedly well known) between these and (E-constructible) beams - and always, needless to say, rigorously ignoring the one who was the lone craftsman, setting in motion all this hype around the new cream pie of the beau monde: " $D$ -Modules".

<sup>612</sup>(\*) In the algebraic case, in addition to the local "regularity" condition, an "infi ni" regularity condition must be imposed. coefficients (in the case of a non-clean variety) to find the "right" De Rham - Mebkhout coefficients, which will correspond, in the case where the base field is the complex field, to  $C$ -vector complexes on  $X_{an}$  with **algebraically** (and not only analytically) constructible cohomology bundles It's for these coefficients too that we have a "theorem of comparison", generalizing my result on De Rham's cohomology, namely that the "total crystalline cohomology"  $RG_{cris}$ , taken from the algebraic (Zariskierian) point of view or in the transcendental sense, is "the same". This statement in turn must be seen as a special case of a more complete statement, namely that the "six operations" from the algebraic point of view are "compatible" with the six operations from the transcendental point of view.

If my students hadn't been so busy burying the master's work, it would have been in the very early seventies (if not the sixties. . .) that they would have come up with the coefficient theory that was needed, in all its simplicity and power. . .

<sup>613</sup>(\*\*) (May 5) The extension of my results on biduality, and on the stability of construc- tibility by the RHom operation, from the étale to the analytic context, is automatic and was known to me as early as 1963. Verdier had been working with me for three years at the time, immersing himself in the yoga of derived categories (whose systematic theory he had taken on) and coherent duality. It was from me that he learned the techniques for extending the coherent duality formalism to the case of discrete coefficients. As we have seen, he appropriated the yoga of duality and biduality, in the complex analytic context, in "the right reference" thirteen years later (in 1976), with the connivance of Deligne and my other cohomology students, all well aware of the situation.

In the mass-murder edition of SGA 5 the following year (1977), Illusie retained (in Lecture I) the biduality theorem, so that for a reader of both texts, Verdier's deception is obvious - but apparently it was taken for granted by everyone (given the times. . .). On the other hand, Illusie has refrained from including the RHom stability result for constructability, which I had of course given even **before** stating and proving the biduality theorem, on which my demonstration (copied by Verdier) in no way depends. So (it has to be done!) Illusie merely establishes the stability in question when the second argument is the dualising complex ! ! This was a way of covering up for his friend

Moreover, if  $F, F'$  are crystalline coefficients in duality on  $X$ , Mebkhout proves that the complexes of C-vector "crystalline cohomology" of  $F$  and  $F'$  on  $X$ <sup>615</sup> (\*\*)

□

p. 956

$$R\Gamma_{cris}(F)!, R\Gamma_{cris}(F)'$$

as complexes of topological vector spaces, are "in duality" by a natural coupling, in other words we have a coupling **that is a duality** (of EVT)

$$H_{cris}^i(X, F) \times H_{screams}^{-i}(X, F') \rightarrow \mathbb{C}$$

(for any integer  $i$ ). This duality theorem "caps" the ("absolute") duality known in the case of discrete coefficients (which Mebkhout calls "Poincaré-Verdier duality"), and in the case of coherent coefficients (which Mebkhout calls "Serre duality"), into a duality which I would call "Mebkhout duality", and which he called "Poincaré-Serre-Verdier duality"<sup>616</sup> (\*).

Verdier's article is copied from my SGA 5 lectures from beginning to end (with the exception of the three pages mentioned above). The best part is that the stability in question is already an immediate corollary of the biduality formalism (which does not prevent it from being mathematically zany to pretend to establish the stability of constructibility by  $RHom(F, G)$  only when  $G$  is the dualizing complex). But the complacent Illusie refrains from mentioning this corollary in his presentation, so as to keep up the appearance that the stability result that appears in his friend's "La bonne référence" is indeed of his own making.

One wonders why, under these conditions, Illusie kept the biduality theorem - butchering for the sake of butchering, he wasn't quite there yet! But if he had emptied it, he would have been obliged to empty Lefschetz-Verdier's eternal formula (which makes essential use of it) - that is, the "head of the Trojan horse": the formula whose supposedly crucial role in SGA 5 was to justify his other friend's impudent "coup de scie" operation, shattering the unity of my work on étale cohomology.

Congratulations to my ex-student Illusie, the clever "editor"-fossoyeur... .

<sup>614</sup>(\*) For the tautological functor  $N$ , this compatibility is itself tautological. On the other hand, for the Mebkhout functor  $M$  (or, what amounts to the same thing, for its quasi-inverse  $m = (G \mapsto DR(G) = RHom_D(Q_X, G))$ ), this is a profound result, proved by Mebkhout in 1976 (under the name "local duality theorem"), together with the global duality theorem for the  $D$ -Modules, to be discussed shortly. Nevertheless, "everyone" now takes this result for granted, and above all (even more self-evidently) without ever hinting at some vague unknown. ...

<sup>615</sup>(\*\*) I remind you (cf. "The five photos", n° 171(ix)) that the crystalline ("absolute") cohomology of  $F$  on  $X$  is defined as follows

$$R\Gamma_{cris}(F) \stackrel{\text{dfn}}{=} RHom_D(Q_X, F)' \quad R\Gamma(RHom_D(Q_X, F)) = R\Gamma(DR(F)).$$

On the other hand, the index ! designates the cohomology (crystalline in this case) with its own supports, i.e..

$$R\Gamma_!(F) \stackrel{\text{dfn}}{=} R\Gamma_!(RHom_D(Q_X, F)).$$

<sup>616</sup>(\*) As I have already said elsewhere (in the note "Le compère", n° 63"), Mebkhout "could do no less" than tip his hat to his "benefactor" Verdier (since the latter had communicated to him the providential "good reference"), everywhere.

when he had the chance. Yet **none** of the essential ideas for either duality (and even less, if you like, for the one that caps them all) are due to Verdier. In fact, apart from Poincaré's and Serre's duality theorems in their original form, which of course served as my starting points, all the essential ideas are contained in the formalism of the six variances and biduality that I introduced and developed at length in both contexts, coherently and discretely, in solitude.

It was with this in mind that I wrote last year, in the note "La victime - ou les deux silences" (n° 78') that Mebkhout's "protectors" "had kindly allowed him to carry with his hands a small corner of the coffin bearing my remains". It would have been right for

I'd also like to point out at this point that Zoghman had the courage, even though he could feel the wind blowing in the beautiful world, to state clearly in each of his articles that he was inspired by my ideas, instead of doing as everyone else did and plundering the deceased while passing over him in silence (in writing), and displaying an air of condescension (in words).

As for the name "Serre duality", which has come to be given to the theory of coherent duality I had been developing for years in total solitude, it has all the more salt (and Serre, who wasn't asking for so much, will appreciate it better than anyone!), as Serre had shown a total lack of interest in my duality work, thus depriving me of the only interlocutor I could have hoped to have for my cogitations! I think I can safely say that this disinterest has remained intact to this very day, including with regard to the notion of derived category (and other useless details. . . ).

As I see it, these are the first steps in a vast duality program, including (among other things (171(xi))) the development of a six-operation (and biduality) formalism for De Rham - Mebkhout coefficients on finite-type schemes over a characteristic body.

p. 957 null (while waiting for better). Given the conditions of isolation and the atmosphere of indifference in which Mebkhout had to work, it was out of the question for him to develop a complete formalism, such as the one I had developed.

in the two contexts from which he drew his inspiration (171(xii)). Among the main results he produced and proved over the eight years 1972-1980 (171(x)), the one that strikes me as the most important from the point of view of my program of the sixties is, of course, the one that highlights **the** correct category of crystalline coefficients, known as "de Rham - Mebkhout". As it happens, it was this result, too, that, from October 1980 onwards, enjoyed the most brilliant, even astounding, fortune, even though it was appropriated (like *l*-adic cohomology, or the crystalline cream pie of car. *p*) as a **tool** only, torn from a vision that gave it all its meaning and strength.

p. 958 Even more than for Mebkhout's other results, and just as in my work developing the biduality and six operations formalism, the language of derived categories is essential here to tease out the simple yet profound relationship between discrete coefficients and coherent coefficients<sup>617</sup> (\*), described in the *théorème du bon Dieu* (aka Mebkhout the never-named. . . ). Thus, it was almost twenty years after the creation of the cohomologie étale tool (which everyone today uses as a matter of course, while treating by the the vision that gave rise to it. . . ), and thanks to this (now "pie-in-the-sky") result by an obscure posthumous pupil, that the language of derived categories will suddenly find itself rehabilitated (as if it had never been buried. . . ), in the limelight and to the ovations of the crowd, who have come to acclaim yesterday's buriers playing (modestly) the new fathers. But then again, I anticipate...

### 18.5.4.3. c.... and the windfall

**Note** 171(iii) Verdier was more or less the "thesis boss" of Mebkhout, whose work over the past seven years had been carried out in complete solitude. At no time did he show any interest in the work of this young man, who was clearly as stubborn as he was stubborn - a vague, retarded Grothendieckian who is treated with the height of his greatness. In the four years since our first meeting in 1975, he has granted a total of three "interviews" to this out-of-nowhere fellow. None of my other cohomology students

<sup>617</sup>(\*) (May 7) Precisely, to a holonomic  $D$ -Module (complex reduced to degree zero) the good-god functor associated in general a constructible complex of  $\mathbb{C}$ -vectorials which will have more than one non-zero cohomology bundle, and vice versa. The simplest and most striking example is where we take a divisor  $Y$  on  $X$ , hence an inclusion  $i := X \setminus Y \hookrightarrow X$ , and the sub-bundle of  $i^*(Q_U)$  formed of the meromorphic functions along  $Y$ . It is a profound result of Mebkhout, obtained as early as 1976 (and later absorbed into the Good God Theorem) that this is a regular holonomic  $D$ -Module (nobody before Mebkhout had ever even considered looking at this bundle as a  $D$ -Module, and suspecting that it was even coherent. ). His transformed by the Good Lord functor is  $Ri^*(C_U)$ , which has non-zero cohomology bundles in dimension 0 and 1 at least.

This is an aspect of Mebkhout's philosophy that was absent from Deligne's approach, who obtained a dictionary between constructible  $\mathbb{C}$ -vector bundles and certain stratified  $Coh(Q_X)$  proobjects (the category of coherent Modules on  $Q_X$ ), without having to move on to complexes and derived categories. (He did, however, take care to intervene in these, at a time when I was still around and it never occurred to anyone that we'd one day bury the said categories. ). This (at least at first glance) is an advantage of Deligne's approach, which is closer to intuition. geometric directness of discrete coefficients - but it's also a sign, no doubt, that his approach is less profound. I tend to believe that it will still have a role to play, though, but no doubt in "tandem" with Mebkhout's point of view, which (I presume) is somewhat dual.

(May 24) For details, see the sub-note "The five photos (crystals and  $D$ -Modules)" (n° 171(ix)), part (c), in particular pp. 1009 ff.

nor do they deign to take an interest in the work of the aforementioned quidam. Its significance for their own research escapes them completely (although it's obvious, even to a old-timer like me who's been "out of it" for fifteen years... .). They're far too entrenched in their trip-burial, and in a dull, crank-driven routine, to be able to apprehend anything new that presents itself without a calling card and without pretense, with the sheer force of things that are all too simple and all too obvious. They long ago buried their own creative faculties, confining themselves to being consumers of fashionable brand-name products. Later, however, they will largely take their revenge on the intruder who took the liberty of seeing what had eluded them and everyone else (even though they had everything they needed, like him and beyond, to see and do. . .). But then again, I'm anticipating... .

The defense took place on February 15, 1979, to general indifference. Mebkhout sent his thesis to all the mathematicians he could think of, rightly or wrongly, who were interested in the cohomology of analytic or algebraic varieties - starting, of course, with all my students. Of all those who received a copy of his thesis, **not a single one** even acknowledged receipt, or sent a word of thanks. It's true that Mebkhout's thesis, even more so (it seems to me) than some of his articles, feels the conditions of adversity that had surrounded it - it seemed to me to be thick and not easy to access, to say the least, and those who weren't in the loop had excuses for not hooking up right away. <sup>By□contrary</sup>, I found p. 959

Mebkhout's oral explanations of his philosophy were perfectly clear and immediately convincing, and there's no reason why those he gave to Verdier (1976), Berthelot (1978), Illusie (1978) and Deligne (1979) should be any less so than those I received.

It was at the Bourbaki seminar in June 1979 that Deligne learned from Mebkhout of the "**Riemann-Hilbert correspondence**" that appeared in the unread thesis (this was the name given by Mebkhout to the category equivalence (or "dictionaries") referred to earlier). Apparently, over the past four years, Verdier had never even thought of saying a word to Deligne about his obscure pupil's work, which clearly escaped his notice until around the time of the Colloque Pervers in 1981 (when Deligne had to take it upon himself to explain what it was all about. . .). For Deligne, on the other hand, it was bound to "click" immediately - it was **the** solution, complete and lapidary, to the problem he himself had left to fend for himself ten years earlier!

The reflex that would seem to go without saying in such a situation (so much so, in fact, that I'm still struggling to imagine how anyone could act differently. . .), is to immediately congratulate the young stranger on having finally found the answer to a question that, I'm sure, is quite profound, that we'd been working on for a whole year, and which we'd finally written off. Times have changed... Deligne, always affable of course, confined himself to a vague compliment (and yet, it warmed the heart of the candid Zoghman, who was not spoiled and had no idea of what awaited him): yes, he had received his thesis and had even read the introduction, and he had found it to be "beautiful mathematics". For Zoghman, it was a great day! It was surely the first time (and the last too...) that he had received a compliment from such a great man, whom everyone knows and quotes.... <sup>618(\*)</sup> I can't tell you what's going on in the mind of Deligne, at that time and in the year that followed, concerning this remarkable theorem he had just learned from the mouth of a stranger. I presume he must talk about it around □de him <sup>619(\*)</sup> - still he com- p. 960

<sup>618(\*)</sup> (May 14) This was the first and only time Mebkhout had the honor of a conversation with Deligne.

(June 7) For another compliment, from the previous year (June 1978) and from Illusie's mouth this time, see the note "Carte blanche pour le pillage - ou les Hautes Oeuvres" (n° 171<sub>4</sub>), especially page 1091.

<sup>619(\*)</sup> (May 14) On reflection, and from what I know about Deligne, I doubt he really "talked about it", before doing so with a clear idea and a well-defined plan. See the note "La valse des pères" (n° 1764) about Deligne's very special play, and the role he had the two straw-fathers Beilinson and Bernstein play (see also "Marché de dupes - ou le théâtre de marionnettes", note n° 172<sub>2</sub> (e)).

munique in October the following year<sup>620</sup> (\*\*) to the Soviet mathematicians Beilinson and Bernstein, who surely guessed that they would have use for it. That same year, in fact, it was this "correspondence" (always referred to as the "Riemann-Hilbert" correspondence when one deigns to name it, and without Mebkhout's name ever being mentioned) that was the essential ingredient, the **new fact** that had been missing until then, for the demonstration of a famous conjecture<sup>621</sup> (\*\*\*) of which I know little more than the name, the "Kazhdan-Lusztig conjecture". At the same time, this was the kick-off to a sudden and spectacular revival in the cohomology of algebraic varieties, finally emerging from a long stagnation of more than ten years (if we set aside Deligne's work on Weil's conjectures). This unexpected revival took shape the following year, with the "happening" of the Colloque de Luminy in June 1981, on the theme "Analysis and topology on singular spaces"<sup>622</sup> (\*\*\*\*).

#### 18.5.4.4. d. The day of glory

**Note** 171(iv) On the subject of this "memorable Colloquium", I refer the reader to the note "L' Iniquité - ou le sens d'un retour" (n° 75), and to the following notes, still written in the heat and amazement (the word is not too strong) of the discovery. These notes form Cortège VII de l'Enterrement, which I have named "Le Colloque" ("The Colloquy").

- or Mebkhout and Perversity bundles".

p. 961

Suffice it to say that in the Introduction to the Colloquium Proceedings, signed by Bernard **Teissier** and Jean-Louis **Verdier**, the famous "Riemann-Hilbert correspondence" is presented as the "Deus  $\square$  ex machina" of the Colloquium. The same is true of the main paper, which (along with the Introduction) forms Volume I of the Proceedings, signed by **A.A. Beilinson, J. Bernstein and P. Deligne** (and in fact written and presented at the Colloquium by the latter, in the absence of the other two co-authors). Moreover, the first two authors named had been informed directly by Mebkhout (and independently of Deligne) of the ins and outs of his theorem, as early as the previous year (November 1980) - Mebkhout had even travelled to Moscow on purpose for this purpose<sup>623</sup> (\*). Teissier had also known first-hand for a long time - not to mention Verdier, who had chaired Mebkhout's thesis jury... . Finally, I'd like to add that it had been decided "in extremis" to ask Mebkhout to give a talk on D-Module theory (which, apart from himself, none of the people there knew much about), so Mebkhout had the opportunity to inform the entire Colloquium<sup>624</sup> (\*\*) about the theorem he had modestly called Riemann's and

<sup>620</sup>(\*\*) (May 14) This appears from a letter from Deligne to Mebkhout (received October 10, 1980). For details of the Kazhdan-Lusztig episode, see sub-note "La maffi a" (n° 171<sub>2</sub>), part (d), "La Répétition Générale".

<sup>621</sup>(\*\*\*) The same conjecture is demonstrated, independently and nevertheless with a remarkable set, at the same time (at For further details, see the sub-note already quoted "La maffi a" (n° 171<sub>2</sub>) parts (c) and (d).

<sup>622</sup>(\*\*\*\*) The Colloquium Proceedings were published in Asterisk n° 100 (1982). These proceedings were not printed until December 1983, and appeared in January 1984, almost two years after the date marked on the volume.

<sup>623</sup>(\*) On this instructive episode, see the sub-note "La maffi a" (n° 171<sub>2</sub>), part (d) "La Répétition Générale (avant Apothéose)".

<sup>624</sup>(\*\*) (May 14) About the participants in this strange Colloquium, very much a "festival of Grothendieckian maths", but with absolute silence on the late ancestor himself, as well as on the obscure posthumous pupil "who had the gift. . . of bringing all these fine people together". . . Deligne and Verdier were the only "pre-1970" students taking part in the Colloque, but they were enough to take center stage. Strangely enough, Berthelot and Illusie (whose work was particularly marked, I might add, by the absence of Mebkhout's point of view, exhumed there with great fanfare) were not part of the festivities. On the other hand, Contou-Carrère ("later" pupil) has wandered in, quite happy to have been invited to recount his method of solving Schubert cycles.

I remember that he came back euphoric, fully identified with all those brilliant and famous people with whom he felt at home, and who had come to listen to him, obviously interested, but yes! He put on a contrite face to tell me about Mebkhout,

Hilbert, without leaving the slightest ambiguity (as one might imagine) about the authorship of this result, which had the gift (unexpected for him as for everyone else) of bringing everyone together.

□ In fact, the reader would be hard-pressed to find any trace of Mebkhout's presentation in the Colloquium Proceedings.

p. 962

Verdier kindly explained to him afterwards that only articles presenting **new** results would be included in the Proceedings, whereas those in his thesis were already two years old and more. Readers will also be hard-pressed to find a single bibliographical reference in the Proceedings, or the slightest indication of the origin of this famous theorem, which is not due to Riemann or Hilbert. It's also hard to find the name of Zoghman Mebkhout. This name does not appear in the first volume, either in the text or in the bibliography. In the second, it appears twice in the bibliography, in references-"thumb!" (we can't say we didn't quote him!) from the pens of Brylinski and Malgrange - references that have nothing to do with the theorem of the good God - alias Riemann- Hilbert - alias Deligne (and especially not of Mebkhout)<sup>625</sup> (\*).

---

who had opened up to him with bitterness, but he couldn't really say why - for Contou, at any rate, life was obviously good!

That was in June 1981. Four months later, (in response to his single candidacy for a post in Perpignan) he received a slap in the face, which he took as a humiliation and an affront. (For this episode, see the note "Cercueil 3

- ou les jacobiniennes un peu trop relatives" n° 95, especially pp. 404-406. This note was written without my having yet made the connection with the episode of Contou-Carrère's participation in the brilliant Colloque).

<sup>625</sup>(\*) (May 14 and 26) Apart from the participants already named, I was informed by name of the participation of **Brylinski, Malgrange** and **Laumon**. All three were fully aware of Mebkhout's work, and he had had the opportunity to inform each of them in detail, even outside the lecture he had given at the Colloquium. This did not prevent Brylinski and Malgrange, in their article published in the Proceedings, which makes essential use of Mebkhout's ideas and the bon Dieu theorem, from glossing over both the crucial role played by the emergence of these new ideas and new tools, and the name of their author.

As for Laumon, he made up for it later, in an article in collaboration with Katz. The same N. Katz had already distinguished himself in 1973 with "Operation APG 7", mentioned in the note "Episodes of an escalation" (n° 169 (iii), episode 2).

Mebkhout had already informed him of the results of this operation in 1979 (see the note "Carte blanche pour le pillage", n° 171<sub>4</sub>). The article in question is entitled "Fourier transforms and exponential sum augmentations" (also Laumon's doctoral thesis), which has been circulating in preprint form for the past two years (I even received a

copy by Laumon). These authors developed a Fourier transformation for *l-adic* coefficients, along the lines of that introduced by Malgrange in 1982 in the case of *D*-Modules (in the wake of the work of the vaguely unknown, and without mentioning his name, of course). Mebkhout's work represents the heuristic foundation of the theory developed by Malgrange as well as that of Laumon-Katz, in the same way as it did for the aforementioned article by Beilinson - Bernstein - Deligne (on what they called, That said, Laumon and Katz are also following the general trend (no mention of the service unknown in either the article or the bibliography - nor, of course, any mention of the ancestor. . . ), following in the footsteps of Deligne, Verdier, Berthelot, Illusie, Teissier, Malgrange, Brylinski, Kashiwara, Beilinson, Bernstein - I apologize for the alphabetical order, but that's already twelve people directly and actively involved in the brilliant mystification-escroquerie of the Colloque Pervers - not to mention Hotta's thirteen!

Malgrange is not quoted in the article in question either - apparently there are coteries of allied authors who quote each other in turn, avoiding quoting those next door even when they're pumping on them as best they can. In any case, when it comes to the ancestor or the vague unknown, they all agree. It's often brilliant math, surely.

- but as an old-fashioned person, I'm not indifferent to the mentality and it takes away my appetite for reading, and ultimately, even for making them. Not the ones they make, anyway. The smell is too distressing...

I also took a look at J.L. Verdier's article, "Spécialisation et faisceaux de monodromie modérée", published in the same Actes. Unsurprisingly, I saw "Riemann-Hilbert correspondence", with no allusion (in the text or bibliography) to the vague stranger whose thesis he had chaired. He must have forgotten. ... There's also mention of a Riemann-Roch étale theorem (that name rings a bell. . . ) - and I'd seen that too in the Laumon-Katz article. As neither of them mentions a certain deceased person, I'm thinking that this "theorem" must surely be due to

Messrs. Riemann and Roch, as well as the special case found among the "technical digressions" and "nonsense" of SGA 5 (not to mention the exposition of conjectures, providentially emptied by the far-sighted and astute "editor" Illusie. . . ).

As early as 1977, Mebkhout had already sensed a link between his philosophy and the Fourier transform, at a time when he was rigorously alone in his interest in a yoga of duality, linking *D*-Modules and discrete coefficients (as I once was, for the formalism of coherent, then staggered duality). This "Fourier transform" intuition remained vague

- the context was no more encouraging for him to continue down this path than it was for me, around 1950, to broaden my horizons.

□ To return to the Colloquium in the flesh, we have to believe that none of the brilliant mathematicians assembled in these parts, deigning to listen to the talk given by a vague stranger on duty, didn't realize that the "Riemann-Hilbert correspondence" presented to them as his own, was in fact the very one so brilliantly introduced by the most brilliant among them, as the heuristic keystone of his brilliant talk, which was (in the opinion of the organizers, Teissier and Verdier<sup>626</sup> (\*)) the "highlight" of the whole brilliant Colloquium on so-called (one wonders why) "perverse" beams. And yet it seems that none of them was surprised that the name of the vague unknown was not mentioned in this talk, which was certainly flying so high that there was no need to bother; nor, two and a half years later, with the publication of the Proceedings (early 1984), that the name of the said unknown did not appear either,

neither in the introduction (already mentioned) nor in the article in question by Deligne et al. This article left little room for doubt as to the true authorship of this <sup>correspondance</sup>, which the lead author and presenter-prestidigitator<sup>627</sup> (\*), with his customary modesty, refrained from naming, not even the names of his two illustrious precursors. If there are any who were surprised, they haven't made themselves known to this day - not to me, in any case, nor especially to the main person involved in providing the sauce for the farce, namely the posthumous and rigorously unknown pupil, as it should be, today as before - Zoghman Mebkhout<sup>628</sup> (\*\*).

## a1. Unnecessary details

### Note 171(v)<sup>629</sup>

**(a) Packages of a thousand pages...** . (May 4) Even Serre is no exception to the rule, having long (like André Weil) developed an annoying tendency to declare maths that doesn't interest him to be "bullshit". Yet he and Weil are of a calibre that (one might think) should put them above such childishness. In the event (and Deligne's "last twenty pages" aside), it was through two or three thousand pages of Grothendieckian "bullshit" that Weil's conjectures ended up being demonstrated (and quite a few other things too that neither Weil nor Serre had ever dreamed of). This did not encourage Serre to be more modest, since in the very text in which he presents Deligne's demonstration of the last step in these conjectures (in the Bourbaki seminar of February 1974, presentation no. 446), he takes this opportunity of all to ironize (in polite terms, of course) about the useless details with which the "1583 pages" of SGA 4 must be crammed. In this easy irony, I don't detect malice or bad faith, but rather thoughtlessness and thoughtlessness. He will have taken the trouble to note the number of pages in three volumes (which he avoided reading and whose substance escapes him) and to add them up - just to mock them with "elegance".

---

theory of coherent duality to a theory encompassing complexes of differential operators (see b. de p. (\*\*) page 946). There is an allusion to the Fourier transform on p. 2 of the introduction to the paper "Dualité de Poincaré" by Z.Mebkhout, in Séminaire sur les Singularités, Université Paris VII (1977-79).

<sup>626</sup>(\*) This is the implicit "opinion" clearly expressed in the above-mentioned Introduction to the Colloquium, signed by Teissier and Verdier.

<sup>627</sup>(\*) For details of my friend Pierre's prestidigitation-around-the-corner tricks to claim authorship of the never-named theorem, see last year's note "The prestidigitator" (n° 75").

<sup>628</sup>(\*\*) (May 19) For details about the misadventures of my friend Zoghman, candidly lost in a milieu of "tough guys" at see the series of sub-notes "Ecllosion d'une vision - ou l'intrus", "La maffi a", "Les racines", "Carte blanche pour le pillage" (n° 171(i) to 171(iv))

<sup>629</sup>(\*\*\*) This note (in three parts (a) (b) (c)) is derived from two b. de p. notes to the note "L'ancêtre" (n° 171 (i)) - see the b. de p. notes (\*\*) p. 944 and (\*) p. 945.

□ But it all adds up, both my former complacency towards such brilliant students, and this Serre's "elegance" (at a time when l'Enterrement had already been going strong for four years. . . )<sup>630</sup> (\*), and all that followed. Barely three years later, it's as if my non-pupil Deligne, with added malice and impudence, has written again about Serre's own terms or their undertones, with those "useless details" that are pruned away, the "confused state" and the "gangue of nonsense" (where this same Deligne learned his trade and found his main source of inspiration), which a pale digest of his pen is charitably intended "to make us forget". Thus, from complacency to ease and impudence, we have arrived in the mathematical world, in barely ten years, at a state of morals where the simple feeling of decency seems to have disappeared.

It wasn't Weil or Serre, still less Deligne, who created the new tools that were lacking for "**La Conjecture**", but rather the one they take pleasure in ironizing - through deliberate ignorance or calculated malice, the effect is not very different. But I who, with infinite care, have written and rewritten, and had written and rewritten, tirelessly, throughout the months and years, a text that sets out with all the breadth it deserves, the language and certain basic tools for a vast, unifying, new and fruitful vision - I know me, and with full knowledge of the facts, that there is not **a single page** among the 1583 left behind by Serre, by my students and by unanimous fashion, that has not been weighed and reweighed by the workman and that is not in its place and fulfilling its function, which no other page written to date could fill. These pages are neither the product of fashion nor of vanity, which takes pleasure in setting itself above others. They are the fruits of my love and of the long, obscure labor that prepares a birth.

For this part of my work, as well as for all my major contributions to mathematics which have now become part of the common heritage, no **one** has yet been able to do what I did (with "bullshit", "useless details" and "nonsense"), except by copying me (with insignificant variations)<sup>631</sup> (\*\*). Some recopy (as is or in related or even new contexts) by saying so (this is becoming more than a rarity. . . ), others by playing the new fathers, and taking

of disdainful condescension towards the work they shamelessly plunder, and towards the worker who taught them their □ **metier**.

. This indecency has only been able to flourish and flourish because it has p. 966 found a consensus ready to welcome it, first and foremost among those who (often through their exceptional stature) set the tone.

**(b) Machines for doing nothing... .** The yoga of the six operations is an integral part of this vast unifying vision" developed in the SGA 4 and SGA 5 seminars. I'd even go so far as to say that this yoga is the central theme of the SGA 5 oral seminar, or to put it another way, that it is its "nerve" and soul. Illusie has therefore taken care to remove it from the massacre edition (destined to become a volume of "technical digressions"). . . ).

In the note "L'ancêtre" (n° 171 (i), p. 945) I write (without further clarification) that the vision-force of the six operations "has given eloquent proof of its power". For me, perhaps the most striking concrete sign of this power is to be found in our mastery of étale cohomology. To achieve this mastery, in 1963, the "six operations" vision that came to me from coherent duality was my constant guiding principle. I believe I'm the only person in the world qualified to comment on what was decisive in the development of this tool.

It's understood here that in the process of discovery, the so-called "heuristic" elements are almost always decisive. If I'm talking about the "power" of a point of view or a vision (something of a completely different nature), I'm talking about the "power" of a point of view or a vision (something of a completely different nature).

<sup>630</sup>(\*) (May 27) For a further reflection on the evocation of Serre, see part (c) of this note.

<sup>631</sup>(\*\*) (June 7) I recently read Fulton's fine book "Intersection Theory" ("Ergebnisse", Springer Verlag, 1984), and find that an exception should be made for the Riemann-Roch-Grothendieck theorem.

This cannot be measured in strictly technical terms. It is above all its "suggestive" power, as a discreet and sure guide in the voyage of discovery, whispering to us at sensitive moments "the" right notion to introduce, "the" right statement to identify and prove, "the" theory that remains to be developed. It's because we forgot such a guiding vision (after burying it) that, in the cohomological theory of algebraic varieties, the powerful impetus of the sixties ended up, in the years following my departure, in a state of confusion and stagnation. Apart from the great "prestige question" (i.e., that of the absolute values of Frobenius eigenvalues), all the essential questions were stubbornly avoided... ..

Another sign of the power of the vision (or, in this case, the formalism) of the six operations, I see the Lefschetz-Verdier formula of fixed points, both in the context of discrete coefficients and coherent coefficients. Here, the role of the "six operations" formalism has been both **heuristic** (in the sense that the formula

p. 967 is irresistibly suggested by <sup>this formalism</sup>) and **technical** (in the sense that formalism also gives the necessary and sufficient means for the proof of the formula). It's true, given the Burial, that only a tiny portion of the cohomological formalism I had developed was used, up until at least the "rush" on intersection cohomology and on so-called "perverse" beams (where part of the formalism is exhumed without mention of the worker. . . ). But I am well aware that, along with Weil's conjectures and the omnipresent intuition of topos, the vision of the six operations was my main source of inspiration in my cohomological reflections throughout the years 1955- 1970<sup>632</sup> (\*). In other words, the "power" of this vision is for me a self-evident fact, or rather, a reality that I have experienced almost daily for fifteen years of my life as a mathematician. This experience has been strikingly reconfirmed over the past few weeks, as I've resumed contact with the "abandoned sites" of De Rham's crystalline coefficients and<sup>633</sup> (\*\*) patterns.

p. 968 □ This very "subjective" experience I have of the power of a certain vision-force, also has a "objective" sense, difficult to dismiss out of hand. This sense emerges when one remembers that (with a few rare exceptions) the main ideas and notions concerning the cohomology of "abstract" algebraic varieties and schemes (which everyone today uses as if they dated back to Adam and Eve<sup>634</sup> (\*\*)) were developed by none other than myself, during the same period 1955- 1970. (It goes without saying that I'm setting aside here my starting point FAC, and Weil's conjectures).

<sup>632</sup>(\*) (May 15) It is understood that the vision itself took shape gradually over this period, from the first seeds contained in my 1955 article "On some points of homological algebra" (in Tohoku Math. Journal). It reached full maturity in 1963, with the sudden onset of étale cohomology. This occurred (as if by chance) in the same days, more or less, that I introduced the "missing functor"  $Rf_!$  (direct image with eigenstands). But the role of the six operations, as "vision-force" and as omnipresent fi l conductor, only became fully conscious, I believe, with the SGA 5 seminar. As early as 1966, with the start of crystalline cohomology, it was clear to me that the first objective (beyond the limited "running-in" program, which would be accomplished in Berthelot's thesis work) was to arrive at a formalism of six operations (and biduality) for "the right" crystalline coefficients. It took a (deceased) crumbler to emerge from the coffin prepared for him, so that (almost twenty years later, and inspired by the ideas of a vague stranger in the service and co-buried) these "good coefficients" finally ended up just being **defi ned**! A description can be found in fi ni type diagrams on  $Z$  in particular, in volume 3 of Réflexions (with the fifth and final part of Récoltes et Semailles).

<sup>633</sup>(\*\*) (May 15) For the image of "abandoned building sites" (or "desolate" building sites), see part 6 of the Funeral Ceremony (notes 176', 177, 178), and in particular the last of the three notes quoted. While writing Récoltes et Semailles, I devoted a few hours here and there to De Rham's problem of crystalline coefficients and that of motifs, and a convincing defi nition for the former appeared, and a principle at least for the construction of the latter, in the (Compare with the comments in the previous b. de p.).

<sup>634</sup>(\*) About this mentality of the "user" (or "consumer") of fi nished mathematical products, who has forgotten (if he has ever known... ) what a creation is, and also on the subject of Adam and Eve and the good Lord, I refer the reader to last year's notes "A sense of injustice and powerlessness... . " (n° 44') and "L'inconnu de service et le théorème du bon Dieu" (n° 48'). See also "Teaching failure (2) - or creation and fatuity" (note n° 44'),

Mathematically speaking (and from what I've seen so far), this great era has led to a morose mediocrity, the root cause of which is in no way technical. It's one of the signs of this mediocrity that a powerful vision designed to inspire and nurture grand designs has been buried or made a mockery of, by the very people who were its custodians and primary beneficiaries. And another sign that neither Deligne, Verdier, Berthelot nor Illusie, overwhelmed as they were by all the facilities conferred by position and prestige, brilliant gifts and consummate experience, were able to do the work that was required on the basis of De Rham's coefficients, in line with their own research (and the rejected vision. . . ); nor even to recognize the innovative and fruitful work, when confronted with it. And it's in this **same** spirit (for it all ties together, once again...) that, once they'd finally recognized the significance of one of the tools derived from the new work, they hastened to seize it without even understanding it, and to bury, alongside the ancestor, the unknown worker who had fashioned it...

**(c) Things that look like nothing. ... - ou le dessèchement** (May 27)<sup>635</sup> (\*\*) The way I express myself about Serre came about spontaneously, and stems from a perception of things, the concerning, which must have formed in me over the last few weeks or months. There has been <sup>□</sup>pourtant, as I wrote these lines, a residue of uncertainty or perplexity, or reserve, with regard to what I had just written. In short, I was suggesting that Serre, on this occasion, lacked "elegance"!

p. 969

The fact is, in the nearly thirty years I've known Serre, he's been the very embodiment of "**elegance**" for me. I'm sure I'm not the only one to feel this way. It's an elegance, both in his work and in his relationships with others, that is by no means purely formal. It also implies scrupulous probity in one's work, and an equal demand for probity in one's dealings with others. On more than one occasion, I've noted his sharpness of judgment in the face of any inclination to "muddle through" on the part of a less scrupulous colleague, trying to gloss over an embarrassing difficulty (so as not to have to admit that he didn't know how to overcome it), or some error of his own making... . This elegance also implied a **rigorous approach**, both to himself and to others.

It's all these things, which for me remain inseparable from the person of Serre, that must have inter- come into this "residual reserve" in me that I've just mentioned, in the face of the spontaneous expression of another perception of things, unexpectedly taking the lead over the familiar perception. There's no question of my wanting to dismiss one of the two for the "benefit" of the other. Both have something to teach me, different aspects of a complex reality that is by no means static. It's up to me to situate one in relation to the other, to arrive at a nuanced apprehension of a person to whom I'm linked by a past, and feelings of sympathy and respect.

This "rigor" I've just mentioned did not, however, extend to everything to do with Serre's relationship with mathematics and mathematicians. Earlier, I invoked an "unconsciousness" or a "lightness", which I could just as easily have called a "**closure**". This contrasts with the attitude of "prudence and modesty" that I encountered in most of my elders who, like Serre himself, welcomed me with kindness in my early days, and sometimes (as was his case) with warmth. I'll say more about this later (in the note "Liberté. . . "). . . , n° 171 (vii)), where I note that this attitude had been part of "the atmosphere of respect. . . that permeated the milieu that welcomed me".

The "closure" I've noticed at Serre, on certain occasions, isn't new. I can see the the second half of the fifties. I believe that it has greatly limited the depth and the scope□ of his work from the sixties onwards. I feel a link between this aspect of "closure", vis-à-vis

p. 970

<sup>635</sup>(\*\*) This third part of the note "Unnecessary details" is taken from a footnote to the first part. See the reference in the footnote (\*) on page 965.

different approaches to mathematics than his own, and a deliberate intention, which gradually developed within him, to confine his apprehension of mathematical things and mathematics to a purely technical or technicist view (or "blindness", I would have liked to write), closing himself off to anything resembling a **vision** ; to something, therefore, that goes beyond the tangible, immediate, **provable** statement (or set of statements), or (at the very least) takes the form of a "pure and hard" conjecture, with its contours entirely transgressed, "closed" in short (except that it has yet to be proven. . . ). With hindsight, it seems to me that he ended up pushing this aspect of his creative abilities to the extreme limit, the exclusively "yang" and "super-yang" aspect, the "**macho**" aspect. Given his exceptional ascendancy over the mathematicians of his generation, and of two or three others that followed, it seems to me that Serre contributed a great deal to the advent of the excessive technicist spirit that I see rampant in the seventies and eighties, the only one nowadays that is still tolerated, while any other approach to mathematics has become the object of general derision.

To use C.L. Siegel's expression, what we're witnessing today is an extraordinary "Verflachung"<sup>636</sup> (\*), a "flattening", a "shrinking" of mathematical thought, deprived of a dimension - the visionary dimension, that of dreams and mystery, that of depths - with which it never had before (I'd like to think of it as a "flattening", a "shrinking" of mathematical thought).

p. 971

seems) lost all contact. I feel it as a **drying out**, a **hardening of** thought, losing its living suppleness, its nourishing quality - becoming pure **tool**, <sup>□raide</sup> and cold, for impeccable execution of "snatch-and-grab" tasks, tasks at public auction<sup>637</sup> (\*) - when the sense of purpose and direction, and the sense of these tasks themselves as parts of a vast Whole, are forgotten by all. There's a deep sclerosis, hidden by feverish hypertrophy.

This imbalance in thinking is just one sign of a more essential imbalance, a deeper emptiness and deficiency. It's no coincidence that, over the past two decades, this dryness of thought has spread and taken root at the same time as the customary forms of delicacy and respect in relationships between people have been eroded. And it's no coincidence either that this wind of contempt, whose breath I've finally felt, has been accompanied by a more or less generalized corruption, which I've been working on for over a year now.

To this day, Serre has never been aware of this corruption, which surrounds him on all sides. I knew he had a fine nose, though. But it's not just a matter of having a fine nose, it's also important to use it, to take note of what it has to tell us, even when the smells he's talking about are apt to incommode us; indeed, to worry us, when they call us into question ourselves. I know that Serre, no more than

<sup>636</sup>(\*) I have taken this expression (in German) from a letter I recently received from Serre. The phrase is taken from C.L. Siegel's preface to Hecke's works. Serre quotes this impression of C.L. Siegel at the very end of his letter, adding: "It was unfair, and it would be even more unfair now, it seems to me". It struck a chord with me, though, and kept on working. My brief reflection on the relationship between Serre and me probably grew out of it.

In fact, I think that if Serre quoted Siegel, it's because in some way this impression, coming from one of the great mathematicians of our time, must already have been working in him; it was like a blip, no doubt, in the mathematical "vie en rose". A blip, no doubt, among others, but less easy to get rid of, apparently... ..

"Flach" in German means "flat", "devoid of depth"; "Verflachung" designates the process leading to such a state of "flatness", or the culmination of such a process which has just taken place. In the main text, I've endeavored to follow the associations aroused in me by this very telling term, untranslatable as it is, unfortunately. Of course, I have no idea whether my perception of the matter overlaps in any way with that of Siegel, whose text Serre quotes I have not read.

<sup>637</sup>(\*) This image of "public auctions" must have been suggested to me by the announcements of "invitations to tender" (sic) that litter the "CNRS newsletters" and other papers I periodically receive, as a fresh-faced research associate in this esteemed Institution. This jargon, among many other signs, shows the extent to which this "flattening" of the work of discovery is by no means limited to the milieu I had known well, nor to mathematical science. I've yet to find a call for tenders in pure mathematics, but it won't be long - and I can easily imagine some of my friends or students of yesteryear, sitting gravely behind padded doors, on some committee with a boring acronym, to decide which "lines of research" to declare a priority, which "approach strategies" to promote, and which "bids" from "winning" teams to "retain" for "preselection", or even, to honor with the jackpot, the official subsidy by the supervisory Ministry, renewable every two years after a favorable opinion from the competent committee. . .

I wouldn't dream of howling with the wolves, looting, scheming and debasing, where "everyone else" is looting, scheming and debasing. He doesn't do any of that, of course - he just plugs his nose (and too bad if he loses a hand as a result. . . ), and pretends he hasn't smelled anything.

And he's here in good company - not one of my friends in the world we once knew

and whose scent reaches me even in my retreat - not a single one has yet spoken to me, even by hint, of an odor□  
that he smelled and that bothered him. Many more, surely, remainp . 972  
among my colleagues who continue to practice the profession of mathematician with probity, which deserves this respect. But among those sitting in the front seats, I don't know of **one** who has had the simplicity to believe the testimony of his healthy faculties (olfactory, in this case), rather than plugging his nose so as not to have to say to himself: something smells bad here - perhaps we should go and have a look... .

But I'd like to come back to Serre and myself, and to this "closure" I sensed in him, which appeared I don't know when and became more pronounced as the years went by. I believe that the most fruitful part of his work, the one that most profoundly influenced the mathematics of his time, took place in the early years, before this closure appeared, or at least, before it took a decisive hold on his relationship with mathematics and mathematicians. It was also in those years, in the 1950s, that contact with him was most fruitful for me, and it was in those years that Serre played the role of "detonator" for me, giving my work some of its most decisive impulses. It was in those years, too, that a vast vision was born and grew within me, inspiring and fertilizing my work in those years and right up to the present day. I can say, with full knowledge of the facts, that if there was anyone besides me who had a part in the blossoming of the vision, it was him, Serre, and in those years. And it could only have been so because, in those fertile and decisive years, he was open to mathematical things for what they are, including those that still elude immediate grasp; those that seem reluctant at first to let themselves be encircled by the meshes of language already formed - those that may require years of obscure and patient labor, if not a lifetime, before condensing into tangible substance and revealing the limbs and shapes and contours of a **body**, alive and vigorous, attesting to the unexpected appearance, in the familiar context of the known, of a **new being**.

I believe that in the early years of my acquaintance with Serre, and right up to the late 1950s, he retained a sensitivity for the delicate, impalpable thing that is "creation", and for the humble labors that prepare a birth. I think there was a moment when he sensed the blossoming of a vision, and the language that gave it form, like the soul or the spirit, and the body... . There was then a warmth without speech, an availability... discreetly and effectively, where he could support a laborious and intense work that was not his own, and yet in which, through sympathy and expectation, he participated.

□I cannot say when or how this vivacity in him, on the level of our common passion, became p . 973  
I've tried to define it. Already in the early sixties, if not before, he stopped perceiving the forest, agreeing to see only such and such a tree as he found to his liking. The rest was irrelevant. It simply annoyed him, I think, to see me so absorbed in tirelessly clearing vast, seemingly empty expanses and patiently planting all those things that didn't yet look like anything, with the air of one who would already see a flourishing forest<sup>638</sup> (\*).

But that hasn't stopped me from clearing, planting and replanting, pruning and replanting and replanting and replanting.

---

<sup>638</sup>(\*) (June 17) Of the six "worksites" I reviewed in the note "Le tour des chantiers - ou outils et vision" (n° 178), only **one** (the "motifs" worksite) had ever been of any interest to Serre - and even then. . . When

I wrote to him recently without comment, in a PS, that I thought I had the principle of a construction in the form of the category of patterns on a fi type scheme nor on Z, he didn't allude to it in his reply. Clearly, these "Grothendieckian maths" no longer make him hot or cold... ..

replanting - nor that we were buddies as always, spending hours and hours discussing maths (usually on the phone). When I had a clear-cut question, and on a question that wasn't on the index, it was to him above all that I used to turn, in case he had any insights - and often, indeed, he did. I continued to learn many things from him, and I'm sure he was learning things from me that would interest him. It was better than an exchange of goodwill or services - there was always a common passion linking us, there was fire and spark.

But he had already ceased to be a source of inspiration for me. That source now lay within myself alone<sup>639</sup> (\*\*).

## a2. Crazy questions

**Note** 171(vi) (May 5)<sup>640</sup> (\*\*\*) My recollection here was a little hazy, and became clearer over the next few weeks, when I had the opportunity to reconnect with these issues to some extent. There were in fact two distinct questions in my mind, one perfectly precise, the other rather vague.

The first question concerned the need for a complete theory of the six variances, for "De Rham coefficients" that had yet to be precisely defined. My crystal-clear ideas, both in characteristic  $p > 0$  only in zero characteristic, provided a very precise primer - we already knew, in advance, what was to replace the "local systems" (or "twisted  $\square$  constant bundles")  $l$ -adic (or Betti, in the transcendental framework), and it was necessary to define "coefficients with singularities", in the spirit of derived categories of course<sup>641</sup> (\*). What was missing, then, was a good "finiteness" condition for crystalline complexes. In zero characteristic, it's "*D-coherence*" (which neither I nor any of my students have thought of, even though it's such a simple and natural idea!), combined with the more delicate conditions of holonomy and regularity, that provides the answer, as we learned (twelve years after starting crystalline yoga) from the philosophy of the good God alias Mebkhout. I'm curious to see whether any of my ex-students will end up making a move (without naming the stranger on duty, or the ancestor, it's a foregone conclusion... .) to find out the conditions

p. 974

<sup>639</sup>(\*\*) (June 12) For a continuation of this reflection on the relationship between Serre and me, see the note "L'album de famille" (n° 173), part c. ("The one among all - or acquiescence"), June 11, and parts d. and e.

<sup>640</sup>(\*\*\*) This note is taken from a note by b. de p. to the note "L'ancêtre" (n° 171 (i)) - see note (\*) on page 946.

<sup>641</sup>(\*) It's also clear, when the base body was  $\mathbb{C}$ , that we wanted a category equivalent to that of  $\mathbb{C}$ -vector bundle complexes with algebraically constructible cohomology bundles. This very precise indication suggested that, by unscrewing, the neuralgic question was that of associating, with any crystalline local system on a subscheme (not necessarily a  $\mathbb{C}$ -vector system), a category equivalent to that of  $\mathbb{C}$ -vector complexes with algebraically constructible cohomology bundles.

This is essentially what Deligne did in 1969. This is essentially what Deligne did in 1969, except that it turned out that instead of a crystalline beam, there was a crystalline **pro-beam**, which was an important new idea at the time (and "obvious", as soon as you take the trouble to look. . .). But systematic work with pro-objects would have required considerable groundwork, of which Jouanolou's thesis (on *l*-adic coefficients) gave a foretaste. We'd have had to roll up our sleeves again. ...

Mebkhout's new approach using  $D$ -Modules therefore amounts (from Deligne's and my point of view) to replacing a crystalline pro-bundle by a crystalline ind-bundle (thanks to the **ordinary** coherent dualizing functor  $RHom_{O_X}(-, O_X)$ ), and **going to the inductive limit** to find an ordinary crystalline bundle, i.e. (assuming now  $X$  smooth on a body of zero characteristic) a  $D_X$ -Modules. The unexpected "miracle" then, established by Mebkhout between 1972 and 1976 (starting from an opposite "end", cf. the note "The three milestones" n° 171 (x)), is that this  $D$ -Module is **coherent** (more precisely, with coherent cohomology bundles). Another equally unexpected miracle is that  $D$ -Modules can be characterized as complexes of  $D$ -Modules, which we obtain by means of simple conditions of an entirely new nature compared to Grothendieckian crystal optics (namely, the "microlocal" holonomy condition, in addition to a "regularity" condition introduced by Mebkhout and which has become familiar in the meantime).

(May 26) For details of the duality relationship between De Rham - Mebkhout coefficients and De Rham - Deligne coefficients, see the note "The five photos (crystals and  $D$ -Modules)" (n° 171 (ix)), part (c). For the need to replace Deligne's view of procoherent modules with that of crystals in coherent promodules, and on the possibility (non proved again) to replace the cumbersome point of view of pro-objects (crystalline or stratified) by crystalline beams without more (by passage to the projective limit), see the same note, parts (c) and (d).

corresponding because.  $p > 0$ , or rather no doubt, in the rigid-analytical context of caractéristique  $p$ .<sup>975</sup>  
 . Better late than never...<sup>642</sup>(\*)).

I didn't pursue this question myself in the sixties, as I had enough other things to do and thought that, with Berthelot and Deligne on the job, it was in good hands (which proves that you can be wrong. . . ). Deligne's work in 1969/70 did, however, in principle provide a null-characteristic answer, which would undoubtedly have satisfied me, had Deligne completed his work.

But in my mind, such a conjectural theory of De Rham coefficients, even if it had to relate "discrete" cohomology (in the form of a crystalline cohomology) and "coherent" cohomology, did not "cap" the theory of coherent duality. Thus, I didn't see that a coherent bundle

zariskian defined an "enveloping crystal"<sup>643</sup>(\*\*) (NB in the language of D-Modules, this is the extension of the Ring of scalars  $\underline{Q}_X \rightarrow D_X$ , for smooth  $X$  at least. . . ) - and even if I had seen it, the crystal obtained (already for  $F = \underline{Q}_X$ , which gives the crystal  $D_X$ ) is **not** of De Rham's type. However, I was wondering whether on a complex analytic space  $X$ , consistent duality (e.g. in Serre's form, if  $X$  is smooth and for locally free coefficients) could not be obtained as a "special case" of discrete duality, developed by Verdier on the model of the étale theory. As it stood, this sounded a bit zany and immediately raised a host of questions: how to explain "in discrete terms" the role of the modulus dualising (differential forms of maximum degree)  $\underline{\omega}_X$ , and how can we take into account evanescent pathologies, which had no analogue in "discrete" duality?

□ It was Mebkhout who was the first (and the only one to this day apart from me, it seems) to understand that there is indeed a deep connection between the two dualities, but that this is expressed **not** by saying that one "caps" the other, but by finding a third theory of duality<sup>644</sup>(\*) that of  $D_X$ -Modules (or "crystals" on  $X$ ), which "caps" both the one and the other, and by limiting itself, moreover, on the "discrete" side, to C-vector complexes which have **analytically constructible** cohomology bundles. There's no doubt in my mind that this is "the correct answer" to that "vague question" (and a bit off the mark. . . ) that I never had the chance to ask my posthumous pupil. . .

p. 976

(May 15) The writing of "L' Apothéose" became at the same time an unforeseen opportunity to familiarize myself with Mebkhout's work, and with the yoga of D-Modules that he introduced into the cohomological study of varieties. Along the way, it also brought back memories that had sunk. In particular, I realized that as early as the late fifties, or the early sixties, I had been closer to "Mebkhout's philosophy" than I realized only ten days ago, when I wrote the beginning of this note ("Les questions saugrenues"). Within the framework of clean and smooth schemes on an arbitrary basis, I had in my hands a duality statement (in terms of a complex of relative differential operators and the "adjoint" complex), "capping" coherent duality and duality for De Rham's cohomology. Technically speaking, this was pretty much the equivalent of the algebraic version of the

<sup>642</sup>(\*) (May 26) Since these lines were written, and as an unexpected fruit of my efforts to write an account of the Apotheosis that is worthy of passing to posterity, I have been led to draw out (almost unintentionally) what now seems to me to be **the most important aspect of the Apotheosis**.

good definition of De Rham coefficients, at least for a finite type scheme on  $\text{Spec } \mathbb{Z}$ , (which appears to me as the most crucial case of all). Of course, the essential new ingredient, compared to my 1966 ideas, is the philosophy of the vague unknown, whom I will refrain (like everyone else) from naming here.

The approach I foresee for finite type schemes over  $\text{Spec}(\mathbb{Z})$ , must also give the right De Rham coefficients (Mebkhout or Deligne style, your choice) for finite type schemes over any body (of zero characteristic, or no). I intend to outline this approach in the "Coefficients de De Rham" section of volume 3 of *Réflexions*, among other "technical digressions" that my students can come and copy at their leisure. . .

<sup>643</sup>(\*\*) (May 26) It may be better to take the enveloping "co-crystal" (see note 171 (ix) part B, for allusions to the notion of co-crystal). I'll no doubt come back to this question in the presentation promised in the previous b. de p. note.

<sup>644</sup>(\*) For details of this "third theory of duality . . . which overshadows the other two", see note. "The work... ." (n° 171 (ii)).

Mebkhout's duality theorem (discussed, in the complex analytical context, in the note "L'oeuvre. . . .", n° 171 (ii)). However, my duality statement did not satisfy me, and I did not think of publishing it or even advertising it, because it seemed to me, in the said form, too close to Serre's duality theorem (relativized on some basis, it is a given), of which it is a more or less immediate corollary. To arrive at a statement that satisfied me, I would have had to know how to make a "derived category" out of complexes of differential operators, so as to be able to formulate a statement of intrinsic duality in terms of the objects of these categories, along the lines of the theory of coherent duality worked out in previous years.

p. 977 What was missing, then, was a good notion of "quasi-isomorphism" for a (differential) morphism between complexes of differential operators,  $\square$  so as to form a derived category (formally inverting- These quasi-isomorphisms). It was clear that the usual definition (via the associated cohomology bundles) was not usable in the algebraic setting (and probably no more so in the transcendental setting<sup>645</sup> (\*)). The transition to the corresponding D-module complexes now provides a wonderfully simple answer to my former perplexity!

Seeing no ready-made definition for the notion of quasi-isomorphism, I didn't try to find out whether it existed or not, and whether it would indeed be a remarkable derived category. This was at a time when I was the only one interested in the (far less sophisticated) derived categories formed from coherent modules and the **linear** morphisms between them. . . . It wasn't clear to me that this question of a notion of quasi-isomorphism (also a little vague, not to say far-fetched) touched on a fertile mystery, which admitted a "key" of childlike simplicity! And that there was a category of remarkable "coefficients" just waiting to be defined. For this to happen, my reflections would undoubtedly have needed to be pursued in an atmosphere where they met with a modicum of interest and resonance, if only from **an** interlocutor who was a stakeholder!

It was De Rham's cohomology that drew my attention to the obvious fact that the global cohomology spaces of coherent bundles, on an algebraic variety  $X$  over a field  $k$  let's say, are "functors" not only with respect to  $\mathcal{O}_X$ -linear homomorphisms, but even with respect to **all** homomorphisms of  $k$ -vector bundles, and in particular, for differential operators. It was this observation that prompted an embryonic reflection on a "coherent" (or "quasi-coherent") theory of duality, in which the "morphisms" between bundles would be differential operators, instead of being linear.

p. 978 As I said, this reflection turned out to be so short-sighted that it didn't even stick in the back of my mind, as one thing (among a number of others) that should  $\square$  well be cleared up one day - it sank (I think) into total oblivion until just a few days ago. Even my sporadic reflection on crystals, around 1966, didn't bring it up in my memory, as far as I can remember. And yet, without my even suspecting it at the time (because I couldn't remember the question at the time!), this crystalline reflection was to provide me, as early as 1966, with **another** key, "dual" in a way to Mebkhout's, for my perplexities of yesteryear, via the complex of principal parts of infinite order associated with a complex of differential operators. I allude to this in a b. de p. note written yesterday (note(\*\*) page 946), and I intend to return to it in detail in the part of volume 3 of Reflections, developing the yoga of "types of coefficients" and giving, in particular, a formal definition of what I presume to be "the"

<sup>645</sup>(\*) I'm mistaken here. Mebkhout assures me that for a (differential) homomorphism between complexes of differential operators, this is a quasi-isomorphism (in the naive sense of complexes of associated C-vector bundles) if and only if the corresponding homomorphism for complexes of associated D-Modules is a quasi-isomorphism. This is equivalent to (by means of the mapping-cylinder) to say that a complex of differential operators is quasi-zero in the naive sense, if and only if the associated complex of D-Modules is quasi-zero, something apparently well known (at least to Mebkhout, who demonstrates it in his inexhaustible thesis. . . ).

good De Rham coefficients (Mebkhout or Deligne style, your choice) on a finite-type scheme over  $\mathbb{Z}$  (for example).

Technically, and even "psychologically" (in terms of the problems already posed at the time, and the overall vision that gave them strength and life) everything was ready, by the second half of the sixties, to release this definition of De Rham's coefficients. Deligne, after me, came very close to the right notion, and he couldn't have avoided it, had it not been for a force to which he gave omnipotence over his life and his work, which put a premature and peremptory end to his reflections along this path. . . <sup>646</sup>(\*)

Discovering doesn't mean hitting a nail, a chisel or a steel wedge with a hammer or sledgehammer. Above all, discovering is knowing how to listen, with respect and intense attention, to the voice of things. New things don't spring ready-made from diamonds, like a sparkling jet of light, any more than they do from a machine tool, however sophisticated and powerful it may be. It doesn't announce itself with a bang, boasting its letters of nobility: I am this and I am that... . It's a humble and fragile thing, a delicate and living thing, a humble acorn perhaps from which an oak tree will grow (if the seasons are right. . . ), or a seed that will give birth to a stem and this to a flower. It's not born in the limelight, or even in the sunlight. It is not the fruit of the known. Its mother is Night and

penumbra, elusive mists without contours - the presentiment that eludes the words that would capture it, the saucy question that still seeks itself, or  $\square$  telle dissatisfaction so vague and so elusive and very real p. <sup>979</sup>

yet, with that indefinable (and indisputable... ) feeling that something is amiss or amiss and that something is fishy... ..

When we know how to listen humbly to these voices that speak to us in hushed tones, and to follow their elusive message obstinately, passionately, then - at the end of obscure and groping labors, muddy perhaps and without appearance - suddenly the mists become incarnate and condensed, in **substance**, firm and tangible, and in **form**, visible and clear. In this solitary moment of intense attention and silence, the new thing, daughter of night and mists, appears... ..

## Freedom . . .

**Note** 171(vii) (May 4) <sup>647</sup> (\*) I don't pretend to be the "mature" or "wise" man, surrounded by the immaturity and irresponsibility of his fellows - I don't imagine that's the image that emerges of me in the pages of *Récoltes et semailles* <sup>648</sup> (\*\*). And yet, in my relationship with mathematics at least, I think I can say that throughout my life I have maintained a good-natured simplicity <sup>649</sup> (\*\*\*), while at the same time

<sup>646</sup>(\*) On this subject, see the reflection in the sub-note ". . and hindrance" (n° 171 (viii)).

<sup>647</sup>(\*) This sub-note is taken from a b. de p. note to the note "L'ancêtre" (n° 171 (i)) - see note (\*\*) on page 945.

<sup>648</sup>(\*\*) (May 26) I can even say that if the writing of *Récoltes et Semailles* revealed anything to me on this subject, it's a state of being. of "immaturity" indeed, a lack of "wisdom", and by no means the opposite. Perhaps the most unexpected discovery of all, and the most crucial in its immediate implications, was the strength of my attachment to a certain past and to my work as a mathematician. This attachment, still in relatively discreet form, first revealed itself to me at the end of March last year.

last, in the course of reflection in the final note "The weight of a past" (n° 50) of *Fatuité et Renouveau*. It was being confronted with the brutal reality of the Burial, in its aspects above all of deliberate contempt and violence, that set in motion the "weight of a past".

powerful egotistic defense reflexes. At the same time, they reveal to me the strength of the ties that bind me to a past that I may have once believed had detached itself from me. Over the past year, these ties seem to have taken on a new vigour, and very often (especially lately) I feel them as a **weight** indeed, an exhausting weight indeed - like other weights that once weighed on me, and which have now been resolved. . .

<sup>649</sup>(\*\*\*) (May 16) I'd have to make an exception here for a certain possessive attitude towards my "chasses gardées", which I put my finger on in *Fatuité et Renouveau*, in the section "La mathématique sportive" (n° 40). These "sporting" dispositions were to lead me to minimize the ideas of others, whenever these were already known to me on my side. We can therefore say (contrary to what I assert in the main text) that in these cases, my vanity did indeed interfere with "my sound judgment", and tended in such cases to incite me to a discouraging attitude, where a benevolent encouragement

p. 980 than a fidelity to my original nature□. Vanity, which has been as pervasive in my life as in that of any other of my colleagues, hardly interfered (as far as I can remember) with my sound judgment and mathematical flair<sup>650</sup> (\*).

In fact, it was only after I left in 1970 that I began to realize, little by little and each time with amazement, how common it is, even among men of exceptional abilities, that these are sometimes annihilated, hopelessly blocked, it would seem, by prejudices of an "irrational" nature - and all the more tenacious for it! My first experiences in this direction date back to 1976<sup>651</sup> (\*\*), and are mentioned in the note "On n'arrête pas le progrès" (n° 50), and a first written reflection on this subject is continued in the note "Le Fossoyeur - ou la Congrégation toute entière" (n° 97)<sup>652</sup> (\*\*\*), in the particular context of□l'Enterrement. It is also only gradually, and against forces of inertia I've come to realize that these "irrational" causes are nonetheless perfectly intelligible, provided we take the trouble to stop and look into them. It's thanks to this that I've come to "accept" them too, as best I can... ..

Getting back to myself and my relationship with mathematics. Because of my working style, I tend to work on the basis of often hasty presumptions, without worrying about "prudence"<sup>653</sup> (\*); but I follow each of the intuitions (or "presumptions") that emerge right to the end, so that the numerous errors that litter the early stages of the work are eventually eliminated, giving way to a solid understanding that (more often than not) gets to the heart of things. My spontaneous way of proceeding is quite different when it comes to passing judgement on someone else's work, and especially when it's on a subject or in registers with which I'm not familiar. It seems to me that I've always tended to be cautious and modest. In fact, this was the example set to me by most of the elders who welcomed me into their midst, such as Cartan, Dieudonné, Chevalley, Schwartz, Leray - to name but a few. I don't recall any of them expressing themselves peremptorily, either for good or ill, on a work whose substance eluded them. This caution, I now realize, was part of the atmosphere of **respect** I've spoken of elsewhere, which permeated the environment that welcomed me<sup>654</sup> (\*\*). It seems to me that it was this prudence, a sign of respect, that first deteriorated in the environment with which I identified myself for over twenty years of my life. Perhaps my memory betrays me and I'm deluding myself, but it seems to me that I was relatively

---

would have been appropriate. It seems to me, however, that such situations have been exceptional in my life as a mathematician, and that they have not hindered my mathematical creativity.

<sup>650</sup>(\*) See previous b. de p. note for reservations on this subject.

<sup>651</sup>(\*\*) (May 16) These aren't exactly my first experiments in this direction - I'd had others in previous years, with Deligne in particular, and also in my past before I left. But these experiences had remained sporadic, whereas the episode surrounding Ladegaillerie's thesis was impressive for the perfect concordance in the acts and omissions of five mathematicians (all of the highest calibre), who surely hadn't consulted each other. This was my first contact with l'Enterrement, over and above the vicissitudes of my relationship with my friend Pierre.

But this extraordinary weight of "irrational" factors in so-called "scientific" thought goes far beyond the context of the Burial, and even beyond that of an era. You don't need to be an expert in the history of science (and I'm not) to realize that it is marked at every step by the effects of an immense inertia, opposing the emergence of any innovative idea, and its blossoming when the idea has nevertheless appeared. For thoughts along these lines, see in particular the first two parts of Fatuité et Renouveau ("Work and Discovery" and "The Dream and the Dreamer"), sections 1 to 8.

<sup>652</sup>(\*\*\*) This reflection is considerably deepened in "The key to yin and yang", in particular, in the two notes (concerning this same "Congregation") "La circonstance providentielle - ou l'Apothéose" and "Le désaveu (1) - ou le rappel" (n° s 151, 152). See also the note "Le muscle et la tripe (yang enterre yin (1))" (n° 106) which opens the long reflection on yin and yang.

<sup>653</sup>(\*) On this style of work, see in particular the note "Brothers and spouses - or the double signature" (n° 134), and also the section (in Fatuity and Renewal) "Error and discovery" (n° 2).

<sup>654</sup>(\*\*) See "The welcome stranger" section, n° 9.

little affected by this aspect of the degradation of an atmosphere of respect. I've always been conscious, I think, of the extent of my ignorance of mathematics in general, and of my limitations in apprehending the work of others, as soon as it fell outside my own, usually strongly focused, sphere of interest.

□ When it came to other people's work, which I was in a position to understand and thereby appreciate or judge p. 982

(Nor do I recall any gross error of judgment, either for good or ill, that I had to note after the fact. The same is true of the feeling I had about my own ideas and intuitions, whether this feeling concerned the presence (or absence) of a "good question", or that of a rich substance to be probed, or the scope of such and such an idea, or the more or less complete and more or less profound understanding I had of a situation or a thing. In all these cases, if there was an error, it was always in the sense of a "minus". Yes - more often than not, the richness of a new theme or idea, its true scope in depth and extension, is only fully revealed little by little, over weeks and months, if not years. This gradual confirmation of an initial feeling that is right (more often than not), but remains vague and diffuse at first, through more or less thorough and meticulous "work on parts", then comes to us as a surprise and as a wonder, constantly renewing itself as the hours and days go by. This is surely the reason for the extraordinary fascination of research work (whether mathematical or otherwise): at every step, the reality that unfolds before our eyes surpasses even our most reckless dreams, in richness, delicacy and depth. ...

But I'd like to come back to my apprehension of other people's work, when it concerned subjects that were familiar to me, or even "hot" subjects for me. I think I can say that my ability to sense the true significance of an idea (which often eludes the author himself) has played a key role in my work. I'm thinking here first and foremost of the exceptional role played by Serre, and of the fact that during those fifteen exceptionally rich years in my work, between 1955 and 1970, most of my ideas, and most of my major investments too, had their starting point in some of Serre's ideas or approaches, some of them seemingly innocuous. I intend to discuss them in more detail in the "Historical Comments" to the Thematic Outline<sup>655</sup> (\*). But this does not mean that I am particularly open to Serre alone. The same thing has happened with other mathematicians, both in my past as a functional analyst and as a geometer<sup>656</sup> (\*\*).

□ I can say that, throughout my life as a mathematician, I have been superabundantly "rewarded" for this simplicity of approach to mathematics, which I've just tried to define. This simplicity, p. 983

<sup>655</sup> (\*) These "Comments" are announced in "Compass and Luggage" (Intr. 3).

<sup>656</sup> (\*\*) By way of example (among many others), I'd like to point out the principle of reducing statements about relative schematic situations "of finite presentation" on any basis, to the case where the latter is the spectrum of a **fi ni** local ring (or even, of a **corps fi ni**), a far-reaching principle which I have extracted from a striking demonstration idea of a remarkable (and very special) result by D. Lazare. On this subject, see the note "Pouce!" (n° 77) and the b. de p. note (\*\*\*) p. 297 to this one.

(May 16) I'm not sure that every time I've taken inspiration from someone else's idea, I've taken care to point it out. For example, I don't remember, in the relevant paragraph of EGA IV, taking the trouble to cite Lazarus as the source of the general reduction method developed there. It was an oversight that, in those days, didn't seem to draw any consequences. I believe that people like Dieudonné (who co-edited the EGA with me) or Serre, who must have known Lazare's result as I did, as being (undoubtedly) the first of its kind, wouldn't have considered it imperative (or even appropriate) to cite it either - it wasn't, in any case, in the canon of Bourbaki style! It's true that Bourbaki made up for it in historical notes, which are lacking in EGA and elsewhere in my work. Today, instructed by the frightening degradation of scientific ethics in mathematical circles during the 70s and 80s, I would be much more meticulous than I have been, in carefully indicating my sources, not only in the technical sense, but also in the heuristic sense, which is often far more crucial still. In the historical "Commentaries" already quoted, I intend to make good at least some of my omissions in this respect.

which I have often lacked in other areas of my life, is a blessing in itself. In fact, the fruitfulness and power of my work are due to this simplicity, which is also that of the **child**. ...

## a4. and hindrance

**Note** 171(viii) (May 4)<sup>657</sup> (\*) I'm mistaken here, and my memories have been clarified (and rectified) over the past two months, as I've got back in touch with the subject a little better. In fact, Deligne's main point had been precisely to give this "purely algebraic description" of discrete bundles (of C-vectorials) and the corresponding derived category<sup>658</sup> (\*\*). The coefficients it introduces (via a condition of  $\square$

p. 984

ad hoc "constructability" on a pro-crystalline beam, a condition defined by the existence of an "unscrewing". (modelled on the one I'd introduced in the stellar or complex analytic context) are "tailor-made" to meet these desiderata. From then on, it became (heuristically) "obvious" that a formalism of the six operations **should** exist for these coefficients (in zero characteristic), and it should even be possible to describe, "brutally and stupidly", by judicious application of the "Weyl principle" of reduction to the (known) case where the base body is C.

It may seem a mystery, then, if we stop to think about it, that a Deligne should have abandoned an approach that was visibly full of promise, in favor of the description of "categories of coefficients" which (it was already clear in the mid-sixties) were to play a crucial role in the cohomology of algebraic varieties. Eight years later, he left it to someone else to come up with a somewhat dual and more penetrating approach<sup>659</sup> (\*), which would immediately<sup>660</sup> (\*\*) renew the cohomological theme in geometry. It hadn't struck me that much before, given that Deligne's theory was launched shortly before my departure, and that nothing at that time could have foreshadowed the fate that would be reserved for it. After my departure, on the other hand, and practically up until the last few months, I had completely lost touch with the cohomological theme.

It occurred to me recently, rather hastily and without giving it much thought, that the reason for Deligne's disaffection with a theory in which he had invested a whole year, might lie in the fact that he was not satisfied with his criterion-definition of "constructability" by unscrewing. It may have seemed too simplistic, and it's a fact that it's certainly less profound than the local algebraic condition of holonomy and regularity, which Mebkhout identified in 1976 in his "dual" point of view. But on reflection, this

p. 985

"explanation" simply doesn't hold water! Surely it's not because an approach to a neuralgic question would be "too simple",  $\square$  that a mathematician in full possession of his means would jettison and the approach, and the question! At the very most, he would abandon his initial approach the day he found another that would enable him to achieve a deeper and more complete vision of this same question<sup>661</sup> (\*)!

<sup>657</sup>(\*) This note is taken from a b. de p. note to the note "The ancestor" (n° 171 (i)), see note (\*) on page 947.

<sup>658</sup>(\*\*) This is the category (noted as  $\text{Cons}^*(X, C)$  in the note "L'oeuvre. . . .", n° 171 (ii)) formed by complexes of C-vector bundles on x, with analytically constructible cohomology bundles, seen as a full subcategory of  $D^*(X, C_X)$ .

<sup>659</sup>(\*) I have no doubt that if Deligne hadn't dropped De Rham's coefficient theme (which he inherited from me), he couldn't help but discover (eight years before the service stranger) the "dual" yoga of the  $D$ -Modules, and thus become familiar with the ideas of the Sato school.

<sup>660</sup>(\*\*) The term "immediately" does not quite correspond to the reality as it was (but rather to the reality "that should have been", if. . . ). In fact, three years elapsed between the moment when the new philosophy and the new tool were ready, and the moment when the people who set the tone realized that there was something there that could be used (and pocketed. . . ).

<sup>661</sup>(\*) In fact, in this particular case, it seems to me that there is no reason to "jettison" Deligne's approach in favor of that of Le Bon Dieu (not to mention Mebkhout). The two approaches complement each other, with Deligne's approach having the advantage of

As soon as I reflect a little on this strange situation, it becomes clear that in this case too, as in many others, my friend Pierre's motivations were not mathematical, nor even "rational". Thinking about it again, I realized to what extent the problematic around De Rham's coefficients, which only made sense from the point of view of the six operations and crystal yoga<sup>662</sup> (\*\*) (yoga that I had introduced a few years before with crystal topos, and precisely in the spirit of the six operations. . . ) - to what extent this whole problematic around De Rham's coefficients made sense from the point of view of the six operations and crystal yoga (\*\*) (yoga that I had introduced a few years before with crystal topos, and precisely in the spirit of the six operations. . . ). ) - the extent to which all these issues were rooted in my work and my person, and **clearly apparent to all**.

It's true that Hodge's problematic of coefficients also came from the same master, from whom the pupil was already, inwardly (and perhaps unwittingly) distancing himself. But the filiation was much less obvious to the outside world (and no one, including Serre, seems to have perceived it<sup>663</sup> (\*\*\*)), and above all: a first tranche of the far-reaching work to be done was not part of an ostentatiously Grothendieckian vision ("six operations" or whatever. . . ), not in a way clearly apparent to all, at least.

□ But it's no accident, as I've pointed out more than once, that Hodge's cohomological theory-Deligne, after a spectacular start at the end of the sixties, is still in his infancy, where the only tolerated coefficients are constant (or, in a pinch, "smooth", i.e. equivalents in the "Hodge-Deligne" sense of local systems), and where such crucial operations as Leray's higher direct images  $Rf_*^i$  (to mention only those) are not used! The question of defining the right notion of "Hodge coefficients" and the relevant operations on them, is not only **mentioned** in Deligne's work (as far as I know), whereas it was already familiar to me, unless I'm mistaken, even before I had the pleasure of making his acquaintance. When, after I'd left and over the years, I'd sometimes ask (I eventually got bored, of course. . . ) what he was waiting for to develop the theory that was needed at the end of the ends, he'd invariably reply: "it's too difficult. . . "<sup>664</sup> (\*). I wasn't convinced, that's for sure - if I hadn't embarked on a completely different adventure, I'd have gone right ahead and developed this "too difficult" theory, and De Rham's coefficients as well... ..

p. 986

---

of being closer to geometric intuition, and Mebkhout's being technically simpler (avoiding recourse to pro-objects), and in various respects deeper.

<sup>662</sup>(\*\*) Incidentally, I remember that in Deligne's presentation of his theory, he systematically avoided recourse to crystalline language, which nevertheless gave his theory a deeper dimension, by inserting it into an already existing toposic cohomological formalism. I also realize that, like Berthelot and my other cohomology students, he had lost sight of the profound **uniqueness** between  $p$ -characteristic crystal cohomology and zero-characteristic crystal phenomena (which were the subject of his seminar). These are signs of a deliberate intention to ignore a fundamental unity, which is arbitrarily fragmented and thereby destroyed. This deliberate intention is in the nature of a "blockage", through the intervention of egotistical forces alien to the drive for knowledge. For an illustration of this blockage in another of my works

cohomology students, whom I have known to be gifted with fine intuition, see sub-note n° 91<sub>2</sub> to the note "Les cohéritiers. . .

". <sup>663</sup>(\*\*) This seems to be clear from Serre's report on Deligne's work, quoted in sub-note n° 165<sub>1</sub> on the note "Requiem pour vague squelette" (notably p. 813). For an explanation of this filiation, see "Les points sur les i" (note

n° 164), I 4 (in particular p. 793), and its sub-note n° 164<sub>1</sub>.

<sup>664</sup>(\*) This answer has recently been combined with "L'Eloge Funèbre" (or burial by compliment), from the pen of Deligne, mentioned again recently (see the note "Les joyaux" n° 170 (iii)). This "Eloge" ends with this question (worth its weight in Pierre. . . ):

He left the IHES in 1970 at a time when his passion for mathematics was waning. Are we to believe that the problems he was tackling along the lines he had set himself **had become too difficult?**" (Emphasis added).

This kind suggestion is taken up again in part 2 of the Eloge, dedicated to Pierre Deligne, where we learn that certain conjectures of the deceased, "today still as unapproachable as then", had undoubtedly been (or so it is clearly suggested) the main obstacle that the aforementioned Deligne had to overcome, to prove a certain conjecture "of proverbial difficulty". These connections make me realize that in my friend Pierre's stereotypical "c'est trop difficile... .", there was an undertone of derision, which must have given him all the more piquant satisfaction, since it was obvious that this big dodo of the deceased was nowhere near suspecting the aforementioned innuendo (any more than he knew he was dead. . . ).

With hindsight, I'm struck by the parallelism between the stagnation in Hodge-Deligne theory on the one hand, and on the other, Deligne's aberrant attitude towards the theme of De Rham coefficients (attitude culminating in the "perverse" iniquity that will remain attached to the memorable Colloque de Luminy of June 1981. . . ).

These two aberrations now appear to me to be intimately linked, and this at a completely different level from the mathematical one. It's true that, visibly, the development of a formalism for Hodge coefficients is **subordinate** to that for De Rham coefficients (something that was obvious to me as early as 1966, and which people seem to have been discovering over the last year or two, on the heels of the work of the student-posthumous-never-named... ). This mathematical fact makes both the link between the two sets of facts, and the aberrant nature of both, all the more striking: for this "objective" link was a powerful additional incentive (for someone at least "in full possession of his faculties") to develop both the one and the other theory, which could then only become clearer and mutually reinforcing.

The stagnation in both theories (until the 1981 Pervers Colloquium in the case of De Rham, and up to the present day in the case of Hodge) is largely responsible for the general stagnation of the cohomological theme, a stagnation to which I have alluded on more than one occasion<sup>665</sup> (\*). Even disregarding the spiritual dimension of the human being, and taking into account only the factors of "profitability" through "cutting-edge" scientific production, this stagnation illustrates for me in a striking way both the unsuspected empire that occult egotistic forces can take over a being, and this even in the exercise of a supposedly "disinterested" science, and the (apparently) aberrant nature of this empire, which here (at first sight at least) seems to constantly run counter to the aim pursued<sup>666</sup> (\*\*).

## b1. The five photos (crystals and D-

Modules) **Note** 171(ix) <sup>667</sup>

<sup>665</sup>(\*) On the subject of this slump, see in particular "Les chantiers désolés" (La Cérémonie Funèbre, 6.), and more particularly the note "Le tour des chantiers - ou outils et vision" (n° 178).

<sup>666</sup>(\*\*) This is the case, at least, if we take as our "goal" the one we have set before the world ("the advancement of Science", let's say), or even the by no means bogus one that would consist in the enlargement of one's prestige, through the accumulation of works forcing esteem and admiration. Yet it seems to me that even this "benefit" is secondary to the satisfactions pursued by the most powerful occult forces, those to which my friend has chosen to give empire over his being.

<sup>667</sup>(\*) This sub-note to the note "L'oeuvre. . . ." (n° 171 (ii)) is of an exclusively mathematical nature. It may be omitted by readers who do not feel inclined to understand Zoghman Mebkhout's work in mathematical terms. "the yoga of  $D$ -Modules", as a new "theory of coefficients" in the cohomological theory of varieties. The following pages can be seen as a short introduction to this yoga, or to Mebkhout's "philosophy", situated in terms of conceptual baggage and a crystalline overall vision. This was already clear to me in 1966.

This vision was systematically, and virtually completely, obscured by my cohomology students Deligne, Berthe-lot, Illusie and Verdier, who had been its principal repositories. The only surviving written trace is the text of my 1966 IHES lectures "**Crystals and the De Rham cohomology of schemes**", notes by I. Coates and O. Jussila, in Dix exposés sur la cohomologie étale des schémas, North Holland Pub. Cie (1968). However, from a technical point of view, this paper contains all the basic ideas of crystal cohomology. Apart from Mebkhout's work, it doesn't seem that any really crucial progress has been made conceptually (or otherwise) - on the contrary, I see a staggering regression from my ideas of the sixties. Unfortunately, these appear only in very fragmentary form, or between the lines, in the cited exposé - the most important gap, here as elsewhere, being the absence of any explicit mention of De Rham's coefficient problems, and of a formalism of the six operations (and biduality) to be established for such coefficients(x). I was able to observe that Mebkhout, although more familiar than anyone else with my written work on cohomology (and that of my students), was entirely unaware of this original problem (until two years ago) - and it seems to me that, from the point of view of the mathematical "substratum" (and disregarding non-intellectual psychological factors), this has been his main handicap to this day.

Hereafter, I will refer to the presentation cited from 1966 by [Crystals].

(x) (June 16) for a correction, see p. b. (\*\*) page 990.

In complex smooth dynamics,  $D_X$  (or simply  $D$ ) refers to the ring bundle (or, more precisely,  $\mathbb{C}$ -algebras) of complex analytic differential operators on  $X$ . A first crucial fact, highlighted by Sato, is that this is a **coherent** ring bundle. A second fact, tautological in nature but also crucial, is that the category of locally free  $\mathcal{O}_X$ -Modules, where we take as

morphisms, not just  $\mathcal{O}_X$ -linear morphisms, but differential operators between such Modules, plunges like a **full subcategory** (but by an a priori **contravariant** functor) into that of the D-Locally free *modules*, using the contrafonctor<sup>668</sup> (\*\*)

$$F' \rightarrow \underline{Hom}_{\mathcal{O}_X} (F, D_d \xrightarrow{\sim} \underline{Op\,diff}(F, \mathcal{O})_X) \quad (1)$$

where  $D_d$  denotes  $D$ , provided with its D-Module structure induced by its canonical D-Module structure **on the right**, which commutes with the operations  $\square$  of  $D$  on the left on itself (which make the second memberp . 989 of (1) a D-Module). This fully faithful functor induces an (anti-) **equivalence** between the full subcategories formed by the free Modules. This does not admit a canonical quasi-inverse functor, "commuting to the restriction to an open" - which is why the first contrafunctor considered is probably not (in general) an equivalence. If  $C$  ( $C$  as "crystal", see below) denotes a locally free D-Module (or even a free D-Module, for that matter), we can certainly associate with it a functorially dependent bundle of  $C$  :

$$C \rightarrow \underline{Hom}_D (C, \mathcal{O})_X \quad (2)$$

This is a contravariant functor, which might seem to provide "the" natural candidate for a quasi-inverse functor of (1). The trouble is that this bundle (2) is not naturally provided with an  $\mathcal{O}$ -structure $_X$  - Module, but only with a  $\mathbb{C}$ -structure $_X$ -Module (where  $\mathbb{C}_X$  is the constant bundle on  $X$  defined by the field of complexes  $\mathbb{C}$ ). When  $C$  comes from a locally free  $\mathcal{O}_X$ -Module  $F$  by the contrafonctor (1), then (2) is canonically isomorphic to the  $\mathbb{C}$ -vector bundle underlying  $F$ .

The functor (1) extends (like any additive functor) to categories of complexes: it transforms a complex of differential operators on  $X$  (in the ordinary sense) into a complex of locally free  $D_X$ -Modules, and the (contra-)  $X$  functor thus obtained is of course fully faithful (for differential morphisms between complexes of differential operators, in the first category of complexes). It is in this sense that D-Module complexes (with locally free components) can be said to **"generalize"** differential operator complexes on  $X$ .

The point of view of complexes of D-Modules has the decisive advantage, over that of complexes of differential operators, of fitting directly into the yoga (first developed in my 1955 article "On some points of homological algebra"<sup>669</sup> (\*\*)) of complexes of Modules on an annulated space, and hence, and above all, into that of **derived categories** (which I had cleared up in the years following the cited article). The crucial notion of **"quasi-isomorphism"** does not appear to the naked eye, when we adopt the point of view of differential morphisms between differential complexes, whereas it becomes manifest when we pass to the complex of D-Modules.

associated. So, more than a **generalization from the** point of view of complexes of differential operators, the point of view introduced by Mebkhout<sup>670</sup> (\*\*) represents a **crucial relaxation**:  $\square$  it's thanks to this point of view p.

990

<sup>668</sup>(\*\*) The isomorphism written here is  $u' \rightarrow \varepsilon \circ u$ , where  $\varepsilon : D \rightarrow \mathcal{O}_X$  is the "augmentation"  $\theta \rightarrow \theta(1)$ .

<sup>669</sup>(\*) In Tohoku Mathematical Journal, 9 (1957) p. 121-138.

<sup>670</sup>(\*\*) (June 8) It should read here: introduced by Mebkhout into the Grothendieckian panoply, for the purposes of a new theory of coefficients. It goes without saying that "the  $D$ -Module point of view" is due to Sato, but used in a completely different light.

Thanks to him alone, complexes of differential operators can now be used as "coefficients" for a new cohomological theory, with all the wealth of intuitions that goes with it. If I were to draw a parallel between De Rham's theory of coefficients and that of l-adic coefficients (which, incidentally, was one of Mebkhout's main sources of inspiration in the development of his philosophy), I'd say that this first step of a **conceptual nature**, a "childlike" step, is akin to the one I took (in 1958) in introducing the notion of étale bundle (containing in germ the crucial unifying notion of **topos**). In the same analogy, the "God's theorem" (to be recalled below) is akin to the base change theorem for a proper morphism in étale cohomology, which was (in 1963) **the** first major theorem to kick-start étale cohomology, leading in the space of a few weeks to a situation of almost complete "mastery" of the étale cohomological tool. The analogous work in the D-Modules framework (or more generally in the crystalline framework), to arrive at a mastery of "crystalline cohomology" (or "De Rham", in a broad sense that I saw to such a theory as early as the sixties) - this work still remains to be done, in the seven years since the first major breakthrough was finally achieved by Zoghman Mebkhout.

The new category of coefficients introduced by Mebkhout, which "contains" (in the explicit sense in the note "L'oeuvre. . . .", n° 171 (ii)) both the "analytically constructible discrete coefficients", and the coherent coefficients introduced by Serre (systematized by me into a cohomological theory of "coherent coefficients"<sup>671</sup> (\*)), is that formed by the complexes of D-Modules with **coherent** cohomology bundles (as D-Modules), seen as a full subcategory.

$$D_{coh}^*(X, \quad ) \text{ or } \underline{Cris}^*_{coh}(X) \quad (3)$$

of the usual derived category  $D^*(X, D_X)$ . If we restrict ourselves to complexes with bounded cohomology (for-mating the full subcategory  $\underline{Cris}^b_{coh}(X)$ ), such a "coefficient" is represented **locally** by a complex of D-Modules free of finite type in any degree, and with bounded degrees; or also, which essentially amounts to the same thing, by a complex of differential operators with bounded degrees.<sup>672</sup>

p. 991 □ When working with derived categories, it is of course necessary to replace the fundamental functors (1) and (2) by the total derived functors

$$F \mapsto \underline{RHom}_{\mathcal{O}_X}(F, D_X), \quad C \mapsto \underline{RHom}_D(C, \mathcal{O}_X). \quad (4)$$

If we look for **covariant** functors of a similar nature to these two functors, we first come across the "scalar extension" functor (denoted by  $N$  in the cited note) :

$$F \mapsto D \otimes_{\mathcal{O}_X} F, \quad (5)$$

(total tensor product), where in the tensor product we still use the  $\mathcal{O}_{\text{structure}_X}$ -Module to the right of  $D$  i.e.  $D, {}_d^{673} (*)$  This functor in  $F$  has the disadvantage, with respect to (1), of not extending to morphisms

<sup>671</sup>(\*) This is the formalism of the six operations and biduality, which I developed in the coherent framework in the second half of the 1950s.

<sup>672</sup>(\*\*) (June 16 - see end of note (\*) on page 988). Mebkhout has just pointed out to me that this is not quite correct - this problem is discussed in loc. cit. 1.5 d) (p. 312). Mebkhout refers to it explicitly in his work "Dualité de Poincaré" (Séminaire "Singularités" de Paris VII, 1977-79), in the last three lines of §4.4 (relative duality theorem for -modules).

<sup>673</sup>(\*) It is known that  $D$  is flat as an  $\mathcal{O}_X$ -Module on the right or left (can be seen immediately on the canonical filtration of  $D$ , and the known shape of the associated scale. . . ). As a result, the "total" tensor product in (5) is in fact a tensor product

between arguments  $F \rightarrow F'$  which are only differential operators (instead of linear). The second functor (4), which should be viewed as a contrafunctor

$$\underline{Cris}_{coh}^*(X) \dashrightarrow D^*(X, C)_X,$$

also admits an important covariant counterpart, given by

$$C \dashrightarrow \underline{RHom}_D(\underline{Q}_X, C) \stackrel{\text{dfn}}{=} \underline{DR}(C) \text{ ("De Rham complex" associated with } C), \quad (6)$$

where the second member is indeed explained by a De Rham complex, thanks to the canonical Spencer resolution of  $\underline{Q}_X$  by locally free D-Modules of finite type (this resolution is deduced from the ordinary De Rham complex, taking the associated D-Module complex by functor (1)).

In crystalline terms (to be explained below), the DR functor is expressed as the total derivative functor of the function  $C \mapsto \underline{Hom}_D(\underline{Q}_X, C)$ , associating with each D-Module (or "crystal") the bundle of C-vectors formed by its "horizontal" sections (on variable openings). This is a **local** operation. The good (global) notion of "**integration**" (or **global cohomology object**) for a "coefficient"  $C$  (i.e. a D-Module or complex of such) is not here the usual functor

$$R\Gamma_X(C) = \underline{RHom}_D(X; D, C)$$

but the functor (familiar to me as a **total crystal cohomology** functor) derived totally from the func-

horizontal sections (global)"  $\text{teur } C \mapsto \underline{Hom}_D(\underline{Q}_X, C)$ ; I denote this total derivative  $R^{\Gamma_{cris}}(C)$ , so that by  $\square$  we have tautological isomorphisms p. 992

$$R\Gamma_{cris}(C) \stackrel{\text{dfn}}{=} \underline{RHom}_D(\underline{Q}_X, C) = R\Gamma_X(\underline{DR}(C)), \quad (7)$$

i.e. the crystalline cohomology of  $C$  on  $X$  is obtained by taking the ordinary (global) cohomology of the associated De Rham complex.

In  $\underline{Cris}_{coh}^*(X)$  a **dualizing functor**, giving rise to a biduality theorem, on the model of those I've identified in the coherent (commutative) context first, then discrete (spread out). I'll denote it  $D$  (as in the contexts cited):

$$D: \underline{Cries}_{coh}^*(X) \xrightarrow{\sim} \underline{Cris}_{coh}^*(X). \quad (8)$$

It is an anti-equivalence, essentially involutive (i.e. we have a biduality isomorphism, functorial in  $C$ ):

$$C \xrightarrow{\sim} D(D(X)). \quad (9)$$

(9). This functor transforms (by composition) the contrafunctors (1) and (2) into covariant functors. The simple fact to remember is that if  $C$  and  $C'$  are "duals" of each other, then De Rham's complex (6) of one identifies with "co-De Rham" (2) of the other: (10)

$$\underline{RHom}_D(\underline{Q}_X, C) \xrightarrow{\sim} \underline{RHom}_D(C', \underline{Q}_X), \text{ and vice versa.} \quad (10)$$

On complexes of differential operators, this operation  $D$  is expressed (with a shift of  $n$  on the degrees) as follows

ordinary.

by passing to the "adjoint" differential operator complex, with components  $\underline{Hom}_{\underline{O}_X}(F, \underline{\omega}_X)$ , obtained by taking the adjoint operators term by term. In this way, the dualizing functor for D-Modules is compatible with the dualizing functor familiar from Serre duality,

$$F \mapsto \underline{Hom}_{\underline{O}_X}(F, \underline{\omega}_X) \xrightarrow{\sim} F \otimes_{\underline{O}_X} \omega_X \quad (F \text{ an } \underline{O}_X\text{-Module loc. lib. of finite type}), \quad (11)$$

where  $\underline{\omega}_X$  denotes the "dualizing module" of differential forms of maximum degree on  $X$ . Note that De Rham's functor

$$DR : D_{\text{coh}}^*(X, D) \mapsto D^*(X, C),$$

does not in general commute to dualizing functors (taking in the second category the  $\underline{RHom}$  functor  ${}_C(-, C_X)$ ). But it is a profound theorem of Mebkhout (which everyone uses without quoting anyone, of course, and as if it were a simple sorite) that for **holonomic** arguments, i.e. for the functor induced

$$\underline{Cris}^*(X)_{\text{hol}} \mapsto \underline{Cons}^*(X, C) (\mapsto D^*(X, C))$$

p. 993 there is commutation to dualizing functors. I do not "recall" here the condition of **holonomy**, and confine myself to

point out that a D-Module complex is holonomic if its cohomology bundles are holonomic D-Modules, and that this is a condition of **local** nature on  $X$ , and moreover, "**algebraic**". On the other hand, Kashiwara's constructibility theorem (which he stated for a holonomic **Module**, at a time when neither he nor anyone else - except Mebkhout - was working with derived categories. . . ) implies that the restriction of De Rham's functor to holonomic complexes does indeed lead to  $\underline{Cons}^*(X, C)$ . Introducing the notion of Mebkhout **regularity**, also local and "algebraic" in nature<sup>674</sup> (\*), we find the "God's functor" (aka Mebkhout)

$$m : \underline{Cris}^*(X) \xrightarrow{\text{hol rég}} \underline{Cons}^*(X, C) \quad (12)$$

which, this time, is an **equivalence** (as we saw in the note "L'oeuvre. . . ", n° 171 (ii)), which is therefore compatible with natural dualizing functors. This is the quasi-inverse functor (13)

$$M : \underline{Cons}^*(X, C) \xrightarrow{\sim} \underline{Cris}^*(X, C) \quad (13)$$

which allows us to consider the category of "constructible discrete coefficients" (of  $C$ -vectorials) on  $X$ , as a full subcategory of  $D^*(X, D)$  and more precisely of  $D_{\text{cons}}^*(X, D) = \underline{Cris}_{\text{coh}}^*(X)$ , which we will inter-

sometimes as a category of "crystalline" coefficients.

(May 19) For the time being, we can say that we have described in three different "languages" or "points of view", as if by as many different "photos", the same reality, or (essentially) the "same" type of coefficients", known as "De Rham coefficients": there is the point of view of bundles of  $C$ -vectors and complexes of such (the "topological" point of view), with an "analytic constructibility" condition<sup>675</sup> (\*\*), playing the role of "topological" point of view.

p. 994 a finiteness condition (essential, in particular, to be able to write theorems of the Riemann- Roch type, involving suitable "Euler-Poincaré characteristics" and "de Grothendieck groups"). He

<sup>674</sup>(\*) Please note that Mebkhout's original definition of regularity was transcendental in nature. For a "purely algebraic" translation, I refer you to the planned discussion of De Rham's coefficients ("Mebkhout" style or "Deligne" style), in volume 3 of *Réflexions*.

<sup>675</sup>(\*\*) Recall that a  $C$ -vector bundle on an analytic space  $X$  is said to be "analytically constructible" if, in the vicinity of each point, it admits a composition sequence whose successive factors are of the form  $i_!(F)$ , where  $i : Y \rightarrow X$  is the inclusion of an analytic subspace  $Y = Z \setminus T$  of  $X$  (with  $T \subset Z$  two analytically closed subspaces of  $X$ ), and  $F$  a locally free  $C$ -bundle

of type  $\text{fini}$  (or "local system of  $\mathbb{C}$ -vectorials") on  $Y$ .

there's the "complex of differential operators" point of view, with holonomy and regularity conditions taking the place of constructibility conditions. And there's the "complex of D-Modules" point of view, with coherence, holonomy and regularity conditions. The second "picture" (taken from the "analytic" angle) is seductive, in that it is intelligible to us in "classical" terms, and the objects it shows us, namely complexes of differential operators, appear to us to be of reasonable "dimensions", whereas D-Modules, even coherent ones (starting with  $D$ ) itself!), appear disproportionate when viewed through " $\mathcal{O}_X$ -Modules" glasses. Technically speaking, however, these provide a more complex. Indeed, while it is "clear" that locally, every complex of D-Modules with cohomology can be represented by a complex of differential operators via (1), it's unlikely that this will also be the case globally, unless we make draconian assumptions about  $X$  (such as a "Stein variety" or, in the algebraic framework, a quasi-projectivity assumption)<sup>676</sup> (\*).

Photo 1 has the advantage of making sense when  $X$  is no longer assumed to be smooth, but is a complex analytic space of some kind. On the other hand, as they stand, photos 2 and 3 are reasonable only under the assumption of smoothness. It's true that we can still define a  $D$ -ring bundle $_X$  without the smoothness assumption on  $X$ , and we can still find a tautological dictionary between complexes of differential operators (with components of locally free  $\mathcal{O}_X$ -Modules) and complexes of D-Modules (with locally free components), but  $D_X$  (it seems) ceases to be coherent, too bad! It's unlikely that a "theorem from the good Lord" will ever be able to make sense of the world.

can emerge in the singular case, on the model of that known in the smooth case. On the other hand, it's obvious that we need pictures of genus 2 or 3 in the singular case too, since the picture n° 1 is **transcendental in nature**: naively modeling it, in terms of Zariski or étale topology for a variety algebraic, we would find "coefficients" that are far too particular to be usable (because these topologies are too coarse, compared to the transcendent topology). Photos 2 and 3, on the other hand, restricted for To begin with, these "smooth" fields of view still make sense in "abstract" algebraic geometry (on a zero-square body, let's say, to begin with), which is (for me) their main charm. In other words, it's essential to enlarge them in such a way that the singular varieties are included in the field of vision.

p. 995

This didn't seem to bother Mebkhout, who had other things to worry about- When I asked him the question, his immediate idea was as follows. Suppose  $X$  is immersed in a smooth variety  $X'$ , as a sub closed analytic space. Then the category  $\text{Cons}^*(X, C)$  can be interpreted as the full subcategory of  $\text{Cons}^*(X', C)$  formed by objects whose restriction to  $U = X' - X$  is zero (i.e. objects with support in  $X$ ). But this can also be interpreted, by the Good Lord's theorem, in terms of pictures 2 or 3, as the category of "De Rham - Mebkhout coefficients" on  $X'$  whose restriction to  $U$  is zero. It should be easy to check a priori (remaining in the context of "De Rham - Mebkhout coefficients", i.e. that of photos 2,3), that this category, with equivalence itself defined to within a single isomorphism, is independent of the chosen "lissification"  $X'$  of  $X$ . I've done plenty of this myself, and I'm willing to believe it works. If, on the other hand,  $X$  is not "lissifiable", never mind (says Mebkhout), we'll "do cohomological descent" to reconstitute a global category from these local pieces, or else introduce the "site of lissifications" of opens of  $X$ , and work on that. Chances are, we can manage, but instead of a "lissifying site" (improvised by Mebkhout for the purposes of

<sup>676</sup>(\*) Of course, nothing prevents us from constructing a "derived category" from the category of complexes of differential operators on  $X$  and differential morphisms between such complexes, by formally "inverting" the "quasi-isomorphisms" (defined by transition to the corresponding  $D$ -Module complexes). We'll find (I presume) a **full** subcategory of  $\text{Cris}^*(X)$ ,<sup>coh</sup> but probably not this whole category, in the absence of assumptions like "Stein" or "projective  $X$ " (or only, quasi-projective, in the algebraic case).

the retort, in a conversation that remained platonic), a site that seems to me to be highly redundant, why not work with the crystalline site, which has proved its worth (even if it has been forgotten, it would seem, with a touching set, by those who were my students... ) ? And all the more so as it was quite clear to me, as early as 1966, when I came up with the initial ideas for crystalline yoga, that the future "De Rham coefficients" were to be expressed precisely in crystalline terms!

This leads me to pull out of my drawer a photo that has had time to gather dust, poor thing - and yet, once I've blown on it, it looks as good as new, and in perfect focus. In fact, it was one of the first things I thought of when I wrote the note "Mes orphelins" (n° 46) last year (before I'd even met the Burial. . . ), obscurely sensing that it was time...

p. 996 that someone expresses themselves with respect about things that deserve respect. ... Incidentally, ever since Meb-khout<sup>□</sup>m told me about D-Modules (in 1980 - God knows I wasn't "hip" then!), I haven't been able to to think of them as "crystals" instead, and to use the words "*D-Modules*" and "crystals" (from  $\underline{O}_X$ -Modules) as synonyms, with (of course) a marked preference for the latter.

This brings me to the promised fourth photo, the "crystalline" photo. First, let's assume  $X$  is smooth. Giving yourself a D-Module  $F$  on  $X$  is the same as giving yourself an  $\underline{O}_X$ -Module, with an additional structure, which can be expressed in various equivalent ways. One, the tautological one, consists in saying that we

"extends" the operations of  $\underline{O}_X$  on the abelian bundle  $F$ , into an  $X$ -operation of the Ring  $D_X$  (which contains  $\underline{O}_X$ ). Since  $D_X$  is generated by  $\underline{O}_X$  and the additive sub-bundle of derivations, we can see that it's the same thing to give ourselves what's called an "**integrable connection**" on  $F$ , i.e. a law which, at each derivation  $\xi$  on an open  $U$  of  $X$ , associates a " $\xi$ -derivation"  $\theta_\xi$  of  $F$ , linearly in  $\xi$ , and compatible with the "hook" operation of derivations<sup>677</sup> (\*). We can say that this is a structure of a "differential" nature on  $F$ , of order 1.

Since we're in characteristic zero<sup>678</sup> (\*\*), this structure can also be interpreted as a richer structure, a differential structure of infinite order, which I've called a "**stratification**" on  $F$  (which  $F$  then takes the name of "**Stratified Module**"). One way of expressing a stratification is as a "**given**".

p. 997 **infinitesimal descent of infinite order**" on  $F$  (with respect to the morphism  $X \rightarrow$  a point), or more precisely, as the given  $\square$  of an isomorphism, above the formal completion of  $X \times X$  along the diagonal, between the two inverse images of  $F$  (by the two canonical projections  $pr_1$  and  $pr_2$ ), an isomorphism that extends the identity on the diagonal, and moreover satisfies a suitable "transitivity condition".

The transition from an integrable connection to an "infinitesimal descent data" (or stratified structure) represents a new idea - and a "trivial" one, like all the new ideas I've had the honor of discovering! However, it only takes on its full force when reinterpreted in terms of the notion of **module crystals**. We show that the structure in question on  $F$  also comes down to the fact that, for any "neighborhood infinitesimal"  $U'$  of an open  $U$  of  $X$ , an **extension**  $F_{U'}$ , from  $F|_U$  to  $U'$  (in sum,  $F$  "grows" above infinitesimal neighborhoods, such as a "crystal" - a crystal of modules, in this case, but there are crystals of all kinds. . . ) - this extension behaving in the way we can guess, for the notion of restriction to

<sup>677</sup>(\*) Of course, a compatibility condition is also required for the restriction to an open.

<sup>678</sup>(\*\*) In what follows, we can dispense with any characteristic assumption (in the context of a smooth relative scheme, say), by replacing the formal completion of  $X \times_S X$  along the diagonal, by the formal completion "with powers  $S$  divided". This also leads/ for an  $\underline{O}$ -bundle  $\underline{O}_X$ -Module  $F$  on  $X$ , to replace the pro-bundle  $P(F)$  of its "principal parts of order  $\infty$ ", by "principal parts with divided powers (of order  $\infty$ )". On the dual side, this amounts to replacing the  $D$ -ring bundle  $\text{bundle}_{X/S}$  of relative differential operators (which is not coherent even if  $S$  is noetherian), by the "enveloping" ring bundle of relative derivations of  $\underline{O}_X$  on  $\underline{O}_S$  (which, as Mebkhout assures me, would be quite coherent!). This is, in fact, the conceptual context for De Rham's coefficients, which will extend Mebkhout's from the coefficients to the coefficients.  $D$ -Modules, for the development in particular of a theory of De Rham coefficients for finite type schemes over  $\mathbb{Z}$ .

an open  $V$  of  $U$ , and for morphisms between infinitesimal neighborhoods (or "thickenings")  $U'$ ,  $U''$  of the same  $U$  (identity-inducing morphisms on  $U$ , of course).

What's interesting from the crystalline point of view is that the objects to be studied (the D-Modules) can be interpreted as bundles of "ordinary" Modules on a suitable site<sup>679</sup>  $(*)$ , ringed in **commutative local rings**, namely the "crystalline site" formed by the thickenings  $U'$  of the various  $U$ -openings of  $X$  (the bundle

structural crystalline being simply  $U' \rightarrow \Gamma(U', \underline{O}_{U'})$ ). From then on, we have the whole arsenal of intuitions at our disposal

associated with such a situation. A remarkable relationship that I discovered in 1966, and which stunned me at the time, is that the cohomology of the crystal site (or of the crystal topos that corresponds to it), with coefficients in the structural bundle (or more generally, with coefficients in  $F$ , at least when  $F$  is coherent on  $\underline{O}_X$ ), is identified with the **De Rham cohomology** of  $X$  (with coefficients in  $F$ , in this case,

i.e. the ordinary hypercohomology of  $X$  with coefficients in  $DR(F)$ ). This was the start of cohomology crystalline<sup>680</sup>  $(**)$ .

□ Thus we have a perfect dictionary, explained at length in my 1966 talks already cited<sup>681</sup>  $(*)$ , between four object types on  $X$ , or four structure types on an  $\underline{O}_X$ -Module:

p. 998

- □ D-Modules
- $\underline{O}_X$ -Integratable connection modules
- Stratified modules (infinitesimal descent data of infinite order) (Cr)
- □  $\underline{O}$  crystals $_X$ -Modules

This dictionary is valid without any coherence or quasicoherence restrictions on  $F$ . Note, however, that if we compare the extreme terms

$$\text{D-Modules} \Leftrightarrow \underline{O}\text{-crystals}_X\text{-Modules}$$

the natural notions of "coherence" in either context **do not correspond**. The crystalline structural bundle is coherent, but the coherent Modules on the crystalline ring topos correspond exactly

to D-modules that are consistent as  $\underline{O}_X$ -modules, in which case they are even free of finite type. The category they form is canonically equivalent, through the "scalar extension" functor relating  $C_X \rightarrow \underline{O}_X$ , to the category of locally free bundles of  $C_X$ -modules, i.e. to that of "**local systems** of C-vectors" on  $X$ . So, for this kind of object, there are five possible descriptions (or five "pictures").

counting the four in table (Cr) above)! But these are "coefficients" of an excessively special nature<sup>682</sup>  $(**)$ , among those (de Rham - Mebkhout) that interest us.

Instead, let's return to the four photos in table (Cr) above, and see what happens when we no longer assume  $X$  is smooth. All four object types remain meaningful. It would seem, moreover, that the two pre-rather, that all  $D_X$ -Modules and all  $\underline{O}_X$ -Modules with integrable connections, which we naturally encounter as "having a geometrical meaning", "originate" (in an obvious sense) from stratified Modules, which moreover can still be interpreted as crystalline rate of  $\underline{O}_X$ -Modules, as in the smooth case<sup>683</sup>  $(***)$ .

<sup>679</sup>  $(*)$  Note that not **all** modulus bundles are found at the crystal site, but only those that satisfy a simple additional condition (called "special" bundles in [Crystals]).

<sup>680</sup>  $(**)$  Here again, start-up ideas are so "trivial" that it's really not worth bothering with the little stuff, when you've spent fifteen years of your life, afterwards, developing a little bit of it (and forgetting the rest. . .).

<sup>681</sup>  $(*)$  See the presentation [Crystals], cited in the first footnote to this sub-note (note  $(*)$  on page 988).

<sup>682</sup>  $(**)$  In fact, it's the  $D$ -coherence, of course (which had escaped me in the sixties) that is the important notion of finitude here.

<sup>683</sup>  $(***)$  this assertion was made hastily, and is false as it stands. For it to be true, the "site" must be replaced by "site".

confess that, because I haven't given it much thought, I can't quite visualize the exact relationship yet, for  $X$

plunged

in  $X'$  smooth (let's say), between crystals on  $X$  and crystals on  $X'$  (and this even when  $X$  itself is smooth)<sup>684</sup> (\*). What is certain is that the crystal site, or better, the crystal topos  $X_{cris}$ , with its ring structure, depends on the analytic space  $X$  in a covariant way, i.e. if  $f: X \dashrightarrow X'$  is a morphism between analytic spaces- we deduce

$$f_{cris}: X_{cris} \dashrightarrow X'_{cris};$$

hence, in particular, a "direct image" functor for bundles of Modules on these ringed topos. We'd like to understand this operation (in the case of a closed immersion  $X' \hookrightarrow X$ , in particular), and understand under what condition a crystal is transformed into a crystal. In the case of a closed immersion,

that this functor is exact. The idea here is this: if  $F$  is an object of the derived category  $D^*(X_{cris}, \mathcal{O})$  and  $F'$  its image by the total derivative functor of  $f_{cris}^*$ , and further assuming  $X'$  smooth, the condition that  $F'$  is

p. 1000

regular holonomy **should not depend on the chosen immersion of  $X$  in a (smooth) space  $X$** . If this is indeed the case, then we define the category of crystalline De Rham - Mebkhout coefficients on  $X$  as the full subcategory (of the derived category) defined by the previous condition (obviously local on  $X$ ).

Thus, modulus of a fundamental work which should have been done twenty years ago and which apparently still remains to be done (concerning fundamental operations on crystalline modules), we can say that in the case where  $X$  is any analytic space (not necessarily smooth), there remain **two** pictures (instead of four) to describe for us the "De Rham coefficients" to which we have some: there's  $\underline{Cons}^*(X, \mathbb{C})$  ne varietur, and there's the category (which for the moment remains hypothetical, and which as it stands I still can't see<sup>685</sup> (\*\*)) of "De Rham - Mebkhout" coefficients  $DRM^*(X)$ , for which I've just hazarded a principle of definition. The  $\underline{Cons}$  category<sup>\*</sup>  $(X, \mathbb{C})$ , whose description offers no problem from the transcendental point of view, **disappears** as soon as we move on to the algebraic context. This makes it clear that we need a good definition of  $DRM^*(X)$  that makes sense in this context. And it's clear to me, too, that the right "frame" for this picture, which at first sight seems to be the only one left, is the one formed by the crystalline modules<sup>686</sup> (\*\*).

---

crystalline", formed by all infinitesimal thickenings of openings in  $X$ , by the subsite (called a "stratified site") formed by those that locally admit a retraction on  $X$  (a condition automatically satisfied when  $X$  is smooth). When we give ourselves a stratified module  $F$  on  $X$ , its inverse image by such a retraction does **not depend**, apart from a single isomorphism, on the chosen retraction, hence a "canonical extension" of  $F$  above the thickening envisaged.

So, when  $X$  is not smooth, a crystalline structure on  $F$  is "richer" than a simple stratification, since it allows  $F$  to be extended (i.e., to "grow") over **any** infinitesimal neighborhoods of openings of  $X$ , and in particular (and this is of particular importance), over infinitesimal neighborhoods of any order of  $X$ , immersed in a **smooth** ambient space. In fact, it turns out that the most crucial and fruitful new notion, between that of the stratified Module and that of the crystal of Modules, is the latter. It is the one that is destined to dominate De Rham's theory of coefficients. Let me "remind" you that, for a clean and smooth relative scheme  $Z$  on  $X$ , the relative De Rham cohomology of  $Z$  on  $X$  (both in the transcendental and algebraic context. . .) is "not only" provided with a stratification, but indeed with a crystal structure, making it "grow" on any infinitesimal neighborhood.

This is a crucial mathematical **fact**, which Deligne had already forgotten before I left in 1969, when he described De Rham-type coefficients in terms of **stratified** procohesive Modules, instead of the stronger crystalline version, i.e. in terms of procohesive Module **crystals**. It has to be said that my name was less notoriously attached to the notion of stratified Modules (so natural you'd swear it must date back to the last century), than to the far less "traditional" looking notion of Module crystals. On this subject, see the reflections in ". . . et entrave" (sub-note n° 171 (viii)).

<sup>684</sup>(\*) (May 26) The situation has become considerably clearer for me with the introduction of the notion of co-crystal, to which it is alluded to in D) below.

<sup>685</sup>(\*) I allude below to a "fifth photo", which is much clearer for me right now, to capture De Rham's "good" coefficients in purely algebraic language in crystalline terms, retaining a sense without smoothness assumptions. This photo is taken from an angle that is somewhat "dual" to that of the De Rham-Mebkhout photo.

<sup>686</sup>(\*\*) I call a "**crystalline Module**" on  $X$  a bundle of Modules on the crystalline ring topos  $X_{cris}$ . We can therefore consider

I must admit that even in the case where  $X$  is smooth, I don't really understand Mebkhout's description of the "de Rham" coefficients, in terms of the good-god functor, which doesn't respect natural multiplicative structures: it's Mebkhout's contra-functor, which we'll be talking about in (b) which (it seems) is compatible with<sup>687</sup> (\*\*\*). A fortiori, this functor does not commute "to the six operations". The in-

tuition which  $\square$  (attaches to Mebkhout coefficients therefore seems very different in nature, at first sight, from p. 1001 discrete coefficients. From a certain point of view, this is an advantage - you have two photos taken from radically different angles! It simply makes it more difficult for those accustomed to looking from one of these angles to recognize themselves in the photo taken from the other.

In fact, in addition to the four photos already reviewed (for "De Rham coefficients", I mean), there's a fifth<sup>688</sup> (\*) that I've been keeping in reserve: it's Deligne's, with stratified pro-modules<sup>689</sup> (\*\*). It has the advantage of "sticking" very closely to the intuition of constructible discrete bundles: an object "of degree zero" corresponds to an object of the same type, the notions of tensor product and inverse image correspond to each other through Deligne's equivalence; so it will be the same for all six operations (which can indeed be described in terms of these two). On the other hand, the operation of passing from the "De Rham - Deligne coefficients"  $DRD^*(X)$ , to the De Rham - Mebkhout coefficients  $DRM^*(X)$ , seems to me to be in line with the "De Rham - Mebkhout coefficients".

principle particularly well understood, in terms of operations (" $\mathcal{O}_X$  -duality") on  $\mathcal{O}_X$  -Modules (at least, initially, for smooth  $X$ ) - I've already alluded to this in a previous footnote<sup>690</sup> (\*\*\*). I have so I have the impression of being on solid, familiar ground, where I can recognize myself,

as soon as I get the chance. I even thought of sketching  $\square$  (in this note the point of view of Deligne, and making p. 1002 the link with Mebkhout's and with the formalism sketched out in my aforementioned 1966 presentations. But this sub-note is getting rather long, and is becoming more and more of a digression! So I prefer to refer the matter to volume 3 of *Réflexions*, where I think I'll also give a description of "good" De Rham coefficients (Deligne style, or Mebkhout, as the case may be) on finite-type schemes over  $\mathbb{Z}$ .

**(b) La formule du bon Dieu** (May 5 and May 21) I'd like to come back to the description of the Mebkhout functor (also called "du bon Dieu").

$$M: \underline{Cons}^*(X, C) \rightarrow \underline{Cris}^*_{coh}(X) \stackrel{\text{dfn}}{=} D^*_{coh}(X, D_X) \quad (1)$$

---

module crystals as special cases of crystalline modules.

<sup>687</sup>(\*\*\*) This "so it seems" is a rather flippant way (almost like a "new style". . . ) of glossing over a beautiful theorem, still due to the same stranger on duty (but of more recent vintage, I understand, than the good Lord's). It implies, for example, for two analytically closed subspaces  $Y$  and  $Z$  of  $K$ , the following formula on local cohomology, obviously too beautiful even to be true (and yet. . . ) :

$$R\Gamma^{alg}_{Y \cap Z}(Q_X) \cong R\Gamma^{alg}_Y(Q_X) \otimes^L R\Gamma_Z(Q_X),$$

which I'm sure some handsome gentlemen will pocket one of these mornings, as if "they'd always known" - while waiting to award it to the most handsome among them... .

<sup>688</sup>(\*) So I've done better than live up to the promise of this note's title "The Five Photos": I've actually highlighted **two sets of** five photos, the first describing "De Rham coefficients" alone, and the second crystalline coefficients in general.

<sup>689</sup>(\*\*) As mentioned in a previous b. de p. (note (\*\*\*) page 998 ), this De Rham - Deligne photo was taken with a slightly distorted "lens" (for reasons beyond the manufacturer's control). It needs to be retouched, and also enlarged, by taking it out of the null feature frame. This will be done in volume 3 of *Réflexions*, where my dear ex-students will be able to come and pump out all the "useless details" and other "technical digressions" they haven't had the leisure to find for themselves, in the nearly twenty years since I left them to fend for themselves with a splendid subject in their hands... ..

<sup>690</sup>(\*\*\*) This "previous b. de p. note" has since been transformed into part (c) of the present "Five photos" note.

where  $X$  is a smooth complex analytic space. As we said in the note "The work. . ." (n° 171 (ii)), this is a functor of deep nature, which is defined as quasi-inverse of the restriction functor of the De Rham  $DR$  functor to the full  $DRM$  subcategory\* ( $X$ ) (of "De Rham-Mebkhout coefficients" on  $X$ ) of

$\underline{Cris}^*_{coh}(X)$ ,

$$m = DR/DRM^*(X) : DRM^*(X) \xrightarrow{\text{dfn}} \underline{Cris}^*(X)_{\text{holrég}} \rightarrow \underline{Cons}^*(X, C) \quad (2)$$

which turns out to be an equivalence ("God's theorem"). In fact, Mebkhout obtains a remarkable direct description of the function  $M_\infty$ , deduced from the functor  $M$  by the "scalar extension" functor  $i$  through the Ring homomorphism

$$D \rightarrow D^\infty \quad (3)$$

where  $D^\infty$  (or  $D^\infty_X$ ) denotes the Ring of "infinite-order differential operators on  $X$ ", i.e. (by definition) the ring of "infinite-order differential operators on  $X$ ".

of the (C-endomorphisms of the bundle  $\mathcal{O}_X$ , seen as a bundle of complex topological vector spaces. It is known that  $D^\infty$  is faithfully flat on the left and right on  $D$ , so that the total derived functor of the Ring extension functor

$$i : \underline{Cris}^*(X) = D(X, D) \rightarrow D(X, D) \rightarrow D(X, D^\infty) \xrightarrow{\text{dfn}} \underline{Cris}^\infty(X) \quad (4)$$

is explained by an ordinary tensor product. Note that we don't know whether the  $D$ -ring $^\infty$  is coherent, but apparently we don't need to. We define the full subcategory

$$\underline{Cris}^*(X)_{HO} \xrightarrow{L} \underline{Cris}^*(X)$$

complexes of D-Modules which are "holonomic", by the condition of being locally deduced (by the functor (i) of a D-module complex  $C$  which is holonomic. (It will follow from the double God's theorem, recalled below, that we can then take even  $C$  to be both holonomic and regular, i.e. a "coefficient of  $\square$  (De Rham - Mebkhout)", and this determines  $C$  on all  $X$  to within a single isomorphism. . . ) Consider the functor  $M_\infty = iM$ , fitting into the commutative diagram

p. 1003

$$\begin{array}{ccc} & \underline{Cons}^*(X, C) & \\ \uparrow M & & \uparrow M_\infty \\ DRM^*(X) & \xrightarrow{i} & \underline{Cris}^*(X)_{\text{hol}} \end{array} \quad (5)$$

$$= \underline{Cris}^*(X)_{\text{holrég}}$$

It turns out (or rather, the unknown worker proves. . . ) that the functor  $M_\infty$  is also a category equivalence (so  $i$  is too). It can also be obtained as a quasi-inverse of the functor  $m_\infty$ , of the "De Rham" type analogous to  $m$ , defined on  $\underline{Cris}^*(X)_{\text{hol}}$ . To describe the functor  $M_\infty$ , it is more convenient to describe the contractor

$$\Delta_\infty \stackrel{\text{dfn}}{=} M_\infty D = D M_\infty = i(MD) = i(DM), \quad (6)$$

where  $D$  denotes the dualizing functor already mentioned, in  $\underline{Cons}^*$  or  $DRM^*$ , and  $D_\infty$ , the dualizing functor similar

that exists in  $\underline{Cris}^*(X)_{HO}$  (and even in  $\underline{Cris}^{\infty coh}(X)$ ). (NB The three functors involved

in (5) commute to dualistic functors). The quasi-inverse  $\delta_\infty$  of  $\Delta_\infty$  is therefore given by the formula

similar to (6)

$$\delta_{\infty} \stackrel{\text{dfn}}{=} Dm_{\infty} = m D_{\infty} \quad (7)$$

We then find the Mebkhout expression of  $\Delta_{\infty}$ ,  $\delta_{\infty}$  by the following two remarkably symmetrical formulas:

$$\begin{aligned} \Delta_{\infty}(F) &= \underline{RHom}_{\mathcal{C}}(F, \underline{Q}) \\ \delta_{\infty}(C) &= \underline{RHom}_D(C, \underline{Q}) \end{aligned} \quad (8)$$

Note that in the first of these formulas, the second member inherits a  $D^{\infty}$ -structure, thanks to the operations of  $D^{\infty}$ ; on the second argument  $\underline{Q}$ , while in the second formula, the second member is interpreted simply as a complex of  $\mathcal{C}$ -vector bundles. The second of these formulas, put there "for the record", is essentially tautological, and simply states that the functor  $\delta_{\infty}$  associates with the  $D$  complex  $^{\infty}\text{-Modules } C$  the complex of differential operators (of infinite order) "adjoint" to that associated with  $C$  (by De Rham's  $DR$  functor  $_{\infty}$ ) - this complex being interpreted as a complex of  $\mathcal{C}$ -vector bundles. (That a complex with constructible cohomology bundles can be found in this way is equivalent to Kashiwara's constructibility theorem).

□ (It is a profound theorem, on the other hand, that the first functor  $\Delta_{\infty}$  transforms constructible bundles into (complexes of)  $D^{\infty}$ -Modules that are holonomic. The finiteness theorem alone implied by this result<sup>691</sup> (\*) (without even mentioning holonomy) is in itself a remarkable new result. Even more extraordinary, however, is **the fact that the two functors are quasi-inverses of each other**. Formally, this fact resembles biduality relations, which can be expressed either in the category  $\underline{Cons}^*$ , or in

p. 1004

the  $\underline{Cris}$  category  $^*(X)_{HO}$  - except that the "dualizing" contrafunctors (expressed in both cases as

as a  $\underline{RHom}_{\infty}(-, \underline{Q}_X)$ ) connect two **different** categories. It was this formal analogy that led Mebkhout to call the theorem that affirms isomorphism

$$\Delta_{\infty} \delta_{\infty} \stackrel{\sim}{=} id \text{ in } \underline{Cris}^*(X)_{coh} \quad (9)$$

the "**biduality theorem**" for  $D$ -complexes  $^{\infty}\text{-Modules}$  (a potentially confusing terminology). This relation, plus the fact that the functor  $\delta_{\infty}$  is fully faithful (or, more precisely, that  $\Delta_{\infty}$  is an adjoint of it, something he includes in the statement of his biduality theorem) had been obtained by Mebkhout as early as 1977, before the complete God theorem. The so-called "biduality theorem" thus essentially means (as does "my" biduality theorem, from which it is inspired) that a complex of **holonomic**  $D^{\infty}$ -Modules can be **reconstituted**, as an object of a derived category, by knowledge of the associated complex of (infinite-order) differential operators, seen as simply a complex of  $\mathcal{C}$ -vector bundles (in the appropriate derived category); and more precisely, that it can be reconstituted by the explicit inversion formula

(8) (first formula). A fortiori, a morphism between complexes of holonomic  $D^{\infty}$ -Modules is a quasi-isomorphism if and only if the corresponding morphism for complexes of differential operators (of infinite order) is so in the naive sense (i.e. induces an isomorphism on cohomology bundles)<sup>692</sup> (\*\*).

<sup>691</sup>(\*) This finiteness result implies, for example, that locally on  $X$ , the complex  $\underline{RHom}_{\infty}(F, \underline{Q}_X)$  is isomorphic (in the derived category) to a complex of  $D^{\infty}$ -Modules that is locally free of type fini in each degree, and that its Cohomology Modules arise (locally), by scalar extension, from coherent  $D$ -Modules. In fact, we can even assume regular holonomy.

<sup>692</sup>(\*\*) (May 26) In fact (as I point out below, beginning of (c)) Mebkhout proves this last result, even outside any holonomy condition, in the equivalent form: if the complex of differential operators associated with a complex of  $D^{\infty}$ -Modules is quasi-zero, so is the latter (and so are the  $D$ -Modules).

□(Mebkhout's biduality theorem is in some ways "half" of God's theorem

(for  $D^\infty$ -Modules), when the latter is taken in its strongest form, that asserting that functors

(8) are almost inverses of each other. This is the central result of Mebkhout's thesis, submitted in January 1980. But this "half" alone is already a new and (as far as I know) entirely unexpected result. It constitutes a typical result, bridging the gap between Sato's ideas and my own, but in the optic of my long-standing program: to formulate "discrete coefficients" by "continuous" or "differential" means (and from the point of view of derived categories). In this respect, it seems to me that the spirit and inspiration of this result completely escape the problematic of the Japanese school of analysis. Kashiwara's constructibility theorem seems to have represented an "aside", and by no means the starting point for a new theory of coefficients. As the publications for the period between 1976 and 1980 show beyond doubt, Mebkhout was the only one to develop such a philosophy.

Mebkhout had told Kashiwara, who was visiting Paris in January 1978 and had just finished writing his thesis, about his results. At Kashiwara's request, the candid Mebkhout, happy to have finally found someone who seemed interested in what he had to say, sent him to Princeton the hot Chapter III - the one containing, among other things, the so-called "biduality theorem". That was in February 1978. Three years later, this same result appeared (with a pretence of demonstration) in a famous article by Kashiwara-Kawai<sup>693</sup> (\*). It was renamed "reconstruction theorem" for the occasion, and without the slightest allusion to a certain Zoghman Mebkhout. Incidentally, it was also the memorable year of the Colloque Pervers - the glorious year when a certain "new style"<sup>694</sup> (\*\*) conquered with aplomb (and without encountering the slightest resistance. . . ), that part of mathematics, of all places, where I used to feel at home.

. . .

### (c) The fifth photo (in "pro mode")

□(May 21) The "biduality theorem" (9) is from 1977. To prou-

ver the other half of the "God's theorem" for  $D^\infty$ -Modules, which therefore amounted to proving that the functor  $\delta_\infty$  is essentially surjective, a first difficulty was to prove that for  $F$  in  $\underline{Cons}^*$ , and by defining the  $D$  complex $^\infty$ -Modules  $C = \Delta_\infty(F)$  by the first formula (8), that this could be obtained via the functor  $i$ , at least locally on  $X$ , using a (holonomic, regular) D-Modules complex. A priori, according to Mebkhout's ideas (i.e. following the double God's theorem, implying that the functor  $i$  in (5) is an equivalence), the latter should be unique to within a single quasi-isomorphism.

I haven't tried to understand how Mebkhout finally managed to construct this D-Module in his thesis. It seems to me that the situation should be clarified, here, by using Deligne's idea of the procoherent bundle associated with a constructible C-vector bundle  $F$ <sup>695</sup> (\*). This idea had been developed by him in the context of **algebraic** varieties over  $X$ , but should be adaptable mutatis mutandis to the analytic case, provided perhaps that we work "locally" on  $X$ , or on each compact of  $X$ . The procoherent bundle associated with  $F$ , which is therefore (at least on each compact  $K$  of  $X$ ) a projective system  $(F_i)$  of coherent bundles (defined in the vicinity of  $K$ ), can be defined very simply as the bundle that

<sup>693</sup>(\*) M. Kashiwara, T. Kawai, On holonomic Systems of micro-differential equations, III Systems with regular singularities, Publ. RIMS 17, 813-979 (1981). The "reconstruction theorem" plundered from Mebkhout can be found in par. 4 of this long work (received November 1980). The main result of the work is a weakened variant of the fact that the functor  $i$  in (5) is a category equivalence. This is therefore an immediate corollary of Mebkhout's (geometric) theory, a consequence that these authors

are obtained analytically (independently of Mebkhout). For further details, see the sub-note "La maffi a" n° 171 (ii), part (b): "Premiers ennuis - ou les caïds d'outre-Pacifique".

<sup>694</sup>(\*\*) On the subject of this "new style" (of which Kashiwara and Hotta are eminent Pacific emulators), see the note "Les félicitations - ou: le nouveau style" (n° 169 ).

<sup>695</sup>(\*) This is the idea he developed in his seminar at IHES in 1969-70, but then abandoned. On this subject, see sub-note ". . . and hinders" (n° 171 (viii)).

pro-represents the functor

$$J \rightarrow \text{Hom}_{\mathbb{C}}(F, J)$$

on the category of  $\underline{O}_X$ -Module coherent  $J$  on  $X$  (in the neighborhood of  $K \dots$ ), which functor, being exact on the left, is well pro-representable. For example, if  $F$  is the constant bundle  $\mathbb{C}_Y$  on an analytic subspace closed  $Y$  of  $X$ , "extended by zero" over all  $X$ , we find the profaisceau formed by the  $\underline{O}_{X_n}$  where the  $X$  are the infinitesimal neighbors of  $Y$  in  $X$ . (NB The projective limit of this projective system is the completed  $\underline{O}_X$  along  $Y$ ).<sup>696</sup> We see (returning to the general case) that the pro-beam  $(F_i)$  is equipped with a canonical stratification<sup>696</sup> (\*\*). Deligne's idea is that the "functor of  $\square$  (Deligne)" from category  $\text{yp}$  of constructible  $\mathbb{C}$ -vector bundles on  $X$ , to the category of stratified pro-coherent bundles, is **fully faithful**, and thus allows us to interpret the first category (which is transcendental in nature) in terms of a full subcategory of the category of stratified pro-coherent bundles. The latter has a purely algebraic meaning, and the full sub-category in question can also be defined (more or less tautologically<sup>697</sup> (\*)), in purely algebraic terms too. This is the category I'll call

$$\text{DRD}^*(X) \text{ or } \text{Del}^*(X), \quad (10)$$

which constitutes the "**fifth photo**", which I didn't want to explain yesterday<sup>698</sup> (\*\*). I seem to remember that Deligne had taken the trouble to develop his interpretation (and the previous full-fidelity statement) in such a way as to move on to derived categories (at a time when it had not yet been decided by my unanimous cohomology students, led by Deligne, to scrap the latter), and it is indeed the "derived category" version that I designate by the notation (10), of course.

That said, the "algebraic part" in  $\underline{RHom}_{\mathbb{C}}(F, \underline{O}_X)$  should be very naturally definable as an inductive limit (in a suitable sense) of  $\underline{RHom}_{\underline{O}_X}(F_i, \underline{O}_X)$  -and in particular (passing to cohomology bundles), we describe canonical arrows

$$\lim_{\substack{\rightarrow \\ i}} \underline{Ext}_{\underline{O}_X}^d(F_i, \underline{O}_X) \rightarrow \underline{Ext}_{\mathbb{C} \times X}^d(F, \underline{O}_X) \quad (\forall d \in \mathbb{Z}) \quad (11)$$

Using the stratification on the pro-object  $(F_i)$  and the tautological stratification of the second argument  $\underline{O}_X$ , we should be able to define a stratification on the first member of (11), i.e. a D-Module structure, such that (11) is compatible with the operator ring homomorphism  $\square$  (corresponding p. 1008

$D \rightarrow D^\infty$  That said, Mebkhout's Good God Theorem should be able to be made more precise, by saying that (11) identifies the second member with the  $D^\infty$ -Module deduced from the first by extension of the scalars<sup>699</sup> (\*) - which implies in particular that the arrow is an **inclusion**. In this way, the left-hand member must be visualized as a kind of "**algebraic**" (or "**meromorphic**") **part** of the right-hand member (which, for its part, is of the same nature as the right-hand member).

<sup>696</sup>(\*\*) The notion of stratification for a pro-Module is defined in the same way as for a Module - the description given in the previous day's notes (part (a)) applies in principle whenever we have a "relative" notion (such as Modules, pro-Module, relative scheme etc.) admitting a notion of inverse "image", i.e. giving rise to a "fibred category" on the category of "varieties" we're working on. ... Please note that if  $(F_i)$  is a pro-Module, a stratification of it cannot in general be described in terms of a "compatible" stratifying system of  $F_i$  - the objects considered are of a much more general nature than the pro-objects of the stratified Modules category.

<sup>697</sup>(\*) "Tautological" at least in terms of the already familiar dictionary (first developed by Deligne) between bundles of locally constant  $\mathbb{C}$ -vectorials (or "local systems") on the  $Y - Z$  complement of a divisor  $Z$  in an analytic space  $Y$ , and stratified coherent modules on  $Y - Z$  that are "regular" (in Deligne's sense) along  $Z$ .

<sup>698</sup>(\*\*) Finally, this explanation (described as "tautological"! ) is not given here either, at least not immediately. It is given below (page 1011). Note that notation (10) refers to the "derived categories" variant.

<sup>699</sup>(\*) In addition, of course, the first member of (11) (in accordance with Mebkhout's philosophy) must be a **coherent, holonomic** and **regular**  $D$ -Module.

"transcendent").

The general situation becomes considerably clearer on the previous particular example,  $F = i_* (C_Y)$ , where  $i : Y \rightarrow X$  is the inclusion of a closed analytic subspace of  $X$ . Then the second member of (11) is a local cohomology bundle with supports in  $y$  - a **transcendental** invariant, while the first member

$$\lim_{\rightarrow n} \underline{Ext}_{\mathcal{O}_X}^d(\mathcal{O}_{X_n}, \mathcal{O}_X),$$

is the well-known expression I introduced for local cohomology, in the schematic framework. The fiber of this bundle at a point  $x \in Y$  is *nothing* other than the local cohomology, on the spectrum  $X_x$  of  $\mathcal{O}_{X,x}$ , of the structural bundle with supports in the "trace"  $Y_x$  of  $Y$  on  $X_x$ .

This example shows just how close Deligne's idea is to those I developed on the subject of local cohomology in the early sixties<sup>700</sup> (\*\*). In any case, the main theme of Mebkhout's work between 1972 and 1976 was to study arrow (11) in this crucial case.

$$\lim_{\rightarrow n} \underline{Ext}_{\mathcal{O}_X}^d(\mathcal{O}_{X_n}, X^{\text{dfn}}) = \underline{H}_Y^d(\mathcal{O}_{X \text{ alg}}) \rightarrow \underline{H}_Y^d(\mathcal{O}_X). \quad (12)$$

It proves in this case the relationship announced above, and furthermore (something I had omitted earlier from the statement) that the first member of (12) D-Module is **coherent**, and indeed, holonomic and regular. From this point on,

the analogous statement for (11) must be an immediate consequence by unscrewing<sup>701</sup> (\*\*)' □ (including in the case where  $F$ , instead of being a constructible  $C$ -vector bundle, is a complex in  $\underline{Cons}^*(X, C)$ ). The only grain of salt, apart from the Deligne functor construction, is in the definition of the  $\underline{RHom}_{\mathcal{O}_X}$  of a complex of stratified promodules, with values in a complex of stratified Modules i.e. in a complex of D-Modules (in this case,  $\mathcal{O}_X$ ), as a complex of D-Modules (and as the object of a derived category).

Modulo this grain of salt, we thus find a simple and conceptual description of the "algebraic" good-god functor  $M$  (as opposed to the "transcendental" good-god functor  $M_\infty$ ), or rather of the associated contrafunctor  $\Delta$  and its quasi-inverse  $\delta$

$$\Delta = MD = DM, \quad \delta = mD = Dm, \quad (13)$$

by a double-formula that paraphrases (8). But to write it, using Deligne's equivalence

$$Del: \underline{Cons}^*(X, C) \xrightarrow{\sim} DRD^*(X) \quad (14)$$

we'll look instead at the corresponding functors  $\Delta^\wedge, \delta^\wedge$  between  $DRD^*(X)$  and  $DRM^*(X)$ , where the  $^\wedge$  signs are meant to remind us that we'll be working (on the "constructible" side) with **pro-objects**. We then find the remarkable formulas (morally contained in (8), but this time linking coefficients "of an algebraic nature"

<sup>700</sup>(\*\*) It will become clear below that Deligne's idea is also intimately linked to the one I introduced in 1966 (in [Crys- tals]): for any complex of differential operators, I consider its "formalized"  $P^\infty(L)$  as a complex of stratified pro-modules or, better still, as defining a **crystalline complex**, whose (global) crystalline cohomology is identified with the (global) cohomology of  $L$ .

<sup>701</sup>(\*\*\*) (May 22) I'm a bit lively here! The "elementary types" of  $C$ -constructible bundles are of a more general nature than just  $C_Y$ , (But it's true that the proof of the general theorem uses the same technique as the 1976 special case.)

both, and this by formulas "of an algebraic nature" as well):

$$\begin{aligned} \Delta^{\wedge}(C') &= \underline{RHom}_{\mathcal{O}_X}(C', \underline{Q}_X) \\ \delta^{\wedge}(C) &= \underline{RHom}_{\mathcal{O}_X}(C, \underline{Q}_X). \end{aligned} \quad (15)$$

So here we have twice the "same" formula, with the only difference that  $C'$  is here a complex of stratified pro-coherent beams (or what amounts to the same thing<sup>702</sup> (\*), a complex of pro-coherent Module crystals), whereas  $C$  is a complex of D-Modules (which can be seen, morally, as a complex of D-Modules).

of  $\underline{Q}_X$ -Layered Indo-Coherent Modules, or as a crystal of Indo-Coherent Modules). It's essentially the "same" functor that passes from one to the other, namely, the "ordinary dualistic functor" (coherent), my old friend from the fifties. ... It's "obvious", of course, that it must exchange pro-objects and ind-objects (even if it means going to the inductive limit in the latter. . . ).

□(Of course, there's some groundwork to be done, to give precise meaning to these formulas - a work of the p. 1010 of the kind made by Deligne in his famous scuttled seminar, or by Jouanolou in his equally famous scuttled thesis (which everyone has been quoting since the Colloque Pervers, and which no one has actually held in his hands... .). I'm sure this work will be a little long, but essentially "sorital". The "hard" part is contained in Mebkhout's theorem of the good God, completed by Mebkhout's formulas

(8) known (perhaps improperly) as "biduality" formulas. Their algebraic translation, on the other hand, asserting that the two functors (15) are quasi-inverses of each other, is indeed (morally) "the" theorem of ordinary biduality for  $\underline{Q}$ -coefficients $_X$ -cohesive, with ind-pro sauce and stratifications (which must "pass" without problems into the dualistic functor).

The correspondence between the two types of dual objects can be visualized perfectly (without any groundwork involved!) in terms of complexes of differential operators. (In this duality, by the way, the condition of holonomy (and a fortiori, that of regularity) plays no role). At such a complex  $L$ , the functor  $F \mapsto \underline{Hom}_{\mathcal{O}_X}(F, D_d)$  (contravariant) considered yesterday (in (a),(1)), associates a complex of D-Modules with locally free components of finite type, i.e.  $C$ . On the other hand, the "formalization" of this complex  $L$ , passing to the principal parts of infinite order  $P^{\infty}(L^i)$  (regarded as stratified promodules) provides a complex  $C' = P^{\infty}(L)$  of stratified pro-modules. Having said this, we can see that these two complexes correspond to each other by the formulas (15), in which here, obviously, the  $\underline{RHom}$  reduces to  $\underline{Hom}$ . (It's enough to check that

term-to-term duality for the components  $L^i$ , and it then reduces to the more or less tautological fact that the "continuous" linear homomorphisms  $P^{\infty}(L^i) \rightarrow \underline{Q}$  correspond exactly, just like the linear homomorphisms  $L^i \rightarrow D$ , to the differential operators  $L^i \rightarrow \underline{Q}_X$ , using respectively

the "universal" differential operator (of infinite order)  $L^i \rightarrow P^{\infty}(L^i)$ , and the "augmentation"  $D_X \text{ data} \rightarrow \underline{Q}$

by  $\theta \mapsto \theta(1)$ ). Since at least locally on  $X$ , any object of  $\underline{Cris}^*_{coh}(X)$ , (i.e. any complex of D-Modules with coherent cohomology) is described using a complex of differential operators  $L$ , we can consider that, for all practical purposes, this particular case gives a perfect grip on the duality (15) between the two types of coefficients, provided we make D-coherence and "D-pro-coherence" assumptions on  $C$  and on  $C'$ , "dual" to each other. It would then suffice to develop the "sorite" to which I have alludes, limiting itself, on the  $C'$  or "pro" side, to complexes of procoherent (stratified bundles that, p. 1011 can be described (with near-isomorphism) as a  $P^{\infty}(L)$ ).

Compared to Deligne's original approach, the fact that the pro-coherent and complex Modules of such that he introduces, can be realized locally by a complex of differential operators, is moreover an **entirely unexpected phenomenon**, brought about by Mebkhout's theory. It seems to me essentially equi-

<sup>702</sup>(\*) See b. de p. note (\*\*) on page 1006, about this translation.

are worth<sup>703</sup> (\*) to Mebkhout's theorem mentioned above (dating back to 1976, even before the Good God theorem was demonstrated), concerning the D-coherence of  $\underline{H}^d_Y(\underline{O})_{Xalg}$  (shown in (12) above). This is a profound theorem, the culmination of four years' work, using the full force of the resolution of Hironaka's singularities (not to mention the courage of the worker who found and proved it, against general indifference). The consequence<sup>703</sup> (\*) that I have just pointed out is a profound relationship between De Rham coefficients (as I saw them from 1966 onwards) and complexes of differential operators, a relationship that I had in no way foreseen (nor had Deligne, when he developed his first approach to De Rham coefficients). As for the condition of holonomy and regularity on the complex of differential operators under consideration, it must be equivalent (a posteriori, thanks to the providential theorem of the good Lord) to Deligne's condition of "finiteness" (plus "regularity") (which I failed to make explicit earlier, when introducing the *DRD* category\*  $(X) = Del^*(X)$ ). It's as follows: the cohomology pro-beams of  $P^\infty(L)$  can be "unscrewed" locally by composition sequences, in such a way that the successive factors can be "unbundled".

can be described (via the Deligne functor) by local systems of C-vectorials on  $Y - Z$  subspaces of  $X$  (where  $Z \subset Y \subset X$  are closed analytic subspaces of  $X$ ). To complete this criterion algebraic" aspect, it suffices to replace the local system of C-vectorials by a **coherent** bundle stratified on  $Y - Z$ , subject to the condition that the connection expressing the stratification (NB we can assume  $Y - Z$  smooth) is "regular" in the vicinity of  $Z$ , in the sense of Deligne<sup>704</sup> (\*\*). (NB. The associated pro-beam is obtained by growing the  $\square$  (crystal we have on  $Y - Z = F$  over the infinitesimal neighborhoods of  $F$ , and "crushing" along  $Z$ , to have coherent beams everywhere, not just in the complementary of  $Z$ . ... )

p. 1012

**(d) Crystals and co-crystals - fully faithful?** When  $X$  is no longer assumed to be smooth, what remains to describe "De Rham coefficients" on  $X$ , in addition to the transcendental "photo"  $\underline{Cons}^*(X, C)$ , are the two "photos" (both crystalline in nature)  $DRM^*(X)$  or  $Del^*(X)$ , which have a purely algebraic meaning. Yesterday (in (a)), I outlined a principle of definition for  $DRM^*(X)$ , and today for the *DRD* category\*  $(X)$ . It's the latter that I now find perfectly intelligible. As I pointed out yesterday (see (a), b. de p.(\*\*\*) page 998), the point of view of stratified pro-Modules needs to be refined by that of crystals in (pro-coherent) pro-Modules<sup>705</sup> (\*). The only remaining problem with this point of view is the "pro" sorite it will force us to develop, a sorite which (in my modest experience in such matters) is likely to take on prohibitive dimensions! These promodule crystals, which associate, to each infinitesimal thickening  $U'$  of an open  $U$  of  $X$ , a pro-coherent Module on  $U'$ , "in a way compatible with inverse images" for morphisms  $U'' \rightarrow U'$  of thickenings, cannot even be interpreted as pro-beams on the crystal site (or what amounts to the same thing, on the topos

<sup>703</sup>(\*) (May 26) Here again, I'm "a bit lively", the 1976 result is not enough. Compare with commentary on b. de p. note (\*\*\*) page 1008.

<sup>704</sup>(\*\*) This condition of regularity is introduced here in a natural way, given the equivalence of categories identified by Deligne, between local systems of C-vectorials on  $Y - Z$ , and  $\mathbb{C}$ -bundles with integrable connection on  $Y - Z$ , provided with a "meromorphic structure" along  $Z$ , and with regular connection along  $Z$ . This meromorphic structure (implying the possibility of extending the coherent Module on  $Y - Z$  into a coherent Module on  $Y$ , at least locally in the vicinity of each point of  $Z$ ) was implied in the description given earlier.

Unless I'm mistaken, when we drop the regularity condition into the previous condition (simply assuming a given meromorphic structure of  $E$  in the neighborhood of  $Z$ , so as to be able to associate a pro-coherent Module over  $X$  as a whole, by Deligne's procedure), we find a "cohomological" description of the holonomy condition. Sato's definition is "microlocal" - I've never really got to grips with it yet, I confess. ...

<sup>705</sup>(\*) (May 27) On reflection, I even find it hard to believe that Deligne's theorem  $\underline{Cons}^*(X, C) \cong \underline{Del}^*(X)$  is true for  $X$  not smooth,  $\underline{Del}^*(X)$  is a challenge, as Deligne does, without recourse to the crystalline site. It is perhaps even for this reason when that he finally preferred to scuttle the whole theory, rather than agree to reintroduce the taboo site. ... (Compare note ". . and hindrance", n° 171 (viii).)

crystalline  $X_{cris}$  )! So we cannot a priori apply to them the known cohomological formalism of bundles of Modules on (commutatively) annelated topos, such as  $X_{cris}$  .

The temptation here is to move to the projective limit of the profied beam on each thickening. We thus find crystalline Modules (if not crystals in Modules), whose "value" on each  $U'$  has not nothing coherent or quasi-coherent. The hope is that, at least for  $\square$  (the type of crystal pro-Modules we are interested in (in particular, those obtained by Deligne's functor) such a pro-module crystal can be **reconstituted** from the crystalline Module  $C$  deduced by boundary crossing, by taking on each thickening  $U'$  "the pro-coherent envelope" of the Zariskian bundle  $C_U$  , (restriction of  $C$  to the Zariskian openings of  $U$  )<sup>706</sup> (\*). This seems to me to be the case, at least for the associated pro-module crystals to a coherent Module stratified on a  $Y - Z$  as above, for example in the typical case where we take the formal completion of  $\underline{O}_X$  along  $Y - Z$  and extend it by zero elsewhere (and so on the thickenings). If my "hope" is justified, then the  $DRD$  category\* ( $X$ ) of De Rham - Deligne coefficients on  $X$  could be interpreted as a full subcategory of the ordinary derived category  $D^*(X_{cris}, \underline{O})$ , defined by conditions of the "finiteness" and "regularity" type (themselves described in terms of unscrewing, as above) on cohomology bundles. This would be a disconcertingly simple description, which I could just as easily have given as early as 1966, had I then had the leisure to continue my crystalline reflection... ..

p. 1013

This "foundation" question (whether it's permissible to go to the limit) obviously doesn't depend on whether  $X$  is smooth or not - if it isn't, we plunge it into a smooth  $X'$  and reduce ourselves to the smooth case. If this point of view (almost too good to be true!) did indeed work, then (in the smooth case now) there would be reason (I think) to interpret the "biduality" formulas (algebraic version) (15) as follows being **ordinary**  $RHom_{\underline{O}_X}$  , without bothering with pro-questions (but simply taking care to transport stratifications. . . ). A first test along these lines would be as follows: if  $u : C_1 \dashrightarrow C_2$  is a morphism of D-Module complexes with coherent cohomology, such that its image by the naive dualizing functor  $RHom_{\underline{O}_X}(-, \underline{O}_X)$  is a quasi-isomorphism, is the same true for  $u$ ? But this amounts (by a mapping-cylinder argument) to asking whether a complex of D-Modules with coherent cohomology, such that its "naive dual" is zero (in the sense of derivative cat., i.e. with zero cohomology bundles), is itself zero (in the same sense). Or, if we have the complex of differential operators  $L$  , is it the same to say that the associated complex of D-Modules has zero cohomology bundles, or is it the same for the "formalized" complex  $P^\infty(L)$  , seen this time not as a complex of pro-bundles, but as a complex of ordinary bundles (passing to  $\lim_{\leftarrow}$  ). Mebkhout will surely be able to tell me... .

$\square$ ((May 23) I phoned Mebkhout again last night - in fact, it's been a week or two since I've I phone him almost every night, for mathematical or historical questions - and all in all, that's going to add up to an astronomical phone bill! But the Apotheosis, which I've been working on and polishing for the last three weeks, is well worth it...

p. 1014

In any case, Zoghman has guaranteed me a result that seems to be close to the "test question" on which the I finished last night: if  $C$  in  $\underline{Cris}^*_{coh}$  is such that the associated  $L$  operator complex  $= DR(C)$  is quasi-zero, then  $C$  is itself quasi-zero (analytic case). We have a homomorphism of bundle complexes (of  $C$ -vectors), given by the "principal parts of infinite order".

$$L \dashrightarrow P^\infty(L),$$

<sup>706</sup>(\*) In speaking here of a "Zariskian" beam (as opposed to a "crystalline" one), I've surreptitiously slipped back into the schematic context. Readers who prefer the analytical context will have rectified this on their own.

hence homomorphisms

$$\underline{H}^i(L) \rightarrow \underline{H}^i(P^\infty(L)) \quad (i \in \mathbb{Z}) \quad (16)$$

on cohomology bundles. We're tempted to say that this homomorphism (16) is always injective, and identifies the first member with the sub-bundle of "horizontal" sections of the second (which would be a kind of exactness property of the functor "bundle of horizontal sections" on a suitable category of stratified pro-Modules... ). Injectivity would already imply that if the second member is zero, so is the first, so if this is true for all  $i$  (and according to what Mebkhout assures me) the D-Module complex associated with  $L$  is quasi-zero - which is what I wanted.

Injectivity in (16) also means that for a differential operator  $E \xrightarrow{d} F$ , and a section  $f$  of  $F$  which at each point  $x \in X$  is "formally" in the image (by passing to the completed local ring of the point), and such that moreover, that the "formal solution" (of the equation  $d(g) = f$  in  $g$ ) can be taken, for  $x$  variable, analytically dependent on  $x$  - the equation then locally admits a solution. Mebkhout tells me that he knows of no such result; yet the question is so natural that the answer should well be known!

To conclude with the "five photos", I'd like to return to the two "crystalline photos", one corresponding to Mebkhout's view of the D-Modules, the other to the dual view. It goes without saying that we have to work in the spirit of the derived categories - i.e., a "crystalline" interpretation worthy of the name.

of this name must take this into account. So the two crystalline photos are "fully faithful" only if the corresponding functor,  $\square$  (going from category  $D_{coh}^b(X, D)$  (say), to a crystalline idon category, such that  $D^b(X_{cris} \rightarrow \underline{O}_{X_{cris}})$ , is itself fully faithful. I am hopeful that this is indeed the case, **without even bothering with holonomy and regularity conditions** on the D-Module complexes under consideration.

The simplest case is undoubtedly that of photo n° 4, which consists in interpreting the category of D-Modules as that of Module crystals, hence a total derived functor (known as "Grothendieck's" - to take the lead over fans of "useless details" and "technical digressions" . . . ) :

$$J : D_{coh}^*(X, D) \rightarrow D^*(X_{cris}, \underline{O}_{X_{cris}}) \quad (17)$$

The crucial question here is whether this functor is fully faithful. Only then is the notation  $\underline{Cris}_{coh}^*(X)$  for the first member is fully justified - and with it, also, the crystalline point of view in De Rham cohomology (at least, in this case, in the complex analytic framework, or the framework of algebraic schemes over a zero-square body). To prove full fidelity, in algebraic geometry let's say, we are reduced by standard arguments to the case where  $X$  is affine (or, in the analytic case, to the case of a polydisc), and to the case where the two objects  $C, C'$  considered in the first member (whose  $Hom$  are to be compared in either direction) are both equal to  $D$  itself, with simply a shift of degrees. (This reduction is straightforward, at least if we assume that  $C, C'$  have bounded degrees, i.e. that we are bounded at  $D_{coh}^b(X, D)$ , which seems to be quite sufficient for applications,) We are therefore led to check finally the formulas

$$\Gamma(X, D_X) \xrightarrow{\sim} Hom(J(D), J(D)), Ext_{\underline{O}_{X_{cris}}}^i(X_{cris}; J(D), J(D)) = 0 \text{ for } i > 0. \quad (18)$$

(for affine  $X$ , resp. Stein). I haven't taken the time to check it<sup>707</sup> (\*), but have little doubt that it's true. I demonstrated something very similar, it seems to me, in [Crystals] (in 1966)<sup>708</sup> (\*\*).

<sup>707</sup>(\*) I apologize, as most of my time over the last year or so has been taken up with tracking the prowess of some of my former pupils... .

<sup>708</sup>(\*\*) This is the result I've already alluded to elsewhere, that for a complex of differential operators  $L$  on a scheme

□(As for photo five, there are several different prints of it. Deligne's original print is in terms of stratified pro-coherent modules. The first important change, with a view to generalization to the non-smooth case  $X$ , is to interpret the animals in question as pro-module **crystals**. But this leads us into the (rather unpleasant!) spiral of endless pro-foundations of pro-cohomological algebra - and we lose the benefit of the direct topological intuition attached to  $X_{cris}$ . So I prefer (if at all possible) to take another photo, from more or less the same angle, using a **contravariant** functor (also known as a "Grothendieck functor", mind you... ).

$$J^o: D_{coh}^*(X, D)^{opp} \rightarrow D^*(X_{cris}, \underline{O}_{X_{cris}}). \quad (19)$$

This can be said to be the one deduced from Deligne's photo by passing abruptly to projective limit bundles on each infinitesimal thickening of an open  $U$  of  $X$ . If  $C$  in the first member is associated (countervariantly, as in formula (1) of (a)) with a complex of differential operators  $L$ , its image by (19) is obtained by looking at  $P^\infty(L)$  (the "formalization" of the complex  $L$ ) as a complex of stratified promodules (an idea introduced in [Crystal]), or as a complex of pro-module crystals, and passing to the projective limit on any thickening. Another way of saying this is that any locally free  $\underline{O}_X$ -Module (for example)  $L$  on  $X$ , is associated with a crystalline module (which is not **not** a crystal of modules, unless I'm mistaken), which I note  $P^\infty(L)_{cris}$ , in an "obvious" way (and which my students have long since forgotten), which module depends functorially on  $L$  with respect to differential operators, and thus passes to complexes of differential operators.

Either of the previous descriptions of the functor (19) remains incomplete, not least because an object of the first member does not necessarily originate, on all  $X$ , from a complex of differential operators. I assume that an intrinsic interpretation of this heuristic description can be given by the formula

$$J^o(C) \rightarrow \widetilde{RHom}_{\underline{O}_{X_{cris}}}(J(C), \underline{O}_{X_{cris}}) \quad (\text{where } J \text{ is defined in (17)}) \quad (20)$$

but haven't checked that it's correct. By the standard arguments, we still come back here (to prove that the natural arrow (20), when  $C$  is associated as above with  $L$ , is indeed an iso) to the case where  $C = D$ , and then (20) reduces to the formulas □ (

$$\underline{Ext}_{\underline{O}_{X_{cris}}}^i(J(D), \underline{O}_{X_{cris}}) = 0 \text{ for } i > 0, \quad (21)$$

which are quite similar to (18).

The meaning of the full fidelity of (19) is in any case quite clear, and once again reduces, by unscrewing (and as for (17)) to the case where  $C = D$ ,  $C' = D[i]$  (shift of degrees by  $i$ ), and then reduces to the formulas

$$\Gamma(X, D) \simeq Hom(P, P), \quad \underline{Ext}_{\underline{O}_{X_{cris}}}^i(X_{cris}; P, P) = 0 \text{ for } i > 0, \quad (18.1)$$

where

$$P = P^\infty(\underline{O})_{X_{cris}},$$

---

relatively smooth (or in the analytic framework, surely), the "Zariskian" hypercohomology of  $L$  is identified with the crystalline hypercohomology of its formalized  $P^\infty(L)$ . In fact, this statement relates more directly to the "dual" arrow (19) of (17), and can also be expressed by saying that for  $C, C'$  cohomology-coherent complexes of  $D$ -Modules, the arrow

$$Hom(C, C') \rightarrow Hom(G^o(C), G^o(C'))$$

is bijective, in the case where  $C = \underline{O}_X$  (which is not bad at all, and allows every hope... ).

which is a remarkable Crystalline Algebra on  $X$ . We assume here (for the nullity of  $Ext^i$  crystalline) that  $X$  is affine (resp. Stein).

Finally, what seemed to me only yesterday "almost too good to be true", when I was still seeing things through Deligne's photo, is suddenly looking quite reasonable - once things are written without being encumbered by conditions of holonomy (and even less, regularity). God willing, and if no one else does the job for me before then, I hope to get to the bottom of this (and the validity of (21) and (18)) before the end of the year, with the part of Volume 3 of Reflections devoted to De Rham's coefficients.

As I said, I prefer photo five, the one that "sticks" most closely to the topological intuition associated with discrete coefficients. It's with a heavy heart that I'd learn that formulas (22) are false (whereas I'd be less annoyed if this were true of formulas (18), which, however, look technically less screwed up). This would show that we'd have to go back to the pro-point of view (of Deligne's retouched photo) - not such a cheerful perspective! In any case, there's no doubt in my mind that, apart from a few technical adjustments, this is an excellent photo, particularly valid in algebraic geometry (and even on something other than bodies of zero characteristic), and without any assumption of smoothness.

As for photo four, whose fidelity depends on the validity of (18), I confess once again that I still "don't see it right" outside the smooth case (and even in the smooth case), and I'm not sure that for  $X$  not smooth, the crystalline interpretation I've proposed really works as it is. However, it seems to me that that my endemic perplexities of variance, concerning Mebkhout's view of D-Modules (and more importantly, my crystalline interpretation of this view), are about to be resolved, by the introduction of from a dual notion to that of crystal, which I call **co-crystal**. It was only yesterday that this diffuse feeling of unease that I had (for the "variance" of D-Modules by closed immersions) finally gave birth to a "good notion" (as far as I can tell, without having really written anything yet). It seems to fit on the "ind" side, as well as the notion of crystal (which is familiar to me) on the "pro" side. On a smooth variety, the two categories (crystals and co-crystals) are canonically equivalent (and that's why I inevitably tended to confuse them - it's excusable...), but the same is no longer true for any  $X$ . The situation is quite analogous to what happens with the cohomology ring  $H^*(X)$  and the cohomology group  $H_*(X)$ , or the Chow  $Ch$  ring  $Ch^*(X)$  and the Chow  $Ch$  group  $Ch_*(X)$ , or the Grothendieck ring  $K^*(X)$  and the Grothendieck group  $K_*(X)$  (re-excuses). Here too, for a long time, the two types of objects were confused when  $X$  is a smooth variety (topological, or algebraic etc. - depending on the case). This is "explained" after the fact, by the fact that the second term is in any case provided with a modulus structure on the first (the "cap"-product - in the last two cases this was introduced by an ancestor I dare not name here. ...), and that in the smooth case, we find that this Module is free of rank 1 and provided with a canonical basis, which has led to its unfortunate confusion with the ring (much more beautiful, of course). Well, it's the same for the categories  $\underline{Cris}^*(X)$  of the crystals of Modules on  $X$ , provided with a structure

"by the tensor product, and the  $\underline{Cris}_*(X)$  of module co-crystals, on which the former "operates" by a cap-product, perfectly!

But it's time to stop this long mathematical digression, entirely out of place (I admit) in the ordering of a fine Funeral Ceremony. Readers interested in the rest (which, it goes without saying, is quite lengthy) will be reduced to buying volume 3 of Réflexions (if they don't pity their pennies), where an unrepentant defunct intends to continue his confusing "technical digressions"<sup>709</sup> (\*).

<sup>709</sup>(\*) This time, needless to say, as the "collaborator" of another of my students, who has long since been promoted to "father" of the

**(e) L'ubiquité du bon Dieu** (May 27) A "final" footnote, added to the "Five photos" at the last minute yesterday (before I typed the first twelve notes of the Apotheosis), has taken on yet "more". prohibitive dimensions", and I will  $\square$  (finally continue "this long mathematical digression" with a last (and short) section. Thus, "The Five Photos" will consist of the **five** sections (a) to (e) - just as everything gets rounded off and perfected. ...

p. 1019

This is a commentary on the true (presumed) domain of validity of Mebkhout's "theorem of the good God", which goes far beyond (in my opinion) the initial framework of complex analytic spaces - not only in terms of the new **philosophy** it brings (and which has already renewed the cohomological theme), but also in a technical sense.

Once we interpret constructible C-vector bundles on (smooth)  $X$ , either in terms of stratified procoherent Modules (à la Deligne), or (by passing to the projective limit on infinitesimal thickenings of openings of  $X$ ) in terms of crystalline bundles (à la Grothendieck), the "theorem of the good God" alias Mebkhout affirms the equivalence of two categories, **both of** which are "purely algebraic" in nature. In other words, this theorem now takes on a precise meaning, in contexts other than the complex analytic context: both the context of smooth schemes over a body (which need not even be assumed to have zero characteristic - see on this subject the note by b. de p.(\*\*) page 996 above; because  $p > 0$ , the "crystalline with divided powers" point of view is essential here), or rigid-analytic varieties of any characteristic, or smooth schemes of finite type over  $\mathbb{Z}$  (and so on. . . ).

The "formal" part of the Good God Theorem concerns **all** coherent D-Module complexes, not just holonomous ones, and states that the Good God functor, revised by the ancestor (i.e. the duality with respect to the structural beam  $\mathcal{O}_X$  essentially) is **fully faithful** to the category  $D_{coh}(X, \mathcal{O}_X) = \underline{Cris}^*_{coh}(X)$ , to the desired coefficient category  $\underline{Coeff}^*$  selected by the

taste). When you get it right, it should be more or less "sorital".

But in the arrival category, we define, "by unscrewing", two remarkable full subcategories, that of "holonomic.coefficients" resp. that of "regular holonomic coefficients" (as at the end of (c)) and in the note of b. de p.(\*\*) page 1011). That said, the "generalized Mebkhout theorem" (in the context envisaged), which will certainly have nothing sorital about it but is surely profound, will say two things:

1.  $\square$  (The  $\underline{Coeff}^*_{HOL}$  of holonomic "coefficients" is in the  $\underline{Cris}$  category image\*  $\underline{Cris}^*_{coh}(X)$  by the (fully faithful) "Mebkhout-Grothendieck" functor. (NB. Morally, this functor is the of Mebkhout, but watched on  $\underline{Cris}^*_{coh}(X)$  in its entirety, and "revised and corrected by the ancestor", so that the goal is in  $\underline{Coeff}^*$  which has a purely algebraic meaning. ... ).
2. Characterize the inverse image of  $\underline{Coeff}^*_{HOL}$  and  $\underline{Coeff}^*_{HOL reg}$  by conditions of "holonomy" and "regularity" "microlocal", in terms of complexes of differential operators.

For this last point (which for my sixties program is perhaps relatively incidental), we have a ready-made holonomy condition in characteristic null. As for the regularity condition, it's time to see if the Japanese haven't got just the right notion up their sleeves - but Mebkhout won't tell me, as he's seen too much to want to hear about it.

As for me, who hasn't seen any like him, it seems to me that there are **three** different **aspects** of regularity, which complement each other:

1. Geometric" aspect revealed by Deligne by unscrewing in  $\underline{Coeff}^*_{HOL}$  back to the condition of regularity for a "local system" (e.g. fiber with integrable connection) in the vicinity of a divisor

---

crystals...

singular.

2. Microlocal" or "Japanese" aspect, expressed directly in terms of differential operator complexes (?)
3. The "cohomological" aspect introduced by Mebkhout, an aspect that for the moment is only well understood (it seems to me) in the complex analytic case. I have no idea whether it has any chance of generalizing to the rigid-analytic case.

Aspect 3°) will of course be crucial whenever we need to establish a **comparison theorem** between "Zariskian" cohomology and "rigid" cohomology, for an algebraic variety defined over a complete value field, and holonomic coefficients.

For my great "variance program" of the sixties, it's of course the "geometric" aspect that's the most important of all. What's important is to define a formalism of the six operations for

$\underline{Coeff}_{hol\ rég}$ . If we can even find one for  $\underline{Coeff}_{hol}$ , as Mebkhout seems to believe, so much the better. But (if I'm not mistaken) the reasons (to which I have some before any □ (other thing) will only give rise to coefficients that are both holonomic and regular.

p. 1021

I return to question 1, which admits as an obvious variant a (more modest) "question 1'", with  $\underline{Coeff}_{hol}$  replaced by  $\underline{Coeff}_{hol\ rég}$ . Once we've proved the full fidelity of the Mebkhout-Grothendieck functor, we're obviously reduced to the following: we give ourselves, on a smooth subvariety (not necessarily closed)  $Y$  of  $X$ , a fiber with integrable connection (or a coherent  $F$ -crystal  $C$ -, depending on the chosen context. . .), with, if necessary, an additional Deligne regularity condition for the latter (at the points of  $Y - Y$ ). The Deligne procedure (possibly revised by the ancestor to move to the crystalline context) allows us to

associate it with a  $\underline{Coeff}$  object\* (which by definition will even be "holonomic", or even "regular holonomic"). Is this object in the image of the Mebkhout-Grothendieck functor? Or, which amounts to the same thing, can the  $\underline{Coeff}$  object in question\* be described locally on  $X$  by a complex of differential operators on  $X$ , using the ancestor's patented process of "formalizing" the complex, interpreted either as a Deligne complex or as a crystalline complex?

The answer to this question is in any case affirmative (unless I'm mistaken) in the complex analytic case, as well as in the case of smooth relative schemes over a body of zero characteristic, without even having to introduce the regularity condition. This is the "entirely unexpected phenomenon brought about by Mebkhout's theory" that I was careful to point out earlier (in (c), page 1011)<sup>710</sup> (\*). In the regular case (including "at infinity"), it's essentially the good Lord's theorem. In the general case, if I'm not mistaken, this must result without tears from what I've called the "cohomological criterion of holonomy" (or "reciprocal: to Kashiwara's constructibility theorem"), due to Mebkhout, referred to in the following note "Three milestones - or innocence" (n° 171 (x), see page 1028).

## b2. Three milestones - or innocence

p. 1022 **Note** 171(x) □ (May 5 and May <sup>711</sup>(\*) Mebkhout's philosophy, developed between 1972 and 1980, can be summarized as follows  
23)

<sup>710</sup>(\*) Nowadays, at least in the field of mathematics we're talking about here, pointing out such facts has become a veritable **work of public health**, at a time when almost all publications on the subject of cohomology, and all (I'm afraid) of those appearing under prestigious names today, are written in such a way **as to obscure** the key ideas that give life to all these texts, and to **blur** or **eradicate** the role and origin of a crucial tool (old or new), a neuralgic notion or a fertile idea. There's an intellectual **corruption** (a sign of a deeper corruption. . .) that's spreading across our science today, in plain sight, that I've never seen in any other science at any other time in history.

can be summed up in **three major theorems**, all three intimately linked to ideas I had developed in the fifties and sixties, but which I (or no-one else) had been unable to foresee<sup>712</sup> (\*\*).

The first major theorem is the main fruit of Mebkhout's work between 1972 and 1976. It concerns **local cohomology** bundles  $\underline{H}^i(\underline{O}_X)$  (a notion introduced independently by Sato and myself) of the structural bundle of a smooth complex analytic variety  $X$ , with supports in a closed analytic subspace  $Y$ .

The essential observation here, which no one had thought to make before Mebkhout, is that the  $D$ -ring operations<sup>713</sup> of infinite-order differential operators on  $X$  (\*\*), due to the fact that they  $\square$  (operate on the argument p. 1023  $\underline{O}_X$ ), also operate on these cohomology bundles. On the other hand, in the "Zariskian" framework of algebraic geometry, I had described these bundles (towards the end of the fifties?) as inductive limits of  $\underline{Ext}$  bundles<sup>i</sup>. This led Mebkhout, by analogy, to introduce an "algebraic part" of cohomology and a canonical arrow

$$\frac{\underline{H}^i(\underline{O})}{Y \quad X \text{ a.l.g.}} \stackrel{\text{dfn}}{=} \varinjlim_n \frac{\underline{Ext}^i(\underline{O}_{O_X} \quad \underline{O}_{X_n})}{X} \rightarrow \frac{\underline{H}^i(\underline{O})}{Y \quad X} \stackrel{\text{dfn}}{=} \frac{\underline{Ext}^i(C, \underline{O})}{C \quad Y_X \quad X}, \quad (1)$$

where  $X_n$  denotes the  $n$ th infinitesimal neighborhood of  $Y$  in  $X$ , and  $C_X, C_Y$  the constant bundle  $C$  on  $X$  resp.  $Y$  (the latter extended by zero on  $X - Y$ ). The second essential observation is that this time the ring  $D$  of ordinary differential operators on  $X$  operates on the first member. It was well known that the kind of The bundles we obtained, both the right-hand member of a transcendental nature, and the left-hand member of an "algebraic" nature, were of rather prohibitive dimensions, as  $\underline{O}_X$ -Modules - nothing coherent, that's for sure. It's also true that we had the feeling (at least on the algebraic side) that there was still a certain type of "finitude" or "cofinitude", in a sense that no one before Mebkhout had thought to specify. Mebkhout's remarkable theorem is that the first member is a  $D$ -Module, and that furthermore, the second member (which looked even more intractable) is simply deduced from the first by the change of Rings

$$D \rightarrow D^\infty$$

Since the second Ring is known to be flat on the first, this implies that (1) is injective. At the same time, given the coherence result/ this can be seen as a finiteness theorem

<sup>711</sup>(\*) This sub-note "The three milestones" is taken from a footnote to the note "The work... ." (n° 171 (ii)). See the cross-reference at the end of this note.

<sup>712</sup>(\*\*) As I pointed out in the note "Les questions saugrenues" (n° 171(vi)), I had long been aware of a variant of Mebkhout's global duality theorem, for a clean and smooth relative scheme  $X/S$ , in terms of complexes of relative differential operators. Specifically, if  $L$  and  $L'$  are such complexes, "adjoint" to each other, then  $Rf_*(L)$

and  $Rf_*(L')$ , as objects of the derived category  $D(S, \underline{O})$ , are "perfect" complexes (locally representable by complexes of free Modules of type fini with bounded degrees), and dual to each other in the usual sense for perfect complexes. In the case where  $S = \text{Spec}(C)$ , this theorem is more or less equivalent to Mebkhout's (restricted to the case of an analytic variety that is algebraic and proper), with the important difference that I lacked a point of view.

"derived categories", to deal with complexes of differential operators. On the other hand, and above all, I had no suspicion that these complexes (subject to the suitable conditions outlined by Mebkhout) formed a perfect substitute for "discrete coefficients" (or De Rham coefficients). On the other hand, it was clear to me, at least as early as 1966, that there had to be such a thing as "discrete coefficients".

substitute for algebraically constructible  $C$ -vector coefficients, making sense for relative characteristic schemes and my crystalline ideas were precisely a first approach in this direction. As we shall see in [Crystals] (these are the talks cited in the previous note "The five pictures (crystals and  $D$ -Modules", n° 171(ix)), the internal logic of my crystalline reflections had, however, brought me back into contact with complexes of differential operators. I was then very close to Mebkhout's philosophy. My cohomology students (especially Deligne, Berthelot and Illusie) must have been blocked by burial syndrome, not to have cleared up this philosophy in the years that followed. (I myself was then fully occupied with other fundamental tasks, and had left the crystalline theme to the care of my students).

<sup>713</sup>(\*\*\*) For a definition of these operators, whose name is frightening at first glance, but which give rise to a formalism in every respect parallel to that of ordinary differential operators, see part (b) of the previous note "The five photos (crystals and  $D$ -Modules)" (n° 171 (ix)).

very strong regarding the second member (which nobody before Mebkhout understood anything about) - this one is notably of finished presentation as a  $D^\infty$ -Module (but perhaps not coherent, since we don't know if  $D^\infty$  is itself coherent).

Mebkhout's first case, that of a divider with normal crossings, was the subject of his post-graduate thesis in 1974. Already this case is not trivial, and of course entirely new - the very question Mebkhout solved had never been seen before. This, moreover, turns out to be the crucial case, to which Mebkhout manages (by successive approximations of increasing generality) to reduce himself to<sup>714</sup> (\*), with strokes resolution of singularities.

p. 1024

□(The result I have just stated, on its own, appears to me to be of such significance that, under certain conditions

If they had been even slightly normal, they would have earned their author an international reputation. Also, the first crucial case he dealt with already showed an originality of vision which, "normally", would have earned him the warm praise of those among his elders (such as each of my ex-students, without exception) who were in a position to appreciate its flavor. Moving on...

In fact, in these four years, Mebkhout arrived at an even more detailed result than the one I've just described. He proves that the D-Module he studies is not only coherent, but also **holonomic** (a notion he found in the Japanese school), and moreover **regular**<sup>715</sup> (\*) (in a sense he defines ad hoc, drawing on my comparison theorem for algebraic-analytic De Rham cohomology). Better still, he proves that the constructible initial C-vector bundle  $C_Y$  (which enters into the definition of the second member of (1)) can be **reconstituted** from the  $D$ -complex <sup>$\infty$</sup>  -Modules  $RHom_D(C_Y, \underline{O}) = C$ , by the extraordinary inversion formula:

$$C_Y = RHom_D(C, \underline{O}_X). \quad (2)$$

No one had ever dreamed of such a formula - and no one would dream of it until D-Day, five years later, when the power of the philosophy was revealed and, at the same time, the signal was given for the burial, alongside the ancestor, of the one who had brought it. ... To dream of it, you'd have to have buried the ancestor's philosophy (with derived categories,  $RHom$  with or without underlining and other "useless details" . . .); and, what's more, to be able to appreciate a geometrical situation that's so trivial yet so full of mystery (local cohomology with supports in a divisor with normal crossings), and to get to the **bottom** of the mystery. This "end" is not yet to be found in the splendid 1976 theorem I've just described - but from that moment on, Mebkhout had a clear vision of it: it's the double "God's theorem", one for regular holonomous D-Modules, the other for holonomous  $D^\infty$ -Modules, and the double inversion (or "biduality") formula mentioned earlier<sup>716</sup> (\*\*). This is also the wonderfully simple solution to the problem of the relationship between discrete (analytically constructible) coefficients and "continuous" coefficients.

p. 1025

□(But I anticipate. When he proved the theorem that constitutes the first great milestone of his work and of his philosophy, the "end", clearly perceived, still seems vertiginously far away. If he'd found a competent, kind-hearted elder with a modicum of experience and mathematical flair, he'd have been disabused of the notion: clearly, he was already very close, and the difficulty to be overcome, as so often in the work of discovery (not to say, always. . .), was more psychological than technical. But before

<sup>714</sup>(\*) For Mebkhout's theorem on local cohomology, see in particular: La cohomologie locale d'une hypersurface, in Fonctions de plusieurs variables complexes III, Lecture Notes in Mathematics n° 670, pp. 89-119, Springer-Verlag (1977), and Local Cohomology of analytic spaces, Publ. R.I.M.S. Kyoto Univers. 12, p. 247-256 (1977).

<sup>715</sup>(\*) Mebkhout's original (transcendental) definition of regularity is recalled in the note "L'oeuvre. . . ." (n° 171 (ii)), b. de p.(\*) page 950.

<sup>716</sup>(\*\*) In previous note "The five photos (crystals and D-Modules)" (n° 171 (ix)), part (b).

In his pursuit of the infinitely distant, he tackled the global duality theorem - the one that was to "cap" the known duality theorem for both coherent and discrete coefficients. The deep motivation, omnipresent in Mebkhout's work, which links the two problems, that of local cohomology and that of global duality, is the presentiment of **an essential unity** between discrete coefficients and continuous coefficients. This was also the thread running through my 1966 crystalline approach, which endeavored to apprehend "De Rham coefficients" (essentially discrete in nature) in "continuous" terms. ...

This is not the place to go back over Mebkhout's duality theorem<sup>717</sup> (\*). His proof ran up against serious technical difficulties, due to the transcendental context, which he overcame using cohomological descent and nuclear EVT techniques (techniques to which I was no stranger either, even if Mebkhout is the only one who still insists on quoting the ancestor... .). From the point of view of his philosophy of duality, this theorem is an essential milestone. If we bear in mind, along with Mebkhout, that applied to holonomous D-Module complexes, it contains global duality for analytically constructible discrete coefficients<sup>718</sup> (\*\*), in addition to coherent duality, we can say that it too already contains the seeds of the whole Mebkhout philosophy of D-Modules. When he first told me about it in 1980 (the year after he defended his thesis<sup>719</sup> (\*\*\*)), its significance became clear to me.

obvious. I don't think I've had the honor of inspiring a work of comparable scope, to any student work<sup>720</sup> (\*).  
p. 1026

Mebkhout had great difficulty getting this theorem published, as it smacked of "grothendieckeries". (The Annals of Mathematics sent it back to him, telling him that this kind of thing wasn't up to scratch. It ended up appearing anyway, in *Mathematica Scandinavica*, in 1982<sup>721</sup> (\*\*).) I think that was his favorite theme, when he was giving lectures on D-Modules philosophy, but in a very different spirit from the Japanese. He told me that this theorem had a way of astonishing listeners, or the occasional interlocutor, with the exception of those who were part of the establishment<sup>722</sup> (\*\*\*). That's a comforting thought. It

<sup>717</sup>(\*) This statement is reiterated in the note "L'oeuvre. . ." (n° 171 (ii)).

<sup>718</sup>(\*\*) At the time Mebkhout established his global duality theorem (1976), he had not yet proved that every analytically constructible C-vector bundle comes from a complex of D-Modules. But he had no doubts about it.

<sup>719</sup>(\*\*\*) See the note "Rencontres d'outre-tombe" (n° 78).

<sup>720</sup>(\*) I'm thinking here mainly of students who have prepared a thesis with me. Deligne is a special case, since he's doing his thesis with me. The inspiration for his work (on Hodge-Deligne cohomology) came from my problematic of "coefficients" of all kinds, which also included a formalism of "Hodge coefficients". Deligne's work is a first step in this direction, much more fragmentary than Mebkhout's, in the direction (intimately linked to Hodge's) of "De Rham coefficients". It's true that Mebkhout, who was severely handicapped by the indifference and disdain of his elders, was not afflicted by the burial syndrome that paralyzed my students. (On this subject, see the note ". . . and hindrance", n° 171 (viii).)

<sup>721</sup>(\*\*) Global duality theorems for coherent D-Modules, *Mathematica Scandinavica* 50 (1982) pp. 25-53. See also "Dualité de Poincaré" in *Séminaire sur les Singularités de Paris VII* (Pub. n° 7), 1977-1979, and especially "The Poincaré-Serre-Verdier duality" in *Proceedings of the Conf. of Algebraic Geometry, Copenhagen* (1978), *Lecture Notes in Mathematics* n° 732, pp. 398-418, Springer Verlag (1979). The introduction to each of these papers, especially the second, represent a sketch of the philosophy brought by Mebkhout, at a time when he was the only one to be its depositary and advocate.

<sup>722</sup>(\*\*\*) (May 24) This ties in well with my own observations. It would seem that the position of a man in the public eye predisposes one to such sufficiency, for whom "nothing is beautiful enough for her to deign to rejoice". I don't know if these dispositions are the rule throughout the scientific world, these days, or even since time immemorial. I was very lucky to be welcomed into an environment where such a spirit of sufficiency did not exist - yet.

It must have crept up on us over the years, settling down in all of us, little by little, without any of us (except Chevalley. . .) noticing. Everything seemed the same as before - and yet it was already different. It was already like a fine layer of dust inside us, covering the original freshness of things. I was touched by this dust, as were others. And today, when I find myself once again confronted with one of those who were once my pupils, I'm touched by it,

shows that this spirit of smugness, which tarnishes the beauty of anything, no matter how beautiful, has not become general in the mathematical community. It prevails mainly (if not exclusively) in the upper echelons, where I've had ample opportunity to become acquainted with it over the last ten years or so... ..

p. 1027

□(This global duality theorem needs to be supplemented by the result already mentioned of a local nature, also deep, saying that the natural dualizing functor for complexes of D-Modules, with coherent cohomology bundles, which transforms holonomous complexes into holonomous complexes (and the same for regular holonomous complexes), is moreover compatible on these with the De Rham functor  $DR$  ("associated complex of differential operators", viewed as a complex of C-vector bundles with constructible cohomology), for the natural dualistic functor I had introduced on these<sup>723</sup> (\*). This compatibility is obviously an essential ingredient of Mebkhout's duality formalism, for an understanding of the meaning of his global duality theorem. For some reason, he calls it the "local duality theorem"<sup>724</sup> (\*\*). This profound theorem, just like the famous "correspondence" (known as the "Riemann-Hilbert correspondence", when one deigns to name it), is treated by "everyone" (Verdier and Deligne in the lead) as something "well known" which would go without saying, and above all without ever naming a certain unknown (which "everyone" knows is not to be named). ... .

p. 1028

□(At last, I come to the third major milestone in Mebkhout's work. Technically speaking that it consists of three (or at least two) distinct theorems, but so intimately linked that in Mebkhout's mind, they appear indissociable. As early as January 1978, he proved the " $D^\infty$ -Modules" aspect: the fact that the restriction  $m_\infty$  (where "Mebkhout functor") of the "associated De Rham complex" functor to holonomic  $D^\infty$ -Modules complexes is a category equivalence (with complexes of C-vector bundles with constructible cohomology). Knowing already that this functor commutes to dualistic functors, it's natural to reformulate this theorem by passing to the associated contravariant functor  $\delta_\infty$ , given by

$$C \dashrightarrow \underline{RHom}_D(C, \underline{O})_X \quad (3)$$

---

or friends, I often have the impression that this dust has accumulated in thick, dense layers, and that it has formed a kind of impenetrable, watertight armor that calls out to me through them. ...

<sup>723</sup>(\*) This is the duality that, by the general consensus of my students and former friends, has come to be known as the "Verdier duality" (both in the complex analytic case, and in the spread case). . . (See, for example, the note "La bonne référence", n° 82.)

<sup>724</sup>(\*\*) It is under this name that the result appears in Chapter III of Mebkhout's thesis. Mebkhout told me that he had been inspired, for this name (as for the "biduality theorem") from the terminology I had introduced - yet, for me, the "local duality theorem" was just another name for the "biduality theorem" I had identified, of which it represents an important aspect, the "geometrical" aspect.

This compatibility result (Mebkhout explains) was an important step in his demonstration of what he calls, in this same chapter, the "biduality theorem". (For the latter, see the previous note "The five photos", part (b)).

Demonstration aside, and from a "philosophy" or "yoga" point of view, it was certainly an "obvious" thing that the good God functor should commute to dualistic functors (since there is a good God!). Funnily enough, Kashiwara (to whom Mebkhout had spoken in January 1978) didn't **believe** this theorem to be true! That's how out of his depth he was, and how he lacked geometrical vision ("six operations" style). This didn't stop him, however, after Mebkhout communicated his Chapter III to him (in February 1978), from appropriating this result (without mentioning its author, of course) in his big article with Kawai already quoted (see b. de p.(\*) note on page 1005) (prop. 1.4.6 of par. 4 of loc. cit.). This is the work in which the "biduality theorem" (loc. cit. 1.4-9 of par. 4) is also appropriated without further ado (under the name "reconstruction theorem"). This just goes to show the extent to which the emulators of the great masters of the "new style" born in Paris (in place of a "Grothendieck school" which had vanished without a trace. . . ), are not to be outdone by their French colleagues.

My biduality theorem (for discrete coefficients) also figures in the same inexhaustible par. 4 of the same work by Kashiwara-Kawai (prop. 1.4.2) But while we shamelessly plunder the posthumous and unknown pupil, notoriously left out by the bosses, without thinking twice, we give the de rigueur tip of the hat to the illustrious colleague opposite, quoting as we should "the good reference" provided by Verdier (himself plundering a deceased never-named. . . ).

These deceptions are notorious among the well-informed, and Mebkhout has heard several echoes of them. But obviously, they are considered appropriate and welcome in the circumstances, as long as the aim is to eliminate the unfit ancestor and his unfortunate successor.

and it's the same thing to say that this functor is an (anti)equivalence. This theorem can be clarified, then, by Mebkhout's magnificent **inversion** (or "reconstitution", or "biduality") **formula**, giving the expression of the quasi-inverse functor as

$$F \mapsto \underline{RHom}_{C_X}(F, \underline{O})_X \quad (4)$$

Following on from this, Mebkhout also proves a **reciprocal of Kashiwara's constructibility theorem**: if a complex of  $D^\infty$ -Modules (or D-Modules) with coherent cohomology is such that the associated De Rham complex (as a bundle complex of C-vectorials) has constructible cohomology, then it is holonomic (**cohomological criterion of holonomy**). In the case of  $D\text{-complexes}^\infty$ -Modules, where there is no question of regularity, so this implies that in the  $\square$ (derived category (in which p. 1029 nobody had been working for a long time, in 1978 and up to 1981. . . ), the complex (or rather, its dual) can be "reconstituted", to within a single isomorphism, by the inversion formula.

As I've explained elsewhere<sup>725</sup> (\*), Mebkhout now has everything he needs to prove God's theorem for D-modules too: the fact that the functor  $m$ , a restriction of De Rham's functor to regular holonomic D-module complexes, is a category equivalence. The result inspires him less, as there is, to all appearances, no inversion formula to the key<sup>726</sup> (\*\*). In any case, even his magnificent inversion formula doesn't make anyone hot or cold - starting with his quasi-thesis supervisor Verdier (who will nevertheless do him the honour of acting as jury president). It's not exactly an encouraging atmosphere for making the technical effort to prove something he feels sure of anyway, and feels he has everything he needs to prove it. He won't worry about it until the rush to prove the conjecture (not Weil's this time, but Kazhdan-Lusztig's) has started.

It was, as if by design, just the other side that people suddenly needed urgently. In any case, "everyone" was in such a hurry to use the brand-new "fracturing iron" that had just appeared on the market, and it was such a common understanding that the question of a demonstration was not to be raised - in case it appeared that the work had already been done by someone unqualified - that no one, it seems, had the idea, apart from the person himself, to copy and paste the pieces of  $D^\infty$ -theory already written, in order to demonstrate the theorem required in D-theory. It seems that the one and only demonstration published to date<sup>727</sup> (\*\*\*) is that of Mebkhout, published last year (and received in June 1981, the very month of the memorable Colloque Pervers. . . ).

In the previous note (part (b)), I explained a simple principle, inspired by Deligne's approach towards De Rham coefficients, to recover an "inversion formula" (or "biduality", to use the expression  $\square$ (de Mebkhout) in the context of D-Modules (regular holonomies). I don't know, since we p. 1030 seminars all over the world on the new "cream pie" of D-Modules, if this very natural approach has been uncovered - Mebkhout was not aware of it in any case. What is certain is that, if Deligne had had reflexes that "in my day" were taken for granted, it would have been he himself, as soon as he became aware of the beautiful ideas of an unknown man, in June 1979, who would have encouraged him to also write the demonstration of the D-Modules side (closer to the algebraic) of his crucial result, and would have suggested to him this "pro" variant, quite obvious all in all, of his beautiful inversion formula. It was also clear to Deligne, who had paid for the knowledge, that Mebkhout's ideas were going to have a major impact on his work.

<sup>725</sup>(\*) See b. de p. (\*) p. 952 at "L'oeuvre. . ." (n° 171 (ii))

<sup>726</sup>(\*\*) As we saw earlier, there is one - and I'll come back to this point a little further down.

<sup>727</sup>(\*\*\*) Reference: Une autre équivalence de catégories, Compositio Mathematicae 51 (1984), 63-88.

give the De Rham coefficients that were missing, at least in algebraic geometry over a body of zero characteristic; the obvious thing was to encourage him to make the necessary adjustments, to state a theorem of the good Lord (or rather, of Mebkhout in this case) for complex algebraic varieties<sup>728</sup> (\*).

But other times, other customs. It will not be said that a new departure in the cohomology of algebraic varieties has been accomplished by the solitary and obstinate efforts of a vague stranger, claiming to be the son of a dead man whose name no one in the "beau monde" has dared to mention for a long time<sup>729</sup> (\*\*). He will not be

says that renewal will come through the kind of mathematics, precisely, that for ten years the heirs of the deceased have buried, while sharing the oripals. Mebkhout the innocent, if he wanted to "survive" (and "break through", had only to follow the ready-made path of the "new style"<sup>730</sup> (\*), as other brilliant young people (and even some not so young) have hastened to do. What a way to quote the (unspeakable) source of one's ideas, when it's so easy to drown a fish and only quote those who **need to** be quoted. Mebkhout, I think your account is good!

You've landed in a world you're not cut out for - and I'm happy for you that you're not cut out for **it**. You did the work you felt you had to do, without worrying about fashion, without calculating returns, simply trusting your own instincts - even if it meant making your way in solitude. You did **your** job, rather than watching for the discreet (and not so discreet) signs of those who decide what is good and decent and what is not. You didn't waver to please, you didn't say "white" when you saw, black, or vice versa - and it's with **your** eyes that you look. I don't have to congratulate you for that - you didn't look for congratulations, mine or anyone else's. And for all that, I'm happy. And for all that, I'm happy, for you and for everyone.

### b3. The master role (2) - or the gravediggers

**Note** 171(xi) (May 5)<sup>731</sup> (\*\*) The natural question here, of course, is whether there exists in algebraic geometry a "six operations" formalism for D-modules (or "crystals") not necessarily of the DRM type, which would "cap" those I had introduced in the coherent and discrete cases - assuming first, to fix ideas, that we are on the C-body. A first difficulty arises from the fact that the notion of D-coherence is not stable by the natural notion of tensor product of crystals, nor by the ana- logic inverse image operation<sup>732</sup> (\*\*\*). To hope for a six-operation formalism, we must (therefore work with a category

<sup>728</sup>(\*) As I've already pointed out, in the algebraic context, when we wish to paraphrase discrete algebraically constructible coefficients, we must impose on the  $D$ -module complexes under consideration, in addition to the condition of local holonomy and regularity, a condition of regularity "à la Deligne - Mebkhout" in the infinitesimal.

<sup>729</sup>(\*\*) It's true that we haven't yet found a way to find substitute references for EGA and SGA. But these providential acronyms contain no hint of a name that must remain silent. As we all know, the acronym SGA refers to an algebraic geometry seminar run by Bois Marie, under the impetus of a number of excellent mathematicians such as M. Artin, J.L. Verdier, P. Deligne, L. Illusie, P. Berthelot and N. Katz,

P. Jouanolou, and even others less well known but just as quotable. Clearly, there was a flourishing school of algebraic geometry here, known as "du Bois Marie", whose heart and soul was the brightest among the names mentioned. For further details on this "**Bois-Marie school**" and on the APG acronym that expresses it, see in particular the notes "L'éviction (2)".

and "Les pompes Funèbres - "Im Dienste der Wissenschaft"" (nos 169<sub>1</sub> and 175). (See also p. 899, paragraph 3, in the note "Les double-sens - ou l'art de l'arnaque", n° 169<sub>7</sub>.)

<sup>730</sup>(\*) On the subject of this style (which took the place of a "Grothendieck school" that disappeared without a trace. . . ), end of note "Les félicitations - ou le nouveau style", n° 169<sub>9</sub>.

<sup>731</sup>(\*\*) This sub-note is taken from a footnote to the note "L'oeuvre. . ." (n° 171 (ii)). See the reference to this sub-note, placed towards the end of the note quoted (p. 956).

<sup>732</sup>(\*\*\*) (May 22) Mebkhout reported to me that he has proved that the holonomy and regularity condition is stable by total tensor product operations (on  $\underline{Q}_X$ ) and by the notion of inverse image, and that the **countervariant** good-god functor  $\delta$  commutes to it.

even larger than  $\text{Cris}^*_{\text{con}}(X)$ , perhaps that of "quasi-coherent" crystals (in an obvious sense) - but so there's little hope of recovering a biduality theorem! What's more, the natural functor of ex-tension of scalars by  $\underline{O}_X \rightarrow D_X$  obviously doesn't commute to the tensor product - so, even though there would be a theory of six operations for crystals, which would extend the one (morally known from At present, thanks to Mebkhout) of De Rham - Mebkhout crystals (obtained by "structure transport" from "discrete" theory, via God's functors), it would not extend that of  $\underline{O}_X$ -coherent moduli<sup>733</sup> (\*). However, this may not rule out the existence of a "global duality theorem", version quasi-coherent crystals, for a proper morphism (let's say) of finite-type schemes over a body of zero characteristic, which "caps" (in an obvious sense) the "known" duality theorem (morally, by structure transport again) for De Rham - Mebkhout crystals, and the known (without quotation marks) analogous duality theorem in the coherent case<sup>734</sup> (\*\*).

□(I was quite flabbergasted that Mebkhout himself hadn't asked himself at least this last question, as early as p. 1033 At the very moment when he had arrived at the formulation of his "absolute" duality theorem (corresponding to the case where the goal variety would be reduced to a point) - only recently he didn't seem to "feel" it so much<sup>735</sup> (\*\*\*)). For me, this makes it all the more striking to what extent a certain "philosophy", which by the first half of the sixties had become second nature for me, and (it seemed to me. . .) for my students too - to what extent this philosophy has been forgotten by everyone, starting with those who took it upon themselves to be its gravediggers, rather than to pass it on. And I see that this is also the main cause of the stupefying stagnation of a theory (that of the cohomology of patterns) that I had left in full bloom after my departure.

It has to be said that Mebkhout placed himself in the transcendental analytic complex context, instead of the schematic one. This introduced considerable technical difficulties, in a way "parasitic", when it came to achieving an understanding of essential variance phenomena. Here again, his elders failed in their task of making their experience, gained through my contact, available to the newcomer.

---

(On the other hand, the good-god covariant functor  $m$  does not commute there, and it transforms ordinary inverse image into extraordinary inverse image). Using this result, we can show that there is no six-operation formalism for De Rham - Mebkhout coefficients that "extends" the two fundamental operations of tensor product and inverse image already known.

In particular, the DRM category<sup>b</sup>  $(X)$  does not admit an "internal Hom" operation (playing the role of  $\underline{RHom}$ ), and for  $f: X \rightarrow Y$ , the functor  $f^*$  does not in general admit a right adjoint  $Rf_*$ . The functor  $Rf_!$  already introduced by Mebkhout (for  $X, Y$  smooth and for  $f$  proper) is a **left** adjoint of  $f^*$ . (NB The operation  $Rf_!$  on the coefficients of De Rham - Mebkhout has been defined in such a way that the **covariant** good-god functor commutes to it, and likewise for  $Rf^*$  - wrongly, or rightly. ...)

So, in terms of the "natural" operations available in the De Rham-Mebkhout context, these are not The question, then, is to what extent this theory extends to  $D$ -modules (let's say quasi-coherent) that are **no longer assumed to be holonomic and regular (e.g. holonomic and regular)**. The question, then, is to what extent this extends to  $D$ -Modules (let's say quasi-cohesive) that are no longer assumed to be holonomic and regular (for example, holonomic without more - a condition that is preserved by tensor product and inverse image). In particular, it would appear that the global duality formula can be written for complexes of  $D$ -Modules with cohomology

coherent (or even just quasi-coherent), and any morphism  $f: X \rightarrow Y$  of separate schemes of type fini on a body  $K$  of zero (let's say) char., so as to cover both the coherent duality theorem and the discrete duality theorem, at least in the following form: the dualising functor "exchanges" the functors  $Rf_*$  and  $Rf_!$ .

<sup>733</sup>(\*) This assertion should be rephrased in terms of a "dual theory with six operations", see b. de p. note. above.

<sup>734</sup>(\*\*) Such a duality theorem can be considered in three different forms. Either by saying that the dualistic functors at the top and bottom "exchange" the functors  $Rf_!$  and  $Rf_*$ , or by saying that two suitably defined functors  $Rf_!$  and  $Rf^!$  are adjoint to each other, or by writing a "projection formula" (which caps both statements):

$$Rf_*(\underline{RHom}(F, Rf^!(G))) \approx \underline{RHom}(Rf_!(F), G)$$

<sup>735</sup>(\*\*\*) (June 8) Mebkhout assures me that he had indeed been asking himself the question for a long time. If I got the impression that he hadn't, it must be because the question had remained entirely platonic for him.

(just as I'd got into theirs . . . ), and thus guide (or at least enlighten) him in his choice of investments, in particular.

But to enlighten and guide is also to **serve**, even though they had long since opted for the role of master.

## b4. Dead pages

**Note** 171(xii) (May 5)<sup>736</sup> (\*) Mebkhout told me that until I mentioned it to him when we met two years ago<sup>737</sup> (\*\*), he'd never even heard the word "six operations" - he wondered what "operations" I meant! Clearly, it had never occurred to him (or anyone else, it seems, apart from me) to go through the main ingredients of a certain simple cohomological formalism, and find that there were six fundamental functors or bifunctors, grouped into three.

p. 1034

pairs of adjoint functors, with such arrows and compatibilities and so on. These were things that seemed so obvious to me, that I imagined that any reader, □ (either of "Residues and Duality" exposing the elements of coherent duality, or of SGA 4 or SGA 5 exposing the elements of discrete duality, with essentially the same form, will have had fun (as I did as early as the fifties, without going all the way, I admit. . . ) to put together for his own use a more or less systematic and more or less complete form of the main isomorphisms and compatibilities - for it is only in this way, and in no other way, that one manages to penetrate the spirit of a new language, to assimilate it intimately, to make it "one's own". This is surely how, and no other way, the pioneers of infinitesimal calculus arrived at a delicate yet sure intuition of the infinitesimally small at a time when they lacked the conceptual tools to apprehend them according to the canons of rigor that subsequently appeared (or reappeared). ...

With the benefit of twenty years' hindsight, I realize that in the "reference texts" cited, done with the utmost care, even brilliance - while all the "real work" (according to current desiderata) is done, culminating in "the" main duality formula, the adjunct formula between  $Rf_!$  and  $Rf^!$  (the only one practically deemed worthy of attention and effort, even if it means forgetting it the next day, as one forgets trees when one hasn't seen the forest. . . ) - that yet in all these texts the main thing is not said and has not passed from the author to the reader (assuming it was seen and felt by the author himself. ) - and yet, in all these texts, the **main thing** has not been said, and has not passed from the author to the reader (assuming it is seen and felt by the author himself). "The principal" is a "yoga", a "philosophy", a foolproof guiding thread through (in this case) the cohomological jungle in algebraic geometry (and elsewhere). It can be developed at length over fifty pages, or over a hundred, once "everything is done" (so they say); or it can simply be evoked in a few pages, and left to the reader to develop it for his own guidance as far as he sees fit for his own needs, or for his own satisfaction.

It's these few pages, whether on the "six operations", or on motives, or on many other things<sup>738</sup> (\*), pages that I felt strongly about but for which I didn't know how much he was

p. 1035

important that I write them down - it's they that have been missing, above all, from my written work. Absorbed as I was by the meticulous, never-ending tasks, at the □ (service of all, of the big "piecework", the only one that was

that was supposed to be published - I didn't feel that there were more essential pages, that **only** I could write.

**The essential** things I had to say didn't come across in the written pages, but only by word of mouth.

---

<sup>736</sup>(\*) (May 22) This sub-note, like the previous one, is taken from a b. de p. note on the page "L'oeuvre. . . ." (n° 171 (ii)). See the cross-reference sign at the end of this note, p. 957.

<sup>737</sup>(\*\*) This meeting is mentioned in the note "Rencontres d'outre-tombe" (n° 78).

<sup>738</sup>(\*) After these lines were written, I was able to see that I was mistaken about the six operations - in fact, I'm not really sure.

I was fooled by the massacre edition of SGA 5, in which Illusie took care to eradicate all trace of a "yoga of the six operations", which I had developed at length in the oral seminar, with a complete form copiously commented on.

- when it was convenient! Or, in a pinch, it was in between the lines, perhaps, of interminable volumes of foundations - but is there anyone these days who can read between the lines?

The essential thing, then, was what was entrusted on a day-to-day basis to those who, in my life as a mathematician, were "close to me", and first and foremost to my students. It was a matter of course, nothing deliberate. It never occurred to me that I was in some way investing them with considerable **power**. It's not that I didn't feel the force of what I was conceiving and transmitting, but that force, too, was self-evident. For me, surely, in mathematics at least, "strength" and "beauty" were and remain one and the same thing. It would never have occurred to me that these things could be abused, things filled for me with peaceful, intense life, made to live and to engender. When I left, in a way that could not have been more unexpected, I had no worries about them. These pages that I had never thought of writing - there was no doubt in my mind that their message had long been accepted and written down, and that these "loved ones" were going to be so many living pages, telling the message and enriching it with the best they had to contribute.

Those to whom I had addressed myself with trust and respect, as to younger brothers in whom I recognized myself, chose to bury and remain silent. And when the one, true to himself, in whom they recognized me came, they, filled with everything, chose to leave him outside their closed doors - a stranger and an intruder. I don't know you! And these unwritten pages, these pages said in vain, now dead pages in these posh homes with their haughty, closed doors, the rejected brother had to find them within himself, in long, groping and groping efforts. Alone, he had to make his way through the inextricable jungle of a thousand and a hundred thousand volumes. Anyone who has been through this, even if, like me, he was fortunate enough to have the fraternal help of experienced and benevolent guides, knows what I'm talking about. ...

He made his way, painstakingly, over the days and years - a bumpy road, without a compass. sometimes seemed to me after the fact, or at least without any compass other than a flair that was still searching for itself, to

through a□(painfully and hard-won experience. He did not rewrite these ready-made pages for himself, p. 1036 these pages-boussoles, now dead pages in haughty houses - if only in scattered snatches. He wrote **other** pages, **his** pages, painfully his own. He wrote them haphazardly, stubbornly, indifferently. And yet, these pages, often clumsy and worthy of a cad, which my brilliant and wealthy students of yesteryear (if they had bothered to read them) would certainly have looked at with commiseration and without seeing anything in them - these are pages that **had to** be written, like a natural, "obvious" continuation of those pages that I had never even thought of writing, so much did they seem to me to go without saying. ...

## Hatching a vision or the intruder

**Note** 171<sub>1</sub> (April 15)<sup>739</sup> (\*) Taking advantage of the recent visit to my home of my co-buried Zoghman Meb- khout in person, I'd like to give a few warm details of his strange misadventures, as he told me himself, in bits and pieces here and there, in the course of our conversations.

Zoghman has had the honor of an "interview" with his "boss"<sup>740</sup> (\*\*) J.L. Verdier on three occasions. The

<sup>739</sup>(\*) (May 30) The three notes that follow (n° s 171<sub>1</sub> to 171<sub>3</sub> ) were written between April 15 and 18 (1985), at a time when "L'Apothéose" was still reduced to a note of around ten pages. These expanded considerably over the course of the of May, following the re-launch of the Four Operations reflection, prompted by Zoghman Mebkhout's visit to my home. The ten pages have grown to over a hundred, almost all of which are of a later vintage than the three notes that follow. This has led to some partial repetition, as certain facts or episodes are mentioned or described, in different lights, in the earlier notes and those that follow. In order to preserve the spontaneity of the writing, I have not made any adjustments to eliminate these repetitions.

<sup>740</sup>(\*\*) (May 24) Mebkhout insists that the term "boss" (even with quotation marks) is misplaced here. From its beginnings in 1972 to

The first is set in 1975 - he needed a technical result, which was contained (as it later turned out) in the biduality theorem for analytically constructible discrete coefficients - at a time when Zoghman didn't even know the notion of constructibility. (This was a notion I had introduced

as early as the 1950s, and which had been taken up again, in the context of étale topology, in SGA 4.) At that time, this notion was by no means "well known" in analysis, as it is (is today). As it happens

p. 1037

exactly the notion he needed for his work. Houzel (who had followed SGA 5 at the same time as Verdier, but who must have forgotten a little about what I'd told him), advised him to go and see Verdier. This was his first "interview" with the great man. Verdier taught him that what he was asking (that two discrete complexes with isomorphic "duals" were isomorphic) was true under certain technical conditions ("constructibility"), which he would find set out in the manuscript he was going to give him. This was the "good reference"<sup>741</sup> (\*), where (among other similar feats) he pretended to invent constructible beams and discover the biduality theorem (and its proof), things he had learned from me twelve years earlier (in 1963)<sup>742</sup> (\*\*). He doesn't breathe a word about me, either in this interview or in the manuscript that was to appear the following year. In any case, Zoghman went home fulfilled, and full of gratitude for the great man who had provided him with exactly what he needed at that time, and in the years that followed, when the notion of constructibility was to play a crucial role in all his work.

It was in early 1976 that he began to take an interest in duality, and to be intrigued by the analogy of duality formalisms that I had developed in the coherent case and the discrete "spread" case, and which had been taken up by

Verdier in the discrete topological case. It was at a time when, for years, this formalism had fallen into disuse, and my students had instituted a boycott (tacit and rigorous on derived categories, which

p. 1038

are its natural language. The notion and the very word "six-operation formalism", which had been one of my main ideas since the fifties and throughout the sixties, was (and still is) strictly taboo after I left. (When Zoghman came to see me two years ago<sup>743</sup> (\*), he hadn't yet heard the word "six operations", and didn't even know what "operations" I meant by that - whereas I thought it had been a familiar notion to everyone for twenty years!) This meant that conditions were adverse for him to embark in this direction, where he was condemned to work in complete solitude. But this didn't stop him from developing a duality theorem in 1976, on non-singular complex varieties, which "covers" both the duality theorem

---

Today, he's done his job without a boss, on his own. Verdier was simply president of his thesis jury. Apart from that, his role was limited to communicating to Mebkhout "the good reference", which was very useful, at a time when SGA 5 was still being sequestered by the combined efforts of my cohomology students (and precisely for the purposes of operations such as the "good reference" one. . . ).

<sup>741</sup>(\*) This is the article by J.L. Verdier, *Classe d'homologie associée à un cycle*, *Astérisque* n° 36 (SMF), pp. 101-151 (1976). It is The question is addressed in detail in the two consecutive notes "The right reference" and "The joke - or 'weight complexes'" (n° 82, 83), and more briefly, in the note "Episodes of an escalation" (n° 169 (iii)), with episode 3.

<sup>742</sup>(\*\*) As early as the second half of the fifties, I had been interested in all kinds of "constructibility" notions for discrete bundles (in the algebraic sense, complex analytic, real analytic, piecewise linear - pending the context of moderate topology. . . ), in addition to notions of coherence, as the natural notions for expressing finitude conditions in the beamtic framework, and I had raised the question of the stability of these notions through the "six operations". It was the subsequent development (in 1963 and the years that followed) of stellar cohomology that led me to return to these questions in the stellar framework, and to develop the techniques (unscrewing and resolution) that enable them to be treated by a uniform method, equally applicable to the transcendental context of complex algebraic and complex analytic varieties. The biduality theorem, valid (and with the same proof) in the stale setting (subject to purity and resolution) and in the transcendental context, had already been identified by me in 1963. It also appeared in the very first presentation of SGA 5 (in 1965), where it survived the massacre of the 1977 Allusie edition.

<sup>743</sup>(\*) This visit is discussed in the note "Rencontres d'outre-tombe", n° 78. For comments on the boycott instituted on the "six operations", see also the note "Les pages mortes", n° 171 (xii).

of Serre, and discrete duality (which he calls "Poincaré-Verdier duality"), in terms of a duality statement for complexes of  $D$ -Modules (which also contains a global duality statement for complexes of differential operators). The "coefficients" he takes are, moreover, of a generality that went far beyond the cases of Serre (limiting himself to locally free bundles) and Poincaré (limiting himself to locally constant discrete bundles), faithful in this to the spirit I had introduced into these themes with the then generally repudiated formalism of the "six operations".

When Zoghman explained this theorem to me two years ago, I felt both its interest, which was obvious to me, and its limitation, because in the spirit of the "six operations" it was also obvious to me that "the good" statement had to be a statement about a morphism of analytic spaces  $f: X \rightarrow Y$ , in the form (for example) of an adjunction statement between two functors  $Rf_!$  and  $Rf^!$ . It's true that placing oneself in a transcendental context introduces considerable additional difficulties, which acted strongly (it seems to me) to obscure for Mebkhout the simplicity of the algebraic mechanisms essential in duality - whereas no one around him, and especially not among those who were my students, would have known (or deigned . . . ) to make him feel it. Nevertheless, he had put his finger on an important "principle" - that the

$D$ -Module theory (which I prefer to call "crystalline modules"<sup>744</sup> (\*\*)) provides a "common denominator" to "cap" the  $\square$ (phenomena (of duality, in particular) in discrete cohomology, and in cohomologyp<sup>1039</sup> coherent. With this momentum, encouraged by someone "in the know" and equipped with a modicum of mathematical instinct<sup>745</sup> (\*) and benevolence, there is no doubt that in the space of the next three or four years he would have developed a complete formalism of the six operations within the framework of algebraic geometry of zero characteristic (at least), providing a faithful purely algebraic "paradigm" of the same (admittedly repudiated) formalism in the transcendental framework, for algebraically constructible  $C$ -vector bundles.

Sensing that he had just discovered something important, Zoghman happily asked for and obtained an interview with his benefactor, to explain his findings. It was **the** exact answer to the question I'd put to Verdier ten or twelve years earlier, but he didn't seem to take any notice of it<sup>746</sup> (\*\*) - chances are he'd forgotten it entirely. In any case, his benevolence towards this young man who had come from nowhere and was doing things that he, Verdier, had drawn a big line on long ago, was exhausted. He didn't even want to listen to Zoghman's explanations of the ins and outs and demonstration of the theorem. He basically (and politely) told him that he, Verdier, didn't believe in Santa Claus anymore and that the young man had better pack it in.

Extraordinarily, **no one** around Zoghman is "hooked" on this result<sup>747</sup> (\*\*\*) - no doubt that was the reason

<sup>744</sup>(\*\*) For the (obvious) reason for this "crystalline" terminology, reflecting a more intrinsic vision of the  $D$ -Modules (which my students learned from me and have long since forgotten), see the comments in the note "My orphans" (n° 46) (especially p. 179) and in sub-note n° 46<sub>4</sub> (p. 188) (x). On the subject of "blocking healthy faculties" against links  
See the note "La mystification" (n° 85', p. 350-351).

(x) (May 24) See also note "The five photos (crystals and  $D$ -Modules)" (n° 171 (ix)).  
<sup>745</sup>(\*) It's not that my former cohomology students lack a "minimum of mathematical instinct" - otherwise none at all.  
of them could not have done with me the good work he did. But this instinct is derailed or blocked by the master's burial syndrome.

<sup>746</sup>(\*\*) (June 5) On this subject, see the note "The ancestor" (n° 171 (i)), particularly the b. de p. note (\*) on page 946.

<sup>747</sup>(\*\*\*) (June 3) There has been a misunderstanding here. As stated in the note "Three milestones - or innocence" (n° 171 (x), page 1026), this theorem often amazed the casual listener. But until now, it seems, it's remained a secret.  
platonian - the theorem has not become a tool, something we know and use without even thinking about it. This surely has something to do with the fact that the person who rejoiced in the obvious beauty of the result was never one of those who "set the tone" and decide what is "important", and what is "bombast". (And it's not uncommon, these days, for yesterday's "bombast" to become today's "cream pie". . . ) - In his comments of April 22, Zoghman writes to me: ". . . there was an embarrassment in the face of this theorem. Some people secretly envied it. But very few encouraged it,

too much "grothendieckerie" of the □ (sixties, we're past that nowadays, thankfully! Perhaps I've was, two years ago, the first person he met who sensed the importance of the result and the new "philosophy" it bears - that of a vast synthesis between "discrete" and "differential" (or "analytic") aspects in the cohomology of varieties of all kinds (algebraic and analytic to start with). This theorem, one of the chapters of his thesis, was eventually published in *Mathématica Scandinavica* in 1982 (t. 50, pp. 25-43). The same article had been submitted to the *Annals of Mathematics*, which made the presumptuous young man realize that it was not of the level required for publication in this standing periodical.

Even today, this theorem is generally ignored or scorned in the "beau monde", even though it already contains the seeds of that new philosophy which, via the theorem of the good God (alias Mebkhout), provided the means for a spectacular renewal in the cohomology of algebraic varieties. But "everyone", including my ex-students in cohomology (whom I once knew to have a healthy mathematical instinct), rushed en masse to the new "cream pie", namely a certain powerful tool (which "everyone", however, is fond of naming only by allusion or periphrasis, such as "the relation between constructible bundles and holonomic differential systems", or as "what would normally have found its place in these notes"<sup>748</sup> (\*). . . ), and on the "latest cry" (intersection cohomology), then □ that the **vision**

The innovative work that led to the tool's release remains just as ignored as before, and the fathers of both are treated as stooges.

The situation here is the same as it was for my vast unifying vision of topos, derived categories, six operations, cohomological coefficients and, beyond that, motifs. It was from this vision that tools such as étale cohomology and crystalline cohomology emerged, which the same "everybody" uses today like turning a crank, whereas the vision itself, powerfully alive on the day I left, was buried the very next day. And I can see clearly that the stupefying stagnation I'm seeing in a splendid subject<sup>749</sup> (\*), fifteen years after I left it in full bloom, is not due to a lack of intellectual means or gifts (which are brilliant in more than one of those I've known so well and so poorly), but to gravedigger's dispositions, or unscrupulous nepotism, or both. - dispositions that are the antithesis of the innocence that makes people recognize and find simple, essential things.

To develop his new philosophy, Mebkhout drew on the spirit of derived categories and the six operations, at a time when derived categories were treated as Grothendieckian smoke and mirrors, and when he hadn't even heard the name "six operations" uttered. Today, with the rush on

---

quite the contrary."

<sup>748</sup>(\*) This is a quotation (from memory) from the "memorable article" by Beilinson-Bernstein-Deligne (written by Deligne) referred to in the note "Le jour de gloire" (n° 171 (iv)). For details of this periphrase, worthy of posterity (as a reminder and as a warning. . . ), and for the ins and outs of the context, see the note "Le prestidigitateur" (n° 75"). The preceding quotation ("the relation between constructible bundles and holonomic differential systems") is taken from the Beilinson-Bernstein article (from the same year, 1981), which will be referred to in the following sub-note ("La mafia", n° 171<sub>2</sub>), where we will also have the advantage of learning about Brylinski-Kashiwara's contribution to the flowering of this kind of style, in the service of the same swindle.

<sup>749</sup>(\*) I first spoke of this impression of "morose stagnation" at the end of the note "Refus d'un héritage - ou le prix d'une contradiction" (following on from "Mes orphelins") n° 47 (p. 195). This impression has only been confirmed in the year since I wrote that note, with essentially the same restriction as I expressed in sub-note n° 47<sub>3</sub> to the cited note: Deligne's work on Weil's conjectures (Weil I and II), and the fresh start that followed the "rush" on the good God theorem (eliminating both the good God and his servant Zoghman), and on the intersection cohomology. But these localized successes seem to me to be out of all proportion to the brilliant, even exceptional means of those I know who have since "settled" in this "splendid subject" - even though fifteen years have passed since I left; and out of all proportion, too, to the richness and vigor of the key ideas I had bequeathed to them, and which I now find exsanguinated... ..

The new tool appeared, inseparable from the derived categories, and the latter were exhumed with great fanfare, while the name of both the person who had rescued them from nothingness during years of solitary work, and the person who had been inspired by them, also solitary, was hushed up to finally give birth to a new theory of coefficients linking topology, complex analysis and algebraic geometry.

□ Les Deligne, Verdier et consorts rush to the brand-new novelties shouting (with the discretion of

p. 1042

It goes without saying that this is a rigorous and well-intentioned approach: "It's me, it's me! None of them has yet found within themselves the courage and loyalty to themselves, to mature a vision in solitude, to bear it heavily for months and years on end, far from the applause, when they would be alone in seeing and unable to share what they see with anyone else in the world.

But I digress, it's time to return to my account of the **blossoming of a vision**. It was in 1976, when Mebkhout demonstrated the duality theorem that "caps" Poincaré's duality and Serre's duality, that he arrived at the idea of the equivalence of three categories, embodying respectively the "topological", the "algebraic" and the "analytic" (transcendental) aspects of the same reality, of the same type of objects. From the point of view of a general theory of "cohomological coefficients"<sup>750</sup> (\*), I'll call these objects "De Rham coefficients" - □ Mebkhout<sup>751</sup> (\*). If  $X$  is a smooth analytic space<sup>752</sup> (\*\*), on the one hand there are

p.

1043

<sup>750</sup>(\*) This idea of various "**types of coefficients**", each of which presented itself to me as a particular incarnation of the formalism of the six operations (and biduality), more or less encircling the finest "type of coefficients" of all, the "absolute", or "universal", or "**motif**" type - this idea was perhaps the main force guiding me throughout the sixties, and especially from 1963 onwards, in the development of my cohomological vision of algebraic and other varieties. The force of this idea in me is clearly visible from the very first note I dedicate to a retrospective on my work, and on these vicissitudes at the hands of fashion: "Les orphelins" (n° 46). I return to it insistently at various points in the reflection on Burial, and more particularly in "La mélodie au tombeau - ou la suffisance" and "Le tour des chantiers - ou outils and vision" (n° s 167, 178). It's also the very first mathematical theme, among those buried by the care of my former cohomology students and by those of a fashion, that I'm thinking of developing following Harvest and Sowing, to give it its rightful place. that it deserves in my mathematical thinking.

Strangely enough, this central idea-force of my cohomological work, and the (basically very simple) algebraic-categorical structure that expresses it, has never been made explicit in literature, not even by myself in the sixties (x). It appears between the lines in my written work, and was conveyed above all in oral communication. In my mind, it went without saying that one of my students would not fail to devote the few days or weeks it took to present this set of ideas in systematic form, while I myself was fully occupied with the basic tasks of EGA and SGA.

With hindsight, I'm more aware of the importance of non-formal texts (even if only a few pages long, in this case, and without any effort at exact, systematic formulations), which give a sense of those rarely-named "key ideas" that lie hidden behind texts that often appear to be technical - how important such texts are in guiding researchers, and in occasionally bringing a breath of air into a literature that tends to suffocate in its technicality. On this subject, Zoghman told me that the few passages of this kind he found in my texts were a great help to him. Among these, he recently pointed out to me the few words of introduction I had attached to Hartshorne's volume "Resigns and duality" (a volume essentially expounding the formalism of the six operations I had developed in the second half of the fifties, within the coherent framework). I now realize how much more useful this introduction would have been, had I taken the trouble to include even a non-formal page or two explaining the "yoga of the six operations" and underlining its importance as an omnipresent conductive file in the edification of cohomological theories that were still waiting to be born... ..

(x) (May 24 and June 1) After these lines had been written, it became clear that from the very start of the SGA 5 oral seminar (in my second presentation), I had taken great care to develop at length the "abstract" form of the six operations, which

would dominate the entire seminar to come. (On this subject, see the b. de p. note (\*) of May 8 to the note "L'Ancêtre" n° 171 (i), page 942.) Moreover, throughout the oral seminar, I constantly referred to the ubiquity of formalism the cohomological approach I was developing, valid in principle for all kinds of "coefficients" other than "*l-adic* coefficients". Illusie was careful to remove from the massacre edition both the detailed presentation of the formalism of the six operations, and any hint of a vision of "cohomological coefficients" that went beyond the particular context of the seminar's main subject.

See also the note "Dead pages" (n° 171 (xii)), and also "Useless details" (n° 171 (v)), part b) ("Machines for doing nothing. .").

p. 1044  $\square$   $\text{Cons}^*(X)$  ("topological" aspect), that of complexes of with coherent cohomology bundles<sup>753</sup> (\*\*\*), generalizing complexes of infinite-order differential operators, which I denote  $\text{DRM}_\infty^*(X)$  (transcendental "analytic" aspect), and finally the category of  $D^\infty$ -complexes with co-herent cohomology bundles, generalizing complexes of ordinary (finite-order) differential operators, which I denote  $\text{DRM}^*(X)$  ("algebraic" aspect). There is a tautological extension functor for scalars of the coherent Ring  $D_X$  to Ring  $D^\infty_X$

$$i : \text{DRM}^*(X) \rightarrow \text{DRM}_\infty^*(X)$$

inserted in a functor diagram (essentially commutative) :

$$\begin{array}{ccc} \text{DRM}^*(X) & \xrightarrow{i} & \text{DRM}_\infty^*(X) \\ & \searrow \text{associated De Rham complex} & \swarrow \text{associated De Rham complex} \\ & \text{Cons}^*(X) & \end{array} \quad (1)$$

where the oblique arrows are the "associated De Rham complex" arrows<sup>754</sup> (\*), which is none other than  $R\text{Hom}_D(Sp_*, \cdot)$  where  $D = D_X$  or  $D_X^\infty$ , and where  $Sp_*$  is the "Spencer resolution" of  $\underline{Q}_X$  by locally free D-Modules<sup>754</sup> (\*).

The existence of vertical arrows derives from Kashiwara's "constructibility theorem", which implies that the De Rham complex associated with a holonomic D-module complex has analytically constructible cohomology bundles. Kashiwara had proved this important theorem in 1975<sup>755</sup> (\*\*), albeit from a completely different angle. He worked with a single holonomic D-module, of which he took the De Rham complex and proved that its cohomology is constructible. Until September 1979 and the subsequent "rush" triggered by the Good God Theorem, he nor anyone else in the beautiful world was working in the spirit of derived categories, and the very idea of writing the vertical arrows in (1) hadn't occurred to anyone!

Once the three arrows (1) have been written, as arrows between derived categories<sup>756</sup> (\*\*\*), the question arises if they are indeed category equivalents. Mebkhout was convinced of this as early as 1976. The conviction had come to him by  $\square$  dressing a table of a dozen typical examples (reproduced in his expository article with The Dung Trang<sup>757</sup> (\*)) of constructible C-vector bundles that can be called "elementary", which

<sup>751</sup>(\*) (May 30) In the note (written later) "The five photos (crystals and  $D$ -Modules)" (n° 171 (ix)), I use a slightly different terminology, referring to "De Rham coefficients" (for short) as "the same type of objects", three of which are given here.

**descriptions** (or three **different** "photos"). Two of these will be called "De Rham - Mebkhout coefficients" (or simply, "de Mebkhout"), "of infinite order" and "of finite order" respectively.

<sup>752</sup>(\*\*) (May 30) In the initial version of these notes, getting carried away by my predilection for the "algebraic geometry" point of view, I had assumed that  $X$  is an **algebraic** variety over  $\mathbb{C}$ . This did not correspond to the framework in which Mebkhout had initially placed himself, not to mention that it made me state a variant of the "good God theorem", for  $D$ -complexes $^\infty$ -Modules, which is true as it stands only when  $X$  is assumed to be proper. So there were some misunderstandings in my mind, and Mebkhout had to kindly call me to order. In retyping these few pages, I have made the necessary corrections.

<sup>753</sup>(\*\*\*) On the subject of definition and first sorital facts concerning the theory of Modules and  $D$ -Modules, the reader is referred to the note "Les cinq photos (cristaux et  $D$ -Modules)" (n° 171 (ix)), and more particularly parts (a) and (b) ("L'album "coefficients de De Rham"", and "La formule du bon Dieu").

<sup>754</sup>(\*) (May 24) See the note already quoted "The five photos. . ." (n° 171 (ix)), part (a).

<sup>755</sup>(\*\*) Masaki Kashiwara, On the maximally overdetermined System of linear differential equations, I Publ. RIMS, Kyoto university 10 (1975), 563-579.

<sup>756</sup>(\*\*\*) Strictly speaking, it would probably be more correct to say that these are full sub-categories (defined by conditions of "constructibility", or coherence, holonomy and regularity) of derived categories in the ordinary sense.

<sup>757</sup>(\*) Lê Dung Trang and Zoghman Mebkhout, Introduction to linear differential Systems, Proc. of Symposia in Pure Mathematics, Vol. 40 (1983), part 2, p.31-63. Zoghman recommended this short article to me as the best introduction in the field.

are also of the type constantly involved in the "unscrewing" of bundles, familiar from the theory of stellar cohomology. From that crucial year 1976, for each of these bundles, he succeeded in constructing a remarkable holonomic complex, both on  $D_X$  ("**algebra**") and on  $D^\infty$  ("**analysis**"), having (from the point of view of the six operations) a very simple algebraic or analytic cohomological meaning, and whose De Rham complex is the bundle in question. Remarkably, while he started from a constructible bundle and not a complex of bundles, in a number of cases the holonomic complex that gives rise to it is in no way reduced to a single cohomology bundle. This showed him that, in keeping with the spirit of the "six operations" (whose name he didn't know. . . ), if there was any equivalence, it could not be deduced from an equivalence between the categories of moduli bundles (on  $C$ , or on  $D$ ) themselves, but only made sense by passing on to derived categories.

For me, it's quite clear that **the act of creation**, in this case, consisted in seeing and writing down the two **obvious** arrows  $m$  and  $m_\infty$  that nobody had deigned to write down - in asking the "very simple" question of whether they might not be category equivalences, thus providing a differential algebraic interpretation, and another differential analytic one, of the topological notion of constructible  $C$ -vector bundle (or complex of bundles). There was the **question, and a clear awareness of the crucial nature of this question**, of its scope - and with it, and as a matter of course, an inner attitude that **assumed** this question, that would see it through to its conclusion. The preliminary "experimentation" with "typical" or "elementary" examples was a first step in this direction.

That was the essential, childlike step, the one that can only be taken by those who know how to be alone. Once this pas-là accompli, le premier de mes élèves cohomologistes venu, utilisant les techniques de dévissage et de résolution apprises à mon contact dans SGA 4 et SGA 5, était capable de le prouver en quelques jours, ou en p. 1046

But not a single one of them, not even Deligne. But there wasn't a single one of them, not even Deligne, who had given up trying to find the unifying vision that would go **beyond** the key idea of the "six operations"<sup>758</sup> (\*), and who was still lacking in linking continuous coefficients and discrete coefficients - not a single one of them was able to see the obvious scope of Mebkhout's ideas, of this vague stranger who still came off as the spitting image of Grothendieck... .

As for the "vague unknown", reduced to his own means and reading, asking himself the question of category equivalences must have seemed to him (and rightly so) the most obvious and childish thing in the world, or to come to the conviction that these were indeed equivalences. On the other hand, in the absence of experience and encouragement from more experienced elders, he developed a world of demonstration that for a long time seemed entirely out of his reach.

And yet, after a year and a half already, he managed to find a demonstration, first for the arrow  $m_\infty$ , in March 1978. He told me that psychologically, my comparison theorem for co

---

literature to the philosophy he has been developing since 1976. The bibliography also includes a (complete?) list of Mebkhout's publications on this theme, at least up to 1983.

<sup>758</sup>(\*) (June 5) On rereading, this formulation seems hasty and a little "out of touch" with reality. In fact, my "idea-force of the six operations" was inseparable from a "philosophy of coefficients", which foresaw (and in a very clear way at least since 1966) a "theory of De Rham coefficients" (intimately linked to my crystalline ideas), having the same essential formal properties as the theory of  $l$ -adic coefficients, and forming with them (for *the* variable) as many different "realizations" of the same type of ultimate object, the "motif". Mebkhout's work, carried out between 1972 and 1980, appears to me as a first major step towards the realization of this intuition - a step for which everything was ripe, practically speaking, at least as early as 1966 with the start of crystalline yoga, when the problem of a theory of De Rham's coefficients was clearly posed, in my mind at least. If this step has not been taken by any of my cohomology students since the sixties, it seems to me that due above all to mechanisms blocking spontaneous creativity, which was not lacking in any of them. On this subject, see the note ". . . and hindrance" (n° 171 (viii)).

p. 1047 of the demonstration. For some reason that I haven't quite grasped, he considers his theorem (namely that the functor  $m$  called "of the good Lord", so as not to say Mebkhout. . . is an equivalence), as a "generalization" of my comparison theorem. From this moment on, he also knows  $\square$  that he has the tools that it takes (with Hironaka's solving technique) to also deal with the case of  $m$ , by far the most interesting for an algebraic geometer like me. As an analyst, he had first focused on the case of the functor  $m_\infty$ , which was his favorite<sup>759</sup> (\*). He didn't return to the question, which seemed to him to be a little incidental, until after the defense of his thesis, and demonstrated the following month (March 1979) that the functor  $m$  (the one that everyone today uses in periphrasis without ever writing it down, so as not to have to name an unnameable author. . . ) is indeed an equivalence of categories. ) is indeed a category equivalence<sup>760</sup> (\*\*). As a result, it follows that the "ring change" functor  $i$ , going from the "algebraic" (in which he was still only remotely interested) to the "analytic" (transcendental), was also an equivalence.

\*       \*

\*

p. 1048  $\square$  In March 1978, Mebkhout had his third meeting with his "benefactor" Verdier, whom he hadn't seen for two years. He explained to him the ins and outs of the (future) "God's theorem", which he modestly called the "Riemann-Hilbert equivalence". With hindsight, Mebkhout is convinced that his explanations must have gone over Verdier's head. What's certain is that Verdier was completely unaware that his "protégé" had just presented him with ideas that deserved attention. He didn't mention it to anyone around him, not even to Deligne, who learned the

<sup>759</sup>(\*) (May 24) Another, perhaps stronger, reason is that in the case of the  $D^\infty$ -Modules he had a magnificent inversion formula at his disposal - see on this subject the note "The five photos" (n° 171 (ix)), part (b), "La formule du bon Dieu".

<sup>760</sup>(\*\*) Mebkhout only wrote the formal demonstration of the fact that  $m$  is an equivalence (demonstration on the same principle as the one for the "analytic" God functor  $m_\infty$ ) only two years later, in 1980. This demonstration is set out in the second of two consecutive articles (the first of which deals with the analytic God functor  $m_\infty$  and takes up his thesis), "Une équivalence de catégories" and "Une autre équivalence de catégories", in *Compositio Mathematica* 51 (1984), pp. 51-62. and 63-88. (Manuscripts received on 10.6.1981.) But from March 1969 and over the following years, he communicated this result (along with the one concerning the functor  $m_\infty$ ) wherever the opportunity arose, notably to Deligne in June of the same year.

I think that because of his extreme isolation, and his analyst's "glasses", he didn't realize that it was above all the functor of the good algebraic God that was going to interest people like Deligne and others, because it forms a "bridge" between topology and algebraic geometry (while waiting for arithmetic, which I seem to be the first and only one to glimpse... ), comparable in scope to that provided by the cohomological étale tool. Otherwise, he would have taken care to edit it into immediate form and publish it illico-presto - especially given the mores (of which he was still ignorant. . . ) of the strange milieu into which he had strayed. Yet his first misadventure (with Kashiwara), in March 1980, should have tipped him off (x).

It was in this same month of March that a note appeared in Mebkhout's CRAS "sur le problème de Riemann-Hilbert" (t. 290, March 3, 1980, Series A - 415), in which he states the equivalence theorem of his thesis (for  $m_\infty$ ), and cautiously affirms that "we hope to show, using the method of cohomological descent as for the duality theorem [7] that the functors  $S$  [which I have called  $m$ ] and therefore  $T$  [which I have called  $i$ ] are also category equivalences". In fact, his demonstrations showed that these are equivalences "locally on  $X$ ", which already implied, in particular, the famous Kawai-Kashiwara theorem (discussed in the next sub-note), namely that the functor  $i$  (scalar extension) induces an equivalence between the category of regular holonomic  $D_X$ -Modules, and that of holonomic  $D^\infty$ -Modules. Incidentally, Mebkhout's final result is considerably stronger, even when applied to **modules** (instead of complex of modules), as it simultaneously displays the canonical arrows

$$Ext^n_{D_X}(M, N) \rightarrow Ext^n_{D_X^\infty}(M_\infty, N)_\infty$$

from the "scalar extension" functor, are also isomorphisms (and not just for  $n = 0$ ).

(x) (May 25) In a letter dated April 24, Mebkhout tells me: "I have to tell you that after my thesis I took a breather. I'd been under a lot of stress for four years."

(at the same time as the "Poincaré-Serre-Verdier" duality, which the same Verdier absolutely refused to believe in three years earlier. . . ), from Mebkhout's mouth more than a year later, at the Bourbaki seminar in June 1979 (four months after the defense). Nevertheless, Verdier gave the go-ahead for Mebkhout to present his results as a state doctorate thesis, for which he agreed to form and chair the jury. The fact that the thesis was not defended until a year later was due to the administrative delays imposed by the notorious "Commission des thèses des Universités de la région parisienne" (an institution that Verdier holds dear as the apple of his eye... ).

As I said in a previous note<sup>761</sup> (\*), the defense took place in an atmosphere of general indifference. Mebkhout may have sent his thesis out left and right, but it continued to go unnoticed - nobody even deigned to acknowledge receipt of the pamphlet.

Mebkhout, however, remains undaunted. Despite evidence to the contrary, he feels he is part of a "family" - people, after all, who do the same kind of math - the kind he learned, for the most part, by frequenting my writings, and even more, by putting oneself in a position of openness, <sup>□</sup> of listening in relation to a p. 1049

certain **spirit** in his writings<sup>762</sup> (\*). He apparently doesn't yet realize, at least not on a conscious level, that this spirit has long since been repudiated by the very people who make up the "family" he believes he has entered, and that for these fine gentlemen who entered mathematics on high-wool carpets, he is a laggard and an intruder.

## The mafia

**Note** 171<sub>2</sub> (April 15-17)

**(a)** But our unsuspecting friend Zoghman, isolated as he is, is not unhappy. Since 1973, he's been lucky enough to have an assistant's post in Orléans, which gives him the freedom to do the maths that interests him, and too bad if for the moment it only interests him. He continues to live in the Paris region, attending seminars and keeping abreast of the literature... .

Had he stopped to think about it, he would have realized that all was not for the best in this "family" that pretended to ignore him, even though he felt part of it. He had come to realize, by frequenting my writings, that at least a good part of the "good reference" that had been like manna from heaven for him, was by no means the work of his "benefactor" Verdier. The notion of constructibility was developed at length in SGA 4 as early as 1963, twelve years before Verdier pretended to invent it in this article. With the publication of SGA 5 in 1977, even in the form of Illusie's edition-massacre, he

<sup>761</sup>(\*) See note ". . and the bargain" (n° 171 (iii)).

<sup>762</sup>(\*) One may wonder (or ask me) what is this famous "spirit" so particular to my writings, which would have inspired my This is the spirit of the "posthumous pupil" Zoghman Mebkhout, who was "repudiated" by all my other pupils, led by Deligne, and by a fashion that followed in his footsteps. If I try to find a filiation for this spirit (insofar as my more than fragmentary knowledge of the history of mathematics allows me to do so), I'd say it's in the tradition of **Galois, Riemann and Hilbert**. If I try to define it in terms of a dynamic of forces at work in the psyche, I'd say it's a mind that manifests itself through a harmonious balance of "yin" and "yang" creative forces, with a "base note" or "dominant" that is **yin**, "feminine". A more detailed description of this approach to mathematics, and to the discovery of the world in general, can be found at In the course of our reflections, we have included notes on "The rising sea", "The nine months and five minutes", "The funeral of yin (yang buries yin (4))" (no.° 122, 123, 124), which are taken up again in notes on "Brothers and spouses - or the double signature", "Yin the Servant, and the new masters", "Yin the Servant (2) - or generosity" (no.° s 134, 135, 136). For a reflection on some

See the two notes "La circonstance providentielle - ou l'Apothéose" and "Le désaveu (1) - ou le rappel" (n° s 151, 152).

it appeared that this famous "Verdier biduality" for complexes of analytically or algebraically constructible C-vector bundles, had been copied purely and simply from SGA's first paper.

5 (the same one referred to in a strangely-named volume "SGA 4<sup>1</sup>" by : "various supplements are given in SGA 5 I"<sup>763</sup> (\*)!). In this same strange volume, whose author likes to express himself with superb disdain about the satellite-volumes SGA 4 and SGA 5 that surround it, he was able to see an exposé on the cohomology class associated with a cycle, from which the volume of "technical digressions" SGA 5 (supposedly subsequent . . .); at the same time, he realized that the cohomological aspect (dual of the homological aspect) of the theme which gave its name to his benefactor's article, had also been copied from SGA 5. However, none of the three themes<sup>764</sup> (\*\*) in "the right reference" referred to me or SGA 5. ...

Of course, he couldn't yet know that what remained of Verdier's article (apart from three pages out of the fifty) had been "pumped" from my lectures on the formalism of stale homology and homology classes associated with algebraic cycles, But the few facts at his disposal were certainly more than enough to alert a well-informed and alert man. In short, it was a situation very similar to the one I had found myself in ten years earlier, leafing through Deligne's article on the degeneracy of spectral suites, in which he glossed over both the initial motivation and the whole yoga of weights (as well as the role of my modest self), and the contribution of Blanchard's ideas, using precisely Lefschetz's "cow" theorem for fibers<sup>765</sup> (\*\*\*). Like me once, Zoghman then had to silence his lucid perception of an unpleasant reality, telling himself (in this case) that this must be a customary "connivance" between master and pupil, that the master closes one eye when his pupils present as

their ideas, techniques and results directly from him<sup>766</sup> (\*\*\*\*). As is often the case in de□tels cases, this interpretation (which suited Zoghman well) was not lacking an element of reality, which

more. On more than one occasion, I had indeed been a party to such ambiguous situations (but it's also true that before I left, things had never yet reached this point, where the master's work becomes a corpse whose pieces are shamelessly shared...). )

Moreover, in the wider family of all those interested in the cohomology of varieties, including the Japanese of the Sato school, all was not so much for the best either. This same Kashiwara, whose 1975 constructibility theorem had been providential in defining the "God's functor", had also pretended to take credit for these unfortunate constructible bundles, which suddenly had everyone in a frenzy! He had renamed them "finitistic sheaves" for the purpose, in par. 2 of his quoted article, where he repeats more or less verbatim SGA 4's developments on the subject. From what I've heard from various quarters, the Sato school is familiar with my cohomological work, even though they quote me only sparingly<sup>767</sup> (\*), and it's hard to believe that Kashiwara was unaware of the notion of constructibility at least in the étale context, where it is the notion of finiteness central to the whole theory. It goes without saying that Verdier the following year no more cites Kashiwara for the "finitist" notion (sic), than he breathes a word about a certain deceased or a certain seminar<sup>768</sup> (\*\*). We may be of the

<sup>763</sup>(\*) For this priceless euphemism, aimed at the appropriation (by him, Deligne, this time) of the same unfortunate biduality theorem, see the b. de p. note (\*\*) on page 872 to the sub-note "Le cheval de Troie" (n° 169 ).<sub>3</sub>

<sup>764</sup>(\*\*) These are the "three themes": constructibility, biduality for constructible bundles, cohomology (and homology) class. associated with a cycle.

<sup>765</sup>(\*\*\*) see for details the beginning of the note "L'éviction" (n° 63), and the b. de p. note (\*\*) on page 233 of this note.

<sup>766</sup>(\*\*\*\*) (May 30) And all the while kindly calling him a smoker to boot. ...

<sup>767</sup>(\*) Mebkhout writes to me on this subject (April 24, '85): "The only references to you that I've seen in the Japanese Sato school are in Chapter 0 of EGA III/ even though they were shamelessly inspired by your work." "

<sup>768</sup>(\*\*) As chance would have it, this seminar (SGA 5) was the very one (along with SGA 4) which, by mutual agreement between my students

nice people both, and from the same "family" maybe - but when it comes to the steak of authorial vanity, everyone grabs for himself. ... <sup>769</sup>(\*\*\*) □ I think it was easier for Zoghman to p. 1052 saying that a Japanese he'd never seen <sup>770</sup>(\*) was definitely a "swindler", than having to say the same about prestigious elders, one of whom was for him like a powerful and distant father and benefactor, elders he had the opportunity to rub shoulders with in seminars, and with whom he even had the honor of being yours and yours again (as has been the custom in French mathematical circles since the days of Bourbaki).

**(b)** Paradoxically, Zoghman's troubles began the day a certain world began to realize the power of one of the tools he had brought to bear in the wake of a whole philosophy (of a kind that was, however, passing as decidedly outdated. . . ). He had mentioned this to Deligne in June 1979, who had listened attentively to his explanations of the duality theorem, and even more so (as one might imagine) of the God theorem. He even very kindly told him that he had read the introduction to the thesis, and that he thought there must be a lot of beautiful mathematics <sup>771</sup>(\*\*). Life was good for Zoghman that day - but not for long.

□ The same year, in September 1979, he took part in the Colloque des Houches <sup>772</sup>(\*), where he gave a talk p. 1053

---

cohomologists and, in the words of their chief fi le Deligne, was destined to be "forgotten" (thanks to the publication of the digest-coup-de-scie from his pen. . . ).

<sup>769</sup>(\*\*\*) (May 24) Mebkhout points out that I'm painting the picture a little black here. Verdier was completely unaware of Kashiwara's article and of the notion of holonomy, which Mebkhout taught him during his "interview" with Verdier in 1976. (This was before the publication of the correct reference (published fi n 1976 it seems), but logically one cannot expect him to cite Ka- shiwara, when he knows that both he and his colleague are "pumping" from the same unnamed source. ... ) Conversely, Kashiwara was unaware of the "correct reference" and my biduality theorem (which appears in it under Verdier's authorship), and it was Mebkhout who made them known to him in January 1978, along with the results of chapter III of his thesis. These were subsequently shamelessly appropriated (and virtually unproven) in the aforementioned article by Kashiwara-Kawai - see at

On this subject, see the note "The five pictures (crystals and  $D$ -Modules)" (n° 171 (ix)), in particular page 1005. The fact that Kashiwara was unaware of the bidualite theorem for discrete coeffi cients shows, among many other signs here and there, how much he was

from Mebkhout's philosophy of duality, directly inspired by my work

<sup>770</sup>(\*) (May 24) He did catch a glimpse of the famous Japanese once! Mebkhout writes to me on this subject (April 22, 85):

"The Sato school had come in full force in 1972 for a conference on hyperfunctions. They hid their methods well. For a long time, their results remained unaffordable. There was a certain mythology around this school, which means that now Kashiwara can afford what he does."

(June 4) It has to be said that if it's true (as Mebkhout seems to be suggesting here) that the Sato school initiated the method of surrounding oneself with obscurity in order to dominate, this method has found emulators on this side of the Pacifi c, who are now not outdone by their masters! And it was they, not Kashiwara et al., who masterminded the incredible mystifi cation of the Colloque Pervers, in which Kashiwara was used as a convenient "pawn" to prepare the ground - and then be dropped... .

<sup>771</sup>(\*\*) (June 3) Mebkhout had already received an equally gratuitous compliment the previous year from Illusie at the Colloque d'Analyse  $p$ -adique in Rennes. On this subject, see the note "Carte blanche pour le pillage" (n° 174<sub>4</sub>), page 1091 (and in particular the b. de p. note (\*\*)) on the same page).

<sup>772</sup>(\*) The proceedings of the Colloque des Houches (September 1-13, 1979) are published in Lecture Notes in Physics n° 126 (1980), Springer Verlag. These Proceedings include Mebkhout's paper "Sur le problème de Hilbert-Riemann" (On the Hilbert-Riemann problem), setting out the whole of the his philosophy (which I'd call "De Rham's coefficients") in a perfectly clear manner, with references for the demonstrations, and the presentation by Kashiwara and Kawai. Any reader of good faith will be able to verify, by comparing the two articles, that there is not the slightest hint of a philosophy of this kind, nor the slightest allusion to something like the "God's theorem", in the article by these two authors.

(June 4) In his letter of comment dated April 22, Mebkhout expresses the same view of the International Congress of Mathematicians held in Helsinki the previous year (August 1978):

"I must say that I attended Kashiwara's lecture as keynote speaker at the Helsinki congress (August 1978). There was no philosophy either remotely or closely related to the comparison between discrete and continuous coeffi cients. I wrote up my Copenhagen lecture, which had taken place a week before, and made it available to the mathematical community, which is supposed to be the judge. The same Kashiwara's lecture is published in the Proceedings of the [Helsinki] Congress."

"On the Hilbert-Riemann problem", presenting his equivalence theorem. His talk seems to have gone completely unnoticed. One of the "highlights" of the Colloquium, on the other hand, was a lecture by Kawai a few days before, announcing a remarkable and unexpected result obtained in collaboration with M. Kashiwara. In a somewhat convoluted and incomprehensible form (in keeping with the particular style developed by the Sato school<sup>773</sup> (\*\*)), this theorem asserted that on a complex (smooth) analytic variety, the "change of scalars" functor from  $D$  to  $D^\infty$  induces an **equivalence** between the category of holo-nomic D-Modules "with regular singularities", and that of holonomic D-Modules. Their proof was to be the subject of a very long article of over one hundred and fifty pages, published since<sup>774</sup> (\*\*\*)).

Mebkhout, like all the other listeners, was a bit overwhelmed. This theorem, presented as

p. 1054 sensational and where nobody quite understood what it was all about, yet had a familiar "je ne sais  $\square$ quoi," to him. In the days that followed, he ruminated on this, slowly but surely, according to his habit. I can imagine that in the hustle and bustle of the Colloquium, it must have taken him a day or two just to put the theorem into a form a non-Japanese could understand. From then on, it was a done deal! I bet none of the Westerners present had the slightest idea what these "regular singularities" were. But Mebkhou, for his part, had well and truly defined a few years earlier, for the needs of a "philosophy of coefficients" that was still in its infancy, a notion of **regular** holonomic D-Module<sup>775</sup> (\*). This one, at least, had a precise meaning for him - and, taking the appropriate **derived category** and going "through the looking glass", he knew how to interpret this category in terms of the corresponding derived category of "constructible discrete coefficients". At least, he had demonstrated at length in his thesis the analogous interpretation, in terms of this same category of discrete coefficients "on the other side", of the category of  $D^\infty$ -holonomous moduli - and he was well aware that he had in hand everything he needed to prove the analogous also in the "regular holonomous  $D$ -module" case. This he had done in his thesis, practically, in the form of a **local** result on  $X$ , which was already sufficient to imply Kashiwara-Kawai's "sensational result". Thus, the point of view of derived categories, and that of the interplay between continuous coefficients, discrete coefficients, gave a result of the Kashiwara-Kawai type, but in principle much stronger still, since it gave at the same time an isomorphism between higher  $Ext^i$ , and not only at the  $Hom$  level (which was all that was obtained, working with D-Modules without more, instead of derived categories formed with such Modules). This being the case, it was a devil of a thing if this Japanese notion of "regular singularities" wasn't equivalent to his own - so that the prestigious result would in fact be a pure and simple corollary of his philosophy of coefficients, to which nobody had deigned until then.

interest.

When the entire Colloquium honors the presentation of a vague unknown with its presence, it's expected in the program for some reason, and that at the end of the conference<sup>776</sup> (\*\*) with arrows and diagrams (the kind of  $\square$ trucs that were made in the sixties and which had long since been dropped) of serious people), this quidam announced without laughing that the famous "highlight" of the Colloquium (which nobody would have been able to repeat, which only made it all the more impressive... ) - that this "highlight" was

p. 1055

<sup>773</sup>(\*\*) (June 4) On this subject, see a previous footnote (note(\*) page 1052). It is especially in the wake of the Colloque Pervers, it seems to me, that the style of deliberate obscurity has been perfected, on this side of the Pacific, into a method of systematic mystification and appropriation to befuddlement.

<sup>774</sup>(\*\*\*) M. Kashiwara, T. Kawai, On holonomic Systems of microdifferential equations III, System with regular singularities, Pub. RIMS 15, 813-979 (1981).

<sup>775</sup>(\*) For Mebkhou's definition of the regularity of a holonomic complex of  $D$ -Modules (along a divisor  $Y$ ), see the note "L'oeuvre. . ." (n° 171 (ii)), p. b. note (\*) page 950. "Regular" in short means: regular along **any** divisor (on any open).

<sup>776</sup>(\*\*) (June 4) In fact, Mebkhou had taken care to allude to this at the start of his talk, naively thinking that it would have the gift of hooking his listeners.

an immediate corollary of a category equivalence theorem (we're asking you!) he'd obtained between the corresponding **derived categories** (what's with these animals?), and another that didn't seem to have much to do with them.), and another one that didn't seem to have much to do with them, a theorem that would appear in a **thesis** (that's the last straw!) that he swears he sent to Mr. Kashiwara and many other eminent colleagues in the large audience some time ago, sounds like a bad joke. There's an awkward silence, a few knowing smiles. It is (no doubt) to dispel the embarrassment caused by the young rascal that Mr. Kashiwara himself asks the customary question. He looks a little stunned, though, and must be wondering if he's dreaming<sup>777</sup> (\*). . . As for the quidam, he doesn't let it faze him. It's just that he's not going to start a second lecture over the first one - that'll be the day!

The next minute, our quidam Zoghman found himself all alone in front of the blackboard, with his beautiful diagrams in front of a deserted room... . No one that day, or in the days that followed, deigned to inquire about the ins and outs of the so-called "results" of the lout, whom we had been so wrong to invite to such a distinguished Colloquium.

It must have been going through Mr. Kashiwara's mind, once the buzz of the occasion. Just a few months later, at the Goulaouic-Schwartz seminar in 1979-...  
80, in an oral presentation on April 22<sup>778</sup> (\*\*), he announces **as his own** this  $\square$  same theorem, which had p. 1056 was enough to send a chill down the spine of a certain Colloque! Yet he is "kind enough" to add, on page 2:

"Note that the Theorem is **also demonstrated** by Mebkhout **by a different route**" (emphasis mine)<sup>779</sup> (\*).

This "also demonstrates" is worth its weight in Kashiwara, even though it's a theorem that neither he nor anyone else suspected, and which he had just learned (a few months before) from the person concerned himself, having not bothered to read the thesis the latter had sent him nearly a year ago! If he'd known about this theorem beforehand, he certainly wouldn't have bothered to give a 167-page demonstration to prove a "cow" analysis result that was an immediate corollary, and even the corollary of a corollary.

The phrase "by a different route" is also priceless. Zoghman assures me that there is no demonstration of his theorem in the literature other than his own, and I doubt very much (given the kind of demonstration, with which I am quite familiar, and for good reason) that any will ever be found. It's a demonstration that corresponds to a geometrical approach to things, using Hironaka-style singularity resolution - a tool that has become second nature to me (and my students), and which analysts (and especially those of the Sato school) ignore. So much so, in fact, that Kashiwara obviously didn't feel capable of simply **copying** Mebkhout's demonstration... ..

<sup>777</sup>(\*) (June 4) Mebkhout writes to me along these lines (April 22):

"After the Les Houches conference someone told me that the same Kashiwara thought his article with Kawai was empty. But he spared no effort to dishonestly catch up. It had been five years [since his 1975 paper proving his constructibility theorem] since he had touched discrete coefficients. His sudden celebrity [with this article] due to a whole other problem allowed him to get down to more "serious" things - especially not bombing! Between 1975 and 1980 I was the **only one**, in the midst of general hostility (something I understood afterwards) to develop that childish philosophy I learned from your writings."

<sup>778</sup>(\*\*) (June 4) Séminaire Goulaouic-Schwartz 1979-80, presentation by M. Kashiwara on April 22, 1980, "Constructible bundles and holonomic systems of linear partial differential equations with regular singular points". For details of this memorable seminar session, where **Mebkhout was present**, see the note "Carte blanche pour le pillage", n° 171<sub>4</sub>.

<sup>779</sup>(\*) I quote here the text of the written presentation, which was written by Kashiwara a year after the oral presentation. For details, see note quoted in the previous b. de p. note.

This kind of whitewash scam can work, **as long as there's a general consensus behind it**, at the expense (in this case) of a vague unknown. The whole<sup>780</sup> (\*\*) world would be wrong to shy away, while the aforementioned  $\square$ inconnu is left out in the cold by the very people who know best. first-hand facts, and who have a direct personal responsibility towards the person concerned: J.L. Verdier (chairman of the thesis jury) and P. Deligne (the first to feel the significance of the result he had learned from Mebkhout the previous year).

While I'm on the subject of Kashiwara, I might as well end this chapter with the epilogue to the total elimination of the service unknown, following on from the dazzling example given three years earlier at the Colloque Pervers in June 1981. This is an article by R. Hotta and M. Kashiwara "The invariant holonomic System on a semi-simple Lie algebra" (*Inventiones Mathematicae* 75, 327-358), published in 1984 (received 2.3.1983). This article, as is clear from line 6 of the introduction, is one of the many applications of the age-old "Riemann-Hilbert correspondence" known as the good Lord's (or service's) stranger's). In this article, **the name of the said unknown is no longer mentioned**, nor does it appear in the bibliography. Already aware of the mentality of the second author, but unable to prejudge the bad faith of the first, Zoghman wrote to him to inform him that he was the author of the theorem crucially used there, and to object to the fact that he was not cited as such. Instead, reference was made to Kawai-Kashiwara's paper (167 pages long), in which the theorem was not mentioned at all<sup>781</sup> (\*). Hotta replied that it hadn't seemed necessary to quote it, since **it was well known that the correspondence in question was due to Kashiwara and Mebkhout**. Curtain...

**(c)** But Japan is far away, and if my friend Zoghman has been toiling for years breaking spears in the center of distant Japan, it's probably because he's

it was far more painful for him to face up to the reality of a mafia that is by no means confined to continents on the other side of the world, but is just as much at the top of its game  $\square$  in the posh seminaries of Paris, as in Moscow or the

Tokyo. It's time to return to the sweet land of France, and to the "little family" formed by my dear cohomological ex-students, and (the slightly larger one) that has formed around them since the distant days of my "death".

News travels fast sometimes. During 1979 and 1980, with the help of Deligne and the Colloque des Houches, "they" must have come to realize that a promising theorem had just appeared on the mathematical market, due, alas, to a vague, retarded Grothendieckian; but that there was a ready-made substitute for this less-than-enthusiastic paternity, in the person of the well-known Japanese analyst Kashiwara, who was only too happy to play the father of the famous "Riemann-Hilbert correspondence".

In January 1980, Mebkhout gave a talk on his unfortunate theorem at Le Dung Trang's "Séminaire des Singularités" at Paris VII. Jean-Louis Brylinski did not attend the talk, but Lê Dung Trang spoke to him about it and had him read his notes. From what he himself told Mebkhout, as soon as Brylinski learned of Mebkhout's theorem, he exclaimed: "But with this, we'll prove the Kazhdan-Lusztig conjecture! (A conjecture that the augurs rightly considered "unapproachable").

<sup>780</sup>(\*\*) (June 4) For a "défi lé" of the actors who participated directly and actively in the mystification-scam surrounding Zoghman Mebkhout's work (or at least, those of whom I was aware), see the note "La maffia" (n° 171), part (f) "Le défi lé des acteurs - ou la maffia". This challenge is not complete - for a more complete list (including the names of thirteen internationally renowned mathematicians), see the note "Le jour de gloire" (n° 171 (iv)), note de b. de p. (\*) page 962. Still missing is the name of R. Remmert, who appeared in the meantime (see the note already quoted "La maffia", part (c1) "Les mémoires défaillantes - ou la Nouvelle Histoire") - and fourteen! (Not counting an anonymous referee - and fifteen. . .)

<sup>781</sup>(\*) (May 25) As has already been explained elsewhere (in "The five pictures (crystals and  $D$ -Modules)" note n° 171 (ix), see in particular page 1005), the work in question contains only "half" of God's theorem, half plundered from the chap. III of Mebkhout's thesis.

You'd think Brylinski would go to him, to have him explain in more detail the mysteries of the holonomy and regularity conditions, giving a precise meaning to the theorem he needed. But according to what he himself candidly explained to Mebkhout, he was "advised" not to approach him, but the eminent Kashiwara. He did not specify who this "one" was. But he obviously had a keen ear (as well as a sharp mind), and was as unknown at the time as Mebkhout still is today. He wasn't told twice, and went to ask Kashiwara, who must still be around. This was his strict right. The result was a joint article with Kashiwara, published in *Inventiones Mathematicae* "64, 387-410) in 1981 (received December 19, 1980), with the title "Kazhdan-Lusztig conjecture and holonomic Systems". Brylinski found himself an overnight star Kashiwara added another jewel to an already impressive list of achievements<sup>782</sup> (\*).

□ Everything would be for the best in the best of worlds, but... I guess the same "we" must have to suggest that the less said about a certain vague unknown, the better. In any case, in the manuscript sent to *Inventiones*, **Mebkhout's name did not appear**, either in the text or in the bibliography.

p. 1059

Mebkhout was aware of the article's preprint, and complained to Brylinski about the procedure, writing to R. Remmert, editor at *Les Inventiones*. Brylinski reacted "flexibly" (in a style with which I'm now quite familiar. . . ), by adding on proofs at the end of the bibliography (out of alphabetical order) three thumbnail references to Mebkhout (while we're at it!), without making the slightest allusion in the text to the so-called Mebkhout<sup>783</sup> (\*). A reader of this article, if by chance he sees the name of an illustrious unknown added to the end of the bibliography for God knows what reason, will say to himself that it must have been put there to please a friend... ..

**Brylinski's entry into fame was a scam.** The truth is that the conjecture he demonstrates was unaffordable until a new tool appeared. Irrespective of the **authorship** of this tool, nothing in this article highlights this new tool, whose role is concealed from the outset (lines 6 to 8) by the "explanation" (sic) neither flesh nor fish :

"The method employed here is to associate holonomic Systems of linear differential equations with R.S. on the flag manifold with Verma modules, and **to use the correspondence of holonomic Systems and constructible sheaves.**"

(emphasis added). There is not the slightest reference or explanation about this famous "correspondance" unspecified. "It" must have been made clear to the young premier that this "correspondence" was now supposed to be one of those things well known to all, for which it was by no means <sup>necessary</sup> □ d, invoquerp . 1060 a particular theorem, thereby raising incidental and (above all) premature questions of authorship. And Brylinski, who is a young man with a future, hasn't been told this twice. ...

As for Remmert, he forwarded the unknown complainant's letter to the referee of the Brylinski-Kashiwara article. The referee rejected the complaint, expressing the opinion that "the result **was independently known, and pro-**

<sup>782</sup>(\*) To associate the Kashiwara celebrity with the demonstration he had just found, and in which Kashiwara had had no part, while passing over in silence the crucial role played by his unknown young colleague, was the "entry price" Brylinski paid, without being asked, for his entry into a certain "milieu" of famous people - the milieu which gives its name to the present note "La maffi a" . . .

<sup>783</sup>(\*) The introduction to Brylinski-Kashiwara's article ends with thanks to various authors, including Jean-Louis Verdier (and, needless to say, with no mention of the service unknown). She continues with par. 1, devoted to a summary of "holonomic differential systems with regular singularities" (that's the name in Japanese, for  $D$ -regular holonomic moduli). In the opening lines of this paragraph, we read: "For the details and proofs, we refer the reader to [6, 15-17]." Reference [6] is Kashiwara's 1975 paper establishing his constructibility theorem, while [15- 17] (added on proofs) is the "thumb-reference" to Mebkhout. Whatever happens, honor is safe for the "young man of the future" Jean-Louis Brylinski... .

bably earlier, by Kawai and Kashiwara", referring to the "Reconstruction theorem" he attributes to these authors (referring to p. 116 in the article by the authors cited, in the "Seminar on Micro-local Analysis" Guillemin, Annals of Math: Etudies, n° 93).

This assessment by the respondent, who is supposed to know what he is talking about, is scandalous on two counts, and shows that

p. 1061 that he is part of the same swindle, in collusion with (for the moment) Kashiwara and Brylinski. It would already be scandalous, on a mere **presumption**<sup>784</sup> (\*) of anteriority of results obtained independently- Such practices obviously open the door (and have long opened the door . . . ) to the most serious abuses<sup>785</sup> (\*). But there's more. The "theorem

<sup>784</sup>(\*) (June 4) I'm even ignoring the fact that this presumption was unfounded. Remmert's letter (dated 26.1.1981) transmitting the referent's reply does not, moreover, mention the date of the Guillemin seminar (quoted in the letter) and of Kashiwara's talk. In extremis, I have just contacted Mebkhout in Italy (by telephone. . . ) to ask for details of this reference and its date. I learn that Kashiwara's presentation takes place in 1978, a few months after Mebkhout had sent him Chap. III of his thesis (in January 1978) - Mr. Kashiwara didn't waste any time! As the thesis was not defended until February 1979 (due to the slowness of the apparatus represented by the Commission des Thèses des Universités Parisiennes, so dear to J.L. Verdier... ), this could give a plausible basis to the "presumption" of anteriority of the referent, at least as far as the "Reconstruction Theorem" is concerned. But if the referee (in addition to being in good faith, which he obviously isn't) had done his job conscientiously, he would have noticed that there is nothing resembling a **demonstration** of the "Reconstruction Theorem" in Kashiwara's exposé.

Mebkhout returned to the subject in a letter dated 3.25.1981, stressing (1°) that the theorem invoked by the referred was "one of the most important results of his doctoral thesis" and that he had communicated this result, with its proof, to Kashiwara (but he forgets to say **when** - Zoghman never does others!), and 2°) that this theorem was "largely insufficient to establish the equivalence of the categories in question". R. Remmert did not deign to reply to this letter, from a nameless, unsupported complainant.

Zoghman told me earlier (and I'm sure I'll find out everything I need to know by insisting...) that he learned about the Kashiwara swindle at the Guillemin seminar the following year, in 1979, the year he defended his thesis. This was his very first encounter with the kind of procedures used in "la maffia". By the time of the Colloque des Houches in September of that year, he already knew what to expect from the great Kashiwara star. But as his philosophy and results were written down in black and white and published, demonstration and all, he never imagined that there could ever be any question of simply dismissing his work, once its importance was recognized. And the first sign of the power of his approach came precisely at the Colloque des Houches, in connection with the Kashiwara-Kawai theorem.

Of course, in January 1978, Mebkhout (who still had no reason to be suspicious) had told Kashiwara not only about what he called the "biduality theorem" (later renamed the "reconstruction theorem" for the purposes of a scam), but also about the complete God theorem, of which it was basically one "half" (the shallower "half" of the two). He told me that, for the biduality theorem, Kashiwara had "got the hang of it" - it looked as if he'd already asked himself questions like that - but obviously he hadn't the faintest idea how to demonstrate it (Mebkhout's demonstration, however, doesn't use singularity resolution). As for the God Theorem, it went completely over his head - so much so that he'd forgotten all about it by the time of the Colloque des Houches. And yet Mebkhout had sent him, and everyone else, his complete thesis at the beginning of the same year (1979) (at a time when he hadn't yet realized what a fraud the Guillemin Seminar had been the year before). Another thing that shows that the good God's theorem had completely escaped the kingpin's notice is that he didn't even think of pocketing it, so to speak (even if he didn't understand what it was all about. . . ), in the same presentation at the Guillemin Seminar.

As I haven't yet had the benefit of holding Kashiwara's paper (\*) in my hands, I wondered whether it might not give an uninformed reader the impression that the philosophy developed by Mebkhout would have been known to Kashiwara (and by his own means, as he says) at least as early as 1978. Zoghman has promised to send me a copy of the presentation in question, which, he assures me, will enable me to disabuse myself. There is (he says) an accumulation of technical statements, more or less (in)comprehensible (Kashiwara could do no less. . . ), without demonstration and without any apparent constructive file, nor anything (any more than in his Helsinki lecture of the same year, or in that of the Colloque des Houches the following year) resembling a "philosophy of coefficients" linking continuous coefficients and discrete coefficients.

(x) (June 16) Mebkhout tells me that the presentation was in fact given by **Kawai**, as a joint effort with Kashiwara.

<sup>785</sup>(\*) This is exactly the same attitude as that, expressed three years later with the same cynicism, by R. Hotta (in the reply to Mebkhout quoted above): the new "rule", or better said "the law of the middle", is to quote people in positions of power (even out of place) and not to quote the unknown (even though their contributions are decisive and attested by irrefutable publications).

I do not question R. Remmert's good faith on this occasion. However, as publisher of Les Inventiones, he is directly responsible for this swindle, regardless of the fact (of which he could not have been aware) that he was involved.

de reconstruction" he cites (and <sup>which</sup> is also plundered in Mebkhout's thesis<sup>786</sup> (\*), where it appears under the (improper) name of "biduality theorem") is still far from the category equivalence (known as "Riemann-Hilbert") used in the proof of the offending Brylinski-Kashiwara article, an equivalence due to Mebkhout alone, and which he in no way implies<sup>787</sup> (\*\*). As far as I'm concerned, the referee's bad faith in relying on the connivence of the cohomological establishment to boycott the name and work of a vague unknown for the "benefit" of famous people, cannot be doubted. Anyone with a minimum of cohomological-analytical culture, and a minimum of interest in a fascinating theme, can convince themselves of the reality of the facts, and see the crude deception to which the anonymous referent contributes<sup>788</sup> (\*\*\*). The situation is all the more unambiguous in that neither Kashiwara nor any other Japanese or Japanese specialist other differential systems, the word "derived category" was not uttered until 1981<sup>789</sup> (\*\*\*\*), and then only for the first time.

less is there the slightest thought in the direction of a "philosophy" linking discrete and continuous coefficients -p. 1063 which philosophy is equally absent, to tell the truth, from the vague, muddled references to a certain "correspondence (sic) between holonomic systems (resic) and constructible bundles (reresic)" - none of these fine gentlemen has had the honesty to this day **to even spell out in black and white** (as I did earlier) **the categories involved**, and the arrows from one to the other that establish their equivalence. On the other hand, a whole series of Mebkhout's seminar papers, notes and articles since 1977 attest to his pioneering work, carried out since 1972 in complete solitude<sup>790</sup> (\*).

I have to confess that, until I came face to face with the thing, and looked at it and examined it at length and from every angle<sup>791</sup> (\*\*), I would never have suspected, even in a dream, that such shameless collective spoliation could ever take place in the world of scientists. And it's a strange thing to have to tell myself that this iniquitous mystification was staged above all by the combined efforts of two of my closest pupils of yesteryear; and moreover, that the signal was given by **the appearance of a continuator of my work** - a work in which I had invested myself with passion, putting my very best into it. to give<sup>792</sup> (\*\*\*). After my departure, this work became the target and prey of the covetousness of those

p. 1064

---

doubt) that he had been misled by a dishonest referee. The referee had expressed "the hope" (cynical, given the circumstances) **"that, as a courtesy**, Brylinski and Kashiwara would mention Mebkhout's result". It was R. Remmert's role as editor to ensure that Mebkhout's result was duly mentioned in the text, not as a "courtesy", but **out of respect for the elementary rules of ethics of the mathematical profession**.

(May 30) Since these lines were written, I've learned of a new fact that sheds unexpected light on R. Remmert's role in the Zoghman Mebkhout scam, by showing his active participation in the scam surrounding mine. As a result, the presumption of good faith that I had been keeping in his regard (out of old habit, and in the absence of irrefutable signs to the contrary) vanished for me. Interested readers will find details of this "new fact" in the following section ( $c_1$ ) (of the note "La maffia"), entitled "Les mémoires défaillantes - ou la Nouvelle Histoire".

<sup>786</sup>(\*) On the subject of this pillage, see the note "The five photos (crystals and  $D$ -Modules)" (n° 171 (ix)), end of part (b) ("La formule du bon Dieu"), p. 1005.

<sup>787</sup>(\*\*) See the note already quoted (also part (b)) for the relationship between Mebkhout's "biduality theorem", and the "God's theorem", of which it constitutes one half - the shallower of the two. It makes no use of resolution, whereas the complete theorem uses the full force of Hironaka's resolution of singularities (a typically "geometric" tool, which was ignored by the Japanese school at least until the early '80s).

<sup>788</sup>(\*\*\*) (May 30) And to which R. Remmert, as publisher of Les Inventiones, gives his unreserved support. ...

<sup>789</sup>(\*\*\*\*) (May 25) Mebkhout points out that this sweeping statement needs to be qualified. While derived categories were practically taboo in France after my departure, the Japanese school continued to use them sparingly. This was a convenient technical means (to avoid recourse to spectral sequences, in particular), but by no means the "tailor-made" language for an intrinsic geometric vision of "coefficients", in cohomology of varieties and spaces of all kinds.

<sup>790</sup>(\*) For a list of these articles, which I won't go into here or even enumerate, I refer you to the aforementioned article by Mebkhout and Le Dung Trang (in Proceedings of Symposia in Pure Mathematics, 40 (1983) part 2). (May 25) See also the bibliographical references given at the end of the pages in the note "Three milestones - or innocence" (n° 171 (x)).

<sup>791</sup>(\*\*) (June 1) I first did this last year, in the week from May 2 to 9 (writing "Cortège VII", called "Le Colloque - ou faisceaux de Mebkhout et Perversité"), and again almost two months ago, writing "L'Apothéose",

<sup>792</sup>(\*\*\*) While retyping this (rather heavily crossed-out) page, the thought occurred to me that if my investment in this

even those who were closest to me, and of a secret violence which, beyond my person and my work, comes to strike even those who openly drew inspiration from it. ...

**(c1) Les mémoires défaillantes - ou la Nouvelle Histoire** (May 30) Six weeks after writing the preceding pages, I'd like to take a break from the story of my friend Zoghman's misadventures, to dwell a little on the "new development" alluded to in a previous footnote (note<sup>793</sup> (\*) page 1061). The pages that follow can be read as an interesting complement to the flowering of the "new style" referred to elsewhere(\*), which excels in the art of writing (to everyone's satisfaction. . . ) a "New History" (of a certain theme in contemporary mathematics, in this case. . . ). Readers eager to know more about the misadventures of my friend Zoghman (lost in a circus he couldn't have foreseen) can continue directly with "La Répétition Générale (avant Apothéose)" (part (d) below, dated April 16).

I have read the introduction and bibliography of the book "Non Archimedean Analysis" by S. Bosch, U. Guntzer and R. Remmert<sup>794</sup> (\*\*). This book sets out the theory of rigid-analytic spaces, rightly presenting J. Tate's 1962 ("private") notes, "Rigid-analytic spaces", as the starting point for the theory. The introduction states that R. Remmert "was able to obtain a copy" of this rare document, which had represented a sort of Birth Certificate for a newcomer to the notions of "varieties" (analytic, in this case).

p. 1065

Remmert must have forgotten that it was I who had taken care to have this document multigraphed by the IHES (which was just starting up) and to send a copy to him and to other specialists in complex analytical spaces - just to draw their attention to this unexpected extension of their favourite theme. This was at a time when none of them was even pretending to be interested in basic bodies other than the real or complex ones - but you never knew... .

Remmert must also have forgotten that if I was then so interested in circulating among my friends this text attesting to the blossoming of a new geometric "universe", it was (among other things) because I had been closely associated with this birth. The very name of rigid-analytic space had been coined by me, before Remmert or anyone else (not even Tate!) had heard the name or even dreamed of the **thing** it was meant to express. I was the first to see Tate's "loxodromic" theory of elliptic curves as having to be a "quotient passage" for a kind of "analytic" varieties that didn't yet exist, and which should give rise to algebraic-analytic comparison theorems of Serre's "GAGA" type. There was another motivation pointing the way to the same kind of new objects: the need to be able to define a "generic fiber" for formal schemes of finite type over a discrete valuation ring.

---

work bore (among others) such unforeseen and unwelcome fruit, it's undoubtedly because in this investment itself and in the spirit that animated me, there was not only this "best of myself" that I like to underline here, but that there was also "worst". This is something that had become quite clear in *Fatuité et Renouveau* (the first part of *Récoltes et Semailles*), but it's also something that powerful egotistical mechanisms keep pushing me to forget! I'm beginning to realize that this "worst" has only been **glimpsed in the** course of last year's reflection, that I haven't done a really thorough examination of it, or a "tour" that reveals its various faces to me in any real detail. That's why the knowledge I have of it remains superficial, as does the action of that knowledge (in my relationship to the Burial, in particular).

This fourth part, "The Four Operations" of Seeding Harvests, represents above all a meticulous recoiling of rough **facts** related to Burial. This "stewardship" work has, however, helped me to feel that a deeper understanding of Burial will come not so much from the kind of work I've been doing for nearly three months, but from a deepening of the work done in *Fatuity* and *Renewal*, that is to say, also from a deepening of my knowledge of who I was, in those distant days "before my departure".

..  
<sup>793</sup>(\*) See the note "Les félicitations - ou le nouveau style", n° 169, .

<sup>794</sup>(\*\*) Grundlehren der Mathematik, n° 261 (1984).

As a third indication along the same lines: I had heard that Krasner (well known in Parisian mathematical circles in the fifties and sixties, as an original who hosted an army of cats in his home, and who went around all the seminars with his big Russian-style coat and his always hilarious air.... ) - that this Krasner was "doing analytic extension" on non-archimedean valuated bodies. That's all I knew, and I'm not sure I'd ever met anyone who'd read Krasner's work on the subject - but it was intriguing. It has to be said that the term "analytic continuation" didn't in itself have the virtue of making my heart beat faster (on the contrary, it brought back unstimulating memories of my student days. . . ). ); but once I saw the need for a new type of geometric object, it was bound to click...

Returning to Remmert - if his memory is so faulty, Tate's original text (which he to boast of possessing) could, however, refresh her. In his notes, Tate makes no secret of the role that I had played in the conception of the theory<sup>795</sup> (\*), writing among other things (I quote here from memory) that it followed "from p . 1066

in a fully faithful manner" a master-builder (for a process of constructing the notion by "putting pieces back together") that he had inherited from me. I had also provided him with a certain type of "building stone" (or "localization procedure" in algebras of restricted formal series), for the purposes of formal schema fibers. He had supplemented these first "building blocks" (or "processes") with those of a second, somewhat complementary type.

This new notion would probably never have seen the light of day (nor would stellar cohomology, nor crystalline cohomology, nor many other things that followed in its wake, including even the latest "pie in the sky", the famous D-Modules... ) if it hadn't been for the common thread of "generalized spaces" (which later became **topos**), the theory of which had yet to be worked out, but had already been foreshadowed for four years. It was this intuition that showed me the way to a type of "variety" that, precisely, **broke out of** the context of ordinary (locally annelated) topological spaces.

From the moment when the **local theory** of rigid-analytic spaces had been started by John Tate, I was also the one who posed and popularized the statements of the first crucial "global" theorems to be proved about these new varieties, statements that had been present in my mind even before a first groundwork had been accomplished: algebraic-analytic comparison theorems for proper relative schemes on a rigid-analytic space, finiteness theorem for  $Rf^i_*$ , for a morphism of rigid-analytic spaces - problems solved by Kiehl in the years that followed<sup>796</sup>

<sup>797</sup>. But it is true that following the wind that blows these days, it is considered a thing of no importance, p . 1067

<sup>795</sup>(\*) More than twenty years have passed since those distant days, when a close friendship bound Tate and me, and his family and mine. It's been years since I received any sign of life from him. Nor am I aware that he, or any of my students and friends of yesteryear who could not fail to have read this book, has been moved by the evasion of my person in the introduction. Other times, other customs...

<sup>796</sup>(\*\*) I should point out that from the moment Tate laid the first foundations of a theory of rigid-analytic spaces, it was clear to me that the context in which he was placing himself was still provisional, and by no means exhausted the intuitive content I had tried to express by the name "rigid-analytic space" - any more than fin diagrams on a body exhaust the intuition associated with the word "diagram". A leading fil towards a substantial extension of Tate's context (which I have put in before to anyone who would listen. . . ) was provided by Tate himself, who had written a "universal Tate elliptic curve" on a certain topological ring (the sub-ring of the ring of formal series  $\mathbb{Z}[[t]]$  which are convergent for  $t$  in the open unit disk of the complex plane, if I remember correctly), which ring was obviously to be considered as "the ring of 'affixed coordinates' of a rigid-analytic space, of a type that didn't fit into the panoply proposed by Tate. Given the general contempt into which all questions of foundation fell after my departure, it's not surprising that the conceptual apparatus set up by Tate in 1962 hasn't moved a muscle since.

<sup>797</sup>(\*\*\*) (June 4) I was also the first to insist on the need to introduce, for rigid-analytic spaces, more general "points" than those envisaged by Tate (with values in finite extensions of the base body only). This necessity was suggested as much by the analogy with algebraic geometry, as by the desire to find a concrete interpretation of the "points" of the topos associated with the rigid-analytic space under consideration.

and, in the final analysis, simply smoky, than to foresee new concepts, to identify project managers, and to ask the questions that real mathematicians can solve. ...

In any case, my name is not mentioned in this introduction as having anything to do with rigid-analytic spaces. Nor, for that matter, is Krasner's - on the contrary, Tate's theory is presented as introducing "a structure rich enough to make the impossible possible: analytic continuation on totally discontinuous bodies" - even though, in 1962, said analytic continuation ("impossible") had already been Krasner's official "raison social" (so to speak) for ten years, if not twenty or thirty (I couldn't say). Nor is there any trace of Krasner or me in the abundant bibliography. My name does, however, appear in passing towards the end of the introduction, in the name "Grothendieck topologies"; for this notion reference is made to Artin's notes (from 1962), superbly ignoring (following the example set by the cohort of my ex-students in their entirety... .) the meticulous fine-tuning work done in SGA 4 (since 1963 and throughout the sixties, but under an obviously undesirable paternity. . .). No allusion either, of course, to the role I assigned to rigid-analytic spaces in the development of crystalline cohomology, at a time (1966) when Remmert (nor any of his eminent complex-analytic colleagues) was not yet showing the slightest inclination to take an interest in these strange (so-called) "rigid-analytic" varieties (we're asking you a bit . . .), that certain algebraic geometers had concocted in their corner - as if complex analytic spaces weren't enough to occupy the leisure time of serious analysts and geometers. ...

p. 1068

□ It is enough to be informed first-hand about the true story of the genesis of the theory set out in the book, to see how this introduction displays the same cynicism that was also expressed in the response made by an anonymous referee to an unknown complainant (with the blessing of the same R. Remmert): obviously, in the minds of the authors, it's a simple question of "courtesy" again, of a "kindness." In short, they are free to grant or refuse, whether or not to include in their "history" (sic) the name of someone who played a crucial role in the genesis of the new theory. For them (and, it would seem, for almost the entire mathematical establishment, who take this kind of falsification in stride... .), "History" is not **what actually happened**, but something that can be **decided** sovereignly by whoever arrogates to himself the right to write it, or by the consensus of a handful of people who decide what has a right to be, as well as what has a right to have been.

These people like to make hot sips about what happened and is still happening in the Soviet Union, and won't miss a beat (I know what I'm talking about) to sign manifestos for the "defense of freedoms" (of thought and all that. . .) **in other countries**, while exercising the same dictatorship of lies, where it's **they** who have the power.

(June 3) When I mentioned Krasner's endearingly picturesque figure on the previous pages just a few days ago, I wondered whether he was still alive. He was a generation or two older than me, and it had been ages (well over fifteen years, if not twenty) since I'd heard his name. Although I remembered him vividly, it took me a few seconds before I remembered his name (admittedly, this is the kind of thing that happens to me a lot now, with age. . .). Krasner had a reputation for being very hospitable, and his Russian origins were another point in common that could have brought us together. But I was too immersed in my maths to have the time to make friends just "for the fun of it". Our approaches to mathematics must surely have been poles apart. We must have chatted once or twice, between two sessions of a Bourbaki seminar if that's what it was, but surely not about maths. And it was hardly just maths that really got to me then... ...

□ Today I receive a little note from Deligne, just a few lines on a question...  
I did this for no practical reason, perhaps to remind myself (it must be a few months since we last exchanged letters); or to place a postscript, which I'm taking the liberty of reproducing here (presuming his agreement):

"P.S. I was saddened to learn that Krasner had died two weeks ago. I still remember a lecture he gave in Brussels some twenty years ago, which of course went over my head, but in which I was one of the few remaining listeners. It struck me that he didn't appear in your picture of the fifties<sup>798</sup> (\*), where he was doing some fine things - albeit alien to the spirit of Bourbaki, and with a genius for badly twisted definitions."

So here's another eulogy, this time for one of my co-burials. In this one, I think I see a feeling of sympathy, or perhaps the reflection of such a feeling that had once been alive. But no more than in my Funeral Eulogy, my friend Pierre will bare his teeth to say, in honor this time of a departed without return, **what** were those "beautiful things" to which he likes to allude without naming them. He knows as well as I do, however, that these "things" paved the way for the advent of a theory that is now in full bloom - and that, for reasons he may know, the New Masters have prematurely buried (alongside me) this good-natured, muddled and "messy" precursor who has just passed away; one, surely, who was "doing analytical continuation" on ultrametric bodies, at a time when Tate, Remmert or I were still "doing" the equality cases of triangles and the Pythagorean theorem, and when our friend Pierre was still getting his nose wiped (and wiped . . . ) by his mother!

**(d) La Répétition Générale (avant Apothéose)** (April 16) But I must return to the series of worm-like "misadventures" of my posthumous pupil Zoghman Mebkhout. I have no idea what what went through Deligne's mind in □ June 1979, when he learned from the mouth of a vague stranger, se Grothendieck's ideas, the elegant solution to a crucial problem<sup>799</sup> (\*), on which he had toiled for a year ten years earlier without arriving at a satisfactory answer. Given his long-standing disposition, one suspects that he wasn't going to congratulate the young man for succeeding where he, Deligne, had failed. But I get the impression that his gravedigger's disposition is such a counterweight to his flair (which I'd known to be astonishing), that even now (six years later) he hasn't grasped the true scope of the vague unknown's ideas and vision. Like everyone else, in the end he only saw "the cream pie", the unexpected tool everyone was waiting for, the iron to fracture "problems of proverbial difficulty". One day, however, he had made his own a vast vision that someone else had communicated to him - only to bury both the vision and the person in whom it had been born, and seize yet another tool, also transformed into a "fracturing iron". . .

The first known trace of Deligne's reaction to Mebkhout's theorem is a short, undated handwritten letter to Mebkhout, received on October 10 1980<sup>800</sup> (\*\*).

<sup>798</sup>(\*) There's an obvious misunderstanding here about what I meant in the first part of *Récoltes et Semailles*, "Fatuité et Renouvellement". At no time was my aim to paint a mathematical "picture of the fifties", be it only that of the Parisian milieu or that formed around Bourbaki. My main aim has been to discover my past as a mathematician. This is what led me to talk about my relationships with colleagues or students, when these appeared to be important in my life, or could shed light on myself.

<sup>799</sup>(\*) (May 25) It's possible that Deligne had long since lost the sense for this "crucial" character. See note ". . . et entrave" (n° 171 (viii)).

<sup>800</sup>(\*\*) This is the document "communicated under the seal of secrecy, and of which I will not say another word here. . .", mentioned in the note "La victime" (page 309). With the benefit of a year's hindsight, Zoghman has kindly allowed me to reproduce it here.

"Dear Mebkhout,

I've sent Bernstein and Beilinson my copy of your thesis: they need your results for their proof of the Kashdan-Lusztig conjecture (I have a summary, in Russian, of their work, which I'll send you if you like). Could you send me another one?

Thank you.

P. Deligne"

I assume, from this letter, that Deligne must have informed the two Soviet mathematicians about the Good God Theorem, perhaps suggesting that it could be used to prove the conjecture in question; either he realized it himself, or it was already rumored that Brylinski had ideas on the subject. Mebkhout's talk, which had "triggered" Brylinski, was already in January 1980. The articles in

p. 1071

Brylinski-Kashiwara on the one hand, Beilinson-Bernstein on the other, proving the famous conjecture using the unnamed theorem of an even less named unknown, <sup>were received</sup>, one on December 19, 80, the other on December 8, 1980, eleven days apart. Coincidence?

The thought even occurred to me why Deligne, who knew about the new tool before anyone else, as early as June 1979 (since no one, including Deligne, had bothered to read the paving stone of the vague unknown) - why didn't Deligne himself think of applying it to this conjecture, and thus reap new laurels instead of helping his Soviet colleagues to pick them? His mind is no less sharp than Brylinski's? It could be that, from that moment on, he saw the possibility of reclaiming paternity over the theorem of the good Lord himself, which (so he must have felt) should have been his for ten years already; that it was by some sort of inadmissible misadventure that this ill-behaved young presumptuous man had arrogated to himself the right to prove things that he, Deligne, had already worked on for a long time without any conclusive success. In the end, he'd only missed by a hair's breadth; it wasn't fair for someone else to reap the harvest where he'd sweated in vain... . But if he wanted to reclaim what was rightfully his (according to the unwritten law that had come to prevail in a certain high-flying milieu of which he felt himself to be the center and kingpin. . . ), he had to maneuver with an entirely different tact, and not try to swallow too much at once<sup>801</sup> (\*).

p. 1072

In any case, Zoghman, already scalded by the strange episodes with Kashiwara and Brylinski, thought it prudent to go and inform MN. Beilinson and Bernstein about the theorem Deligne said they needed - in case such a great man as Deligne forgot to mention, when telling them about the theorem, who its modest author was. The timing was perfect: the following month, from November 24 or 28, 1980, there were held the "Conference on Generalized Functions and their Applications in Mathematical Physics" in Moscow. Mebkhout gave a talk on his theorem, published under the title "The Riemann-Hilbert Problem in higher dimension", and he takes great care to speak to Beilinson and Bernstein in person to explain the ins and outs of his findings.

The timing was perfect. It was barely ten days after the conference that the two authors sent their work on Kazhdan-Lusztig, in the form of a note to CRAS (t. 292, Jan. 5, 1981, series I - 15), "Théorie

<sup>801</sup>(\*) It is, of course, a mere presumption that the appropriation of the famous "correspondence" was present from the time Deligne became aware of it. I, for one, am convinced of this. It's true that the letter quoted above would seem to give rise to a presumption to the contrary. For my part, I see in it yet another sign of a challenge - one that he, Deligne, had absolutely no need to pay any attention to, as long as it concerned a vague stranger, **who would not budge, in any case**, when he was alone against all; one that he, Deligne, could afford to "compromise himself", just as he could also afford, by the provocative appellation "faisceaux pervers", to proclaim, symbolically and yet resoundingly, the true nature of its dispositions. On this subject, see the note "Perversity" (n° 76), and (in a rather similar, but less extreme, psychic context) the note "Joking - or "weight complexes"" (n° 83).

des Groupes - Localisation de *g-modules*", Note by Alexandre Beilinson and Joseph Bernstein, forwarded by Pierre Deligne. Fittingly, Mebkhout's name was not mentioned on their manuscript - apparently Deligne had entirely forgotten to tell them about the vague unknown, whose thesis he had shared with them, precisely for the purpose of...? Comprenne qui pourra! Mebkhout struggles to convince Beilinson ("the more honest of the two", he assures me with the utmost seriousness) that in the Kashiwara-Kawai article they cited in the bibliography, there is everything but the "construction" (here replacing the age-old "correspondence") which they too, like everyone else, only allude to, (surely Deligne, while communicating to them the thesis of the unknown where the desired result was indeed<sup>802</sup> (\*), must have suggested to them that it was perhaps more reasonable, if they wanted to give a reference, to quote an article by Kashiwara, and it didn't really matter which one, since nobody would look that closely. ) Still, we promised the said stranger, who appeared there in person, that we'd think of him and put things right for Kashiwara. Sorry - the story of my friend Zoghman's misadventures is decidedly repetitive! In the note from these brilliant authors, **forwarded by Deligne** (whose letter I have just reproduced, written just a month before), **Mebkhout's name is not mentioned**. Nor is Kashiwara's, for that matter (and I can already see here a piece of ear... ). There is, on the other hand, a double off-the-cuff reference, in the last part of the note (proving Kazhdan-Lusztig), to a "**construction expounded in** [4], [5] . . . "<sup>803</sup> (\*\*)' □ "construction" which (youp you guessed it!) is none other than the never-named functor of the even less-named service unknown. Reference [4] is to an article by Kashiwara (the temporary surrogate father). In this article, of course (no more than in Kawai-Kashiwara's, which is written off), there is nothing remotely resembling the "construction" referred to by these authors; this article dates from 1975<sup>804</sup> (\*), i.e. almost five years before the presentation of a vague stranger at a Colloque in Les Houches gave this same Kashiwara the idea that it wouldn't be so stupid after all to utter the word "derived category" and thus appropriate, according to the simple law of the strongest, credit for work done by others. As for the reference [5], it's Mebkhout's talk at the Colloque des Houches in September 1979 - the very one in which Kashiwara learned that derived categories could be useful, and for something other than ripping off a stranger left behind by his bosses and elders... ..

<sup>802</sup>(\*) (April 17) There was at least a very similar result in the thesis, even if the version in the form used by Beilinson-Bernstein (and by Brylinski-Kashiwara) did not appear in full. See the b. de p. note of the same day (note (\*\*)) page 1047) for further details.

<sup>803</sup>(\*\*) The vagueness of the expression "la construction **exposée** dans . . ." is to be admired. "(or "correspondence", or "relation" . . . ); this question would be resolved with the virtuosity we know only six months later, at the famous Colloque (see the note "Le prestidigitateur", n° 75)": we would learn, in the article Beilinson-Bernstein-Deligne, that the laconic reference [4] [5] (in two places where, surely, the construction must have been (luckily) "exposed") was pure courtesy, and that the brilliant father of "correspondence" is indeed who we guess... ..

But even apart from the sleight of hand I've just mentioned, it's already a swindle in itself to refer to a new, profound and diffi cult theorem by the term "the construction set out in... .", as if it were a simple "construction" that had just happened to be lying around, and whose authors had chosen, also by pure chance, to use it here for their brilliant demonstration. I recognize in this the same spirit as that of the "SGA 4<sup>1</sup> - SGA 5" operation, which consisted in recalling (in passing) "the construction exposed"<sub>2</sub> in SGA 4 and SGA 5 of a formalism of stale cohomology (as well as the "gangue of nonsense" from which the brilliant author had been obliged to extract it), before pretending to roll up one's sleeves and start doing "**real** maths. . .".

(May 25) On the subject of this "new style", see the note "Les félicitations - ou le nouveau style" (n° 169 ).<sup>9</sup>

<sup>804</sup>(\*) Check this out: it's Kashiwara's article, quoted above, in which he demonstrates his constructibility theorem, which plays out well. The Kashiwara theorem certainly plays a crucial role in defining "God's functors" (functors which, apart from Mebkhout, nobody had ever dreamed of before the 1980 rush). It's a gross swindle to confuse Kashiwara's theorem (which no-one would dream of disputing) with the theorem of the good Lord, which is incomparably more profound, and of a completely different scope. From a demonstration point of view, this theorem uses the full power of Hironaka-style singularity resolution. From a philosophical point of view, much more important still, it establishes bridges between topology, algebra and analysis that were lacking in cohomological formalism (while waiting for arithmetic, if some of those I see fossicking end up regaining the use of their healthy faculties... . ).

□No more than in the Brylinski-Kashiwara article, nothing that would give a reader the slightest suspicion that this brilliant note would not have seen the light of day, were it not for the appearance of a new and providential tool, euphemistically dubbed "the construction exposed in... .". I also recognize the tried-and-tested<sup>805</sup> (\*) method of drowning a fish, known as "by dilution", by "mating" the person you want to drown (even though you want to be "thumbed" and be able to say, if need be, that you quoted him or her... .) with another, who has nothing to do with the question or whose role is minimal, as if to say here (between the lines, and yet quite clearly): this vague stranger we've put there (purely as a courtesy and in view of his insistence) has no more to do with this famous "construction" (about which the newcomer consensus dictates speaking only by allusion and as about something well known to all. . .), than an article published in 1975, at a time when no one in the wider world deigned to utter the word "derived category" (if only in jest. . .).

**(e) A fool's bargain - or puppet theater** I'm not sorry to have taken the trouble, for my own sake as much as for that of any mathematician reader who might be interested, to review here the three preliminary scams surrounding the service unknown theorem. These scams are by Kashiwara, Brylinski-Kashiwara (with the assistance of an anonymous referee), and Beilinson-Bernstein, with a Deligne behind the scenes<sup>806</sup> (\*\*). There's a striking uniformity of style, which I needn't go into here. It's the style I've been reading about over and over again throughout my long investigation of l'Enterrement<sup>807</sup> (\*\*\*), and which is strikingly prefigured in

the 1968 article by my most brilliantly gifted student, the same Pierre Deligne<sup>808</sup> (\*\*\*\*). And this circumstance also suffices to remind□my good memory that through an attitude of ambiguity and complacency

With regard to Deligne and others, whom I saw as brilliantly gifted, I'm not without having contributed my share to the corruption I see everywhere today.

It's also becoming clear that the apotheosis of the Colloque Pervers in June 1981, barely six months after the third episode we've just reviewed, didn't come out of the blue. Strangely enough, this colloquium was (to the best of my knowledge) the first and only one after my departure to be devoted (admittedly without saying so, yet unequivocally) to exhuming a certain aspect of "Grothendieckian mathematics", through the unforeseen opportunity of a new tool suddenly appearing, which proved irreplaceable. This tool could only be used in an approach to things that fashion consensus had long since dismissed as obsolete and vaguely ridiculous<sup>809</sup> (\*). And by a strange twist of fate, due to the particular genius of my brilliant ex-student, this dazzling confirmation in practice, and under the pressure of need, of an approach disavowed by him and by all, was also the occasion, through the medium of this same Colloquium, of the total and definitive burial of the deceased and unnamed master, in the company of the posthumous student (just as unnamed) who had had the good fortune (or misfortune. . .) to bring all these fine people together.

<sup>805</sup>(\*) For other examples of this "dilution by assimilation" method, see the sub-note "Les vraies maths. . ." n° 169<sub>5</sub>), p. b. note (\*) page 885.

<sup>806</sup>(\*\*) (June 5) Deligne's role "behind the scenes" is clear at least in the third episode, and there are strong presumptions in the same direction for the second. But it would seem that Kashiwara "opened fire" (for the Mebkhout scams) on his own behalf as early as 1978, at a time when (it seems) Deligne knew nothing about it. On this subject, see part c) of this note ("Les prix d'entrée - ou un jeune homme d'avenir"), b. de p. note (\*) page 1050.

<sup>807</sup>(\*\*\*) On the subject of this style, see the end of the note already quoted "Les félicitations - ou le nouveau style", n° 169<sub>9</sub>.

<sup>808</sup>(\*\*\*\*) See the beginning of the note "Eviction" (n° 63).

<sup>809</sup>(\*) For the psychic mechanisms at work behind these "fashion consensuses", this overlapping with a certain "reaction visceral" rejection of a certain style of approach to mathematics, see the notes already cited "La circonstance providentielle - ou l'Apothéose" and "Le désaveu - ou le rappel" (n° s 151, 152).

This symposium didn't come out of the blue, no. One of my friend Pierre Deligne's particularities is that he knows how to wait and seize the right moment. The three episodes surrounding the "tarte à la crème", with the almost complete elimination of any mention of the stranger on duty, clearly showed him that the moment was ripe to discreetly pick up, with his characteristic smiling and affable nature, what was in any case supposed to be rightfully his. I presume that Verdier was carefully consulted, and made to understand that the moment had come to exhume with great fanfare derived categories and a long-repudiated "paternity"; at the same time, to bury in the limelight both the vague unknown, and the long-deceased master (in case anyone had the bad idea of remembering that he had had something to do with all these beautiful things that were suddenly appearing in the light of the "new world").  
"the latest technology. . ).

□Kashiwara as the father-à-la-sauvette of a certain theorem-of-the-good-God-never-named, it was fine for a while, as long as it was understood that the theorem in question would neither be named nor written down. Kashiwara himself must not have been too keen on this theorem, which he understood even less than Verdier himself - he must have picked it up inadvertently, as if by accident, opportunity and habit. Deligne, on the other hand, who knows how to wait, was well aware that this theorem would not remain the theorem without an address or a name forever. It was, in short, a theorem **in search of a father worthy of it**, and which would only be able to appear in the full light of day once "true" paternity, the one that should normally have been his (and for twelve years already. . . ), was the object of a general and intangible consensus. The "perverse" article, the jewel in the crown of the Colloquium of the same name, was a first milestone in this direction, laid down by the principal interested party with his customary skill.

I have the impression that Beilinson and Bernstein, no doubt flattered to see themselves unexpectedly associated with paternity over the so-called (but wrongly) perverse beams, and with an even more prestigious kingpin, were in fact manipulated by Deligne, so that they could be used as alibis "just in case... .". As the article is written, any uninformed reader can only assume that it is none other than Deligne, of course, who is the author of the providential "correspondence", though never named or spelled out (since everyone is supposed to know it already. . . ).

All that's left is this (carefully calculated) shadow of ambiguity, in this brilliant turn of phrase, about the unnamed "relationship" that "should have found its place in these notes... ."<sup>810</sup> (\*). This was the "inch!" way of delicately and clearly implying, without actually spelling it out, that the said relation (in the absence of any mention to the contrary) was at least due to **one of the three authors of** the brilliant article, or (at the very least) to all three jointly. But it was also clear that when the time came (for whoever who can wait... ), it would be neither Beilinson nor Bernstein who would compete with a Deligne for a paternity that was already all but assured. There must have been a deal<sup>811</sup> (\*\*), tacit if not ☐ expressly formulated: to Beilinson etp

Bernstein's Kazhdan-Lusztig conjecture and (for good measure, given that there was already Brylinski-Kashiwara

<sup>810</sup>(\*) On this subject, see the aforementioned note "Le prestidigitateur" (n° 75).

<sup>811</sup>(\*\*) The presumption of such a "market" came to me by association with two analogous situations. On the one hand, the market (perhaps (The latter "sacrificed" the Lefschetz-Verdier formula, which was written off, for the purposes of the "SGA 4<sup>1</sup> - SGA 5 operation", but in return "picked up" all the "duality" inheritance of the deceased, and the derived categories (discount article) as a bonus. (For the detailed story, see the sub-notes group "La

Formule", n° s 169<sub>5</sub> - 169<sub>9</sub> .) On the other hand, there's the "deal" Deligne struck with a master who had been declared deceased, and who had in any case disappeared from circulation and was unlikely to react, concerning the SGA 7 seminar held jointly during the

two years 1967/69, which was "shared" three years later by half and half, one for the deceased, the other for Deligne and a makeshift teammate. (For details, see e.g. "Episodes of an escalation", note n° 169 (iii), episode 2.)

It also goes hand in hand with the "deal" with this same (unsuspecting) deceased for the so-called conjecture (Mac Pherson dixit) "de Deligne-Grothendieck" (see episode 1 in the same note already quoted): the first half for "the letter carrier" Deligne, who had informed Mac Pherson of a conjecture (kept secret until then by the care of my cohomology students), and the second for the deceased, in his capacity as "collaborator" of the first... ..

famous nameless "relationship", awaiting the day, soon to come and without his modesty needing to be disturbed, when everyone would call it the "Deligne theorem". And the future "father" had a good enough nose to know at least this much about this child (whom he had previously repudiated rather than agree to give birth to. . . ): that he had concluded a "good deal"<sup>813</sup> (\*\*). As for Kashiwara, his role was over, and there is no more mention of him in the brilliant article, in connection with the providential "relationship", than there is of the service unknown. All against one when it's a vague stranger, all right - but once the place has been cleared of an intruder, every man for himself ... .

**(f) The parade of actors - or the mafia** The "family album", opened just three weeks ago<sup>814</sup> (\*\*\*), has just been unexpectedly enriched by a few new faces. The "family" has obviously grown a lot, and the old-timer that I am finds it hard to identify with it, especially as times have changed for the better. changed. This time, in order of appearance<sup>□</sup>, it was **M. Kashiwara**, **R. Hotta**<sup>815</sup> (\*), **J.L. Brylinski**, and the **anonymous referee** of the Brylinski-Kashiwara article at Les Inventiones. A group of "tough guys", that's for sure, with well-honed reflexes, and what's more, a finger-in-the-eye agreement when it comes to ripping off a vague particular, at a discreet sign from the Big Boss behind the scenes (or even, without waiting for a sign. . . ).

And once again, I'm back to the allure of a **mafia**<sup>816</sup> (\*\*), reigning supreme over their uncontested fiefdom, the heart of which is the cohomological theory of algebraic and other varieties. Brilliant, hard-working people with impeccable brains, whom I saw at work throughout the four successive episodes of the so-called "operation of the unknown on duty", culminating in the Colloque Pervers. In addition to the four bigwigs I've just mentioned (including one anonymous one), I'd like to remind you of the five other members of the "hard core"; that's nine who mobilized to bury **the Intruder, the one who wasn't one of them**.

There's the Grand Chef, **Pierre Deligne** - the man who always knows how to "wet himself" the least, while pocketing the most. There's his second-in-command, **Jean-Louis Verdier**, known as "the benefactor" - the same man who chaired the jury for a certain thesis by a certain unknown man, and the same man who was one of the two organizers of a memorable colloquium shamelessly plundering that same unknown man. Then there's the other main organizer, **B. Teissier**, who

co-signed the memorable Introduction to the memorable Proceedings of the memorable Colloquium. Unlike the others, it semblerait that he acted merely as a comparse and prête-nom, while he had nothing to gain for himself - except the pleasure of pleasing people he knew to be prestigious and unscrupulous. And last but not least,<sup>817</sup> (\*) **A. Beilinson** and **J. Bernstein** (whose work I've just done in this very room).

<sup>812</sup>(\*) See "Perversity", n° 76,

<sup>813</sup>(\*\*) It's a "good deal" that at the same time seems to me to be a very bad deal, even (and especially. . . ) in the case of where everything goes to plan for the interested party, wasting precious gifts and creative energy playing gangster.

<sup>814</sup>(\*\*\*) See note of the same name dated March 22, n° 173.

<sup>815</sup>(\*) An attentive reader may be surprised not to find in this "actors' challenge" (in the swindle-mystification around of Zoghman Mebkhout's work) the name of Kawai, co-author with Kashiwara of the oft-quoted article, par. 4 of which shamelessly plunders Chapter III of Mebkhout's thesis. (See on this subject the note "The five photos (crystals and *D* - Modules" n° 171 (ix), and in particular page 1005,) Mebkhout insists that Kawai cannot be lumped in "the same bag" with Kashiwara (be it would be content to follow, eyes closed... ). He described him to me as a guy who was a bit out of his depth, and I got the impression that he'd taken a liking to him - he's basically his "good Japanese", and there's no way he'd let me touch him! That's probably why he refrained from writing to him (as he had written to Hotta, another of Kashiwara's team-mates), to point out the frauds in his article with Kashiwara, and thereby oblige him to show explicit solidarity with his team-mate and boss.

<sup>816</sup>(\*\*) This unusual impression had already occurred to me last year, in the note "Le Colloque" (n° 75) (you can guess which one. . . ), in view of an atmosphere of racketeering such that it seemed as if we were dreaming, or witnessing "a film about the reign

throughout the present peregrination through the misadventures of the vague stranger on duty... .  
<sup>817</sup>(\*) (May 25) This "enfi n" turned out to be premature - other gang members have since come to my attention. See

more acquaintance), delicately moved by invisible strings. ...

And I await, without impatience or illusions, what other Perverse Colloquia the future holds in store for us, with the unreserved acquiescence of the entire Congregation, for the greater Glory of "Science" and for the "honor of the human spirit".

## Roots and solitude

**Note** 171<sub>3</sub> (April 18) At the end of this fourth day spent following step by step the misadventures of my friend Zoghman, I understand better than last year attitudes and dispositions, towards me in particular, which had seemed strange to me only last year. In short, with his work, the scope of which he was well aware, he had thought he was entering "a big family", a bit like that of the deceased master, of whom nobody ever spoke, it's true, and yet who was present even without being mentioned. And now he found himself in a world of sharks with polite, even affable airs, and ruthless teeth - stripped in a jiffy of what he had brought with him, the fruit of eight long years of solitary labor; after which he was made to understand that he had been seen enough: an intruder and an intruder. There aren't many in his place who wouldn't have been traumatized. I don't know if he's ever opened up to anyone about his setbacks, except in bitter hints, so vague that they seem to testify against him, like an embittered man, a bit of an associate.

I may not have been named, but I was the "Father" of this unscrupulous world, and there was really no reason for him to trust me. It's true that our first meeting in 1980, when he was still a thousand miles from suspecting what lay ahead, laid the foundations for trust, and I feel that, against all odds, those foundations have been preserved to this very day.

Deep down, he knew, shark "father" that I am, that I wasn't going to do what they did. But there was a **grudge**, that's for sure, and she liked to take□the allure of a distrust that would have wanted to be visceral, and p . 1080 which (so I felt, at least) was "tacked on".

It's easy to "fight" for what you believe to be your right, when you're part of a group, however small, with which you feel in unison. But the one who is alone against all, the outcast, the unwelcome stranger, is like a tree deprived of its soil. The strength within him is of no help; it becomes bitterness that turns against itself, as if to chorus with the whole world, which rejects him.

When I held in my hands this book which consecrated the exhumation of the motifs as well as the burial of the worker who had brought them to light, this book signed by four of the most brilliant authors of a brilliant generation (which I had helped to shape) - when I finally became acquainted with it, by the greatest of coincidences (given that until then nobody had noted anything in particular that was worth pointing out to me. . . ) - at that moment I knew, for the first time in the thirty-six years I had been acquainted with the world of mathematicians, that I was alone against all. ) - at that moment I knew, for the first time in the thirty-six years I'd been acquainted with the world of mathematicians, **that I was alone against all of them**. A lot of things that had happened over the past eight years suddenly came together and made sense. It's a funny feeling when you suddenly rediscover that solitude. I had to catch my breath that day, and throughout the weeks that followed, taking in day by day the full dimension of L'Enterrement - a burial worthy of the work.

But this has nothing in common with Zoghman, who was "left behind" by his own people before he could really take root. Fate had smiled on me. Thanks to the elders who had taken me in (and it didn't really matter that they were dead or retired and perhaps hadn't been doing maths for a long time).

---

b. de p. note (\*) page 962, in the note "Le jour de gloire" (n° 171 (iv)).

(May 30) Latest news: yet another member, R. Remmert, has just been identified. See part (c ) of this note ("Les mémoires défailantes - ou la Nouvelle Histoire").

myself. These roots have plunged and grown, and over the years they have become deep and powerful. These roots are firmly planted in a soil that is neither that of "consensus" nor that of any fashion - more deeply, no doubt, than in any of those who find satisfaction in making fashions and following them<sup>818</sup> (\*).

□ I can afford, in short, to be "alone against all" - say what I have to say, and go my own way.

p. 1081

(May 25)<sup>819</sup> (\*) It doesn't take much imagination to understand the frustration of Mebkhout, who suddenly feels "swept away"<sup>820</sup> (\*\*) like a straw, once the strength of his central result is recognized. He writes to me (in a letter dated April 24, after his recent visit to my home): "It took me eight years to put together the results used in the Kazhdan-Lusztig demonstration. It took them a week to demonstrate it." A restrained him, this time again, from going to the end of what he really felt, surely, and I take it on faith that he will do so.

p. 1082

□ moi ici d'ajouter le "nondit": et une fois la chose faite, "ils" se pavant fiers entre eux avec l'outil that another had fashioned in solitude, letting the worker know that he'd seen enough... ..

It's such an enormous thing, however, that Zoghman doesn't quite believe the testimony of his healthy faculties - just as I had trouble believing the testimony of mine, on May 2 last year, when I read the Proceedings of the Luminy Colloquium<sup>821</sup> (\*). It was when he read these same proceedings in January last year, three years after the Kazhdan-Lusztig "Dress Rehearsal", that Zoghman finally came to realize what had really happened.

<sup>818</sup>(\*) Although I've never bothered to follow or follow fashion, whether in mathematics or elsewhere, I know that this is precisely one of the manifestations of the strong roots I was lucky enough to develop in my early childhood. Having had strong roots in myself from the outset, the energy mobilized in my major investments is not dispersed by compensatory cravings, such as the craving to set the tone, or to be and appear in conformity with the de rigueur "tone".

I express myself concretely on my childhood and these "roots" (without pronouncing the word, I think) in the note "L'innocence (les épousailles du yin et du yang)" (n° 107).

<sup>819</sup>(\*) The following two pages are taken from what was originally intended as a b. de p. note to the note "... et l'aubaine" (n° 171 (iii)). I had some hesitation as to where to insert them, and finally decided to include them in the present "Roots and solitude". Indeed, this is the only note in "L'Apothéose" in which I have tried, on the basis of my own experience, to grasp as best I could the way Zoghman himself experienced the events and situations I chronicled.

<sup>820</sup>(\*\*) The expression "swept away" is borrowed from a letter by Mebkhout (from the day before the one quoted in the main text), from which I reproduce here the relevant passage:

"It's true that [Kashiwara's] theorem of constructibility... .. allowed me to get started. In fact, from that moment on, someone like Deligne would have found all my results in the blink of an eye, including the theorem of the good Lord in all its forms, with demonstrations in four spoonfuls, as you say. That explains why it was all swept away in a few days."

It seems to me that Mebkhout has spelled out exactly the tacit "reasoning" of a Deligne, appropriating the fruits of others' labors because he **could** (and **should**) **have** found them himself (with his means, baggage and all) "in four spoonfuls". The only problem with this line of reasoning (which we're often tempted to adopt in similar situations) is that **it was all a matter of thinking about it** - and it was Mebkhout, not Deligne or anyone else, who "thought" about it. Creation is not a matter of **technology**, which, once it has seen something that no-one else has been able to see, "sweeps away" a situation in less time than it takes to write it. Creation is not in the "sweeping", but in **the act of seeing** what no one else has been able to see; of seeing with one's own eyes, without "following" anyone. And it's part of the probity of being a mathematician to distinguish between one and the other - between the act of creation, and the turning of a crank that goes round and round.

<sup>821</sup>(\*) On this Colloquium (June 1981), see "Iniquity - or the meaning of a return" or "The days of glory" (n° s 75, 171(iv)). In fact, the writing, in the first week of May last year, of "Cortège VII: Le Colloque - or bundles of Mebkhout and Perversity" (n° s 75-80) was still not enough to overcome this almost insurmountable inertia "according to the testimony of my healthy faculties", in a situation where one is rigorously alone in doing so. use. It was only five months later, when I came face to face with reality "in the flesh", so to speak, in the person of my friend Pierre (Deligne) who came to see me in my retreat, that a secret and tenacious incredulity finally vanished. On this subject, see the note "Le devoir accompli - ou l'instant de vérité" (n° 163), especially pages 782 to 784.

It was a terrible shock, I understand - Zoghman thought he was going to lose his life. Fortunately, he's a solid man - Zoghman is still alive today, and has even married and fathered a child in the meantime. ... But I think that even then, when he held these "Acts" in his hands, he still couldn't believe them completely. Something must have "stuck". As it happens, he still doesn't fully believe it, even as I write. It has to be said that, even in simply "rational" or "objective" terms, the thing is so incredible, so enormous, that to this day, **nobody** except me (except maybe him, and still. . . ) has dared to believe his eyes and see it, even though it's bigger than a cathedral!

But for those who have been hit head-on by the cynical, **gratuitous** iniquity at the hands of their admiring elders, it's not enough.

res, fulfilled with everything - surely this is one of those things you can never quite believe, one of those things **that "go beyond understanding"**. . . And it's also the kind of thing that can devastate a man's life.

What gives them this□destructive power is the obscure perception, desperately repressed and yet

p. 1083

**for** the pleasure of crushing with a careless gesture that which is precious to you, the very thing (if possible) that makes up the substance and salt of your life. It's this perverse pleasure in malice "for nothing", which truly "passes understanding". . .

I don't think Zoghman ever really talked to anyone about it, either before or after the big move - except in monosyllables, indecipherable to anyone but himself. The Kazhdan-Lusztig episode alone was already too enormous, too implausible for him to expect anyone to believe it. Established consensuses sweep away the most obvious, the most obvious, the most irrefutable facts like chaff. And here, he was dealing with something so painfully close, so "raw" in his being, that the only risk was that the person to whom he opened up about it would reject the unwelcome message, that his distress at "what passes understanding" would not be accepted - this risk or probability took on the dimension of **the intolerable**, something to which one will not expose oneself for any price - even if it means dying on the spot, if one has to die... .

To me, two years ago, he spoke of it "in monosyllables". Perhaps deep down he was hoping that I would understand these monosyllables, not only in their literal sense, but that I would also hear in them everything he didn't dare to say out loud (perhaps not even to himself. . . ). It was a completely mad hope, to be sure (in a situation where everything seemed mad as hell!); I was a thousand miles from imagining anything of what I've since learned, with certainty. It couldn't have been any other way, in the absence of meticulous, detailed information<sup>822</sup> (\*). And Zoghman, for his part, was also a thousand miles from daring to give me this information. It was crazy, but that didn't stop him from being angry with me. He had to blame someone, someone close enough to him, someone tangible, on whom he could transfer at least part of what had been triggered in him by "what passes understanding", and free himself in some small way from what was eating away at him.

## Carte blanche for pillage - or High Works

**Note** 171<sub>4</sub> □(June 2) It's been two months since I had the satisfaction of putting the "final touch" under Enterrement, with the ultimate "De Profundis" note (of April 7) - and it's been two months too since I've been hard at work putting "the final touch" to the last part of l' Enterrement! It's the reissue, more or less of what happened around this time last year - when I was still

p. 1084

<sup>822</sup>(\*) (June 1) It would be more accurate to say that it "couldn't be otherwise" in my state of limited openness and presence, except on very rare occasions. I believe, however, that we are all equipped with an "ear within an ear", perfectly capable of hearing the unspoken - but more often than not we take care to exclude from the field of conscious attention the messages picked up by that ear... ..

putting the finishing touches to what was to be the first part of the Funeral. It was, as it is now, the "last minute" that was dragging on and on - to the point where I was forgetting about eating, drinking and, above all, sleeping. It went on like that until my body gave up, at the end of its tether. That was exactly a year ago (give or take a few days), and I had to drop everything for more than three months, fully occupied with pulling myself out of a state of acute exhaustion<sup>823</sup> (\*). But this time I'm wary, and I'm very careful not to go down the same road again. I care about my skin...

Once again, it was the "investigation" that never ends. I was planning a ten-page memo called "The Four Operations", which would summarize and "tidy up" the results of last year's whirlwind investigation. And now it's been four months since the survey started up again, the ten pages have become three hundred or so, and it's not (quite) finished yet! I don't dare make any more predictions - this is the ninth month, since resuming work at the end of September, that I've been "on the verge of finishing"! I won't know it's **really** over until the last packet of notes has been typed up, proof-read and corrected, and handed in for duplication. (After that, the rest is no longer my job.) All I know is that I can't wait to get to that point, just as I can't wait to see the end of a long, grueling illness; and that I have to see it through to the end, as best I can, without letting imaginary deadlines get in the way. I won't stop to breathe until the end, when everything that needed to be seen and said **now**, will have been seen and said.

It's that damn "Apotheosis" that's given me the most trouble - I can't say why. These "four operations" are the only part of Harvest and Sowing that came in bits and pieces.

and struggling - when in principle it was supposed to be everything cooked, a simple "mise en ordre" yes; nothing that engaged or challenged my person in a **névralgique** way, so as to mobilize forces of resistance, a

**"friction"**. And yet God knows there was friction, and with the Apotheosis more than with anything else! Where does it come from?

Already with "Les manoeuvres" it was laborious. That's when it started stretching to infinity. It ended up being eighty tightly packed pages for that operation alone - and now, a month later, Apotheosis is well over double that. And yet, with the possible exception of a few pages (a little too "detec- tive" around the edges. . .) in "Les manoeuvres" (where I enter, perhaps, more than would have been essential into the intricate details of a certain impossible "scam". . .) - apart from this circumstantial "work on parts", which is no doubt a bit of a pain in the ass for a reader who's not "in the loop", I don't feel that these hundred-page packets I've ended up lining up here are superfluous, or even a rehashing, a splitting of hairs. What kept me on my toes was precisely the abundance of **new** and unexpected **substance** that was pouring in, and that I absolutely had to fit in, whether I wanted to or not - including, yes, mathematical substance! At times, I felt overwhelmed, so many things at once that I had to put down in black and white dare dare - things that were all hot, even burning, and yet you're obliged to deal with them one after the other... .

Yet such richness is in itself a powerful stimulus to work, and in no way does it create "friction" - quite the contrary. This friction, to be sure, comes not from the substance itself, but from the strength of my egotic investment in the work undertaken. Paradoxically, it's my very impatience to "get it over with", to "throw down the gauntlet" of what I have to say, about such and such things that are happening right now and that concern and affect me closely - it's this impatience (I believe) that creates the friction, the dispersion of energy. Friction is a sign of division, of forces pulling in opposite directions, each exasperated by the resistance of the other.

---

<sup>823</sup>(\*) For this episode, see "The incident - or body and mind" (n° 98).

I've been in a hurry to "get it over with", to "let it go", ever since I first set my mind to it - and there's the need to follow through on what the present moment suggests to me, not to settle for anything less than that, not to let myself be pushed around, not to let myself be trapped in a "program" to be completed, in a "schedule" fixed in advance. I know that that as soon as I exclude the unforeseen, that impediment to going round in circles, my work loses its quality and its meaning. Il ☐ devient "du gratte-papier". I have become very sensitive, over the years, to this "little difference" p . 1086 that looks like nothing, but is everything. It still happens, rarely, that such a turn begins, in moments of great heaviness - but never for long. When it does, the kid just throws it all away.

- it's no use even trying to go on. The very desire to work, that **desire** which is something other than the urge to accumulate pages or to place a period - desire and desire suddenly gone, and you find yourself foolishly blackening paper. Then there's really no point - I'll just have to put things right, and right away!

There's always a certain **impatience** at work (an old acquaintance of mine. . . ), which constantly pulls me forward. It seems to me that it's not the same as the one that's been weighing heavily on me ever since I started working on these "Four Operations". The other impatience is not a weight that weighs down, but a force that pulls. It's the sign of an appetite, not of weariness or fatigue or satiety. It's not impatience to accumulate, or to be done with it, to "finish" a program, but impatience to know the unknown before me, about to deliver itself. It's the impatience of the naked child, alone before the infinite sea, to plunge into it to know it. ... <sup>824</sup>(\*)

But now it's time to return to the story of my friend Zoghman's misadventures, in this note intended as the last of the Apotheosis. As I've already said, Zoghman himself only gives me this account in bits and pieces, here and there, in the course of letters, phone calls and meetings, and surely this has affected the progress of my thoughts and the writing of L'Enterrement, at least in the part devoted to the vicissitudes of my friend. I now have a better sense of the meaning of this reticence, as any attachment to a "victim" role (which I thought I had detected last year) has vanished (assuming it was indeed present). There must also have been times when I felt a certain saturation, expressed in an attitude of "don't throw any more away, for pity's sake! ". That must not have encouraged him. I was annoyed, it has to be said, by a ritornello about "the Japanese" here and "Kashiwara" there, which Zoghman must have been singing for four or five years, and he'd seen it with them, it's true. But I knew that if he had seen them, and if his work had been plundered in this way, in an almost official: "Go ahead, good people, help yourselves to plenty, don't be shy... . ! ", it wasn't because of some distant Japanese ☐ . It was **because of "his" people**: those of the "little family"<sup>825</sup> (\*) - good people from p. 1087 whom he never named except to quote their work with all the respect due to their high reputation.

I didn't want to hear any more about Kashiwara et al! Zoghman had the wisdom and patience to let it go, without losing his interest in my work, and without ceasing to provide me with discreet and effective assistance here and there.

It was during his last visit to my home, at the beginning of April, that I finally got to know him, the "Japanese package". At first, I was a little reluctant. I thought I was going to be bored to death by inextricable, ultra-technical stories and illegible papers (in Japanese, if that's possible. . . ), which I'd never read anyway - but no! It was as easy as pie - a bit like a pick-pocket story in the Paris (or rather, Tokyo) subways. Fun even, to say the least (at least, as long as it's the other guy who's getting his wallet nicked... . ).

<sup>824</sup>(\*) This is the image already featured in the note "L'enfant et la mer - ou foi et doute" (n° 103).

<sup>825</sup>(\*) (June 16) Mebkhout would like to emphasize that he no longer identifies with the "little family" in question.

As a result, the situation between Zoghman and myself became more open, and I was treated to bits and pieces of his misadventures, in flashes here and there. Episodes that I'd written down a bit in the style of a "technical information sheet" were fleshed out by on-the-spot reminiscences; precisely the kind of things that seem forever banished from scientific texts, in their impassive "attention to yourself", and even from letters between colleagues - you wouldn't want that! I even had to shake myself, in "Les quatre opérations", not to fall back into that very style, the "conclusions d'enquête" style (or even, "feuille de récriminations" . . . ). These "snippets" delivered by Zoghman helped me to get out of it, and to keep in touch with a living substance.

I got back to Apothéose the very day Zoghman left my house, just to make another sub-note or two, while what he'd told me was still hot. The result was "Ecllosion d'une vision - ou l'intrus", "La maffia" (which I later subdivided into seven parts, each with a name), and "Racines et solitude". I sent the whole thing to him straight away, for his comments before I gave it to the typist. I felt I was speaking a little on his behalf, and I wanted to be sure that everything I reported, from what he'd told me, had his stamp on it. unreserved approval. He sent me his detailed comments by return (letters dated April 22 and 24).

□ In these comments there are quite a few of these "snippets", putting living flesh on a skeleton of facts that appears a little skeletal at times in my notes.

p. 1088

That's also how I knew Zoghman had been there, on that memorable April 22, 1980, at the Goulaouic-Schwartz seminar. This was the day when Kashiwara announced as his own the theorem of the good Lord, which he had learned from Mebkhout a few months earlier, at the Colloque des Houches<sup>826</sup> (\*)! It's that big, and with Mebkhout still in the room, it may seem unbelievable. Mebkhout didn't explode on the spot (I wonder how he did. . . ). He waited politely until the end of the presentation "to protest publicly against these methods, reminding him of the Les Houches conference and his question<sup>827</sup> (\*\*). Goulaouic asked me to settle my affairs in private. The room suddenly emptied in a matter of seconds".

So here's one of the "snippets", delivered by this laconic description. I later got some details on the phone. The incident is worth noting. It says a lot about the state of mores in the mathematical world in the '80s. We're not talking here about the mentality of some long-toothed "kingpin", an extreme symptom of the breakdown of traditional values in the scientific world, or even of the "establishment" of prominent and well-connected people, whose class reflexes favor one of "their own". Here, the whole room empties out in the blink of an eye - no one left all of a sudden<sup>828</sup> (\*\*\*)! Work it out amongst yourselves - we don't want to hear about it. ...

I wonder what went through the minds of Goulaouic and the other peaceful listeners at this seminar, where a distinguished foreign lecturer was speaking (on a topic with which none of them, I believe, were overly familiar). This incident, after all, was food for thought. I doubt □ any of them I don't think any of them took the trouble, and rather assume that they all agreed to forget the sinister incident. But in the end, if you took the trouble to think about it instead of running away, there was **one** thing that was clear, in this dark story. The tone and words of Mebkhout (someone they knew from seminars, to say the least), left no room for doubt.

p. 1089

<sup>826</sup>(\*) On the Colloque des Houches and the Goulaouic-Schwartz seminar episode, see the note "La maffia" (n° 171 ), section (b) "Premiers ennuis - ou les caïds d'outre-Pacifique".

<sup>827</sup>(\*\*) This was the question posed by Kashiwara at the end of Mebkhout's presentation at the Colloque des Houches in September 1979.

On this subject, see the note cited in the b. de p. above.

<sup>828</sup>(\*\*\*) this evocation irresistibly evokes in my mind the association of ideas with the very similar situation I'd experienced three years earlier, at the end of a Bourbaki seminar where I'd been given ten minutes to talk about a certain scurrilous law affecting foreigners. See "My farewell, or: foreigners", n° 24.

There was little doubt that there had to be a **swindler** in the story - either Mebkhout, or Ka-shiwara. It's possible, of course, that inwardly, they'd already made up their minds: Mebkhout was making it up, so how could anyone imagine the distinguished visitor looting the anonymous listener! This would mean that, in relation to an unknown person, the famous man, whatever he does, is above suspicion: it's **carte blanche for plunder**, given to the man of notoriety against the man who has no recourse. What he has to say goes unheard: "Work it out amongst yourselves!"

Or else they've buried themselves in a state of doubt: how can you tell who's telling the truth and who the lie? (It's true that the brutal nerve of a Kashiwara, publicly pillaging a vague stranger in the presence of the person concerned, hardly seems believable. But it would be an even more incredible thing after all, if a vague stranger (whom they all know, and who hadn't brought himself to their attention yet by crooked tricks nor by his nerve... .) dares to publicly accuse a Kashiwara of crude plagiarism, if what he has to say is pure fabrication... . And supposing that what he says is perhaps well-founded, to send him packing with a "sort it out amongst yourselves!" is once again *carte blanche* for looting. It's as if we were shouting to someone who's been robbed in the middle of the street by thugs in tuxedos and who cries out "au voleur!" - "work it out amongst yourselves!"

It seems that this is how it's been for ages, in the slums of New York and other big American cities, where no one wants to have anything to do with the mafia that rules there. At least, that's how things are these days (I can't say for how long), in the mathematical world and in what passes for the "beaux quartiers", such as the Séminaire Gaulouic-Schwartz<sup>829</sup> (\*), or among all those prestigious people who "do" cohomology of algebraic varieties.

□ In rational terms and taken at face value, this "work it out amongst yourselves" borders on debility, in a situation where it's clear anyway that one of the two parties must be acting in bad faith. From a psychological point of view, this idiotic formula reflects an **abdication of** responsibility in the face of a situation that is felt to be "embarrassing". It also reflects a deliberate ignorance of an obvious fact: the question of respect for the elementary ethical rules of the mathematical profession is by no means a purely "private" affair, to be settled between the one who arrogates to himself the right to disregard them, and the one who pays the price. It's a **public matter**, one that concerns **every** mathematician.

p. 1090

General indifference and a panic to assume personal responsibility allow a gangster mentality to flourish with impunity in the scientific world, as well as operations as shameless as the Colloque Pervers. The panic of some and the impudence of others are like the other side of the **same corruption**. Those who ran away with their ears plugged on April 22, 1980, contributed to the Apotheosis of the memorable Colloquium the following year, just as much as the bigwigs who staged the grandiose hoax and proudly strutted their stuff.

(June 3) It was during Mebkhout's last visit to my home, too, that he gave me some edifying details about some of the participants in this same brilliant Colloquium, and the "new style" that is flourishing among them. I had a chance to leaf through the proceedings, in the second volume of the Actes, where there are articles by Verdier and Brylinski-Malgrange, and to take a look at Laumon's thesis (with a more informed and less distracted eye than the day I first received it). This thesis is in fact a collaborative work with N. Katz. I give some comments on the "new style" followed in this work, in the long b. de p. note to the note "Le jour de Gloire" (God knows it deserved that name. . . ), page 962. For further details, I refer you to this note

---

<sup>829</sup>(\*) I'm happy to report that Laurent Schwartz was not in the room on the day of the memorable incident at "his" seminar. I don't know if he was subsequently informed.

(not yet written). A promise made, a promise kept!

p. 1091 Mebkhout told me how he had had the honor and advantage of talking to N. Katz twice about his ideas on duality and the links between continuous and discrete coefficients. The first time was at the Colloque d'Analyse  $p$ -adique in Rennes, in July 1978. He then explained  $\square$  "in small group" his theorem of global duality for  $D$ -Modules, on a complex analytic space - the theorem that caps Serre's duality and Poincaré's<sup>830</sup> (\*). There were Katz and Illusie, the same two mentioned more than once in L'Enterrement. Illusie, kind and gentle as usual, thought it was really very pretty - something like this<sup>831</sup> (\*\*). As for Katz, who I imagine was hearing about  $D$ -Modules for the first time in his life (at a time when it was far from being all the rage, as after the memorable Colloque), he simply declared curtly "C'est connu ça!", and turned on his heel. As long as it was a vague Monsieur Personne who was talking to him, N. Katz (who that same year was to give a speech in front of thousands of distinguished colleagues, in honor of the new Fields laureate Pierre Deligne... ), he was bound to be "famous".

The second time was shortly after the Colloque des Houches in September 1979<sup>832</sup> (\*\*\*). Katz was then at IHES. Given his well-known competence in  $p$ -adic differential systems, which Mebkhout sensed had something to do with the theorem of the good God he'd just talked about at Les Houches, Mebkhout went to IHES on purpose to bring him his paper from Les Houches, and to talk to him about his ideas and results. After the welcome he had received in Rennes, it's fair to say that he had the persistence to keep going! In any case, it was more of the same. Katz once again received a very high reception from this vague stranger, who took the liberty of coming to ask him a second time, and without announcing himself yet, if that turns out to be the case. When you're an important man, you sometimes don't know how to protect yourself from intruders... ..

p. 1092 Just one year later, these same ideas, long held and matured in solitude by a vague unknown, are trumpeted everywhere as the latest find by a Deligne (or a Kashiwara, we weren't sure. . . ), in the wake of such a brilliant Colloque that Katz was unfortunately unable to attend. to honor them with his presence, so that they take on  $\square$  for the great man both importance and weight. It must have been Laumon who explained the ins and outs to him - one of Deligne's most brilliant disciples. This same Laumon also knew first-hand the origin of these ideas, having been informed of them by the vague stranger himself. But the disciple takes pride in following in the Master's footsteps, and the latter had made it quite clear, and without the slightest equivocation, what conduct was to be adopted towards one doomed to silence and obscurity.

To the Delignes and Verdiers the limelight, and to the Brylinskis, Katzes and Laumons, who rushed in at just the right moment to get their share! To them, the music and flons-flons, and the standing ovations of a grateful crowd, who came out in jubilation to celebrate these High Works, in the hands of their New Masters.

## Epilogue beyond the grave - or the sacking

p. 1093 **Note 171**  $\square$  (June 14) Up until a month ago, it had seemed to me that the spirit of Burial was limited to what I sometimes call "the beautiful world" or "the great world" of mathematics, and more particularly, the

<sup>830</sup>(\*) This theorem is discussed in the two notes "L'oeuvre. . ." and "Three milestones - or innocence" (n° 171 (ii), (x)).

<sup>831</sup>(\*\*) It was a gratuitous "kindness". While the style of reaction was different from one to the other (in "yin"), it was the same from one to the other.

in Illusie, in "yang" in Katz), the bottom line was the same: as long as it comes from Monsieur Personne, it goes in one ear and out the other! On this subject, see the note "La mystification" (n° 85), in particular my comments on Illusie, page 351.

<sup>832</sup>(\*\*\*) On the Colloque des Houches and the Kashiwara scam at the Goulaouic-Schwartz seminar, see the note "La maffia" (n° 171 ), part (b), "Premiers ennuis - ou les caïds d'outre-pacifique".

The world I used to haunt and to which I myself belonged. At the USTL (Université des Sciences et Techniques du Languedoc, Montpellier), which has been my home institution for the past twelve years, I did not perceive any signs of ostracism, disrespect, discourtesy or even rudeness, in line with the burial that has been in full swing for the past fifteen years<sup>833</sup> (\*). A new fact has just burst into this peaceful picture, and drastically transformed it, and my own relationship with my home institution.

In keeping with ingrained mechanisms, I did not at first consider including this recent incident in my "Harvest and Sowing" testimonial, which at first sight seemed to come to me "like hair on the soup". It was against serious resistance that I finally admitted that it would be failing in the spirit of my testimony to pass over this episode in silence. It's still a fresh episode, of course, and one I've "taken in" rather hard - which, incidentally, gives added force to those "inveterate mechanisms" I've just alluded to. But the sheer force with which I took the eloquent and unwelcome lessons of this incident this time, is also a sign that it affects me very closely - and this at the level of my professional activity and my links with the professional milieu to which I belong. This, then, is typically the kind of thing that Harvest and Sowing is intended to be an in-depth account of, with no "reserved corner" that I would forbid myself from touching, whether out of misplaced "discretion" towards myself or anyone else.

Moreover, in the more specific context of my reflection on the Burial, I feel it is obvious that there are direct links between it and the incident in question. It's possible that these links are not those of a simple cause-and-effect relationship: that certain colleagues on the spot would have ended up taking note of the Burial, and would have concluded that they, too, could now "give it a go". Even if there were such a causal link, it would, it seems to me, only affect an incidental, accidental aspect of the situation. A more essential aspect, on the other hand, and one that struck me the most, common to what happens in "the world" of Science (with a capital S), or in a modest provincial university, is a certain

□ **deterioration**, unprecedented perhaps, in scientific and academic circles: deterioration at the level of p. 1094 quality of relationships and basic forms of courtesy and respect for others, as well as scientific ethics, itself indissolubly linked to respect for others and for oneself. The pages that follow can therefore be seen as a contribution (among the many others already provided throughout the reflections on Burial) to the "tableau de mœurs d'une époque", or of the end of an era no doubt, in the mathematical milieu.

Rather than give a more or less detailed account of the events, I prefer to reproduce four of them here **documents**, which will describe them as well. These are:

1. a "letter to my colleagues teaching mathematics at the USTL", dated May 28, in which I inform them of a certain situation and express the wish for a discussion at a General Meeting;
2. the "reply" from Mme Charles, who is in charge of the mathematics building at the USTL, in the form of a circular letter dated May 30, addressed by name to me, and in fact to all mathematics teachers;
3. the resolution passed by the EBU 5 General Meeting on June 6 on the agenda: "Information and discussions on the relocation of Professor Grothendieck's office"; and finally
4. a "Letter to my former colleagues in the Mathematics building", dated the following day, June 7.

---

<sup>833</sup>(\*) I express myself along these lines in note no. ° 93 (page 396, paragraph 3).

I have refrained from including among the documents my letter to Mrs. Charles of May 21 (referred to in the first quoted document) and my letter to Mr. R. Cano, Provisional Administrator of the USTL (referred to in this same document, and in document 4°, or "Epilogue d'un malentendu"); these letters do not seem to provide any new information, compared with that contained in the documents reproduced below.

As my only comment to Mme Charles' letter ("it is in fact very difficult to contact him" - "him" meaning my modest self, to whom the letter is supposed to be addressed), I'd like to point out that letters from Montpellier to my home take a day to arrive, and that for years I've only been away from home when I'm at the USTL.

Institute of Mathematics

## RANSACKING THE MATHEMATICS BUILDING

Letter to my colleagues teaching mathematics at U.S.T.L. by  
Alexandre GROTHENDIECK

Montpellier, May 28, 1985

Dear Colleague,

I was informed last week, by an EBU secretary whom I had asked to pick up some work from my office on the fourth floor, that it had been emptied of all my belongings.

- which I was able to verify today: all that's left is the bare floor. I had not been informed that my office would be requisitioned without further ado, so I had been unable to give my consent to the operation, let alone authorize anyone to enter my office in my absence and touch my belongings. On the same day, I telephoned Mr Lefranc, director of the EBU, to inform him of the situation, which (it seemed) was the result of an initiative by Madame Charles, something which seemed to be confirmed by this phone call. I made it clear to Mr Lefranc that I was shocked by the procedure, that there was no way I would agree to an office transfer being carried out in such a brutal manner, and that I expected my belongings to be returned to their rightful place as soon as possible. He assured me that he would do whatever was necessary. On the same day, Tuesday May 21st, I wrote to Madame Charles, telling her that I considered the untimely "emptying" of my office to be an abuse of power, and felt it to be violence; that I expected a detailed explanation from her, and an unreserved apology. If not, I would submit the matter to the University Council, which would decide whether such behaviour towards a USTL lecturer should be considered acceptable.

Coming to the USTL today, I could see that Madame Charles had not seen fit to reply to my letter (a copy of which I sent to Messrs Cano and Lefranc). Nor has Mr Lefranc seen fit to send me any explanation for the fact that my office is still empty of my belongings, a week after he assured me that he would arrange for their return to my office. Neither he nor Madame Charles has seen fit to inform me of the whereabouts of the items that have been collected. I was told by the secretaries that the items would be stored in the office of one of them. Having bumped into Madame Charles in the meeting room, she assured me that she had only followed the instructions of the EBU director, Mr Lefranc, and asked me to speak to him about this matter, which did not concern her. Until the situation has been resolved, Mr Nguiffo Boyom has kindly agreed to share his office with me.

□ Maybe I'm the only one who finds there's something wrong - a violence and contempt; it's p. 1096

It's true that I'm the only one who's being thrown out without any further ado. (If there's anyone else out there who thinks this isn't the kind of atmosphere they'd like to work in at USTL, I'd really appreciate it if they'd let me know ... .<sup>834</sup>(\*)). For my part, I consider that it would not be a luxury if, following this "misunderstanding" (to use the charming euphemism of one of my colleagues), there were a meeting of the EBU, to give the Director, Mr. Lefranc, and Madame Charles, the opportunity to

<sup>834</sup>(\*) It goes without saying that such a gesture only makes sense to me if it is understood to be binding on the signatory, who authorizes me to make public mention of it.

to explain their intentions and motivations, and for EBU teachers to say whether they consider these procedures normal (when applied to others. . . ).

In the twelve years I've been at USTL, I've often had the opportunity to appreciate Mr. Lefranc's benevolent disposition, dedication and efficiency whenever it was a question of rendering a service - and I'm grateful to him for it. It is with all the more regret that I would withdraw my confidence from him, seeing that he is making himself an instrument in the hands of others and allowing an atmosphere of arbitrariness and contempt to develop. From now on, I urge him to assume his responsibilities as director of the EBU, or to step down. And I call on Madame Charles to resign from her position as "Head of Premises" at the EBU, a position she has abused to her heart's content.

We look forward to hearing from you.

Alexandre GROTHENDIECK

P.S. Being inclined to be of service, last year, at Monsieur Lefranc's request, I agreed to an office exchange with Monsieur Lapacher, who (I was told shortly afterwards) subsequently changed his plans. It goes without saying that my agreement did not mean that I authorized the ransacking of my office, at that time or any other.

MATHEMATICS

□Madame J. CHARLES "responsible for the premises at the Institut de Mathématiques".  
to Mr A. GROTHENDIECK, Professor of Mathematics.

p. 1097

Dear Colleague,

1. Where does the "work" of the "premises manager at the Institut de Mathématiques" begin and end?

This "manager" receives requests from Mathematics teachers

- or to house a new teacher (or researcher)
- or to house a teacher (or researcher) already accommodated elsewhere.

In this second case, requests are generally motivated by a work objective: bringing together members of the same group.

This "manager" then studies the possibilities first and foremost with the director of U.E.R.5, who is officially the manager appointed by the President of U.S.T.L., for the premises of the Mathematical Research building. He then works with the people concerned to find possible solutions; changes are made only after agreement has been reached.

2. This is what has been achieved in recent years:

- grouping of geometry group members
- mechanical group members

3. The difficulties encountered in this "work" :

- virtually every person contacted feels they "own" their office
- it seems impossible to force anyone to "change" their office.

4. The last request received by me and the evaluation of the search for "solutions" to the problem posed:

- the request made by Mr. LAPSCHER, a teacher, to put Mr. LAPSCHER and his secretary's office, Mr. MICALI, on the same level.

- the first solution envisaged: exchange of offices between the third and fourth floors, so that "applicants" could be grouped together on the fourth floor. This exchange concerned in particular Mr GROTHENDIECK and Mr THEROND. Mr GROTHENDIECK contacted by

the director of the UER 5 □lui specified that PEU LUI IMPORTAIRE L'EMPLACEMENT DE SON p. 1098  
OFFICE AS LONG AS HE HAS ONE. On the other hand, Mr. THEROND, who at one point agreed to the move, later refused.

- the second solution envisaged: I then asked Mr LAPSCHER to contact his colleagues himself to propose another solution; this was confirmed to him by the director of EBU 5. He kept us informed of his steps: the "occupants" of 5 offices had agreed to a swap, with Mr GROTHENDIECK's agreement resulting from his conversation with the director of EBU 5.
- the realization of this second solution: after taking note of this agreement, the Director of EBU 5 gave the "green light" for the proposed office modification.

Mr. LAPSCHER having told me about a problem with the keys during the period when the move would be discussed but not completed, I pointed out to him that

- no new keys were available,
- I didn't think it would be a good idea to drag out this move, which could be done in a few hours with the participation of all concerned.

Mr. LASPCHER then informed me that the equipment from Mr. GROTHENDIECK's office had been transported to his future office; this had been done without having been able to contact Mr. GROTHENDIECK beforehand.

It should be noted that Mr GROTHENDIECK lives far from Montpellier and is currently on secondment to the CNRS, making it very difficult to contact him.

5. My "responsible" impression of what would seem to be a "conflict":

- I had the opportunity to point out to Mr GROTHENDIECK that, acting on behalf of EBU 5, I could not respond to his letter myself; he would therefore have to ask the EBU 5 Director for a reply. Following this 2nd letter addressed to all of you, I feel I have to get out of the "obligation of reserve" I had imposed on myself.
- I would have thought it advisable to at least inform the people concerned before moving their equipment.
- I would also have liked the move to have taken no more than 1/2 a day.
- I thought the solution was a good one, but it didn't change the office occupancy rate of any of the people concerned.

I'm not waiting for an answer.

Yours sincerely

N.B. Copy of this letter sent for information to

- all Mathematics teachers who received Mr GROTHENDIECK's letter of 28.05.85.
- the Director of EBU 5 having also received a copy of the letter sent to me by Mr GROTHENDIECK on 21.05.85.
- the provisional administrator of the USTL, who received a copy of the letter dated 21.05.85 and to whom I enclose a copy of the letter dated 28.05.85.

Minutes of the meeting held on Thursday, June 6, 1985 at 6 p.m.

Present: M. AUBERSON, Mme CHARLES, MM. CIULLI, CONTOU CARRERE, MM. CUER, DE LIMA, DELOBEL, DE ROBERT, GROTHENDIECK, HOCQUEMILLER, ESCAMILLA, Mie HUBERT COULIN "M. LEFRANC, M. LOUPIAS, Mme MEDEN, M. MOLINO, MmePIERROT, M. PINCHARD, M. SAINT PIERRE, Mle VOISIN

After discussion, those present (19) adopted the following text by 16 votes in favor and 3 abstentions:

"The Mathematics teachers apologize to Mr GROTHENDIECK for the unacceptable conditions under which his belongings were moved. They undertake to ensure collectively that these regrettable events do not recur. In particular, it must be made clear that an office key cannot be used by anyone without the occupant's explicit agreement."

M. LEFRANC

Director

Institut de Mathématiques

Epilogue to a "misunderstanding

Letter to my former colleagues (teaching and technical staff, 3rd cycle students) in the Mathematics building

by Alexandre Grothendieck

. . on 7.6.1985

Dear Colleague, I'm writing as an epilogue to the ransacking of my office mentioned in my letter of May 28. That letter was addressed solely to math teachers, whereas it equally concerns all those who occupy an office in the math building. Inadvertently and indiscriminately, I omitted to address my letter to the technical staff and students of the 3° cycle, judging (hastily) that to do so would be to give the incident an extension that it did not deserve. I sincerely apologize to all concerned, and all the more so as I have received expressions of sympathy from several of them (supposedly uninformed. . . ), which have touched my heart. It was also no doubt due to this oversight that yesterday's EBU General Meeting on the incident was restricted to "EBU 5 members".

Among many other things, this incident will have taught me that it's not the first of its kind to occur at EBU 5 - it's just the first time that it's a "rank A teacher" who's been targeted. I don't know whether the pious resolution passed yesterday will prevent this kind of incident from happening again, in the general indifference (as before) towards non-tenured teachers or 3° cycle students in particular. I'll be sure to check with Mrs Mori and Mrs Moure that they have received instructions from the director of the EBU not to entrust the key to any of the offices to anyone, or to use it for anyone, under any circumstances, except with the express authorization of one of its occupants.

My previous letter ended with the words "awaiting your (or your) reply". In response to this expectation, I have received three expressions of sympathy and solidarity. They come from Louis Pinchard, Pierre Molino and Christine Voisin. I have also received a similar testimonial from Philippe Delobel, a 3° cycle student who (like Christine Voisin) had done a DEA with me. It was on his initiative that a few 3° cycle students attended yesterday's General Meeting. I'm delighted to express my esteem and gratitude to him, and to all those I've just mentioned, who have (without ambiguity or evasion) shown me their solidarity. It's one of the fruits of "hard" experiences like this one, to have one's friends recognized, when one is lucky enough to have them... .

I received yet another letter in reply to mine, from a colleague who was obviously delighted at what was happening, and took the opportunity to make fun of me. It's the only echo in this sense that I've received. From all the others, a great deal of total indifference on the part of some, embarrassment on the part of others (where more than once I sensed the unspoken fear of being badly seen and thus compromising one's chances of promotion, or a precarious situation). In all those, among them, who were so moved that they went out of their way to attend this General Meeting (called on the spur of the moment at the last minute, even though it had been scheduled for a week... . ), I sensed above all the deliberate intention to drown a fish, to the tune of "everyone's nice, everyone's cute". We finally settled on (after three quarters of an hour of palaver)

on the designated "villain", the absent (as it happens) Mr. Lapscher - the one who had taken (according to what had just been hinted at) □ the initiative to lend a hand. There was no question of going as far as to blame the poor guy by name - or anyone else for that matter, of course.

On the part of those "in charge" involved in one capacity or another in the sacking incident, I have been

shocked by the shameless brutality of one Lapscher, by the rudeness "for the fun of it" of a Mme Charles (who covered up the coup de main, once presented with a *fait accompli*, by adding some insolence of her own), and by the discourtesy of a M. Cano, Provisional Administrator of the USTL, dispensing with any response to the letter in which I informed him of the situation and asked him to refer it to the University Council. But most of all, I was disconcerted and saddened by the ambiguous attitude of Mr. Lefranc, Director of UER 5. From Monday May 20 (when I informed him of the situation I had just discovered and of my feelings about it) until yesterday, he had not seen fit either to inform me of what had happened, or to disassociate himself unequivocally from the brigandage of a Lapscher or the rudeness of a Mme Charles. By doing his utmost, from beginning to end, to maintain the fiction of an unfortunate "misunderstanding", he has succeeded in making behavior that I, for one, feel is intolerable seem harmless, even respectable, so as not to hurt anyone's feelings. I also took note, among other signs, of the silence of many of those I had thought to count among my friends (including three who were once my students); of the indifferent ostentation of one, the embarrassment of another, and the honeyed jubilation of yet another. And also the silence of one Micali (co-beneficiary of the helping hand, and who had had ample opportunity to convince himself, a few years ago, of the disadvantages of attracting the bad graces of Mr. and Mrs. Charles...), and the complacency of Mlle Brun, taking orders from a Lapscher to play the mercenary locksmith-mover (without a word of regret, once the nature of the operation was no longer in doubt).

Against the backdrop of all this, and finding yesterday what for twelve years had been my office, transformed this time into a battlefield - my belongings (plus the furniture) hastily rearranged (a good fortnight after a helping hand - lightning. . .) - I no longer have the heart to rearrange it again. I'm assured that the same incident is unlikely to happen to me again, and I can take the precaution of taking the second key, entrusted to Mmes Mori and Moure, with me. But insofar as this is materially possible, and in particular for the duration of my secondment to the CNRS, I prefer to forego the use of an office at the USTL, and leave the place, without a struggle, to the Lapschers, the Charles et al.

If I can avoid it, I won't go back to teaching at USTL. I'm sure I'll have spent my life there as a foreigner - one whose homeland is elsewhere - in terms of my approach to mathematics, teaching and lifestyle. What the academic microcosm had to teach me, I think I've learned, with the final "part" being the lessons of this incident, which has just closed to general satisfaction. Chances are that this EBU 5 meeting I've just attended will be my last, and that this letter will also be the last I have the opportunity to write to you (or to you). And this time I don't expect a reply.

Alexandre Grothendieck

### 18.5.5. The threshold

**Note 172** □ (March 22) I thought I'd have a day or two and a dozen pages at the most, with these p. 1102 the famous "four operations" that I've been planning to review since October. I've been hard at work on it for over three weeks now, lining up well over a hundred pages - and I'm still not quite finished! The first draft, from February 26 to March 1, already took me four days. It just provided me with the canvas, on which to embroider (after all) a "story", and not just investigative conclusions. When I reread this first draft the day after March 1, it gave an unfortunate impression of a "sheet of paper".

de doléances" that went on and on, and as it stood was probably incomprehensible to all but three or four truly expert readers (assuming they had the patience to read it. . . ). I realized that I had to at least explain roughly what it was all about, so at least give some context - otherwise there was no point<sup>835</sup> (\*).

This inevitably led to a few repetitions, compared to the first part of Burial - but there are cases where repetitions are not only useful, but even indispensable (in mathematics as much as anywhere else). In such cases, moreover, we soon realize that the so-called "repetitions" are not really so, for what is "repeated" is in fact **revised, seen anew** and in a different light. By situating certain aspects of my work as "context" for the four operations, I feel I've learned something about it, that I've been able to situate it better. I may not have learned anything really new about myself or others in the process, but I don't regret the trouble I've taken to rewrite this first grief draft over several days. I had put the best I had to give into this work, and it deserves the hindsight that maturity gives me to look at it anew and in a different light. At the very moment when I was about to make a detailed assessment of what this work has had to endure since I left it (in good hands, I had no doubt. . . ), it was right that I should reflect on it, on its place and on the unity that makes up its beauty, if only for the space of a few pages, as a way of once again showing my respect for what I have seen scorned.

□ But that wasn't all, far from it! Abandoning the "feuille de doléances" style, with numbered cross-references to the fleshier notes in the first part of L'Enterrement, I realized that these notes, which I was taking up again, like all the other sections and notes in Récoltes et Semailles, had to be intelligible and convey the essence of what they had to say, independently even of these references to notes that were part of **another moment** of reflection. Here again, this led me to a number of "repetitions" that were not repetitions at all, in other words, to revisit in a new light what I had noted down from day to day almost a year ago, in the fresh emotion of discovery. At the time, I was overwhelmed by so many unexpected and sometimes unbelievable facts, that there was no question of a real "investigation", even remotely methodical. At the time, I was content to try my best to take in what was tumbling down on me, and to "fit it in" as best I could, without going into too much detail. Most of my energy was then absorbed in **dealing** with the **crazy**, the unbelievable (as in the tale of the Chinese Emperor's robe... .<sup>836</sup>(\*)), and above all, to take on this "breath" of violence, cynicism and contempt that suddenly came back to me, "underneath these good-natured airs... . ..." that I recognized all too well; the breath of other times, that I had lived through and that I have not forgotten...

The last three weeks, however, have been an opportunity to complete last year's stormy investigation, by delving a little more closely into certain texts (SGA 5 and, above all, the so-called "SGA 4<sup>1</sup> "). This gave rise to a series (which at times never seemed to end!) of (more or less) detailed footnotes, some of which became sub-notes, and one of the latter (with the intended name "The Formula") occupying me over four consecutive days and splitting into four others<sup>837</sup> (\*\*). . . At times it seemed as if I was never going to finish - and then no, it ended up converging<sup>838</sup> (\*\*\*). I'll leave aside for the moment a dozen or so pages that are decidedly too crossed-out and need to be redone, as well as the footnotes.

<sup>835</sup>(\*) The only other moments in the Harvest and Sowing reflection when I made such a (admittedly smaller) departure from the "spontaneous" mode of writing, was in the section "The note - or the new ethic" (n° 33) and in the note "Iniquity - or the meaning of a return" (n° 75).

<sup>836</sup>(\*) See note of the same name, n° 77'.

<sup>837</sup>(\*\*) (June 1) Which have since become six. . .

<sup>838</sup>(\*\*\*) (June 1) A very temporary "convergence" indeed, since the note "L'Apothéose" ended up splitting into some thirty separate notes, sub-notes etc., running to well over 150 pages on their own!

of the last two notes ("Le partage" and "L' Apothéose") which I'll add later. That's enough for now! I'll come back to "l'intendance" later, but I can't wait to finish, and say p. 1104

Without further ado, I'd like to say a few words about the "four operations".

I distinguish two closely related, yet distinct "aspects" or "levels" in Burial.

They are quite clearly separated (to my eyes at least) by a **threshold**.

On the one hand, there's the "wind of fashion" aspect (sometimes going as far as that "breath of derision" I've spoken about more than once in Récoltes et Semailles). It manifests itself above all in what I have elsewhere called<sup>839</sup> (\*) "attitudes of automatic rejection" - attitudes that often cut short the simple reflexes of mathematical common sense, and are exercised against certain people and their mathematical contributions. In this case, it's me, and a few others who are classified (sometimes despite the best efforts of the interested party to distance himself from me) as having "connections" with me. In my case, it was certainly not possible to "reject" (or "bury") everything I contributed, even though much of it had already entered the common domain of everyday use, even before I left the mathematical scene in 1970<sup>840</sup> (\*\*). It's true, however (and I made this point for the first time in the note "My orphans" of a year ago (note n° 46)) that by far the largest part of my written or unwritten work on cohomology was buried, first and foremost by my students, in the aftermath of my departure. (Some of the themes I had introduced were unearthed four, seven or twelve years later without any mention of me.

- but here we are already touching on the "second level". . . )

We can certainly deplore such automatic rejections, which sometimes run counter to simple delicacy and the respect due to others, and are in all cases foreign to common sense and mathematical discernment. It is all the more regrettable when it strikes young mathematicians of sometimes brilliant means,

when the "bite of disdain" extinguishes a joy and denatures what had been a beautiful passion, in the bitterness of investments that appear as wasted (according to the consensus that makes law. . . ). And we can regret it<sup>1105</sup> after p.

also, when this rejection strikes simple, fruitful ideas that have amply proved their worth, to bring out of the void powerful tools that nowadays "everyone" uses without looking twice. In the first case (that of a devastated vocation), the damage is likely to be irreversible, but not in the second - because sooner or later, the simple and essential ideas, those "on the way", will eventually appear or reappear, and become part of the common heritage. In any case, it's unreasonable to try and force anyone to think **well of** a person, or a work, or an idea, which (for whatever reason) they want to think **badly of**, or forget altogether. This kind of question is certainly, and in a delicate and essential way, a matter of personal "ethics", but we cannot, it seems to me, make it a question of collective "scientific ethics"; or if we were to try, it's to be feared that the cure would be worse than the disease... .

The second "aspect" or "level" I was referring to, however, is precisely where such a collective ethic is breached. The **threshold** I was talking about is a **consensus** which, as far as I know, has been universally accepted in all the sciences, ever since they have been the subject of written testimony. It is the consensus that no one is supposed to present as his or her own the ideas<sup>841</sup> (\*) that he or she has taken from

---

<sup>839</sup>(\*) In the note "Le Fossoyeur - ou la Congrégation toute entière", n° 97.

<sup>840</sup>(\*\*) It is true, however, that even some of the ideas and techniques that had already come into "everyday" use (at the very least within the limited circle of my students and close collaborators) were buried as soon as I left. This was particularly true of the *l-adic* cohomological tool, which I had developed in great detail in SGA 5 (based on the key results of SGA 4). It was kept under wraps by my cohomology students, led by Deligne, only to be exhumed in the form and spirit I know in 1977.

<sup>841</sup>(\*) When I say "ideas", I'm obviously not talking about "results" alone in mathematics. Often, a simple, well-posed **question** that touches on a crucial point that no-one has seen before is more important than a "result",

□ **autrui**

. This consensus obliges us, therefore, to indicate the provenance of the ideas we present,

let's use or develop them, at least whenever these ideas are not of our own making or part of the common heritage, already known (not by three or four insiders, but) by "**everyone**".

I don't recall ever having heard this consensus challenged. From the time I was part of the mathematical community, between 1948 (when I was a twenty-year-old beginner attending Cartan's classes at the Ecole Normale Supérieure) and 1970 (when I left the mathematical scene), I only very rarely had the opportunity, and with only one colleague and friend who was a little negligent in this respect<sup>842</sup> (\*), to witness or even to be informed of a clear breach of this consensus, or principle. As I pointed out in the first part of *Récoltes et Semailles* (in the section "Un secret de Polichinelle bien gardé", n° 21), respect for this principle is by no means a matter of course for anyone with a modicum of honesty and self-respect. On the contrary, it requires a great deal of vigilance, since inveterate reflexes from childhood naturally lead us to overestimate our own merits, and to confuse the work of assimilating ideas from others with the actual conception of those ideas - something which is in no way the same thing. When I wrote the above section over a year ago, I wasn't really sure what I was talking about.

obviously not yet clear with myself about the importance to be attached to this consensus. There was then a certain vagueness in my mind (which I didn't clearly realize at □ **this** stage of the reflection), in relation to this widespread feeling that a strict demand **on others** (my own pupils, for example) to respect this principle in their relationship with me, was a sign of a lack of generosity, of a pettiness unworthy of me. So there was an **ambiguity** in me at the time, which I only clearly detected in the reflection of the note of June 1, of the same name (n° 63"). This reflection completely dispelled this ambiguity, which (I then realized) had weighed heavily on my relationship with my students, from the beginning (in the early sixties) until just last year. I understood that rigor in the practice of the profession of mathematician (or, more generally, of scientist), means first and foremost great vigilance with regard to oneself, in respect of that crucial consensus between all, but also an equal requirement with regard to others, and all the more so, with regard to those whom

---

even arduous. This is still the case, even if the question has not yet been condensed into a precise **statement**, which would constitute an embryo of a hypothetical answer, or even a more or less complete (and still conjectural) answer. It goes without saying that generating such a statement from an initially vague question is an essential and creative part of mathematical work. Presenting an elaborated version of a (perhaps profound) question while concealing its origin (even though the elaboration is the work of the presenter-prestidigitator), just as concealing the origin of a statement in deep form, under the pretext of presenting a demonstration of it, is plagiarism just as much as presenting as one's own a demonstration taken from someone else.

The same applies to the introduction of fruitful **notions**, which are often even more crucial than good statements - because the question of "good statements" only arises once the right notions have already been identified. Here again, using the pretext of having modified or even improved a notion taken from someone else, in order to hide its origin, is just as dishonest as "borrowing" the notion *ne varietur*. More often than not, it's the first step - raising a question (however vague), proposing a statement or notion (however imperfect and provisional) - that's the crucial one, not the improvements (in precision, breadth, depth) you make to it. But even if this weren't the case, it can't be taken as a "reason" for someone to make an original work by improving what they've received, in order to hide what they've received (or, which may amount to the same thing, to "debunk" it. . . ).

As I have already pointed out elsewhere (in sub-note n° 106<sub>1</sub> of the note "Muscle and gut (yang buries yin (1))", n° 106), the "value" of a conjectural statement depends neither on its presumed difficulty, nor on its more or less "plausible" character, nor whether the statement turns out to be true or false. In any case, the "value" one is willing to attribute to a mathematical idea (whether expressed in a question, a statement, a notion or a demonstration), or to a set of ideas, is to a large extent subjective and can hardly be the subject of a consensus of scientific ethics. This is why an honest scientific will indicate the origin of **all the** ideas it uses (explicitly or tacitly) and which are not part of the "well known", without indulging in the inclination to keep quiet about the origin of an idea which it has decided in its heart of hearts (and perhaps for the needs of a dubious cause . . . ) was in any case "obvious", "trivial", "unimportant" (or other qualificatives of the same water).

<sup>842</sup>(\*) This colleague's case is discussed in passing, in the first part of *R & S*, in the section quoted in the very next sentence.

With the benefit of over a year's hindsight, this "case" takes on a weight I hadn't given it before.

our job is to introduce them to our profession.

With each passing year, I've come to understand better just how much **more** there is to this profession than just a certain technical know-how, or even the ability to use one's imagination to solve problemly difficult problems. In a way, I knew this all along - but I underestimated the "ethical" aspect, or **collective**<sup>843</sup> (\*), as something that was supposed to be "taken for granted" between people of good faith and good company. In this way, I was ready for the "ambiguity" of which I spoke, and which was also (under cover of a false "generosity") an **indulgence** towards my students and assimilates, and in an even more hidden way, an indulgence towards **myself**.

I left this milieu of "people of good faith and good company", which had also been **my** world, with which I had been happy to identify. When I took a closer look (in the weeks following last year's April 19th), less than fifteen years after leaving it, I found a **corruption** I could never have imagined, even in a dream.

□ It's a mystery to me what **meaning** it can still have to "do math" as a member of This world - if not only as a means to **power**, or (for those of modest status) to secure a **livelihood** under material conditions that are, well, comfortable (when you're lucky enough to already be "settled" as best you can... ).

p. 1108

## 18.5.6. (5) The family album

**Note** 173<sup>844</sup> (\*)

**a. Un défunt bien entouré** (March 22) To put it more bluntly, there's a "fashion" level to funerals, and a "swindle" level. Perhaps I'm just being tardy, and that what was considered a swindle "in my day" has now become a perfectly acceptable and honorable thing, as long as those who practice it are part of the "beau monde". Perhaps the "threshold" has long since disappeared?

The "second level" consists of **a single, vast swindle**, targeting my entire work on the cohomological theme, and after it, that of Zoghman Mebkhout, the imprudent continuator, posthumous, obscure and obstinate pupil of the buried master. The great conductor of the operation was another pupil, by no means posthumous but on the contrary occult, that's right, playing on a tacit role of "heir" to my work, while disavowing and debunking both the work and the worker. This is my friend **Pierre Deligne**. His zealous lieutenants were none other than the four students who, with him, had opted for the "cohomology" option:

**J.L. Verdier, L. Illusie, P. Berthelot, J.P. Jouanolou.** The deceased is certainly well surrounded, both by the

<sup>843</sup>(\*) I don't mean to imply that the "ethical" aspect of a situation is always, at the same time, a "collective" aspect, touching on the relationship of a person to a group (in this case, a group of "colleagues" or "congeners"). This is certainly the case with the "consensus" I'm examining.

In keeping with the particular conditioning that has shaped my view of things since childhood, until last year I tended to underestimate (or even ignore) what was collective, in favor of what was personal. The "collective adventure" aspect of my personal "mathematical adventure" became clear to me last year, first in the "Galois legacy" section (n° 7), but especially in the sections at the end of the first part of R et S, "L'aventure solitaire" and "Le poids d'un passé" (n° s 47, 50).

<sup>844</sup>(\*) This note, "The Family Album", was originally written as an immediate follow-up to the previous note, "The Threshold", written on the same day.

day (March 22). This part now forms part a- ("A deceased well surrounded"), to which two other parts were added on June 10 and 11, b. ("New heads - or vocalizations") and c. ("The one among all - or acquiescence"). The following note "L'escalade (2)" (n° 174), again dated March 22, follows directly on from part a. (of the same day) of the present note. The b. de p. notes to parts b. and c. are dated June 13 and 14. Finally, a last part d. ("The last minute - or fi n d'un tabou") was added on June 18.

co-deceased<sup>845</sup> (\*\*) sharing the honors of the funeral with him, than by those who, during his "lifetime", were close to him. As auxiliary undertakers, coming to lend a hand in the double Burial, staged by the Great Chief, I see seven other "world-renowned" mathematicians (to quote the

p. 1109 □ terms from a certain advertising placard<sup>846</sup> (\*)), appearing episodically during the Funeral Ceremony reviewed in the family album (also known as "The Four Operations"). They are (in order of importance in the Ceremony) **B. Teissier, A.A Beilinson, J. Bernstein, J.S. Milne, A. Ogus, K.Y. Shih, N. Katz.**

I've now listed all the mathematicians I know to have played **an active part** in Operation Burial in one capacity or another. There are twelve<sup>847</sup> (\*\*). For the last four named, I cannot prejudge their bad faith, based on the facts known to me. However, I consider that their responsibility is just as much engaged as that of the others. For if they were unaware of what they were doing, this was a choice, which in no way relieves them of responsibility for their actions.

As for the participants in direct collusion, I'm certainly incapable of drawing up even an incomplete list, or of estimating their numbers, which are surely of an altogether different magnitude. Suffice it to say that these include all those who took part in the "memorable Colloque" at Luminy in June 1981 (known as the Colloque Pervers), as well as all those, among the readers of the volume entitled "SGA 4<sup>1</sup>", who 2 were even remotely aware of the meaning of the acronym SGA - and who "let it run".

I see two written texts that bear witness to a **disgrace** in the mathematics of the seventies and eighties, the like of which has probably never been seen in the history of our science. In one of these texts, the disgrace bursts forth in the name it has already given itself, which is in itself an im- posture (of genius. . . ): the text named "SGA 4<sup>1</sup>" (as a current reference acronym), and also "Cohomology".

p. 1110 Etale" - by P. Deligne, with the "collaboration" (among others and in addition to L. Illusie and J.L. Verdier) of A. Grothendieck<sup>848</sup> (\*\*\*). The second text is the Proceedings of the □ Colloque de Luminy of June 1981, especially the first volume, consisting of the Introduction to the Colloquium (by B. Teissier and J.L. Verdier) and the main Colloquium article (by A.A. Beilinson, J. Bernstein, P. Deligne).

It would surely be to everyone's benefit, and to the credit of the generation of mathematicians who have tolerated such disgraces, if at least one of those who have directly contributed to them, in one capacity or another, could find it in himself to make a public apology - or better still, to explain publicly what has happened, as far as **he is concerned**. But that's probably too much to hope for.

It's also too much to hope that J.L. Verdier will cease to occupy Henri Cartan's position at the Ecole Normale Supérieure. This is surely the key position in France for training the next generation of mathematicians. When I learned, a long time ago, that Verdier had been promoted to this position, he who had been one of my students and for whom I was very fond, I felt honored (and at the same time, secretly flattered). There was not the slightest doubt in my mind, then, that Verdier would fulfill Cartan's role perfectly, with regard to the most mathematically-motivated young people, who would learn their trade perfectly from him. If I see today (and since

<sup>845</sup>(\*\*) In fact, there are not one, but **four** "co-defuncts" of which I am aware, which are the subject of the four coffin notes (coffins 1 to 4) n° s 93-96.

<sup>846</sup>(\*) This is the IHES jubilee brochure published in 1983 to mark the twenty-fifth anniversary of its foundation. See

For more information, please refer to the Eloges Funèbre notes (1) (2) (n° s 104, 105), particularly page 454.

<sup>847</sup>(\*\*) The same "twelve" as in the section (of the first part of R et s) "Jesus and the twelve apostles", reviewing all the students who have worked with me up to the level of a state doctorate thesis. It's true that among the active participants in my Funeral, but this time on the company side of Springer Funeral Services GmbH (instead of the Congregation of the Faithful), there is still Dr. K.F. Springer (co-director of the esteemed establishment) and Drs. Peters and M. Byrne, who will be mentioned

in a later note (n° 175). And that's fifteen!

<sup>848</sup>(\*\*\*) On the meaning of this "collaboration", which forms part of the mystification created by Deligne, see the note "Le renverse- ment" (n° 68').

years ago, but never before with such brutal evidence) that I was mistaken, and if I say so clearly here, it's not to opprobriate him or anyone else. I believe he has disqualified himself from directing research. In saying this, I'm not denying my share of responsibility, for having badly taught (to him as to all my other students) this profession that I loved, and that I continue to love.

**b. New heads - or vocalizations** (June 10) Two and a half months have passed since I wrote the beginning of this note "The family album". Certainly, I had no idea that I'd have to come back to it again, following new twists and turns in the Burial investigation. Above all, it was the break-up of the modest five- or ten-page "apotheosis" I'd just written, into a grandiose one-hundred-and-fifty-page capitalized Apotheosis, which immediately introduced me to "new faces", who must have their place in the family album. There were also some familiar faces, including

that they too are part of the legion of those who actively participated, at the "swindle" level, in "Operation Burial". I'm reviewing them here "for the record", and to make sure that each of the p. 1111

interested parties feel in good company (but that's probably been the case for a long time now. . . ). I'm inserting the new photos in the order in which they came to my attention.

First of all, on the Springer Verlag GmbH side, there are **K.F. Springer** (one of the company's co-publishers), **K. Peters**, and Mrs. **C.M. Byrne**. I give more details in the note below "Les Pompes Funèbres - im Dienste der Wissenschaft" (n° 175). At the time of writing the beginning of this note, on March 22, I had just received K.F. Springer's letter (dated March 15), which dispelled my last doubts about the spirit reigning in the esteemed Funeral Home, faithful to its motto "In the service of Science".

On the Apotheosis side (via the burial of the service unknown), I'm aware of contributions from **M. Kashiwara**, **R. Hotta**, **J.L. Brylinski**, **B. Malgrange**, **G. Laumon**, and **R. Remmert**, not to mention an **anonymous referee** whose bad faith can't be doubted; but it's true that if we start adding up the complacent referees of articles or shady books, closely or remotely linked to the Burial, we'd surely need a new album. Also, my old friend N. Katz has reappeared, this time in such a context that the presumption of good faith (relative, at least) that I had with regard to him has vanished. This brings to fourteen (and fifteen, counting the famous anonymous referent) the number of mathematicians, all of international repute, who are known to me to have participated actively in one capacity or another in the "Colloque Pervers" scam. For duly documented details on this subject, I refer to the Apotheosis, and more particularly to the notes ". . . et l'aubaine", "Le jour de gloire", "La maffia", "Carte blanche pour le pillage - ou les Hautes Oeuvres" (n° s 171 (iii) (iv), 171<sub>2</sub>, 171 ).<sup>4</sup>

Finally, on the side of the "Motifs" operation, another of my former students appeared (better late than never), a little away from the main pack. Afterwards, I was almost forced to count him (as a sixth grader) among my "cohomology" students, even though "in my day" he hadn't the slightest idea what cohomology was. We're talking about Neantro Saavedra Rivano, who, obviously, was used (of his own free will, of course) as a "pawn" in the hands of others, rather than acting on his own behalf. his own account. His adventures, battling with Monsieur Verdoux (disguised as a "cavalier□servant"), were p. 1112 reconstructed page by page in the suite of notes "Le sixième clou (au cercueil)" (n° s 176<sub>1</sub> à 176<sub>7</sub> ), dated April 19th and 20th (except for the last one, which has yet to be written). This brings to six (out of twelve) the number of my "former" students who took an active part in the master's funeral. Saavedra's part in this burial stands out in that the "Tannakian Categories (sic)" operation, of which he was an active participant, is the first large-scale operation aimed at concealing the authorship of a part of the "Tannakian Categories".

of my work and the philosophy I'd developed (in the wake of, and on the occasion of, that of motifs, in this case).

Taking into account the new arrivals in the album, and putting aside the Springer-Pompes- Funèbres contribution, to retain only those from the Congrégation des Fidèles, this brings to nineteen<sup>849</sup> (\*) the number of notorious mathematicians known to me to have actively participated in the Burial, at the level of what in my day was called a swindle operation. Among these participants, there are only three, namely the three co-signatories with P. Deligne of the "memorable volume" Lecture Notes 900, whose bad faith I do not take for granted.

This list is by no means exhaustive of all my colleagues and/or former students or friends, who in one capacity or another and in a more or less active way took part in my funeral, without going so far as to associate themselves with a blatant swindle. I've listed around thirty of them, most of whom I've already mentioned in the course of my reflections on L'Enterrement; counting the previous ones, that makes about fifty - and these are only those of which I've been aware, as if in spite of myself, even in my distant retirement, over the last eight or nine years, or those who have come to my attention in the course of an investigation which, by deliberate design, has remained very limited.

These figures alone speak volumes, and give unexpected support to the impression I had already gained last year, namely that the burial of my work and my modest self is not the enterprise of a single person, nor of a strictly limited group (such as my students before I left),

or that of my "cohomology students"), but a collective undertaking, at the level of "the whole Congregation"; or at least, at the level of the part The mathematical establishment that had been □witness

and an integral part of the growth and development of my work as a geometer between 1955 and 1970. My departure in 1970 was the signal, in this part of mathematics at least, for **an** immediate and draconian **rejection** of "Grothendieckian" mathematics, seen as the symbol and embodiment of "feminine mathematics"<sup>850</sup> (\*): where vision constantly precedes and inspires the technical aspect, where difficulties are constantly resolved rather than cut and dried, where constant contact with the profound unity in the apparent disparity of things, enables us at every moment to detect what is essential in the amorphous mass of the accidental and the accessory. At the same time, my departure also signalled a spectacular halt to all conceptual work, or to put it another way, the **outlawing** of all such work, suddenly derided under the pretext of "deepening".

Thus, by mutilating one of the essential "sides" of mathematical creation, the "yin" or "feminine" side, the result was an astonishing "Verflachung", a "flattening", a "drying out" of the mathematical work<sup>851</sup> (\*\*). The thing was done (it seemed to me) by a brutal and draconian turn, practically overnight. It's such a strange thing, so unheard of, that it seems unbelievable. It took me over a year of intensive reflection on L'Enterrement to finally grasp what had happened and come to terms with it. I don't know if there has been a comparable turning point in recent years or decades, or at any other time, in any branch of science or any other human activity.

<sup>849</sup>(\*) Twenty, including the famous anonymous referrer.

<sup>850</sup>(\*) On the subject of these reactions of rejection towards a certain style of approach to mathematics, see the notes "Le muscle et la tripe (yang enterre yin (1))", "Les obsèques du yin (yang enterre yin (4))", "La circonstance providentielle - ou l'Apothéose", "Le désaveu (1) - ou le rappel", "Le désaveu (2) - ou la métamorphose" (n° s 106, 124, 151, 152, 153). I'm trying to identify certain features of "feminine mathematics", alongside complementary "masculine" features, in the notes "La rising sea. ...", "The nine months and the five minutes", "The arrow and the wave", "Brother and husband - or the double signature", "Yin the Servant, and the new masters", "Yin the Servant - or generosity" (n° s 122, 123, 130, 134, 135, 136).

<sup>851</sup>(\*\*) For the beginnings of an observation about this "flattening", see the note "Useless details" part (c), "Things that look like nothing - or dry out" (note n° 171 (v)).

involving (among other forces) our creative abilities.

But let me come back to my album. I thought it would be useful to include here the names of those, apart from those already mentioned, whose participation in the Burial I have no doubt about. I'm not convinced either

that any of them would wish me harm, and there is more than one among them, surely, who feels □ even p. 1114

I'm sure there's not one of them who won't be genuinely surprised to hear of a "funeral" of my person and my work. There may not be a single one of them who will not be genuinely surprised to hear of a "Funeral" of me and my work, and even more, to learn that he is supposed to have participated in it in some way. The fact that he is mentioned by name here will already have the (welcome for me) effect of informing him about this, and (if he is himself interested) thus giving the opportunity for an explanation between us. I am, of course, entirely at the disposal of interested parties, to provide any clarification they may require on the subject of what I have perceived (rightly or wrongly) as a participation in my funeral, either directly or through "co-burials". There's no question of my questioning the good faith and honesty of my colleagues.

professional of any of them<sup>852</sup> (\*), and for more than one I can even add that their complete good faith and honesty are for me above suspicion. □ Rather than stupidly listing them in order p. 1115

alphabetical order (something a computer would do better than me), I prefer to list the names of the faithful, chorusing at my Funeral, in approximate chronological order; not according to the times of their appearance at the Funeral Ceremony (which are mostly unknown to me), but according to the times when I clearly became aware of their participation. On the other hand, I'll set aside all my students<sup>853</sup> (\*). With the sole exception of Mme Hoang Xuan Sinh, who works in Vietnam and is decidedly a little far away to lend a hand at my Funeral, there is not a single one of my students who, in one way or another, did not take part. I've already explained this in the note "Silence" (n° 84) and at the beginning of the note "Coffin 1 - or the grateful D-Modules" (n° 93), and this is not the place to return to it. This is

---

<sup>852</sup>(\*) (June 16) Further to new information that has just reached me, this presumption of good faith is no longer valid in the case of A. Borel. According to correspondence between him and Z. Mebkhout last year, on the occasion of a seminar on the theory of  $D$ -Modules directed by Borel in Zurich, I already knew that Mebkhout had informed him of the fact that he was the author of the central category equivalence in the theory (known as "Riemann-Hilbert"), giving precise references and sending him all his works, where Borel could easily convince himself of the reality of the facts. But this didn't stop Borel from treating him with the condescension (and even discourtesy) he was accustomed to. In a Colloquium just held in Oberwolfach on the same theme (Algebraic theory of Systems of partial differential equations, Oberwolfach June 9-15 1985), where Borel gave the first three introductory talks (under the title "Algebraic theory of  $D$ -Modules"), preparing the ground for the "God's theorem", **Mebkhout's name was not mentioned** in any of these talks, or indeed in any of the following ones (except for a single "thumb-reference" in passing, in Brylinski's talk). According to Mebkhout's account, this Colloquium, in which Borel played the role of conductor (in place of Deligne, who wasn't at the party), was a veritable **re-run of the Colloque Pervers** that had taken place four years earlier. Virtually the entire "maffi a" was there: Verdier, Brylinski, Laumon, Malgrange and even (this time) Kashiwara (who had already played a leading role in the Zurich seminar, notwithstanding the detailed information Mebkhout had given Borel about the character). Needless to say, (no more than at the Zurich seminar) it was not deemed useful to ask Mebkhout to give a talk, and (apart from occasional interventions by the same Mebkhout, falling into freezing cold) the ancestor's name was not uttered (apart from his presence in the unfortunate "Grothendieck group"). The theory of biduality still goes by the name of "Verdier duality", including in Borel's presentations. Mebkhout emphatically reminded him last year that this biduality had been copied from SGA 5's Expository I - but apparently Borel has developed an allergy to a certain style and to a certain absentee, an allergy that forbids him to take such references into account. ... In fact, he was party to the same swindle in his book "Intersection Homology" (Birkhauser Verlag, 1984), published **after** Mebkhout had pointed out Verdier's deception to him.

I had maintained a presumption of good faith towards Borel to the limit of what was possible, having known him well in the years fifty, when we were both members of the Bourbaki group and worked together there. He is the first among the members of what I truly consider to be "my original milieu" in the mathematical world, whose direct participation, at the level of "swindling", in the Burial I have to acknowledge today without any possibility of doubt.

<sup>853</sup>(\*) When I speak here of "my students", I mean those who have worked with me at doctoral thesis level and who (with the exception of Deligne) have done a doctoral thesis with me. There are fourteen of them (including two "after my departure"), reviewed in the note "Jesus and the Twelve Apostles" (n° 19).

in the case of each of my students that an in-depth explanation of what happened seems to me the most desirable.

The "choruses à mes Obsèques" are set in the most diverse diapasons. I've picked out four main ones, which make for a first-class polyphonic funeral in grand style! There's the "discreet and effective" **boycott** of any attempt to develop grothendieckian-scented mathematics. There's the

**discourtesy** and lack of delicacy, the like of which I had not encountered in the mathematical world before my departure; in one or two extreme cases they take the form of thinly veiled **derision**. There's the

**deliberately ignoring** or minimizing the influence of my ideas and points of view in his personal work, or in any part of contemporary mathematics, in cases where this influence is nevertheless obvious and crucial, or attributing to a third party results or ideas that are due to me without any possibility of doubt. Finally, there is **the attitude** (known as "**ostriching**") of those who find themselves unfortunate enough to be confronted with a blatant scam, to bury their heads in the sand and pretend they haven't seen or felt anything.

Needless to say, more than one member of the faithful choir is vocalizing on several tuning forks at once.

All that said, here at last is the promised list<sup>854</sup> (\*) to complete our family album: B. Eckmann, A. Dold, N. A. Campo, B. Mazur, V. Poenaru, D.B.A. Epstein, P. Cartier, D. Quillen, N. Kuiper, R.D. Mac Pherson, H. Hironaka, F. Hirzebruch, J. Tits, S.S. Chern, M. Artin, R.P. Langlands, G.C. Rota, C. Goulaouic, W. Fulton, A. Borel, J. Tate, J.P. Serre.

### c. The one of all - or acquiescence

(June 11) I felt a little silly last night, typing this list of

names, when each of the names lined up there stupidly evoked, in itself, a whole rich cloud.

associations, none of which are apparent here. But I can't dwell here on each of these names and what they evoke - that would require another volume, and I can't wait to finish with this one! I

I apologize to those concerned for "sticking" them, rather cavalierly, in a not very inspiring "table" of presence (at my Funeral). It's true that most of them have already been mentioned in one capacity or another here or there during Harvest and Sowing, even if not necessarily as participants in my Funeral. Four of them are friends of mine from the Bourbaki group, with whom I had close ties, through work and (for two of them) friendship, thirty years ago and more. There are nine more, in this lapidary list, to whom I felt bound by feelings of warm friendship, and who have not died out even as I write these lines. But more than once, in the course of the years that have passed, finding myself confronted with one of these friends of yesteryear, or with one of those who were my pupils, I have been seized by the strange impression that the one to whom I still felt this surge of sympathy, which I found within myself intact, was no longer there - or at least, that contact with that one had been lost, perhaps irretrievably; that another had taken the place of the one I had known, filled with intense, quivering life, and seemed to have

<sup>854</sup>(\*) I have not included in this list the names of the eight "non-cohomology" students, which can be found in the note (n° 19) already quoted, together with the names of the cohomology students already reviewed above.

It would be fair to include in my "Family Album" the names of those of my colleagues and former friends who are known to me as "non-entrants", through unequivocal expressions of sympathy and esteem. First of all, in connection with my work "A la Poursuite des Champs" ("In Pursuit of the Fields") pursued in 1983 (work to which I intend to return), I received warm encouragement from J. Benabou, N.J. Baues, A. Joyal, and above all from Ronnie Brown and Tim Porter, who (in more ways than one) gave me efficient help throughout the duration of my work.

It's true that these colleagues belong to a rather different milieu from the one with which I used to identify myself, which is also the milieu in which my magisterial Funeral was naturally placed. As mathematicians who belong to or are close to this milieu, and from whom I have recently (over the past year or two) received testimonials along the same lines, it is a pleasure for me to name here B. Lawvere, J. Murre, D. Mumford, I.M. Gelfand and (last not least!) J.P. Serre. It is this last nominee who has the unique distinction of appearing on both "lists" at once - those of the "buriers", and that of the faithful friends!

erased all traces. It was like a **drying out**, a desiccation that had taken place, and a hard, watertight shell had appeared, where there had been sensitive, living flesh. ...

Before closing this family album, which I've only just opened, I'd like to focus a little on just one of those I've just inserted, in the blink of an eye. It's the one that comes last in this album. Even more than for any of the others I ended up including, there was serious resistance within me (unconscious, as it should have been) to parting with certain preconceived and long-standing images of our relationship, and surrendering to the humble evidence. This is Jean-Pierre Serre.

More than once in the course of Harvesting and Sowing, I've had the opportunity to talk about Serre, most often by name<sup>855</sup> (\*). The little I've said about him here and there will already have been enough, I think, to make it clear that he played a role in my mathematical past that belongs to no one else. This is something I'm not

I'd never stopped until I wrote *Récoltes et Semailles*, and which I discovered as the pages went by. p. 1118  
For twenty years, from the early fifties until my departure from the mathematical scene, he played the role of "privileged interlocutor" for me<sup>856</sup> (\*), and most of my major ideas and investments were directly stimulated by Serre's (sometimes "innocuous") ideas. At times, especially (I think) in the second half of the fifties and perhaps again in the early sixties, there was a kind of intense mathematical "symbiosis" between him and me, who were of complementary mathematical temperaments<sup>857</sup> (\*\*) - a symbiosis that proved to be very fruitful every time. The relationship between Serre and me was not of a "symmetrical" nature; for example, Serre was by no means inclined, as I am, to rely on one or more "privileged interlocutors" to keep him abreast of what might interest him or what he felt he needed. This does not prevent me (or so I presume) from having played an equally exceptional role in his mathematical past, and I can imagine that my unexpected departure in 1970 was a breaking point in his mathematical life (from a certain equilibrium, perhaps, where I represented the "yin" pole), a sudden turning point, through a kind of "void" that suddenly appeared. I don't know...

Still, Serre's close relationship with me and my work was certainly perceived in the mathematical world, even if it remained in the realm of the unspoken. Surely, apart from Deligne, Serre was perceived, with good reason, as the mathematician "closest" to my work. Deligne's relationship to my work and to me was very different - it was one of pupil and "heir". Deligne was nourished by my thought and my written and unwritten work, whereas none of my major ideas or investments were inspired or stimulated by him. He was "closer" to me than Serre, in the sense that during the years he spent with me (1965-69), there were no reactions of rejection in him.

with regard to certain aspects of my work and my approach to mathematics, as was the case with Serre; this is what enabled him, in the space of barely three or four years (given his exceptional means, and p. 1119 exceptionally favorable circumstances too), to intimately assimilate in its entirety the vast unifying vision that had been born and developed in me over the preceding years. But his relationship with me

---

<sup>855</sup>(\*) I refrained from naming Serre two or three times, in *Fatuité et Renouvellement*; at a time when it didn't seem useful, more often than not, to refer by name to people about whom I was expressing some criticism. The passages in *Récoltes et Semailles* where I express myself most fully about Serre and the relationship between him and me are in the notes "Les neuf mois et les cinq minutes", "Frères et époux - ou la double signature", and "Les unnecessary details" (notes n°s 123, 134, 171 (v)).

<sup>856</sup>(\*) Between 1965 and 1969, while the relationship between Serre and me remained close, it was Deligne who took on the role of privileged interlocutor. The reason for this surely lies in our very strong affinities of temperament, and above all, in Deligne's openness (towards what I felt was the essence of what I had to contribute), which was often lacking in Serre. I'll come back below to the very different nature of the two relationships, which were the two closest in my past as a mathematician. See also the note quoted in the following b. de p. note.

<sup>857</sup>(\*\*) On this complementarity, and on the affinity between Deligne and myself, see the note already quoted "Brothers and spouses - or the double signature" (n° 134).

was profoundly ambiguous - and he systematically played on this tacit relationship of pupil and heir, which represented for him the means to **power**, while denying it and working to bury both the master and his vision... .

There was no such ambiguity in the relationship between Serre and me - at no time was there the slightest desire on either side to take "power" over the other, or to use this relationship for the purposes of power. I think I can even say that such power games did not exist in the "Bourbaki milieu" that welcomed me at the end of the 1940s, and I don't think I was a witness to, let alone a co-actor (even in spite of myself) in any such games, right up to the time of my departure in 1970<sup>858</sup> (\*). Another way of saying the same thing, concerning the relationship between

Serre and I (or the relationships I observed within the Bourbaki milieu): at no time did I detect the slightest element of antagonism<sup>859</sup> (\*\*), on either side. There were occasional<sup>□</sup>nelles frictions,

p. 1120

I'm sure I've already mentioned them, and perhaps I'll have to come back to them, but that's another matter entirely. The relationship between Serre and me drew its strength, it seems to me, from our shared passion for a common master, mathematics, without any "parasitic" component of an egotistical nature, where the other would appear as a means, as an instrument, or as a target. This is undoubtedly why, when I recently resumed a correspondence with Serre that had been interrupted for ten or twelve years, I rediscovered, between the lines of the two or three letters I received from him, the signs of an intact friendship and delicacy, as if we had just parted the day before.

In fact, even though the opportunity to write to each other had not arisen for over ten years, the echoes that reached me from Serre, far and wide, all pointed in the same direction of an unchanged friendship - and by no means in funeral tones, as was the case for many of my friends of yesteryear. That's why, until just a few weeks ago, it never occurred to me that Serre would have played a part in my funeral. Everything I knew about him seemed to point in the opposite direction. It's certain, moreover, that his mere presence on the mathematical scene set certain limits to the Funeral (a most modest limit, I must admit. . . ). Leafing through J.S. Milne's book

"Etale Cohomology"<sup>860</sup> (\*), published in 1980, so **after** the incredible "SGA 4 operation<sup>1</sup> - SGA 5", I was

<sup>858</sup>(\*) I should, however, make a reservation, taking into account a certain game that has been played, entirely without my knowledge, among some of my students around my person and my work. This game began at least as early as 1966 (the year the SGA 5 seminar ended), with Deligne's 1968 article on the degeneration of suites

(On this subject, see the note "L'éviction", n° 63). I only began to learn about these games, which are indeed power games, last year, almost twenty years later. It's true that the active players were not members of the

I was integrated into the initial environment that had welcomed me (an environment in which I still can't discern such games, even with the hindsight afforded by greater maturity). They formed "the next generation". It's also true that the qualitative deterioration I'm seeing in this new generation, compared to the mother environment, is surely closely linked to a similar deterioration that has taken place in the past.

made in each and every member (or very few) of this initial milieu, of exceptional quality. On this subject, see the two sections "Bourbaki, ou ma grande chance - et son revers", and "De Profundis" (n° s 22, 23).

<sup>859</sup>(\*\*) I should, however, make an exception here for the episode *Survivre et Vivre*, in the early seventies. This episode had made it abundantly clear that my own ethical and ideological options, on many points that were important to me (and still are today), were the antithesis of those of almost all my friends in the mathematical establishment, including Serre. This suddenly put an end to my feelings of identification with this "establishment", which I had tended to confuse with an ideal (and idyllic) "mathematical community". (See

For more on this subject, see "The "Mathematical Community": fiction and reality", n° 10.) This unexpected revelation, and the resulting "change of camp" in the space of just a few months, then led me to adopt antagonistic attitudes towards some of my former friends, whom I was now inclined to classify as "reactionaries", and so on. I've since moved on from these peremptory and superficial classifications. Still, in an unsurprising turn of events, Serre has become one of those whom, for a time, I perceived as "adversaries", if not "haters". I was pleased to note that this episode left no trace of resentment or enmity in him - nor in me either, need I add!

<sup>860</sup>(\*) Published by Princeton University Press, Princeton, New Jersey. This is the same J.S. Milne who, two years later, participated in the "memorable volume" *Lecture Notes 900 scam* (discussed in the note ". . . and exhumation", n° 168 (iii)).

It was striking to see Milne follow "with confidence", practically verbatim, the terms in which Serre had expressed himself in a certain Bourbaki seminar (February 1974, n° 446) concerning the authorship of cohomology.

The theory had been "developed by Grothendieck, ☐with the help of Mr. Artin"<sup>861</sup> (\*). It is visible in more ways than one, that Milne has only occasionally read in SGA 4 and SGA 5<sup>862</sup> (\*\*), and he follows both Serre (casually expressing himself on SGA 4 and SGA 5, in the same Bourbaki exposé) and Deligne (shamelessly debunking these same seminars, in the volume he christened "SGA 4<sup>1</sup>" ) to present, in his introduction, Les textes originaux SGA 4 et SGA 5<sup>863</sup> (\*\*\*) as being difficult to access. This is precisely the situation that his book (following Deligne's three years earlier, a little thin on the ground) is intended to remedy; or, to put it plainly, to spare the user the useless and tedious work of reading the original texts. The opinion of the highest eminences (in this case, Serre first, followed by Deligne, with the deceased sitting mute in his padded coffin... ), an opinion that Milne, like everyone else, follows with his eyes closed (if not with eagerness, given the funeral context . . . ), peremptorily excludes the possibility that these texts present anything other than "useless details" (or even a "gangue of nonsense" . . . ), but rather the foundations of a new "general topology" version of topos (buried by unanimous agreement at the same time as the worker . . . ) - and that we'll be able to put into practice in the future. ) - and that, in the long run, we'll no more be able to do without this new topology, which (among other things) enabled the theory discussed in Milne's book to blossom, than we were able to do without ordinary general topology, which Milne, Deligne and Serre had the advantage (like myself) of learning on the school benches, and which they therefore meekly admit (as a matter of course) must have been worth the effort... .

p. 1121

☐I think it was last year that I first took a quick look at this presentation

p. 1122

Bourbaki de Serre, on which I recently commented, in the note "Les détails inutiles" (n° 171 (v)), part (a), "Des paquets de mille pages. . . ". The passage in which Serre ironizes the 1,583 pages of SGA 4 had then held so little of my attention, that I had even forgotten about it entirely, when I took this same exposé in my hands again, a month or two ago, on the occasion of writing Les Quatre Opérations. It has to be said that Serre's attitude of distancing himself from my famous "thousand-page packets" had been known to me for a long time, long before the SGA 4 seminar series appeared, so it came as no surprise. The first time (I think) that such a reaction of "visceral rejection" was triggered in Serre, towards a certain style of approach to mathematics that is mine, was on the occasion of the theory of coherent duality, which I had developed in the second half of the fifties. These were potential "bundles of a thousand pages", at least, especially if we consider that there was a whole new cohomological algebra at stake, in the derived categories version; but potential or actual "bundle", which was

---

Leafing through Milne's book, I got the impression that it was written in good faith, and without any deliberate intent to bury. Even though his perception of things is clearly limited to following in the footsteps of eminences Serre and Deligne, he nevertheless has the merit (and originality. . . ) of expressing himself courteously on the subject of the SGA 4, SGA 5 mother seminar.

<sup>861</sup>(\*) Two years earlier, at the 1978 International Mathematical Congress in Helsinki, in the speech given by N. Katz (still the same Katz) in honor of the new Fields laureate Pierre Deligne, the theory of étale cohomology is presented as "developed by M. Artin and A. Grothendieck, in the direction envisaged by Grothendieck" - which goes to show that alphabetical order sometimes works well. ... The fact that Milne chose to follow Serre, rather than Katz, in his version of things, seems to me to be one sign among others of his good faith.

<sup>862</sup>(\*\*) In particular, I was struck by the fact that Milne (and Mebkhout, who was an attentive reader of my works... ) had even noticed the existence in SGA 5 of an explicit Lefschetz formula for general cohomological correspondences on an algebraic curve, a formula brilliantly concealed by the two conjurers Deligne and Illusie - a work of art, to say the least! On this subject, see the two sub-notes "Les prestidigitateurs - ou la

formule envolée" and "Les félicitations - ou le nouveau style" (n° s 169<sub>8</sub>, 169 ).<sub>9</sub>

<sup>863</sup>(\*\*\*) As far as the published version of SGA 5 is concerned, which (thanks to the "care" of the publisher-sic Illusie) only represents a defined ruin of the original seminar, Milne apologizes for finding it "difficult to access", Le bon samaritan Illusie has done all he can to turn it (following the good pleasure of the good samaritan Deligne) into an indigestible collection of "technical digressions"... .

Clearly, Serre didn't want to hear about it any more than Weil did to see a cohomology group written in black and white, or to hear the words "topological vector space" uttered.

This time though<sup>864</sup> (\*), when I came back to this text by Serre from 1974, against the backdrop of a year-long reflection on a certain Burial (which, in 1974, had been "going well" for four years. . . ), this passage finally clicked. It worked in me, slowly, over the days and weeks. I realized that this attitude of Serre's, to which I had become accustomed and which, before my departure, "had no consequences", acted as a kind of **green light** for the burial that took place. The first thing that occurred to me in this sense, with the force of evidence, was that Serre's very words (but "with malice and impudence to boot"), were eagerly taken up by a Deligne (or better said, with a secret delight) barely three years later, as "background noise" for his memorable Manoeuvres.

I first expressed myself in this vein in the aforementioned note of May 4, and this reflection is ap-  
deepens in part (c) (of May 27) of this same note, "Des choses qui ressemblent à rien - ou le dessèchement". This, too, is the first inkling of a reflection on the relationship between Serre and me, □ à la lu-  
l'Enterrement<sup>865</sup> (\*). As I wrote these pages, there must already have been in me a diffuse perception of the crucial role played by Serre in l'Enterrement. In the two weeks since then, the work of integrating and assimilating a whole range of facts and impressions must have continued, and the forces of inertia opposing a direct and nuanced perception of things have, I believe, resorbed, without struggle or effort. The time seems ripe to bring this work to a conclusion, now trying as best I can to formulate what is perceived.

One might think that this old-fashioned tendency to distance oneself from certain aspects and parts of my work would have acted as a kind of unfortunate coincidence, which would, alas, have favoured an equally unfortunate Burial. But that's a superficial view, and doesn't get to the heart of the matter. To come straight to the heart of the matter, it has become clear to me, given Serre's unique relationship to me and my work, and given his exceptional ascendancy over mathematicians of his generation and those that followed, that **the Burial could not have taken place, if there had not been in him a secret acquiescence to my burial.**

In addition to the decidedly absent "deceased", there were **two main actors** in this Burial, whose acts and omissions followed on from one another and complemented one another, without the slightest friction or burrs it would seem (but there's no question, for me, of any connivance here, so much so that the two protagonists operated on different tuning forks): they are Pierre Deligne, and Jean-Pierre Serre.

The former has been discussed at length since the very beginning of this long reflection on the Funeral; he represents the "foreground of the picture" of the Funeral, as the Grand Officiant at the Funeral, as well as the occult heir and principal "beneficiary" of the operations he initiates (and this, even before the symbolic "death" of the deceased. . . ). Serre, who is mentioned here for the first time as a leading figure in the funeral ceremony, represents the "third plane of the picture", formed by "the Congregation of the Faithful".

□ Departing from last year, or rather, even before I discovered L'Enterrement sous ses  
the crudest and most aberrant forms (and under that name), I was well aware that those who were burying me with such eagerness, in a world where I had known no enemies, were above all my **friends of yesteryear**, some of whom had not ceased to count themselves (albeit with lip service. . . ) among those who had been my friends for so **long**.

<sup>864</sup>(\*) In fact, it was only the third time I had this text in my hands that it "clicked".

<sup>865</sup>(\*) In a previous b. de p. note (note (\*) page 1117) I also noted two other notes where I expressed myself about the relationship between Serre and me, but in a rather different light - the "pre-Burial" light.

number of my friends. Now, it's also clear to me that among those friends who were also (and above all) my students<sup>866</sup> (\*), the one who was truly the **pillar of** the Ceremony, as representative of the Congregation and guarantor of the acquiescence of all the Faithful, was also the one, among all, who at the level of our common passion, had been closest to me.

For me, the most striking sign of Serre's acquiescence is certainly not a certain quip, sent with the casualness I know so well - a quip that almost escaped my attention (even if it wasn't lost on everyone. . . ). For me, the sign, which is truly astonishingly obvious once I stop to think about it, lies **in the ignorance in which he was happy to keep himself**, at the

about this Burial that was taking place right under his nose, so to speak<sup>867</sup> (\*\*) - the burial of a <sup>work</sup>□to which he had been linked from its very origins, and more closely than anyone else in the world. And it'sp . 1125

It's a total mystery to me whether reading Récoltes et Semailles (supposing he does read this "package" of over a thousand pages, yet. . . ) will finally encourage him to use his nose (which has been working hard for fifteen years now. . . ), and the rest. But I'm well aware that for him, as much as for any other participant in my funeral, accepting my message and making use of his healthy faculties also means accepting to question himself, profoundly.

It seems to me that Serre's role at the head of the Congregation of the Faithful who came to attend and chorus at my funeral is both typical and exceptional. If it's exceptional, it's because of its extreme character - as the one closest to me, closer than any other member of the Congregation; and also because of its sta-<sup>868</sup> (\*). This eliminates from the deeper motivations the usual "parasitic" components of antagonism "by compensation"<sup>869</sup> (\*\*). As I pointed out earlier, I can only detect □la relationp . 1126

<sup>866</sup>(\*) In the course of my reflections on Harvest and Sowing, it became clearer and clearer just how much the very fact of having been someone's pupil (mine, in this case) marks a relationship and gives it a special quality, making it akin to a relationship with a father or mother.

<sup>867</sup>(\*\*) It's fair to say that in his Bourbaki lecture of 1974, in which he presented Deligne's demonstration of the last part of Weil's conjectures, Serre had his nose right in the Burial - without, however, having the innocence to take note of it. I thought I sensed his unease at being confronted with this seemingly aberrant situation: that ten years after my paper (also at the Bourbaki seminar) in which I outlined the demonstration of a  $l$ -adic cohomological formula for  $L$ -functions, the crucial "fixed point formula" (which I had admitted there) had still not been demonstrated in the literature.

Serre then chose **to evacuate** this discomfort with a mood swing, ironically referring to SGA 4's infamous "1583 pages" (which, by the way, didn't **even** provide the formula we needed). This was the easy way out, evading an unpleasant reality (x). He knew full well, however (but had perhaps been pleased to forget. . . ) that in the SGA 5 seminar, I had demonstrated at length a formula for fixed points that went far beyond that for the Frobenius correspondence - and he also knew that the editing of my lectures had already been dragging on for eight years in the hands\* of so-called volunteer "editors". Although he was happy to forget the theme of SGA 5 (" $L$ -functions and  $l$ -adic cohomology" - the title says it all) and its content, he knew me well enough, having seen me do maths for more than twenty years, to know that I was not in the habit of doing things by halves, quite the contrary (and I even did them so "not by halves" that he was often annoyed, if not excused. . . ). It might have helped him to refresh his memories of what had happened at the SGA 5 seminar, where he'd been often enough, at least, to know the broad outlines of what I was doing there and where I stood.

Clearly, he didn't want to see his memories refreshed, or to ask himself any questions. And this is just one of many cases where my friend preferred to close his eyes and plug his nose, rather than face up to a reality he couldn't accept without deeply questioning himself.

(x) (June 22) Since these lines were written, I've come to realize that this kind of "unpleasant reality" is now welcomed with alacrity, almost as a godsend! See parts d. and e. of "The family album".

<sup>868</sup>(\*) There's a third circumstance that gives Serre's role in L'Enterrement its exceptional, or "extreme", character. He is one of a group of "benevolent elders" who welcomed me when I first came into contact with the world of mathematicians.

(I write about this group, for the first time in my life, in "L'étranger bienvenu" (section n° 9), and then in the Introduction to Récoltes et Semailles (I 5, "une dette bienvenue")). This is perhaps the main reason, in addition to the links of friendship and sympathy between us, which meant that it took me more than a year to come to terms with the fact that Serre had played a crucial role in my mathematical burial.

<sup>869</sup>(\*\*) I've already alluded two or three times, here and there, to this (apparent) "causeless antagonism", notably in the note

de Serre to my person or my work, and it's clear to me that there's no trace of it at the level of the deep forces at work in his acquiescence. As far as I know, apart from the famous quip, this acquiescence was expressed in a purely passive way, by **omissions** only. But this tacit "green light" given to a Burial of vast dimensions, accompanied by operations so enormous at times that they seem to define both common sense and decency, now appears to me as the indispensable and crucial "counterpart", the "negative" as it were, of the intensely active participation and Deligne's interest in the same funeral<sup>870</sup> (\*).

p. 1127

□ It seems to me that I have keenly perceived the force that was at work in Serre. It is at a level than that of a personal antagonism, or that of the search for a "profit", in the usual sense of the word.

---

April 3 (below) "Le messenger (2)" (n° 182). There is no doubt in my mind that such "archetypal" antagonism is at work in the vast majority of the participants at my funeral - perhaps in all of them, with the sole exception of Serre. This force seems to me to be distinct from that which expresses itself in the process of repression (or "burial") of "the disowned woman who lives within oneself". But these two forces are nonetheless intimately linked, and in Burial they appear in a kind of amalgam, where it is often difficult to dissociate them. Yet I believe I have identified in them **the two great forces** at work in L'Enterrement. But I'd be hard-pressed to say whether one is more important than the other, and if so, which. I'd tend to think that it's the first of the two that I've detected, namely, the force of repression of the feminine side of one's own being.

If Serre's case struck me as "typical" (as well as exceptional), it's undoubtedly because it's the latter of the two forces at play (the one I tend to see as primordial) that appears there in all its force, to the exclusion of any trace of the other (qualified here as "parasitic" - in the sense that it would obscure a clear apprehension of what I thought I perceived as **the essential**). I presume (provided that the work of integrating and assimilating the raw facts and perceptions continues) that the coming months will bring me a more nuanced understanding of the part to be played by each force, both in the Burial and in other conflict situations in which I am involved in one capacity or another.

<sup>870</sup>(\*) There's a rather remarkable **inversion** here in the distribution of roles between Serre and Deligne, in L'Enterrement: Serre's appears almost exclusively passive, Deligne's intensely active (even if this role of "playmaker" is constantly concealed, for the sake of the argument and in keeping with my friend Pierre's particular style). In fact, it is Serre's persona that is strongly "masculine" dominant, and Deligne's equally "yin" (or "feminine") dominant; and this (for both) as much at the level of egotic mechanisms, of the "self" and its conditioning (i.e. that of the "**boss**"), as at that of the drive for discovery, of that which is original and escapes (in its intimate nature) conditioning (the level of the "**child**"). Between the extreme opposing temperaments of Serre and Deligne, the two "pillars" of L'Enterrement, the deceased represents a sort of middle ground, with a strong "masculine" dominance on the "boss" side, and an equally strong "feminine" dominance on the "worker" (or "child") side. (This

The distribution of "basic tones" appears in the note "Brothers and spouses - or the double signature", n° 134.)

The forces and mechanisms of "reversal" between yin and yang roles were also **the** main topic of discussion, giving rise to the long meditation "The key to yin and yang" and remaining present in *fi ligree* throughout. It appears implicitly in the very first note of the Key, "Muscle and gut (yang buries yin (1))" (n° 106), and comes more or less to the forefront of attention in eleven of the later notes (notes n° s 124, 127, 132, 133, 138, 140, 145, 148, 151, 153, 154). Here, I've just unexpectedly come across a somewhat similar "reversal" situation, driven by the internal logic of the deep forces at work in Burial.

Lately, I've been struck by yet another seemingly paradoxical aspect of the "reversal" of yin and yang roles in this funeral rich in apparent paradoxes! This time, it's a question of the respective roles of the premature "deceased" on the one hand, and of all the participants in his or her funeral, on the other. At the level of collective unconscious intentions, this Burial of the deceased (who is supposed to confine himself to the complete passivity befitting his state) is that, above all else, of "feminine mathematics" - of a style and approach to mathematics with strongly "feminine" connotations; while the burying Congregation is supposed to embody "pure and hard" virile values, delivering the soft feminine deliquescence to the appropriate disdain. (See, for example, the notes "Les obsèques du yin (yang enterre yin (4))", and "La circonstance providentielle - ou l'Apothéose", n° s 124, 151.) And yet, the internal logic of the situation forces each of these "hard" participants to play a typically "yin" or "feminine" game: a game of "velvet paw", of halftones and silences, omissions, insinuations placed there under the surface of nothing, or constantly suggesting such and such a thing while pretending to say the opposite - the "thumb!" style, in short, in which my friend Pierre is a master among all, and which each of the buryers had to make their own, by necessity. (See, on the subject of this style, the note "Thumb!", and especially the notes "Velvet Paw - or smiles".

and "Le renversement (4) - ou le cirque conjugal", n° s 77, 137, 138.) On the other hand, it's the "deceased", the embodiment of plethoric feminine sluggishness, who emerges from his cosy coffin when least expected, and takes on a "macho" role. who was familiar to him, putting his cards on the table, sticking his indiscreet nose and impertinent verb, electric torch in hand, into the most exquisitely ambiguous penumbras, rudely calling everyone by their name and a cat a cat and a rascal a rascal - a real misfit, to say the least, and a ~~fiendish~~ hindrance to going round in circles in the hushed purr of a beautiful

of the term. The recent exchange of letters with him was revealing in this respect. I feel that in the fifteen years since I left, my friend has undergone a **transformation**<sup>871</sup> (\*). This transformation will in the sense of this □ "visceral reaction of rejection" towards certain dominant aspects in my approach p. 1128 of mathematics. These are aspects that were also present, but to a less pronounced degree, in Serre's own approach, in the most fruitful years of his mathematical past - years of intense openness and creativity, before a process of **repression** of these aspects of his creative personality, of the "child" in him, set in. These are the "yin" or "feminine" aspects and traits of creativity. The transformation I sensed in my friend, with startling force, was that of a state of harmonious cooperation of yin and yang creative forces, with a pronounced yang (or "masculine") "dominance", into a state of "zinc-stranded virile" imbalance, where "yin" or "feminine" qualities are ruthlessly extirpated.

In fact, as I already hinted two weeks ago (in the note quoted earlier), this is the culmination of an evolution whose first signs I detected as early as the 1950s, and which became more pronounced during the 1960s. Already then, there was a gradual upset in the balance, manifested in a **narrowing of** vision, and in the range of creative faculties allowed to come into play. Reactions of rejection towards certain major aspects of my approach to mathematics, and progressively, towards everything that really made up the life, depth and strength of my work - this rejection was simply the outward projection, the tangible manifestation at the level of his relationship to me, of a rejection of an entirely different scope, towards an essential side of his own being and his own creative faculties.

It's possible (as I suggested earlier) that as long as I was around, the relationship with me acted as a brake on this evolution in Serre, that it represented a kind of counterweight in his life, in the fifties and especially in the sixties, and thus a factor of relative equilibrium. If this is indeed the case, my sudden departure must have given free rein to this force of repression of feminine qualities - a kind of force that has become familiar to me, as one of the dominant egotistic forces that have also acted in my own life; with this remarkable difference, however, that in my

however, this force of repression was confined to my egotistical mechanisms and my relationships with others' □ **without** interfering with my love affair with lady mathematics, or (more generally) with my p. 1129 spontaneous adventure of discovery, whether mathematical or otherwise<sup>872</sup> (\*).

To return to the subject of burial, I can do no better than to quote the lines that conclude the reflection of November 10, in the note "The funeral of yin (yang buries yin (4))" (n° 124, page 564):

". . . And all of a sudden, these funerals appear to me in a new, unexpected light, in which my own person has become an accessory, a **symbol of** what must be "handed over to disdain". This is no longer the funeral of a person, nor of a work of art, nor even of a work of art.

---

funeral ceremony...

<sup>871</sup>(\*) This expression "**transformation**" is immediately associated with the "**metamorphosis**" in my friend Pierre, which I clearly perceived for the first time during his visit to my home last October. (I say more about this in the note "Le désaveu (2) - ou la métamorphose", n° 153.) The term "metamorphosis" is stronger, and corresponds to the fact that my friend Pierre has undergone a reversal of an original temperament with a pronounced yin "dominant", into "macho" borrowed attitudes with a hint of yin. Apart from that, the transformation I felt in both friends was in the same direction, driven by the same force of repression of traits felt to be "feminine".

<sup>872</sup>(\*) I discuss the role of this repressive force in my own life in the note "Le Suprême (yang enterre yin (2))", n° 108. I began to detect this force in 1976, the year that marked a crucial turning point in my spiritual adventure. This turning point is discussed in the two notes "Reunion (the awakening of yin (1))" and "Acceptance (the awakening of yin (2))". du yin (2))", n° s 109, 110. I note the predominance of "feminine" traits in my mathematical work (where said traits seem to have taken refuge, safe from suspicion!) in the note "La mer qui monte. . . ", n° 122.

of inadmissible dissent, but the funeral of the "mathematical feminine" - and even more profoundly, perhaps, in each of the many attendees who came to applaud the Eulogy, **the funeral of the disowned woman who lives within himself.**"

This last intuition appeared that day in a sudden flash, at the very moment of writing these last two lines, coming as an unexpected revelation, in addition to the one that was the subject of the previous lines. This intuition remained a watermark in my thinking over the weeks that followed, to be finally taken up and deepened in the three consecutive notes from December 23 to 26: "La circonstance providentielle - ou l'Apothéose", "Le désaveu (1) - ou le rappel", and "Le désaveu (2) - ou la métamorphose".

Neither on the day this intuition first made its appearance, nor in the first two of the three notes quoted, where I probe it further, did I have in mind a precise case in point, if not, to some extent, that of my friend Pierre (examined in more detail in the third note quoted). I was well aware, moreover, that this case was by no means typical of the entire Congrégation des Fidèles, forming

p. 1130 the famous "third plan" at my Burial. Also, in the absence of a precise case in point, my apprehension of a certain reality, suddenly glimpsed, remained marred ☐ encore by a certain vagueness - that of things sensed, "known" at some level, but not fully and clearly "seen". I vaguely remember being a little embarrassed by this vagueness, that there was a desire to find someone "representative", among those of my friends whom I knew to be involved in the Burial, to somehow "hang" this diffuse knowledge on it, to see it embodied in a tangible reality.

The thought of Serre never crossed my mind at the time - he was one of the very few of my old friends for whom it was clearly decided (on a conscious level, at least) that he, at least, was not a party to my Funeral! But if my groping mind couldn't find then (or even before...) the person who, at my funeral, was to embody "the whole Congregation", it must have been that somewhere inside me, it was clear that there was **only one person in the world** suited to play this role - and that it was precisely the person whom a heaviness within me had made me exclude from the outset, by a kind of tacit and peremptory taboo... .

Now that this heaviness has dissipated, following a slow and obscure subterranean work, it now appears to me in full light that it is also the one, of all, to whom this intuition-in-search-of-an-incarnation applies in such a perfect way, that you'd think it was none other than the very one who brought it out in me and gave it, from the very moment it appeared, that peremptory and unrepeatable force of things "known"<sup>873</sup> (\*).

p. 1131 **d. L'Enterrement - or the natural slope**

☐ (June 17) Every time, reality goes beyond any presen-

It's only when I come into contact with it, usually unexpectedly, that I can gradually absorb its taste and smell. Even though this contact might seem to simply **confirm**, without more, what was sensed or "known", it often disconcerts and shakes a certain, almost ineradicable **disbelief** in what is well and truly known, said, written, retold and rewritten - and yet, to

<sup>873</sup>(\*) I'm even inclined to think that this "one could believe" actually corresponds to the reality of things. This would attest, once again, to the extent to which our faculties of knowledge go beyond the pale and derisory reflection to which we allow access to the narrowly delimited field of the conscious gaze.

(June 14) The thought, or sudden intuition, that concludes yesterday's reflection also appeared in a "flash" at the moment of writing, without any apparent preparation or desire for examination. It presented itself with a kind of "force of evidence". It was only in retrospect that I remembered that in the note immediately preceding the one from which the quoted passage of November 10 is taken, I had mentioned Serre's person and the relationship between him and me in some detail (for the first time, incidentally, in Récoltes et Semailles).

At a certain level (that of an immense heaviness), it continues to remain a dead letter. More than once, I've detected this heaviness<sup>874</sup> (\*), and my impatience has been irritated by it - a stubborn heaviness that tenaciously wants to keep me in the rut of familiar ideas and images, or those that have more or less general assent - even though I also "know" (or that someone or something **else** in me knows...) that these well-established ideas and images are a sham, often an obvious sham, that they don't stand up. . . ) that these well-established ideas and images are a sham, often an obvious sham, that they don't hold water. . . Thought, even when driven by an intense desire to know the final word (of the thing both "known" and rejected) - thought alone is powerless to erase this heaviness, deeply rooted in the structure of the self. It's only the peremptory force of direct contact with reality that sometimes has the power to upset this heaviness, to dent it or shift it just a tad, if not actually erase it.

I phoned Serre yesterday. It was a simple question of information, about Tate's "Rigid analytic spaces" notes, which were discussed recently<sup>875</sup> (\*\*). I thought I vaguely remembered that there had been a short introduction to this text, mentioning the sources of this work - it seemed to me that this introduction had "jumped" from the edition made by the care of *Inventiones Mathematicae*, in 1971. In fact, Serre confirmed that there was no such introduction in Tate's notes. They were more or less day-by-day notes that Tate had sent to Serre on his rigid-analytical cogitations, like letters almost, and (of course) without any fixed idea of publishing them. I remembered taking care to have them distributed by care of IHES (with the subtitle "Private-notes published with(out) his permission □ - after the name of the author), but I'd forgotten that Serre had been an intermediary. In any case, apart from Tate and myself, it was Serre who had been most "in the loop", in the birth of rigid-analytic spaces, in 1962. It was he who had explained to me, perhaps a year or two before, the theory of elliptic curves known as "Tate's curves", on the fraction field  $K$  of a complete discrete valuation ring. I was a little taken aback by what I remember as a flurry of explicit (and, it seems, "classical") formulas, which went a little over my head, without "catching on". But a striking geometrical image remained, surely prompted by a comment of Serre's along these lines: that, in short, Tate's elliptic curve (or, at least, its "points") was obtained by "passing to the quotient" in the multiplicative group  $K^*$  by a discrete isomorphic subgroup  $Z$ . This was the analogue of the complex case, where we first divide  $\mathbb{C}$  by a first factor  $Z$ , to find  $\mathbb{C}^*$ , and then again by a factor  $Z$ , this time to find an elliptic curve. In this case, the passages to the quotient had a precise meaning, in the complex analytic domain, and Riemann-Serre theorems (GAGA type) ensured that the final quotient (which was a compact complex curve) had the canonical structure of an **algebraic** curve. In Tate's case, alas, working in the context of somewhat familiar analytic spaces, on the complete value field  $K$ , the quotient was a **totally discontinuous** compact analytic space, and there was no chance of deriving an elliptic curve. And yet (this is what Serre must have said to me then) everything was happening, as if... . In any case, Tate was able to produce a genuine elliptic curve in terms of  $K^*$  and its discrete subgroup, using explicit formulas.

I seem to recall that neither Serre nor Tate believed that there would indeed be an "explanation" in terms of a new notion of "analytic variety" over  $K$ , for Tate's computational construction<sup>876</sup>.

<sup>874</sup>(\*) On the subject of this "heaviness" and "incredulity in the face of the testimony of one's healthy faculties", see also the note "Le devoir accompli - ou l'instant de vérité" (n° 163), pp. 782-784, and in particular the b. de p. note (\*\*) p. 782.

<sup>875</sup>(\*\*) see note "La maffia" (n° 171), part (c), "Les mémoires défaillantes - ou la Nouvelle Histoire".

<sup>876</sup>(\*) (September 1985) As it appeared from a correspondence with Serre last July, there has been a distortion here of letters from Tate (4.8.59 and 16.10.61) and me (18.8.59 and 1.10 and 19.10.1961), addressed to Serre, enable us to reconstruct the film of events. It was Tate (not Serre, nor I) who first had the intuition and conviction that there had to be a "new notion of analytic variety", to simply explain the formalism of "Tate's elliptic curves", around August 1959. It didn't "click" with me right away (as I'd put it).

As for me, it clicked right away(\*) , and there was no question of me "seeing" Tate's curve as anything other than the result of a quotient passage, for a notion of suitable "variety" that had yet to emerge - the kind of work, precisely, that I have a crush on! It may well have been Serre too, skeptical though he was, who pointed out to me that there were people, and at least Krasner, who were "doing analytical extension" on ultrametric, i.e. totally discontinuous, complete value bodies. This might have seemed to support my (somewhat zany) hope that there would be, in spite of everything,

p. 1133 a "good notion" of analytic variety, smarter than the one we knew and close (by "connection" type properties) to real or complex, or even, algebraic  $\square$  analytic varieties. But then again, I was the only one in the trio who really believed it - at least, that's the impression I had at the time.

I couldn't get it out of my head for months, maybe a year. The situation reminded me of an old perplexity - the impossibility, in the conceptual context available at the time (using ringed spaces, like schemas and formal schemes), of making sense of the **geometric fiber** of a formal scheme on the discrete valuation ring  $A$  under consideration. It soon became clear that this was essentially the same perplexity - and that the kind of "varieties" I was looking for to give a geometrical meaning to Tate's construction, had to be the very one that would make it possible to give a meaning to this famous yet non-existent "generic fiber". Finally, I had a third thread (in addition to the rumor about Krasner), which appeared in 1968 - it was the intuition of "generalized topological spaces" (which at the time hadn't yet been given a name such as **site** or **topos**, since I hadn't begun any conceptual work on them), which was to make it possible to define the famous "*l*-adic Weil cohomology" entering (implicitly) into Weil's conjectures. This suggested to me that, as with Weil's cohomology, the new "species of structure" I was looking for should not be sought on the side of the endless ordinary "ring spaces", but perhaps in these "generalized spaces", provided with a bundle of suitable rings.

I don't know when these scattered intuitions finally became strong and convincing enough to prompt me to take a break from my day-to-day tasks (especially EGA and SGA), to begin an embryonic piece of work. What I do know is that this work was done, as is often the case, in solitude - I was the only one to "see" that there was something there, and the only one, consequently, who was in a position to do the initial work that would bring it to light. I remember starting to think about it for a few hours here, a few hours there, even a whole day, a bit like playing hooky (although there was no shortage of "regular" work!). Eventually, I got the bit between my teeth and had to stick with it for good - I must have spent at least a few days in a row, if not a week or two. The hardest part was overcoming the inveterate habits of thought that constantly seemed to want to pull me back into the rut of the known - that of "ordinary" analytic spaces.

now, I think, "flabby" - or "welk", in German). I had to go over it three or four times - to get out of  $\square$  the rut, when I saw that I was back in it, like a horse in its stable! But decidedly, here, it wasn't the old man who was going to do the trick. ...

p. 1134 At the end of the job, I knew for sure: modulo additional technical work, which I wasn't

---

thought I remembered), my very first reaction to Tate's suggestion was rather skeptical, before I started to think about it. It wasn't long before I was convinced, once I realized that existing notions (notably that of the formal schema) were unable to account for the phenomena associated with Tate's elliptic curve. In the two years that followed, I think I was the only one to think of a definition principle for the new notion, while neither Tate nor Serre had the slightest idea how to approach it. It went on like that until October 1961, when I provided Tate with the blueprint for a theory. This immediately triggered him into developing the foundations required to get a grip on the local pieces (work which would have made little sense until he had a clear idea of how they could then be assembled to build global objects). For more detailed comments and quotations from the relevant letters, I refer you to the "Historical Comments" in Volume 3 of Reflections.

motivated to do so, I had set up a notion of "rigid-analytic space" (this is the name I gave it, to express by the word "rigid" properties like connectedness, close to algebraic varieties and at the antipodes of those of analytic varieties called "flabby"), sufficient in any case to answer the two desiderata that were then in my mind: to give an interpretation, in terms of these spaces, of Tate's construction, and of the generic fiber of a formal scheme.

I didn't think to look any further, as I was in a hurry to get back to the tasks I'd momentarily abandoned. If I'd played around a bit more, I'd soon have realized that some of the es-

paces as simple as the closed crowns  $r \leq r \leq R$  (which also deserved a "rigid-analytical") escaped my construction. It was Tate, whom I had made aware of my cogitations of course, who made the necessary adjustments to be able to include them. Apart from the conceptual work itself, which I had done for the most part, there was also work of a more technical nature to be done, to get a good grasp of the "building blocks" used, playing the role of affine diagrams. This is precisely the work that is done, with characteristic elegance and care, in Tate's 1962 notes<sup>877</sup> (\*).

□ It took me a while, moreover, before I came to the realization that the building stones I had used were a little short around the edges. They were sufficient for the two initial problems that had motivated me - so why look any further! I couldn't get over it. Tate finally convinced me, in his quiet yet thorough way, that there were more than just those two examples after all, and that even though I didn't seem to have encountered circular crowns yet in my life, that was no reason to rule them out. And there was no way, apparently, to "make up" for them with my own building stones (except by using an infinite number of them, which more or less put me back in the "flabby" rut).

p. 1135

<sup>877</sup>(\*) To put things in perspective, I think it's fair to say that both my work and Tate's were equally essential stages in the development of the theory of rigid-analytic spaces. My part had been in the initial vision (which had been lacking in both Tate and Serre) and in a mostly conceptual work, which was by no means exempt from certain technical aspects that had to be tackled head-on. The work at Tate had been mainly technical, although there was also a certain amount of conceptual work. My work was predominantly "yin", "feminine" (and that's why, in addition to my absence from the scene, it's the object of general disdain), while Tate's was predominantly "yang", conforming to the canons of good taste and good manners.

If I hadn't intervened, pushing my work far enough to remove any doubt about **the existence** of a good "rigid-analytic" notion, and for a clear vision of a theory's master builder, it's likely that this notion would still not have seen the light of day today. Indeed, while it was inevitable that this notion - which is by no means an "invention" - would be discovered and developed "sooner or later", the need for it has not, in the twenty-three years since then, been sufficiently pressing to "force" people to "take the plunge". I was apparently the first to foresee (in 1966) another field of application for rigid-analytic theory, apart from the two initial motivations, with the development of crystalline cohomology.

I'm not aware of any geometrical uses other than the three I'd planned - including, of course, the generalization of Tate's theory to general Abelian schemes. It would seem that the people who subsequently "worked on the subject" saw it mainly as an opportunity to develop the theory in a vacuum (since it existed, and there was a consensus that it was a "serious research topic"), without inserting it into a broader geometrical vision. This is a striking example of the **atomization** and compartmentalization of mathematical thought, linked to the contempt in which any kind of fundamental work has fallen, as well as any work that is not reduced to some technical tour de force, enabling the solution of some "competition problem". A particularly eloquent sign is the absence of any attempt to develop a more general notion of rigid-analytic space, which would be to that developed by Tate as the notion of scheme is to that of algebraic variety over a body - so as to be able to link together rigid-analytic geometries over "variable" complete value bodies (and in particular, of variable characteristic, and including both real and complex cases, as well as "ultra-metric" cases). This absence is one of many signs of the astonishing stagnation of mathematics over the last fifteen years, at the level of any work on foundations (obviously crucial, in this case).

Getting back to Tate and me, it's just as likely, of course, that if my first "breakthrough" hadn't "clicked" with Tate and set him off for a "second round", rigid-analytical spaces wouldn't exist any more I'd have talked about it here and there around me, but as there's never been a shortage of juicy questions (including ones that seemed even more "urgent"), it's doubtful that anyone would have taken to it - and certainly not these days, when the very idea of introducing such crazy things would have sounded a bit too much like someone it's more charitable not to name here. . .

I'd done my share of the work on my own, as was normal, when I was the only one who believed in it - but that didn't stop me, of course, from talking to both of them once I'd reached the (provisional) end.

main (and practically only) concerned, namely Serre and Tate. At Tate's it obviously clicked, and I think Serre must have been convinced too, when I told him what I'd come to. I don't remember exactly, but

if by some extraordinary chance it had been otherwise, I'm sure I would have remembered. So when I phoned Serre yesterday, I took it for granted that he knew, almost as well as I did, what my part had been in

the birth of the new notion of variety. I didn't expect him to mention it, but when I told him about Tate's notes, he pointed out that they had been published *ne varietur* in the *Inventiones*, and that Remmert and two other authors had just published a book devoted to the famous rigid-analytic varieties. This is the book I had occasion to mention recently, in the note "La maffia", part (c<sub>1</sub>) "Les mémoires défaillantes - ou la Nouvelle

Histoire", where I accuse Remmert of a "faulty memory" (even though Tate's own notes could well have refreshed it), in the service of a bad faith that seemed obvious to me. I touched on this in passing to Serre - I

had already had occasion, in my last letter to him, to allude to a certain Funeral<sup>878</sup> (\*), and there was a rather blatant illustration.

The first crazy thing was that Serre (God knows he'd had a front-row seat in the past!) - well, he didn't remember that I'd had anything to do with those famous rigid-analytical varieties either! I was literally speechless! It was really crazy

- when I alluded to a modest part I thought I had played in it, based on the two examples that had triggered me, it was **just the opposite that** he, Serre, thought he remembered: almost that I wouldn't have wanted to know anything about these new varieties, saying (according to him) that with formal schemas, we had already

everything he  $\square$  fallait! I could hardly believe my ears at the time<sup>879</sup> (\*) - and yet, a few days just before, I'd written a few pages in the most serene fashion, about a crucial role, a "pillar" role, that Serre would play in a certain Burial. Well, there I was, right in the middle of the Burial, in front of my nose at the other end of the line, and in the very person of this same Serre, very much at ease as is his wont, and obviously in the best faith in the world! (And I can't imagine Serre acting in bad faith anyway, especially when it comes to maths... ).

I didn't feel like chatting, that's for sure, and Serre even less so, but we did have an off-the-cuff conversation, for five or ten minutes. Ten minutes well spent if ever there was one, to rub shoulders with the tangible reality, color, taste, smell and all, of a Funeral that had become a little distant, by dint of my limiting myself to looking at nothing but paper!

The first thing I had to think about saying was that the **name** itself, "rigid-analytical spaces", was me.

<sup>878</sup>(\*) It is in the reply to this letter (in the last letter from Serre that I received) that Serre quotes Siegel's expression, on the "Verflachung" ("flattening") of contemporary mathematics, on which I comment and continue in the note "Useless details" (n° 171 (v)) part (c), "Things that look like nothing - or desiccation". As I say in this note, Serre had dismissed this impression of Siegel as "**unfair**" - yet I had the impression that it turlipinated him a bit, that Siegel thinks like that. And it's that same term again (probably unintentionally) that he uses, also to dismiss my allusion to a Funeral.

Needless to say, it didn't occur to him to ask me **what it was that** made me say there was a funeral (I hadn't said a word about it in my letter, preferring to wait for him to ask). The cause, obviously, had already been decided...

<sup>879</sup>(\*) In retrospect, I've come to understand the deformation that took place in my friend's memory (a little faulty around the edges). Since I'd used formal diagrams as my main and virtually only guide to defining a rigid-analytic space (so as to be able to associate a rigid-analytic generic fiber with a formal diagram), he'd remembered (twenty-three years later) that I'd stubbornly maintained that there was no need for a new notion of variety, since "my" formal diagrams would suffice for everything (as memory lapses often do...).

However, already  $K^*$  (my second conductive wire) does **not** come from a formal scheme. In any case, here again, the case had already been made!

who had given it (implying, if I didn't say so clearly: at a time when I was still the only one dreaming about it, about these things I called them... .). Serre was a little taken aback - obviously, he couldn't remember either, but it was also obvious that I wasn't having fun making up stories. But never mind, a name is just a name after all, and **such a natural one at that**... . That "so natural" clearly implied that it was so natural that it didn't even mean anything anymore, that anyone with their nose in front of it couldn't help but call it just that: "rigid-analytical". In short, my friend was unintentionally paying me a compliment on the name - but with the air of "if that's all it is...".

...!". Besides, I hadn't published anything about it, had I? So there was nothing to say...

I was more and more dumbfounded. Published or unpublished, it made no difference to me. A woman who carried a kid nine months and brought him  $\square$  into the world and here he is frolicking and in good shape, someone

p. 1138

tell her it's not her kid, since nothing's been published and she can't even show off the birth certificate - she's sure to laugh in the face of anyone who says such a thing. To tell the truth, I didn't laugh at Serre, which isn't my style, and anyway, I was still too blown away. Nor did I think to discuss the fact that Tate himself, in his notes, made no secret of the part I'd played in starting the theory (something Serre had apparently forgotten, as had Remmert<sup>880</sup> (\*)). - and that in 1972, when I wrote the *Esquisse Thématique* in which I alluded to it<sup>881</sup> (\*\*), Serre hadn't even pretended to notice (his memory must have been working since then). It would have been a wasted effort anyway, obviously - as long as nothing was published, anything I said would count for nothing. ...

But the "unpublished" had struck a chord, and I went on to say that a major part of my work consisted of unpublished stuff, communicated by word of mouth. I sensed that Serre was still taken aback.

this was an idea that seemed to him to be a little preposterous, like a contradiction in terms "work - not published. . .", for him it didn't seem to  $\square$ aller together. I said the word "motif", and he jumped on it right away: now he was going to disabuse me of the ideas I'd had about burials, and he was happy to tell me that two or three years ago, a whole book had been published on motifs - really, I couldn't complain about the "motifs" chapter!

. 1139

"So, have you held it in your hands, this famous book?" I asked her (it was fitting, I'd been thinking about asking her this interesting question for a while).

Holding it in his hands - but perhaps I was joking, Serre retorted, for sure he knew this book; he even spoke of it as if he'd read it at length, and that's because he had to have read it

<sup>880</sup>(\*) I felt, once again, that "**in any case**, the case had been made". If Tate said he was following "in a totally faithful way" a masterpiece I'd provided, well, never mind - it was only a masterpiece after all, a vague drawing that any kid could draw in the sand, a vague Grothendieckian sauce, for sure - it was still nice of Tate, really chummy as hell, to take the trouble to mention it... ..

<sup>881</sup>(\*\*) This is the text, dated 1972, presenting a rather dry (and not very inspiring) sketch of my mathematical contributions to that date, written on the occasion of my application for a position at the Collège de France (a position which was awarded to J. Tits). This text, supplemented by more detailed historical comments, will appear in volume 3 of *Réflexions*. It is discussed in particular in Introduction 3 (Boussole et Bagages). In the *Esquisse Thématique*, 5 e), I write:

**"Rigid-analytic spaces** . Inspired by the example of the "Tate elliptic curve", and the needs of "formal geometry" on a complete discrete valuation ring, I had arrived at a partial formulation of the notion of rigid-analytic variety on a complete value field, which played its part in J. Tate's first systematic study of this notion. Moreover, the "crystals" I introduce on algebraic varieties over a body of characteristic  $> 0$  can sometimes be interpreted in terms of vector fields with integrable connection on certain types of rigid-analytic spaces over bodies of zero characteristic; this hints at the existence of deep relations between crystalline cohomology in char.  $p > 0$ , and cohomology of local systems on rigid-analytic varieties in zero characteristic."

That's Grothendieck all over again!

indeed. I could have left it at that if he hadn't found anything peculiar in it - he obviously hadn't, and yet (that's how we're made, I can't help it!) I asked him anyway! And as he didn't seem to understand the meaning of the question, I told him that when I picked it up last year, I could hardly believe my eyes.

I had to say the word "swindle", but I felt it was an understatement. As I had really felt it, and still feel it as I write these lines, it was an **indecent** - but I refrained from reading it. Deep down, I sensed that it didn't matter what term I used; nothing had passed in the fifteen years since "it was hard" and Serre chose not to feel anything (which is what I'd just written, a few days earlier), and no matter what I said, it wouldn't "pass".

It was as if he'd been waiting for it. Swindle? You want to dream, my poor fellow, but it was Deligne himself who wrote this book, and a fine piece of work it was too - okay, everyone knows very well that it was you who introduced the motifs, but that's no reason to repeat it every time the word "motifs" is uttered, is it? Not to mention the fact that you've never published a line, and that your yoga depended on unproven conjecture (here I thought I was hearing someone else speak to me through Serre's mouth...), whereas the whole point of the book is that it doesn't use any conjecture - in fact, it doesn't use **anything** you've done in the past...

The tone was crisp and unapologetic, of one who knows very well what he's talking about and has nothing more to learn - with a hint of annoyance, of the un□peu pressured man, taken to task by a lump who stubbornly refuses to

p. 1140

understand the most obvious things. It wasn't the right mood to ask about anything.

- everything had already been settled and awarded. Serre's axioms of business ethics and what's important and what's incidental had obviously changed - and there was nothing I could do about it. I had to take it as it was, with its new axioms.

So I hit on "conjectural", in desperation! I could have told him that Weil's conjectures were conjectural too - and yet, there was no question of him or anyone else treating them underhand - but it's true that Weil had taken care to publish these conjectures! But as I'm just at the "Sixth Nail" (in my coffin)<sup>882</sup> (\*), I turned to the "Galois motivic group" instead; there was nothing "conjectural" about it, I had developed a whole theory of great precision on Galois-Poincaré type categories, which was one of the basic notions used in this famous book, without it seeming necessary to make the slightest allusion to myself.

Serre jumped at the hint, again, so that he could disabuse me of my Burial ideas - the whole theory was published in black and white in a book by another of my students, Saavedra<sup>883</sup> (\*\*)

- Wasn't it me who even got him to do this thesis? Here again, obviously, it was a book he knew perfectly well, he'd had to refer to it more than once<sup>884</sup> (\*\*\*). "And then, in that book, nothing struck you either" - I asked him again (and this time, it was clear that I already knew what the answer would be).

No, it obviously didn't strike him that my name shouldn't be mentioned in this book, nor for the theory

---

<sup>882</sup>(\*) This is the group of notes (n° s 176<sub>1</sub> à 176<sub>7</sub>) to which I'm putting the finishing touches, and in which I unscrew the con, precisely, around the notion of motivic Galois group and Galois-Poincaré-Grothendieck categories (christened "tannakiennes" for the occasion) - scam set up by a Deligne and (initially) through the "pawn" Saavedra interposed. ...

<sup>883</sup>(\*\*) This is the famous book "Tannakian Categories" (sic) by the same Neantro Saavedra Rivano, published in Lecture Notes 265 (1972), Springer Verlag.

<sup>884</sup>(\*\*\*) In fact, I understand that when Serre has the opportunity to quote from this book, in which my name is not mentioned (so to speak), and in which he finds (as far as he is concerned) nothing abnormal, he nevertheless takes care (I don't know what scruple) to refer to me at the same time. He must be the very last person still to take this kind of trouble... .

nor for the ancillary notions (such as motif, crystal and tutti quanti) introduced therein.

□ ab ovo and developed as examples. Here, however, Serre did not seem to have any p. 1141

memory - he still remembers (for the moment at least. . . ) to whom these notions are due, which appear there, under the pen of another of my pupils, without my name being mentioned either. If there is indeed a "failure" here, in my friend, it's not in any case at the "memory" level... .

We talked for a few more minutes about the name "Tannakian categories", which I implied I considered a hoax, whereas Serre, with the evidence to back him up, thought it was a perfect fit. Here too, I knew it well before I even raised this new issue; just as I know **why** this name suits my friend so well, while I, who bore and gave birth to this thing, find fault with it.

As is usually the case between us, it was Serre who cut me short - and indeed, it's true that the conversation had gone on long enough. There had been no "communication" at any point, and that's surely why it left me with this feeling of dissatisfaction, of disharmony. And yet, just like the two or three short letters I've received from him lately, and with even more peremptory force, this short conversation taught me a great deal. Things "known", surely, but half-rejected; known and not believed! And surely this feeling of frustration (which hasn't dissipated even today) is a sign of my resistance to welcoming and accepting the message.

An unwelcome message, to be sure. Just a few months ago, I had no doubt that Serre (as I vividly remembered him, the embodiment of incisive elegance and probity free of all complacency), when he became aware (better late than never. . . ), thanks to the reading of the providential text "Récoltes et Semailles", of the turpitudes of a certain Burial (of which he was certainly a thousand miles from suspecting, poor fellow. . . ),

well, his blood would run cold and he'd throw himself into the fray, this time<sup>885</sup> (\*). This image

d' Epinal has dissipated over the course □ de the last few weeks, a harmless exchange of letters helping. And yesterday he p. 1142

that it's been a long time since Serre has been in the thick of it, in l'Enterrement, and that he's quite happy with it. And this, needless to say (and without any hint of irony on my part), with the best faith in the world!

It's been a while since I realized that "good faith" is by no means as simplistic and clear-cut as it had seemed for most of my life. A certain type of "good faith", one of the most widespread, simply consists in giving oneself the lie, like a good-natured flag used to cover sometimes dubious merchandise. Our psyche is made up of superimposed layers, and as our eyes become sharper, we see the "good faith" of one layer sometimes serving as a cover and alibi for the deceptions of the one below.

As for Serre's good faith, I continue to give him credit for the fact that he will never write a book that makes essential use of someone else's ideas without saying so clearly - even if these ideas have never been published, and would be known only to the person who communicated them to him (assuming he's still alive) and to himself. In other words, I think I know that Serre will never write a book like the ones we discussed yesterday. I think I can even say that the mere fact that someone

---

<sup>885</sup>(\*) When I wrote "this time", I thought of the two other times I'd gone out on a limb, trying to get a message across to the famous "mathematical community" - and even, on both occasions, to mobilize it. The first time was in 1970, when I left the mathematical scene, on the occasion of the connivance of the scientific establishment with the military apparatus. The second, at the more modest level of French colleagues alone, was in connection with a certain iniquitous article concerning foreigners. in France. (See "My farewells - or: foreigners", n° 24.) Both times, my efforts were met with general indifference, where Serre, no more than any of my other friends in the milieu I had just left (with the only with the exception of Chevalley and Samuel), was no exception. All bets are off as to the effect (or non-effect) that the "Récoltes et Semailles" paving stone will have in this very establishment - starting with Serre himself. ...

like Serre or like me<sup>886</sup> (\*), to write a text (mathematical in this case) addressed to a public, brings into play inveterate reflexes of professional conscience, which will tend to eliminate or at least correct (I believe) certain "memory failures", which are not so consequential in

a simple off-the-cuff conversation like yesterday's<sup>887</sup> (\*\*). This is all in line with what I wrote three weeks<sup>□</sup>encore ago, in the note "Things that look like nothing - or drying up"

(n° 171 (v), part (c)): "I'm well aware that Serre, no more than I, wouldn't dream of howling with the wolves, of looting, scheming and debunking, where "everyone else" is looting, scheming and debunking".

Having said that, I can see that all this does not prevent Serre from enjoying, in some cases at least, the plundering, scheming and debauchery of **others**, openly and overtly, "in the public square" and "under the spotlight". He can certainly do it "in the best of faith".

- he doesn't get his hands dirty, merely giving his unreserved blessing to the plundering, scheming and debauchery of others, and all the more so as he doesn't pocket any visible profits: he doesn't boast about the fruits of others' labors, while finding it good that others (appointed dealers, I might add) play such a game, in plain sight. The "profits" he reaps are more subtle than the publications (a little shady around the edges) and bank accounts that others are so fond of. And yet they are of consequence, giving rise to the astonishing metamorphosis of the man I once knew, who is now (I can't say how long ago) participating, eyes closed and nostrils plugged, in the general corruption<sup>888</sup> (\*).

**e. The last minute - or the end of a taboo** (June 18) Yesterday, I hesitated to add a fourth part to the note "The family album" (n° 173), in order to give an "on-the-spot" account of the phone call with Serre the day before. This phone call, it's true, had left me with a "feeling of dissatisfaction, of disharmony" (as I wrote yesterday) - and these are euphemisms, even, to express such uneasiness.

incisive, that he was approaching anguish. This malaise gave rise to the need to return to this episode, as to a ripe abscess now, and which it would be high<sup>□</sup>temps to empty. And then there was the usual procrastination. That

For weeks now, the USTL duplication department has been waiting for someone to bring them the continuation of this famous fascicule IV of Récoltes et Semailles (Harvest and Sowing), which is still giving birth; already, it's just-August to manage to pull and stitch everything before the annual closing of the Fac (July 15), especially as it's not just me - at the end of this academic year, there's an influx of theses of all kinds, which have to take priority. In short, I told myself that you've got to know how to finish a book; that if I kept adding "last minute" stuff, I wouldn't be able to finish it again next year, that it had gone on long enough... .

And yes, I've finally got around to it - and too bad if the Harvest and Sowing issue is only due back in September! It's waited fifteen years (not to say thirty), now it can wait another two or three months, but let me take the time to look at what I have to look at, and to say what I have to say, without letting myself get carried away.

<sup>886</sup>(\*) When I say "Serre ou moi", I'm actually thinking of any of the members of the milieu to which we both belonged in the 1950s - a milieu I try to define to some extent in parts III and IV of "Fatuité et Renouveau", and more particularly in the section "Bourbaki, ou ma grande chance - et son revers". It's true, however, that even in this restricted milieu, I'm aware of two members who have "gone wrong" (mentioned in due course in Récoltes et Semailles).

<sup>887</sup>(\*\*) Thus, I have no doubt that if Serre had been the author or co-author (as R. Remmert is) of a book on rigid-analytical spaces, he would not have indulged in the "natural inclination" to pass over in silence that which must be passed over in silence; that he would go beyond somewhat complacent "lapses" of memory to the said natural inclination, to which it pleased him to indulge in a private conversation. It's also true that even fifteen years ago, with the rigor I knew him for then, he wouldn't have indulged in such a slope, it seems to me, even in private conversation... ..

<sup>888</sup>(\*) This observation of participation in corruption echoes that made (for the auditors of a certain seminar in March 1980) in the note "Carte blanche pour le pillage - ou les Hautes Oeuvres" (the name says it all), n° 171<sub>4</sub>, in particular page 1090 second paragraph.

rushed by "deadlines" . .

It's been a hard day's work, or rather a night and part of a morning - I wanted this "extra" text for typing to go out with today's mail. And so it did.

At this point, I feel as if I've come to the end of some work that **needed to** be done. Suddenly, I feel light, as if I've been relieved of a great weight that I've been carrying around, probably without realizing it, and I can't say for how long. It must be the weight of a certain tenacious illusion, which must have started to settle in me from the end of the forties, when an adopted identity began to blossom in me, that of a member of a certain (mathematical) "community", of a certain milieu, which for me was filled with warmth and life. I talk about this blossoming of a new identity in *Fatuité et Renouveau*, in the sections "L'étranger bienvenu" and "La "Communauté mathématique" : fiction et réalité" (n°s 9, 10), and also in "Bourbaki, ou ma grande chance - et son revers" (section n° 22). It's true that this identification was swept away without return by the events surrounding and following my departure in 1970, in the wake of my involvement in militant activity. With hindsight, I now realize that there was still a **link** to the milieu I had left behind, in which I no longer saw myself; an invisible link perhaps, but one of great strength, forming part of this "weight of a past" (which I began to glimpse last year, in the section of the same name).

name, n° 50). While I had left this environment with no desire to return, a certain **image** of what had been this "family", in short, which I had ☐quitted for another adventure, remained alive in me, and maintained this link. This image must have remained more or less static, it seems to me, from the moment I left (and long before that, of course) until the moment of reflection in *Harvest and Sowing*. The latter began to nuance the image I had of a certain past, and to incorporate as best I could elements of the present, often disconcerting and unwelcome. Eventually, I came to realize that there had been an astonishing **deterioration** in the state of mentalities and mores in what had taken over from the milieu with which I had identified myself, and (it would seem) in the mathematical world in general. This deterioration, I realized, had been going on for some time, and I had had time, even before I left, to play my part in it. (At least, in the course of my reflections in *Fatuity and Renewal*). I did get the impression, however, that there was a kind of unbridled escalation in this degradation after my departure, in which some of my ex-students played a leading catalytic role.

p. 1145

Be that as it may - throughout the revelations that followed one another in my investigation of the Burial, I maintained in my mind a sort of tacit "taboo" around those of my old friends who were part of the milieu that had welcomed me in my younger years. I simply couldn't conceive that any of them had been seriously affected or "damaged" by the profound degradation I was witnessing. When I sometimes spoke of the complacency of the "whole congregation" towards operations which (for me at least) were beyond imagination, surely there must have been some kind of inner "clause" in me, absolving those who, for me, had to remain "above suspicion". They didn't suspect a thing, obviously - they must have been busy elsewhere, surely - you can't blame them! A bit in those tones. And for the oldest of my elders, this way of seeing things corresponds, I'd like to think, to reality, or at least to a certain aspect of reality. But certainly not for people like Serre, Cartier, Borel, Tate, Kuiper, Tits and others whom I've known well, who are of the same generation as me, in full activity, fully integrated into the milieu I'm examining here and who continue, even today, to wield a not inconsiderable power and to set the tone, just as much as certain newcomers who have ended up forming an unscrupulous "mafia", with the unreserved blessing of their elders.

So there was a stubborn and flagrant contradiction in my image of reality, as it appeared through the first-rate "revealer" that is Burial. It was this contradiction

surely' perceived at one level and rejected at another, which created that "malaise" I spoke of earlier, at the anguish - anguish revealing a **division**. And the person who, more than any other, embodied for me this milieu, of people whom someone in me persisted in perceiving as "close", and the one who had been "closest" of all among them, was Jean-Pierre Serre. As such, it was in him, more than in anyone else, that lay the crux of the eluded contradiction.

I timidly began to address this contradiction only six weeks ago, in the first part (dated May 4) of the note "Useless details" (n° 171 (v)). This reflection deepens considerably in the third part of the same note (dated May 27, three weeks later), "Des choses qui ressemblent à rien - ou le dessèchement". I return to the person of Serre again, against perennial inner resistance, a week ago (June 11) in part c. ("The one among all - or acquiescence") of this note. This time, Serre's crucial role in l'Enterrement finally came to light. This was another major step forward in my understanding of L'Enterrement - but the crux of the contradiction remained unaddressed! Serre remained for me (as if nothing had ever happened) the embodiment of "elegance" and "probity" without fear or reproach. The "taboo" remained safe and sound!

It was the phone call the day before yesterday that exploded the contradiction, rubbing my nose in it (l'Enterrement), whether I liked it or not. As is only natural, considerable forces of resistance (mentioned earlier) were immediately mobilized to maintain the status quo, rather than accept the contradiction: to acknowledge it, one way or another, and thereby resolve it. I was free to do so, or not.

I took the plunge - and I'm glad I did. The reward was immediate: a sense of **liberation**, a feeling of lightness, of relief; relief from inner tension, of course, but more than that, liberation from a weight.

The only other moment in Harvest and Sowing when there was a similar sense of liberation was the one that marked the first major turning point in our thinking, in Fatuité et Renouveau, with the section "La mathématique sportive" followed by "Fin le manège!" (n° s 40, 41)-I have the impression, moreover, that this new step I've just "taken" follows on from the one I took last year. I couldn't say enough, at the time, about why and <sup>en</sup>quoi. The triumphant exclamation then, "No more merry-go-round!", was premature that's (as I realized as early as the following month). But the new step I've just taken is, to say the least, a step further away from the merry-go-round. Time will tell to what extent this is the case.

After yesterday's reflection and that of June 11, I feel I've arrived at a less hazy vision of the Burial. It was mainly this "third plan" that remained vague. The reflection of the 11th will have made it "incarnate", in a tangible way, in the person of Serre, and this in turn took on very concrete outlines (so to speak) during yesterday's reflection.

Finally, in this entire fourth part of Récoltes et Semailles, it is the reflection on the relationship with Serre that seems to me to be the most crucial part, for my own understanding of l'Enterrement, beyond the "complements of investigation" and the colorful tables from the shallows of the mathematical megapolis. It's also true that if I hadn't taken the trouble, out of respect for the subject I've set myself the task of investigating, to stick to this "tidying up of an investigation" with all the care I'm capable of, taking great care also to illuminate as best I could all the slightly dark corners that presented themselves along the way, this reflection on Serre would probably not have seen the light of day either, and my understanding of the Burial (and my involvement in it) would have remained blurred as before. Everything fits together in a research project!

The most substantial part of the reflection, in this last part of Burial, appeared in

done "last minute". In principle, the "period" under this section had been set two and a half months ago (April 7). There were just ten or so pages left to retype, and a few footnotes to add (as had also been the case a year ago, towards the end of May. . . ). The unexpected started to happen in the following days, with the visit of Zoghman, who came to read this last part (in principle finished) and give me his comments. They materialized in some three hundred pages of additional text - and among them, these pages where I return to the relationship between Serre and myself, in the light (hitherto eluded) of the Burial.

### 18.5.7. Climbing (2)

**Note** 174 □(March 22)<sup>889</sup> (\*) As I have pointed out elsewhere, there are not actually four operations p. 1148 (for a Funeral), but a single "**Operation Funeral**". Its division into four major parts was convenient for exposition, but is artificial and (if taken too literally) apt to mislead. Surely, in the *Metteur en scène* - Chef d'orchestre - Principal Officiant aux Obsèques, there weren't **four** little devils in four different corners of his head telling him what to do, but one and only one! During the long meditation on yin and yang<sup>890</sup> (\*\*), I tried to get to know this little devil better than I had in the past, when I'd merely noted from time to time that he was always there stirring, and moved on to something else the next moment. I don't claim to have fully succeeded in making his acquaintance, and perhaps that's not my job after all. One thing's for sure, though: he's still out there waving his arms, and there's no guarantee that he'll stop before my friend breathes his last. Still, the famous "Operation Burial" continues, even as I write these lines. And I wonder whether the publication of this "Family Album" will at least put an end to the biggest (and most iniquitous) of all partial operations: that of burying alive a young mathematician, Zoghman Mebkhout, whose ideas and results have been used by "everyone" working in the cohomology of algebraic or complex varieties for the last four or five years. ...

Abandoning the fiction of "four" operations where there is clearly only one, it would be interesting to sketch, in chronological order, the main episodes and stages known to me. I won't do so here, as I feel I've done enough in the four main notes above ("Silence", "Manoeuvres", "Sharing", "Apotheosis", n° s 168, 169, 170, 171) to bring together all the episodes known to me, which the curious reader can arrange in chronological order. Curiously, from a "second level" or "operational" point of view (to use euphemisms), the year of my departure from the mathematical scene, 1970, doesn't seem to mark a discontinuity in the succession.

episodes, which have been continuing at a fairly regular pace, it seems to me, since the end of the SGA 5 seminar in 1966, until 1977 with the double publication of "SGA 4<sup>1</sup>" and the -□Illusie edition of SGA 5<sup>891</sup> (\*). This p. 1149 operation seems to me to mark a sudden and striking **qualitative change**. Before, there was a discreet "reaping". Now I feel the sudden eruption of a gust of violence and contempt, raging against the work of someone absent, declared "dead".

After this sort of collective **outburst** by all my cohomology students (under the compliant eye of the "whole Congregation"), it seems that there's been a lull for four years. Whereas

<sup>889</sup>(\*) (June 14) This note follows on from part a. ("A deceased well surrounded") of the previous note, written on the same day.

<sup>890</sup>(\*\*) This is the reflection forming the major part of the third part of *Récoltes et Semailles*, with notes n° s 104 to 162".

<sup>891</sup>(\*) (June 3) This impression should be corrected, taking into account the large-scale operation "Tannakian Categories" (sic), whose first episode (with the "straw father" N. Saavedra) takes place in 1972 (and the epilogue in 1982, with the "real Father" P. Deligne taking over). On this subject, see the series of notes "Le sixième clou (au cercueil)" n° s 176<sub>1</sub> - 176<sub>7</sub>.

while in the eleven years between 1966 and 1977, I detect a typical "episode" every one or two years, I know of none between 1977 and 1981 (the year of the Colloque Pervers). On the contrary, Deligne's long article "La conjecture de père, II", published in Publications Mathématiques in 1980, i.e. the year before the incredible Colloque, can almost be considered normal, these days. ... <sup>892</sup>(\*\*). It was also the year in which Deligne learned of the "theorem of the good Lord" (alias Mebkhout)<sup>893</sup> (\*\*\*), at a Bourbaki seminar and from the author himself. This was the start of a sudden melting of the ice in a long stagnation of the cohomological theme. And it was also the signal the following year for the second and ultimate (?) culmination of Operation Burial, this time on the iniquitous diapason, when all restraint, and even simple prudence, were blithely thrown overboard.

The episode of the "memorable volume" LN 900 the following year (consecrating the exhumation of the motifs without men-

tion of my person, an episode that so moved me on a certain April 19th of last year. . . ), just like Berthelot's report of the same year (consecrating the elimination of my humble self of the "history"-sic-of crystalline cohomology), appear to me afterwards□as the natu-

The Colloquium's name will perhaps go down in history (or what remains of it) as a **warning**. And the "Funeral Eulogy" the following year, incredible as it may seem to anyone who "poses" on it, also appears as such a pro- longing, or (as I wrote earlier<sup>894</sup> (\*)) as an "epilogue". As for the two years that have elapsed since then, they have merely confirmed, in writing and in the minds of many, the "achievements" of a brilliant Colloquium and its follow-up. ...

It's a remarkable coincidence - or rather, it's clearly **not** the effect of a "coincidence" - that as early as last year, and before I'd even become acquainted with the "SGA 4<sup>1</sup> - SGA 5" operation or the Colloque Pervers, I noted two "turning points" in my friend Pierre's personal relationship with me, set in the same years 1977 and 1981. I include them for the first time in a common attention and try to fathom their meaning, in the note "Deux tournants" of April 25, six days after I discovered l'Enterrement (by reading the memorable LN 900). At the time of the two turning points, years before, I was far from suspecting (not on a conscious level, at least) that the Burial was taking place, and I would have been hard-pressed to link either of them to any event known to me that might have shed light on them.

### 18.5.8. Funeral parlours - "Im dienste der wissenschaft" (In the service of science)

**Note** 175 (March 23) To complete my tour of "Operation Burial", it remains for me to review the role of one last active and eager participant, whom I've had occasion to mention "in passing" many times in the course of this long reflection on the said Burial. I'm talking about the esteemed Springer Verlag GmbH (Heidelberg), a well-known publisher of books and scientific periodicals, ho-

<sup>892</sup>(\*\*) Of course, no allusion is made to me in connection with the main result of the work, the statement of which was part of the yoga of motives that Deligne took from me. On the other hand, I was struck by the fact that my name appears, along with Miller's, in one of the paragraphs of the work, in connection with De Rham's power-divided complex, which had been introduced (around 1976) independently by Miller and myself. I had given a talk on this theme in 1976, at the IHES (it was, incidentally, the last public lecture I gave in my life), but it was clear that I wasn't going to publish anything. No one would have noticed, or even objected, to the author's failure to mention this official co-paternity... ...

<sup>893</sup>(\*\*\*) (June 1) In fact, this episode took place the previous year, in June 1979, at the Bourbaki seminar.

<sup>894</sup>(\*) In the "Jewels" note, n° 170 (iii).

norant d'ailleurs de la devise "Im Dienste der wissenschaft" - au service de la science<sup>895</sup> (\*\*). In the company's mathematical edition, the Lecture Notes in Mathematics series is undoubtedly the most important.

most famous of all. It is also perhaps the world's most successful series of scientific texts □ la p. 1151

more prodigious: over a thousand titles published in twenty years or so. In fact, I believe I played my part in this unprecedented success, by lending my support to this series, still in its infancy, through the publication of numerous texts by students or myself, during the sixties and into the early seventies. I was also associated with Springer as one of the editors of the "Grundlehren" series (der Mathematik und ihrer Grenzgebiete), where three books (including the reprint of EGA I) were published by myself<sup>896</sup> (\*).

After my departure from the mathematical scene in 1970, I refrained from any activity as editor. By a simple inertia effect, I continued to be one of the editors of the series until just last year, when I finally "officially" withdrew from any editorial responsibility at Springer. I was prompted to do so by two concordant motivations. On the one hand, at a time when I'm returning to "orthodox" mathematical activity, by publishing maths again, I want to draw precise limits to this "return", which for me in no way means a return to a "powerstructure" (a structure of power and influence), but solely to personal mathematical **work** destined for publication. On the other hand, since 1976 (with the episode of Yves Ladegaillerie's thesis), I had had occasion to smell a certain air of En-terrement, long before I had the slightest inkling of the large-scale operation I discovered last year. (See "On n'arrête pas le Progrès" (n° 50), and especially the more detailed "Cercueil 2: ou les découpes tronçonnées" (n° 94), about the episode in this thesis, one of the most brilliant I've had the honor of inspiring. This made me realize that "the kind of mathematics I like and would like to do

encourager no longer has a place in Springer Verlag"<sup>897</sup> (\*\*); and perhaps even more than that, that the spirit I felt □ didn't encourage me to continue or resume any kind of close ties with this house. p. 1152

The year that has passed since I resigned from the Grundlehren editorial board in February last year has only confirmed and strengthened this feeling.

But this is on the fringe of "Operation Burial" proper - that "second level" I mentioned yesterday, to which it's time to return. To my knowledge, there are **five books** directly linked to the operation in question<sup>898</sup> (\*). They are, in chronological order of publication, the volumes SGA 7 I (published under my name in 1972) and SGA 7 II (published under Deligne-Katz's name in 1973), presenting the SGA 7 seminar.

<sup>895</sup>(\*\*) (June 1) On enquiry with Dr. J. Heinze, it appears that this is not really a "motto", but rather an advertising slogan. Its English form is "Springer for Science".

<sup>896</sup>(\*) The other two books are Jean Giraud's and Monique Hakim's theses (on the formalism of fields and non-commutative 1-cohomology, and on relative schemes on general ring topoi).

<sup>897</sup>(\*\*) This quotation is taken from the short letter (addressed to Dr. Peters) of February 18 last year, in which I informed him of my decision to retire from the Grundlehren editorial board. Dr. Peters had in fact already left Springer Verlag (he now works at Birkhäuser Verlag), and correspondence continued with Dr. J. Heinze, in charge of Grundlehren at Springer. I had asked for a copy of my letter to be sent to each of the eighteen co-editors of the Grundlehren, and had repeated this request to Dr. Heinze on two occasions (in April '84 and January '85) without him seeing fit to tell me whether or not it had been complied with (as it turned out, it **hadn't**). I took the trouble myself to send a copy of my letter to each of the eighteen publishers, with a few words of explanation as to why it had been sent. I know seven of them well personally, and counted five of them among my friends. Only one (Artin) took the trouble to reply, and none of them apparently found it unusual (if only to **themselves**) that Springer didn't take the trouble to send them the letter in question (and as early as February 1984).

<sup>898</sup>(\*) (June 1) Since these lines were written, it has come to light that a sixth book, whose very name is a mystification, should be added to the following list: "Tannakian Categories", by Neantro Saavedra Rivano. Remarkably, this book too appeared in the same series of Springer's Lecture Notes in Mathematics. But in this case, Springer's responsibility does not seem to be engaged, as it is for the other five volumes. For

For details of the "Tannakian categories" operation, see the "Sixth nail (in the coffin)" suite of notes, n° s 176<sub>1</sub> - 176<sub>7</sub>.

on monodromy groups, 1967/69; the volume entitled "SGA 4<sup>1</sup>" (by Deligne) and the Illusie edition of SGA 5 (published under my name) in 1977; finally, the "memorable volume" devoted to the exhumation of motifs, published under the joint Deligne-Milne-Ogus-Shih signature in 1982. Remarkably, all **five** volumes were published by the **same** publishing house, and in the **same** Lecture Notes series<sup>899</sup> (\*\*). The first four volumes were published when Dr. K. Peters was in charge of Lecture Notes<sup>900</sup> (\*\*\*), the last with Mrs. M. Byrne in charge of this series.

These five publications took place under conditions that seem to me to be grossly irregular. As I have already pointed out elsewhere, the two volumes SGA 7 I and SGA 5 **published under my name** in 1972 and 1977 (LN 288 and 589) were published without Springer deeming it necessary to contact me, either to request my agreement or merely to inform me of the publication project. The publication of two volumes of the name "SGA 7 II" and "SGA 4<sup>1</sup>", thus presenting themselves under the acronym "SGA", which I believe is not

2

p. 1153 not available to all, but notoriously linked to my work and person, have been published without asking for my agreement to the use of this acronym for the planned publications, while I do not appear (as would have been expected) as the author, or director (or one of the directors) of the volume, or of the seminar of which it presents a redacted version. Finally, volume LN 900 presents, without naming me, notions, ideas and constructions that are well known among well-informed mathematicians to have been introduced by me. In this case, it was obvious (without having to be one of the few insiders at an SGA 5 or SGA 7 seminar) that this volume constituted what is commonly known as **plagiarism**. I certainly don't expect Mrs. Byrne, who was in charge of LN (unless I'm mistaken) at the time of this volume's publication, to have the competence to recognize the fraud on her own, in view of the manuscript. But it is, I imagine, part of the job of a serious publishing house to ensure the seriousness of its publications, by surrounding itself with competent advisors.

These same advisors were also in a position, if they were honestly doing the job for which they are (I imagine) paid, to point out to those entitled that the APG sign is not an acronym to be taken lightly, that it has a **meaning**, which should be respected by consulting the only person qualified to decide on the use of this acronym, namely myself. Finally, as an aggravating circumstance concerning the publication of the volume presenting itself under the misleading name "SGA 4<sup>1</sup>", one need only peruse either the introduction to the volume, or the "Ariadne's Thread" which follows it, or the introduction to the first chapter, to note the casual disregard with which the SGA 4 and SGA 5 seminars are treated; it's also common knowledge among even the least well-informed that the latter seminars took place in the mid-sixties, whereas the volume presenting itself as "SGA 4<sup>1</sup>" is made up of apocryphal texts from the seventies. In my opinion, therefore, for a reasonably well-informed person in possession of all his means, the deception was obvious. All the more reason, therefore, not to publish such a volume under such a name, without first seeking my express consent.

I therefore consider Springer Verlag to be entirely responsible for the publication of each of these five volumes, which constitute key episodes in the monumental swindle that has been perpetrated on my work on cohomology. Through these publications, Springer acted as an auxiliary and **conveyor** for this unusual operation. I cannot, of course, assert that it was by

full knowledge of the facts. But I can say that the repeated discourtesies I have experienced from this house in its relationship to me, since the year 1976 (I have not had the opportunity, I believe, to have with her between 1970 and 1976) are also in line with this operation and are part of a certain

p. 1154

<sup>899</sup>(\*\*) These are volumes n°s 288, 340, 569, 589, 900.

<sup>900</sup>(\*\*\*) As stated in the penultimate b. de p. note, Dr. Peters has since left Springer Verlag for Birkhäuser Verlag.

**spirit**, which is inseparable from it.

In the sub-note "The eviction" (n° 169<sub>1</sub>) of the note "The maneuvers", I alluded to my letter to Mrs. Byrnes concerning the publication of SGA 5, and to her reply, which blew me away I must say. (It's certainly not the first time nor the last that I've been "blown away", in this brilliant operation "in the service of science". . . ) I learn from his letter (dated February 15, '85) that, in accordance with "the usual way of acting when a work contains contributions from several authors" (sic), there was no need to address myself specifically, as I was only the **director of** the Seminar. ... The five "authors" of SGA 5 are Bucur, Houzel, Illusie, Jouanolou and Serre, to the exclusion of my humble self, who appears only as "director" - no doubt purely honorary, I had said too much<sup>901</sup> (\*) - for this brilliant seminar.

As soon as I received this instructive letter, and finding the time long (having received nothing for a month), I took up my best pen (in German) to write to Dr. K.F. Springer himself, who is one of the directors responsible for Springer. It was a fine two-page machine letter, explaining to him that I was very saddened by a long series of unpleasantnesses in my relationship with Springer, and beyond these, by a number of gross irregularities against me, of which I was content for the moment to submit two, which seemed to me particularly flagrant: the publication of two volumes of Lecture Notes (n° s 288, 589) published under my name and without deeming it necessary to consult me. That in these two texts, the ideas, methods and results I had developed in oral seminars were shortened or mutilated, sometimes to the point of being unrecognizable. That the coincidence of this last fact, with the unusual circumstances surrounding the publication of these two volumes, could not be for me the effect of pure chance. And that I expected a public and unreserved apology from Springer, in a form to be determined by mutual agreement, once an agreement in principle had been reached. That I hoped

that he, like me, would be keen to put an end to an unpleasant and unacceptable situation and to find a solution that was equal to the circumstances □ ("eine dem Fall geziemende Lösung zu finden", which is p. 1155 even more distinguished), "hoachachtungsvoll" (as it should be) signed by my finest hand.

To put my cards on the table, it seems to me that I have put my cards on the table! He won't be able to say, Sir K.F. Springer, that he was not personally informed of the situation, and not even at first hand, by anyone other than the main interested party himself!

As luck would have it, I finally received a reply (a good month later) just yesterday. It's so short that I can't resist the temptation of reproducing it here (translated) in extenso. It took me a moment to realize that it was in fact a reply to my beautiful letter of last month. So here it is.

Heidelberg 15.3.1985

Dear Professor Grothendieck,

I must thank you again for your letter of February 9. Mrs. Dr. Byrne's letter of February 15 will no doubt have answered your questions.

Receive etc

K.F. Springer

At least now I know! The "well-informed" people (already mentioned) must have explained to him that he didn't need to tire himself out for the slightly excited gentleman who wrote to him there - that he decidedly didn't do any

not part of the beautiful world. And it's true, too. . .

We look forward to receiving this enlightening reply from the management of Springer Funeral Services.

<sup>901</sup>(\*) In this famous "Ariadne's thread" (through SGA 4 etc.) in the volume entitled "SGA 4 $\frac{1}{2}$ ", nothing could lead the reader to suppose that I had the honor of making presentations in SGA 4 and SGA 5 (on the other hand, I did have the honor of "collaborating" in "SGA 4<sup>1</sup>". . . ). On this subject, see my comments in the note "Les double-sens - ou l'art de l'arnaque" (n° 169<sub>7</sub>), p. 899.

Verlag GmbH (it was kind of them to honor me with a reply signed by the director himself), I had time to sound out my own intentions. The role played by the esteemed company seems to me to be really big, and I thought about the possibility of a show trial, in which I would ask for astronomical damages, as an outraged "gentleman", victim of unspeakable preferential treatment. But I also told myself that a trial like that must take a lot of energy. Even if I were to win the case and collect dizzying damages (let's be optimistic!), after X number of years of course - what would I have to gain? I'm not in need, and I don't need more than I've got - and a scam is no more or less a scam, because a certain lawsuit has been won, or lost. I'm not going to

improve the world, nor myself, nor the manners of Mr. K.F. Springer and certain employees of the company  
☐ which

p. 1156

he runs, and in any case not their way of conceiving their profession, mobilizing lawyers and by making them mobilize their own<sup>902</sup> (\*). Nor will I improve a certain spirit in a certain beautiful world I've left behind, the spirit that makes possible the kind of operation that Dr. Springer and his esteemed house have made themselves (for thirteen years) the servants of. I have (I hope) a few years left to live - time flies, and I see plenty of exciting things to do in the time I have left. It can't be very exciting to gather evidence to convince judges that I have something to do with SGA. It's not for them, any more than it is for Mr. K.F. Springer, that I've bothered to write them... ..

As for those (apart from myself) for whom I've written the SGA, their relationship to what (for me at any rate) remains a part of myself, is by no means indifferent to me. It's part of their relationship to me. Strangely enough, I only know this relationship (or at least a little bit about it) from my five cohomology students: the very ones who have made it possible for a Dr. K.F. Springer to dismiss me like a scoundrel who has nothing to say about what people do or don't do with texts bearing the SGA acronym, whether or not the person in question appears on the cover.

The mathematician reader who may have followed me here, and who may one day have haunted the SGA (the real ones, I mean), may have the idea to drop me a line about what he thinks of it himself. It would certainly please me to receive a note from someone who thinks that the work into which I alone poured all my energy for ten years of my life, and which **no one** in the world had the heart to continue once the worker had left - that this work does indeed bear the imprint of the person who conceived it and carried it inside him for as long as it took, before it took shape under his hands and became a **home for all**<sup>903</sup> (\*\*). And that a house for all is not a vespasian in a slum, where everyone feels free to relieve themselves as they please and scribble their obscenities on dilapidated, sticky walls... ..

☐ And if he who reads me is one of those who were my pupils, or of those who were my friends, and he doesn't feel

p. 1157

to write or speak to me, at least on this subject if no other, let him know that his silence is also eloquent, and that he will be heard.

<sup>902</sup>(\*) Incidentally, I've also considered the possibility that the situation might be reversed, with the esteemed company suing me for damage to its reputation. These people "in the service of Science", they must be fastidious in this respect (as long as it's their reputation that's at stake. . . ).

<sup>903</sup>(\*\*) This idea of building "houses" that are good "for everything" has played a considerable role in my mathematical work since the early fifties. It has been the concrete expression in my work of what I've called the "service impulse", which has been part (without my even detecting it before the reflection "The key to yin and yang") of the profound forces giving my mathematical work its living force. The "house" archetype appears for the first time I had not foreseen it, but it came to my mind with great force in the November 26 note "Yin the Servant, and the new masters" (n° 135).

## 18.5.9. The sixth nail (in the coffin)

### 18.5.9.1. a. Pre-exhumation

**Note** 176<sub>1</sub><sup>904</sup> (\*) (April 19) I finally had the opportunity to read (on April 10) the article by R.P. Langlands cited in the note "La pré-exhumation" (n° 168<sub>1</sub>). According to the "commented bibliography" on motifs that Deligne sent me last August, this article by Langlands is, along with Deligne's article in the same volume (which is the subject of the cited note), the first in which motifs have been used, since my departure in 1970<sup>905</sup> (\*\*). I'm excused for not having been aware of Langlands' article until last year (nor of Deligne's), since the author didn't deem it necessary (nor did he want me to!) to publish it.

than my ex-student) to send me a separate print. One wonders why he would have bothered,

when it's clear from reading his article that my humble self has strictly nothing to do with the subject p. 1158

"Automorphic representations, Shimura varieties, and motives" discussed in his article. My name (to use a formula that my typewriter knows by heart, for a year to the day!) is nowhere to be found in this article, nor in the bibliography. However, I thought I recognized certain ideas I had developed around 1964 (or dreamt I had developed them - I'm definitely repeating myself again. . . ), and I even wrote down in black and white this memory of a dream (or perhaps the dream of a memory of a dream. . . ), on that same nineteenth of April 1984<sup>906</sup> (\*). I'd think I was back on that very day, a year ago.

It's true that I've had time to become blasé in the intervening year. If there was any displeasure, it was hardly a surprise (considering how little, one might say. . . ), and certainly not a shock. There is, moreover, a major difference between this article, the precursor of the memorable LN 900 volume that was to follow three years later, and the latter: I didn't have the honor of meeting Langlands in person, and it wasn't from my mouth that he learned (as Deligne did around 1965 or 66) about the yoga of the Galois group (or "fundamental group") known as "motivic". But, throughout the second half of the sixties, I talked enough about it around me, to whoever would listen (and Langlands, after all, hasn't just arrived. . . ), to have a presumption that Langlands knows full well where this new "geometrical" philosophy concerning Galois and fundamental groups of all kinds, seen as suitable affine pro-algebraic groups, comes from. I presume he knows full well that this philosophy was not born in 1972 from the brain of a certain Neantro Saavedra Rivano, who has since disappeared from circulation without a trace<sup>907</sup> (\*\*\*) - I feel that it would not be a luxury for Langlands to explain himself on this subject, if he deems it useful of course. Admittedly, given the times we live in, it's perhaps over-optimistic of me to hope he'll take the trouble... ..

---

<sup>904</sup>(\*) (June 16) The following group of notes (n° s 176<sub>1</sub> to 176<sub>7</sub>), entitled "Le sixième clou (au cercueil)" ("The sixth nail (to the coffin)"), should be seen as a natural sequel to the group of notes entitled "Le silence" ("Silence") (n° s 168 (i) to (iv)), devoted to the "Motifs" operation, and in particular to the last of these, "La pré-exhumation" ("The pre-exhumation") (n° 168 (iv)), dated April 8. The following notes, with the exception of the last one (n° 176<sub>7</sub>), are dated April 19th and 20th. If I have preferred to reject them here, at the end of the "Four operations", instead of attaching them to the "Motifs" operation, it's because the reflection that had been going on in the preceding weeks on the other three operations had not yet been completed.

operations, and especially the one (known as "the Perverse Colloquium" or "the stranger on duty") which is the subject of the "Apotheosis" group of notes, threw unforeseen light on the (equally unforeseen) "new fact" which had just appeared. I recall that at

At the time of writing the following notes, I had already, in principle, set the "final point" under Burial (whose final note, "L'amie" (n° 188) is dated April 7), and I expected to have the complete manuscript of Burial III typed up any day now. In other words, these notes were written as "last-minute complements"... ..

<sup>905</sup>(\*\*) With the exception, however, of the presentations by Kleiman and Saavedra in 1972, in line with the few modest "ranges" on the description of the category of motifs (compare with the b. de p. note (\*\*) on page 794, in the note "Les points sur les i", n° 164).

<sup>906</sup>(\*) On this subject, see the note "Souvenir d'un rêve - ou la naissance des motifs", n° 51.

<sup>907</sup>(\*\*) According to what Deligne told me during his visit to my home last October, Saavedra has practically changed profession (he is now "in economics"), and hasn't done maths at all since defending his thesis in 1972.

### 18.5.9.2. b. The pleasant surprise

p. 1159

**Note** 176<sub>2</sub> □ As good surprises never come alone, the day after I got to know-

In the wake of Langlands' article, I also had the opportunity to peruse Neantro Saavedra Rivano's volume (to which Langlands refers extensively), entitled "Tannakian Categories" (Lecture Notes in Mathematics 265, 1972).

Of the nine (male) students I had before I left, Saavedra had been the only one of whom I had never heard another word, nor had I heard anything to indicate that he had taken on the "color" or "smell" of a certain Burial. I had hastily concluded, with my customary naive confidence, that (if only for lack of opportunity, perhaps, having left the mathematical waters from what I heard. . . ) he was the pupil of all who had remained entirely alien to the spirit of the Burial "operation". Yet, as in Jouanolou's case, I had heard so little about it, that it might just have tipped me off. I knew, of course, that what was supposed to be his thesis when he was working with me, had finally appeared in Lecture Notes in 1972 in the volume cited, which I don't recall ever bothering to look at until last week<sup>908</sup> (\*). Fully absorbed in other tasks, the thought hadn't occurred to me that it was a little strange that Saavedra hadn't given me any sign of life, even if only to inform me of his thesis defense, and to ask me to sit on the jury, as the person best placed to know what it was all about. It's when I read this volume that it becomes clear why he preferred not to disturb me in my other occupations, and to pass his thesis "à la sauvette", before a jury whose composition I'm entirely unaware of<sup>909</sup> (\*\*). The burial was already well underway, since no one of the members of the jury saw fit to even inform me of the defense, let alone ask for my participation in the jury (as had also been the case for Jouanolou's thesis, which must have taken place around the same time)<sup>910</sup> (\*\*\*)).

p. 1160

□ This volume exposes a crucial aspect of this "arithmetic geometry" whose vision was born and developed in me throughout the sixties (without yet having been given a name), and of which the yoga of motives was (and still is<sup>911</sup> (\*)) the soul. Essentially, Saavedra's book is a careful and detailed exposition of my ideas on a kind of "Galois-Poincaré theory" of certain categories (which I would never have dreamed of calling "Tannakian"...), ideas that I explained to Saavedra at length and patiently, at a time when it was still doubtful whether he would make the effort of familiarization and assimilation necessary to be able to include them in an "expository" part of his thesis work. I had entrusted him with detailed handwritten notes, complete with four-pin statements, demonstration sketches and all, and I'm still waiting for him to send them back to me<sup>912</sup> (\*\*). Of course, the subject of the thesis itself

<sup>908</sup>(\*) (June 16) Saavedra must not have seen fit to send me this book, of which I don't own a copy, but I may have held it in my hands in the seventies. I had remembered, but no more than that, that he had made a careful work and perfectly usable as is, but I can't pinpoint the exact source of this impression. It had been present, in particular, when writing the note "La table rase" (n° 67, and in particular p. 252-253), where I comment on this "mystery" of a Deligne "copying" practically the thesis that Saavedra had done with me.

<sup>909</sup>(\*\*) The mystery of this jury's composition is elucidated in an entirely unexpected way in the seventh and last of the notes of the "sixth Clou" (n° 176<sub>7</sub>), of which I will say no more here. . .

<sup>910</sup>(\*\*\*) For a correction, see the note quoted in the previous b. de p. note.

<sup>911</sup>(\*) But in the meantime, this "soul" has been enriched by "Anabelian" yoga, which is mentioned in some detail in "L'Esquisse d'un Programme". (For more on this text, see Introduction 3 "Compass and Luggage". It will be included in volume 3 of Réflexions 4.

<sup>912</sup>(\*\*) It was my habit to distribute my handwritten notes right and left among my students, as needed - and one of the

dite was not to expose the ideas of another, whose motivations completely escaped him. The point was to explain a "useful" intrinsic characterization of "tensorial" categories that I'll call here "de Galois-Poincaré"<sup>913</sup> (\*\*), i.e. a category admitting a description "à la Galois-Poincaré- Grothendieck", in terms of linear representations of a "(pro)algebraic affine sheaf" on the base ring  $k = \text{End}(1)$  of the category under consideration. When the latter is a body, I had indicated such a condition by the so-called "rigidity" property (in the terminology I had introduced), and I seem to remember that I had written a complete demonstration (from my first thoughts on the motivic Galois group, on p. 1161 1964/65)<sup>914</sup> (\*). I had to show him the principle, but refrained from giving him my written notes on the subject, since it was up to him, not me, to learn his future trade by doing the work himself. If I remember correctly, the only outstanding question for me was to determine the natural domain of validity of such a theory à la Galois-Poincaré, as regards the hypothesis to be made about the base ring  $k$ , being interested in particular in the case where this would be a ring such as  $\mathbb{Z}$  (because of the applications to pattern theory).

Of all the students I had before I left, Saavedra, the latest to arrive<sup>915</sup> (\*\*), was also the least well prepared, and (initially at least) the least motivated to "give it a go". That's why I didn't expect him to go beyond the very limited technical problem I'd given him, which required only the most modest knowledge (a little diagram language, linear algebra, flat descent, sheaf language, and nothing more). The more delicate questions that are the subject of Chapters IV to VI of his book (filtrations of fiber functors, polarization structures on a Galois-Poincaré category over  $\mathbb{R}$  and a list of such categories that are "polarizable", applications to pattern categories and numerous variants) required somewhat "all-round" knowledge<sup>916</sup> (\*\*\*), and hence a considerable effort to get up to speed, which I didn't believe Saavedra would be able to provide; at most, I hoped that he would perhaps append to his work a summary (more or less dictated to him by me) of the following points important aspects of the theory that would not have been included in a formal exhibition. I was disabused than last week, and I realized that Saavedra has done a really impressive job and in p. 1162 in record time<sup>917</sup> (\*). The result is a book with a detailed and careful presentation, impeccably mimed and perfectly usable as it is, presenting a virtually exhaustive (as did I...

---

first thing they had to learn, was to decipher my handwriting. It was always understood that I wanted them to return my notes as soon as they had finished using them - but I don't think this was ever respected. This is just one of the many signs that my students didn't fear me at all, but rather saw me as the "good guy", demanding in terms of work to be sure, but otherwise accommodating like no other. . .

<sup>913</sup>(\*\*\*) So as not to call them "Grothendieck categories"! And yet, among the many species of categories (and other new notions) that I've had the honor of introducing and naming (and which, for this reason, don't bear my name), if there's one for which this appellation would be appropriate, out of simple decency I'd be tempted to write, it's this one! (Apart from the topos, whose name seems perfect as it is...) As for the name "Tannakian categories", surreptitiously slipped in by a brilliant ex-student (and complacently adopted by a unanimous Congregation), it's nothing short of a *mystification*.

(See the note following "He who knows how to wait... ", n° 176<sub>3</sub>.)

<sup>914</sup>(\*) I didn't want to take the time to check this in my notes on the motivic Galois group (or rather, on what which I didn't give to Saavedra). In any case, I'll come back to this in volume 3 of *Réflexions*, probably in the chapter entitled "Les motifs mes amours".

<sup>915</sup>(\*\*) If I remember correctly, Saavedra asked to work with me in 1968 or 69, a year or two before my unexpected departure from the mathematical scene.

<sup>916</sup>(\*\*\*) Above all, it required a thorough knowledge of the structure theory of reductive algebraic groups, of their classification on the field of reals, plus familiarity with a whole range of notions such as motif, crystal, F-crystal, stratified modules, local systems (for someone who had at most a vague notion of the singular fundamental group of a topological space), plus Hodge theory, and delicate "polarization" properties that had never been spelled out in the literature but remained "between the lines" in current reference texts.

<sup>917</sup>(\*) For more information on this "record", and its (obvious) explanation, see the note "Monsieur Verdoux - or the cavalier servant" (n° 176).<sub>5</sub>

the geometric-algebraic formalism I had developed in the sixties. From this point of view, then, I feel that he has done a useful and thoroughly creditable job, and the "surprise" I referred to earlier has indeed been "a good surprise".

This work consisted, very precisely, in putting into "canonical" and publishable form (according to the rigorist criteria that were still mine at the time) a set of ideas, statements and demonstrations that had been supplied by me. It's part of the mathematician's job, of course, to present one's own ideas and results, as well as those of others. Unlike many of my colleagues, I don't believe that such work should be counted as a negligible quantity when it comes to assessing the quality of a thesis or any other publication, and even when it comes to awarding the title of "docteur" in mathematics to the person who does it - in other words, to consider him or her a mathematician in his or her own right. On the other hand, it seems to me essential that a certain elementary ethic of the profession be respected, and that where a job consists of exposing and developing the ideas of others, the matter be clearly indicated, so as not to leave the slightest ambiguity in this respect.

In this case, however, nothing in the entire volume, apart from three lines of vague, perfunctory "thanks" lost at the end of a brilliant introduction<sup>918</sup> (\*\*), could lead the reader to suspect that my modest self had anything to do with any of the themes developed, starting with the one that is the very subject of the book. I'd have thought I'd returned to the day of my first encounter with the

memorable volume-exhumation of motifs (exactly one year ago today, to the day)! My name appears practically nowhere in the volume, except on two or three occasions, when some references in form are necessary, and none are available that are not from my pen.

p. 1163

This is by no means the only effect of **embarrassment, not to** seem to recognize that the author is "only" presenting the ideas and results of another - which (especially in this case) is not bad, when the work is done with intelligence. But I've come to realize, through a number of unmistakable "little details", that this is by no means just a bit of "reaping" to burnish one's reputation, before disappearing into the wings. It really is **a funeral for a funeral**. To give just **one** example - God knows I spent days and weeks explaining at great length to Saavedra, who had just arrived and knew nothing about anything, the notions of crystal,  $F$ -crystal (replacing in  $\text{car. } p > 0$  the missing  $p$ -adic "coefficients", enabling  $L$  functions to be defined. . . .), stratified moduli (and their relations with local systems), and finally a minimum of pattern yoga (taking as a provisional heuristic basis the standard conjectures); all this to make him understand, through a wide range of examples, where I was going with these Galois-Poincaré categories, and for the case (one never knew. . . ) that he would find the courage and perseverance to include at least, beyond the planned "minimum program", a chapter of typical examples. As he knew very well, without my having to explain it to him at length, these are crucial geometrical notions that don't go back to Adam and Eve; it was none other than I, who explained them to him over and over again without tiring, who had introduced them over the previous five or ten years, to serve as tools for a certain vision (even if it went over his head, as it went over the heads of all my students except one<sup>919</sup> (\*)). But my name doesn't appear either where he introduces and develops these notions (in Chapter VI devoted to

<sup>918</sup>(\*\*) This introduction essentially consisted in copying verbatim the four main statements I had indicated to Saavedra as being the "pillars" of the Galois-Poincaré yoga to be developed (excluding questions related to filtrations on fibres functors, which were difficult to summarize in a single lapidary statement) ; but by augmenting one of these statements, the one that was supposed to constitute the "minimum program" of his thesis, with a monumental and obvious error, which rendered it trivially false! This is discussed in the next note ("He who knows how to wait... ", n° 176<sub>3</sub>), and especially in the note already quoted "Monsieur Verdoux - ou le cavalier servante (n° 176<sub>5</sub>)" and the one that follows it "Les basses besognes" (n° 176<sub>6</sub>).

<sup>919</sup>(\*) Who stopped himself from burying it, as soon as the master's back was turned. ...

to examples), than in the part of the text devoted to the development of the theory of which he pretends to be the author. However, I can't imagine Saavedra imagining that the reader, however ill-informed he may be and however willing he may be to believe him the father of these categories (which he generously calls "Tannakian"), would go so far as to think that it was this same Saavedra who, for the sake of the argument, invented the F-

crystals, patterns and other gadgets of the "Tannakian" (sic) panoply. If these notions are treated like any-thing we'd just improvised, or picked up at □the nearest orphanage, I've well recognized a **style** that I know all too well, from the year I've been touring l'Enterrement. ...

p. 1164

Mebkhout had brought me the volume in question, delighted to be able to show me the case of one of my students who, at least, had been "honest"<sup>920</sup> (\*). He had been visibly dazzled by the three lines of thanks at the end of the introduction - it's true that in 1972 it wasn't very popular to thank a certain deceased person, and since then it's been more the tone of a persiflage or a joke that's become the order of the day with more than one of my ex-students, if not complete silence. The fact remains that this time I'm entitled to "deep gratitude", for "having introduced [the author] to this subject", and for my "advice and encouragement... .." which were indispensable in bringing this work to a successful conclusion... ."<sup>921</sup> (\*\*). That's what we call paying lip service, when simple honesty in the presentation of one's work would have seemed to me a more convincing way of expressing "gratitude", at a time when the Burial was definitely going well.

### 18.5.9.3. c. He who knows how to wait

**Note** 176<sub>3</sub> □In fact, it was enough for me to hold this book in my hands to realize that before the memorable "operation SGA 4 $\frac{1}{2}$  - SGA 5", there hasn't been a single episode in the whole of Burial, which is comparable in scope to this LN 265 volume, aptly named "Tannakian Categories". Previous episodes<sup>922</sup> (\*) were all limited to a more or less discreet "reaping", concealing the filiation of certain important ideas. Here, a crucial part of my vision of "arithmetical geometry" has been "hijacked", and this, by means of the one who may have seemed the most "insignificant" of all my students!

p. 1165

<sup>920</sup>(\*) (June 16) By the way, he was absolutely sorry that it had failed, and did his best to win me over - it reminds me of the case of Kawai (see b. de p. note (\*) on page 1078), or that of Beilinson, whom Mebkhout found "more honest" than Bernstein (see page 1072). (\*) page 1078), or that of Beilinson, whom Mebkhout found "more honest" than Bernstein (see page 1072) - like Diogenes with his lantern, but this time looking for an honest mathematician in the "gang" of those who dabble in the decidedly ill-famed theme of cohomology of all kinds... ..

<sup>921</sup>(\*\*) These "thanks" are a joke, given the circumstances: you'd think I'd "introduced" the author to the "subject" of functions of a complex variable, or to any other classical subject of the same kind. In fact, the "subject" in question didn't **exist** when I spoke about it to a Saavedra in need of a thesis, except in a vision that had developed within me in symbiosis with that of the motifs, and in my handwritten notes that gave it shape. I write about the birth and development of this vision in the note "Souvenir d'un rêve - ou la naissance des motifs", and about the contempt in which it is held. with which one of my former students (and under the complacent eye of all) wipes the slate clean of these roots, in the note that follows "L'Enterrement - ou le Nouveau père" (notes n° s 51, 52).

(June 16) Saavedra's thanks are all the more "a joke", as the author never bothered to tell me about his work. to send only a copy of his book and his bogus thanks. Now that I've seen the whole "Tannakian categories (sic)" operation through, I understand all the more how my ex-student had no reason to be proud of his "work"-sic, and that he was in no hurry to see me take note of it. And as things looked then, and as they did until two years ago, it seemed very unlikely that the workman would ever see it... .

<sup>922</sup>(\*) The "episodes" in question are briefly outlined in the note "Burial. . . " (n° 168 (ii)), part of the suite of notes devoted to the "Motifs" operation.

It's true that, behind this one, I clearly recognize, in a style that's not misleading, who's pulling the strings - and who, incidentally, figures prominently among those to whom my ex-student lavishes his thanks<sup>923</sup> (\*\*). The very **name** given to the volume from Saavedra's pen, and to the crucial notion I had introduced, is a subtle act of **dispossession**. It would not be surpassed, in its lapidary effectiveness, until five years later, by the sole virtue of yet another name, given to another volume, but this time from the pen of Deligne himself<sup>924</sup> (\*\*\*)).

If the name " $\mathrm{SGA}_2 4^1$ " given to a certain saw-cut volume is a sham of genius, the name "Tannakian category" is a **mystification**, just as genial. Even in the case of a "trivial" or "neutral" Galois-Poincaré category, equivalent to that of finite-dimensional linear representations of an affine group scheme  $J$  over a body  $k$ , the yoga I had developed is typically "Grothendieckian", inspired as it is by the analogous yoga I had developed in the case of the fundamental group of a topological space, a scheme or (more generally) a topos. The idea of defining the fundamental group as the group of automorphisms of a fiber functor on the category of coverings of a "space" or "topos", and the idea

p. 1166 The idea of systematically working with the not **necessarily**  $\square$  **connected** category of slab coatings (which is just as crazy because it's new, and therefore unusual) had, in the past, earned me a great deal of sarcasm. I don't

I never bothered, knowing that none of those jokers who thought they knew Galois or Poincaré's theory because they had learned it at school, had really understood it - and none of them, to this day, could take even **the first** elementary **steps** in Galois theory of coverings of a (let's say) somewhat general scheme<sup>925</sup> (\*), without repeating verbatim the work I've done on this subject, and the formulation I've given of Galois-Poincaré theory of coverings in terms of category equivalence<sup>926</sup> (\*\*).

And similarly, the idea of reconstructing an affine group scheme (over a body, to fix ideas) from the "abstract" category of its finite-dimensional linear representations, equipped with its natural multiplicative structure and its natural "fiber functor" "forgetting the operations of  $J$ ", as the **diagram in groups of the automorphisms of this functor** - this idea is due neither to Tannaka (who never asked for so much), nor to my modest ex-student Saavedra, nor to my most brilliant student Deligne (to my great regret - but he wasn't around yet), but it's a typically "Grothendieckian" idea. And the same goes for the fact that we thus find a perfect correspondence between affine group schemes over  $k$ , and rigid tensorial  $k$ -categories equipped with a fiber functor over  $k$ . And the same goes for the idea that, if by chance (as tends to be the case for categories of patterns on a body of non-zero characteristic) we have a rigid tensorial category which (by misfortune, or by extra good fortune. . . ) does **not** have the advantage of possessing a fiber functor, then the "algebraic group" must be replaced by an "algebraic **sheaf**". This idea was spelled out at length when young Deligne had yet to hear the word "sheaf" used in maths, and it's still true today.

had never yet dreamed of anything like it. There too, when Giraud took it upon himself to develop an arsenal of  $\square$  non-commutative cohomological algebra in dimension  $\leq 2$  in the sixties, blows

p. 1167

<sup>923</sup>(\*\*) On the "mathematical" side of things, these people are (in order of appearance) myself (out of alphabetical order, that was nice), Berthelot and Deligne.

<sup>924</sup>(\*\*\*) As will become apparent below (in the note "Monsieur Verdoux - ou le cavalier servant", already quoted), there is at the very least a strong presumption that instead of reading here "but this time from the pen of Deligne in person", it would be licit to read "and also from the pen of Deligne in person".

<sup>925</sup>(\*) "So-so general" could be interpreted here, precisely, as "a non-normal scheme". Before me, the fundamental group of an algebraic variety had only been introduced (by Lang and Serre) in the case of normal varieties, by describing it as a suitable quotient of the "absolute" profi ni Galois group of its function field,  $Gal(\bar{K}/K)$ .

<sup>926</sup>(\*\*) Today, this way of formulating the relationship between fundamental groups and coverings, even in the "school" (if you will) special case of ordinary topological spaces (locally simply arc-connected), is beginning to be seen everywhere, without any allusion to the ancestor, need I say... .

of fields, sheaves and links<sup>927</sup> (\*), there was no shortage of sniggers. It's the kind of thing that Deligne and co. have been calling a "gange of nonsense" for a long time now. These sniggers didn't bother me<sup>928</sup> (\*\*), I knew where I was going - and it was with "rapture" (as I write elsewhere) but no real surprise, that I saw this "gange" capture with perfect finesse delicate and profound relationships that I knew no other "language" would be able to capture.

That said, when the same sneerers one day realize a "cream pie" that had escaped them, whether it's the categories that some are quick to christen "Tannakian" (while waiting for something better. . . ), or a certain "correspondence" or "relationship" or "construction" (a little neo-Grothendieckian around the edges) that is euphemistically dismissed or dubbed "Tannakian". ), or a certain "correspondence" or "relation" or "construction" (a little neo-Grothendieckian around the edges) that is euphemistically dispatched or dubbed "Riemann-Hilbert" (while we wait for something better. . . )<sup>929</sup> (\*\*\*) - then everyone rushes in, and it's a race to see who can play the genial inventor. That's the mathematical "zeitgeist" of the seventies and eighties of this century... . What's certain, in any case, is that it wasn't a Saavedra who would have had the idea of calling these categories (which I had explained to him at length) by the truly brilliant name of "Tannakian categories". Left to his own devices, he wouldn't have he'd ever dared change the terminology he'd inherited from me, without at least asking for my agreement - and that was

It was necessary for the example and encouragement to come from on high, so <sup>that</sup>□ he would per- p . 1168 to treat me like a negligible quantity. What's more, the unfortunate man already had enough work to do to bring himself up to speed on what was essential if he was to achieve even part of the ambitious writing program I'd submitted to him<sup>930</sup> (\*), without having to delve into the literature and read Tannaka and what-have-you, which he'd surely never heard of back when he was still working with me<sup>931</sup> (\*\*).

The name is "genius" through the subtle combination of two qualities, which might seem contradictory. One is that, to a superficial observer, the name doesn't sound totally zany. "Everyone vaguely remembers that there's such a thing as "Tannaka duality", in which the multiplicative structure plays an important role. role - and it does seem a little like what happens with those famous  $\otimes$ -categories that a certain Saavedra (who's that one?) calls "tannakiennes"; so go for "tannakiennes", why not!

But for those who know how to wait, things mature on their own. Thirteen years have gone by since then, and instead of a book by an unknown author whom nobody has ever seen, there has been for the last three years a far more prestigious reference, in the brilliant volume LN 900, from the pen of none other than Deligne, and a man called Milne working in tandem. These well-known authors develop ab ovo all the formalism of the categories they

<sup>927</sup>(\*) This suggestive terminology was introduced by Giraud, in place of a provisional terminology (somewhat ad hoc) that I had been using since 1955 (such as "finite categories of a local nature" and other unwelcome names, for notions whose fundamental nature required terse, striking names).

(June 16) On the first page of the introduction to his book, Saavedra talks about the "formalism for non-commutative homological algebra **introduced** by Giraud". This is one of the many places where I could sense someone smarter than the author of this book, who "held his hand". . . the same one who likes to speak of "derived categories" only to add "**introduced** by Verdier" (when he knows perfectly well, in both cases, what he's talking about... . ).

<sup>928</sup>(\*\*) But Giraud did - who distanced himself without return from the theme he had pursued with me, only just beginning it. On this subject, see the note "Les cohéritiers... ." (especially pp. 386-387), and the following note ". . . and the chainsaw" (notes n° s 91, 92).

<sup>929</sup>(\*\*\*) On the subject of this last "en attendant mieux", see the entire "Colloque Pervers" package, and in particular the notes on "Le prestidigi-

tateur" and "Marchés de dupes - ou le théâtre de marionnettes" (n° s 75", and 171<sub>2</sub> (e), the latter being part of the long note "La maffi a" n° 171 ).<sub>2</sub>

<sup>930</sup>(\*) He completed this program in the record time of just two years, from the time of my departure, when this program had hardly even begun (beyond a basic introduction to schematic techniques). Even with the support of a Deligne (who had shown no interest in this pupil before I left), this performance was nothing short of a prodigy - which "prodigy" is examined a little more closely in the note "Monsieur Verdoux - ou le cavalier servant" (n° 176 ).<sub>5</sub>

<sup>931</sup>(\*\*) I recall that Saavedra worked with me for just a year or two before my departure (around 1968, 1969), after which I

lost sight of him almost entirely. His background at the time was no more or less extensive than that of any other 3<sup>rd</sup> cycle student from the Third World (or from one of our provincial faculties).

call them, too, tannakian. Clearly, this is a fundamental notion, used for years by the likes of Langlands, Deligne, Serre and others, and destined for a bright future. No one, of course, will believe that it was a certain Saavedra, quoted two or three times in passing in this article, who was the author of this crucial notion, and of the highly refined formalism to which it gives rise. The very tone of the article of the two brilliant authors, taking up the subject with all the mastery we know of the main author, doesn't leaves no room for doubt on this subject<sup>932</sup> (\*). Not to mention the fact that, in the theory presented in Saavedra's book such a gross error (which even forces them to start from a completely different definition, which finally seems the right one<sup>933</sup> (\*\*)) that one is justified in wondering whether this unfortunate Saavedra (to whom someone - and we can guess who. . . - had to try to explain what he was talking about) had really understood what he was talking about. And it's not Milne, brilliant as he is, and who had the honor of co-signing with the prestigious Deligne an article developing a visibly fundamental idea, who would have the idea that he could pass for father or only cofather of it; nor would Beilinson or Bernstein come and claim that they invented (or even co-invented. . . ) the famous "relationship that should have found its place in these notes. . . ." which they had the honor of co-signing with the same prestigious Deligne, after the latter had been kind enough to point them in the direction of a Kazhdan-Lusztig demonstration... . And who could **seriously** believe that this famous Tannaka, who lent his name (without being consulted) to designate this fundamental notion, **really had** anything to do with it? Nor would he be the one to come and claim, assuming he's still alive, the day when it will be clear to everyone who is the **real father** of this notion, and of the whole theory of perfect delicacy that goes with it. If anyone has the slightest doubt about this, all they have to do is go through Tannaka's work, or if his patience is too thin, the work on "Tannaka's duality", to realize that it has nothing to do with anything... ..

Here again, once a few milestones have been set, all we have to do is let time take its course. Clearly, this theory, which will increasingly reveal itself as the technical means of a new **philosophy** for linking geometry and arithmetic, is destined to come more and more to the forefront of the mathematical scene in the years to come. In five or even ten years' time, no one will have the slightest idea of referring to a certain book by an unknown author on this subject, when the person who undoubtedly held his hand took the trouble to write the paper that

was necessary, with the assistance of a brilliant collaborator, to form the heart of the no less brilliant volume where the notion of motif is finally developed on solid □ terrain. (Volume in which he appeared more charitably,

to make no mention of the usual conjectural "gangue of nonsense" on this theme, which obviously went beyond him, of a vague, precursory draft, long since forgotten. ...). ) It will become second nature to quote "Tannakian categories" by P. Deligne and J.S. Milne as one would quote FAC or GAGA (de Serre) or the SGA (the well-known anonymous seminar at IHES, known as "du Bois Marie"). And in so doing, there will be no ambiguity in anyone's mind as to the authorship of these innovative ideas - which certainly does not lie with co-author Milne, and even less with Tannaka, or even with a certain rigorously unknown author (a fellow by the name of Saavedra), named two or three times in passing in their article, for having written (in the introduction to a volume by his pen) an "excellent summary" (with a few reservations) on the subject.

But we wouldn't expect the father of the theory to do violence to his well-known modesty, to the point of calling "Deligne's categories" (or "Deligne's correspondence", in a completely different field. . . ) what, by all accounts and by the unanimous consensus of the "good" people who decide in these matters, should be "Deligne's categories".

<sup>932</sup>(\*) On the article in question, see in particular the notes "L'Enterrement - ou le Nouveau père" (n° 52, especially p. 214) and "La table rase" (n° 67, especially pp. 252-253).

<sup>933</sup>(\*\*) See, on the subject of this feat by Deligne (assisted by Milne acting as fi gurant), the beginning of the oft-quoted note "Monsieur Verdoux - or the cavalier servant" (page 1176).

yet it's really called that...

#### 18.5.9.4. d. The father waltz

**Note** 176<sub>4</sub> (April 20) Yesterday's reflection made me see with new eyes something that last year, when I had just landed in l'Enterrement, had left me flabbergasted: ". . this seemingly absurd thing: Deligne "redoing" Saavedra\*'s thesis ten years later! It all started on April 19 of last year, when I discovered the "memorable volume" LN 900, in which (among other beautiful things) Saavedra's thesis<sup>934</sup> (\*) is reproduced practically verbatim. I return to it a week later, in the note "La table rase". By this time, I had come to the "intimate conviction" that the meaning behind this nonsense was the desire of the brilliant Deligne (acting as Saavedra's scribe) to

"to give himself the illusory feeling of liberation from something he surely felt to be a painful obligation: to have to constantly refer to the very one he was trying to supplant and deny, or even to such and such another who referred to him."

But last week, taking the trouble for the first time to leaf through the work of this "so-and-so", I to my surprise that he did not  $\square$ songe at all to "refer to me" (except by the three lines (the "deep gratitude" I'd been quoted as saying, obviously intended to give the impression). All of a sudden, my "intimate conviction" of a year ago became lame - there must have been something in it, surely, but it was still a mystery: it's not the three lines in question, which no reader will ever think of unearthing at the end of the introduction, that will have motivated a Deligne to play copyist to the most obscure pupil of a master long dead! Not to mention the fact that, at the end of the introduction, I'm almost at one with him and Berthelot, who are entitled (as am I, we'd say<sup>935</sup> (\*)) to thanks for their "help and advice which they have generously given during this work". . .

p. 1171

This "mystery" became completely clear during yesterday's reflection, and without my having to look for it, and without my even having to think about it. Thinking about it again, after I'd stopped writing, various associations surfaced - they must have already been present when I wrote, without my even being aware of it, and guiding my pen without my knowing it. I was struck by a similarity not only of style, but of **patented process** of appropriation, across the three major "operations" in L'Enterrement (of the four in which Deligne himself is the principal (if not sole) "beneficiary"). We're talking here about what we might call the "provisional substitute father", surreptitiously introduced into the mathematical racket to conceal a real paternity, while the person of my friend pierre remains temporarily in the shadows. Once the natural father has been completely eliminated from the scene, to everyone's satisfaction, the substitute father is himself retracted as if he had never existed, and the **real father**, modest and smiling, appears on the scene, without even having to say that it's him; because for the one who has quietly known how to pull the strings and who has known how to wait, things take care of themselves without any resistance whatsoever: the unanimous agreement of the entire Congregation has already invested him with the role that rightfully belongs to him.

This process only began to dawn on me a few days ago, as I recounted the misfortunes of the past. tures of my friend Zoghman through the various episodes of Operation IV, the so-called "service unknown". The "surrogate father" in this case (for a certain "correspondence". . . ) was **Kashiwara** - I wouldn't know... say whether it fell out of the sky like that, provi $\square$ dentially and by the greatest of chance, or whether the future true p.

1172

father gently made him understand that this result of a stranger, who was hanging around without a father worthy of the name

<sup>934</sup>(\*) See the notes cited in the penultimate b. de p. note.

<sup>935</sup>(\*) With the difference, however, that I "introduced him to the subject" (sic), and that he "owes a large part of his mathematical training to me" (that's really too much of an honor).

name, was by no means to be sneezed at<sup>936</sup> (\*). In any case, our friend Pierre was able to play perfectly on a supposed ambiguity of paternity, fabricated from scratch by the peremptory consensus of "experts", even before the significance of the new thing was generally recognized. The surrogate father Kashiwara appears as early as March 1980<sup>937</sup> (\*\*), if not already at the Colloque des Houches six months earlier; he is retracted without trace (and without too much formality, it would seem) at the memorable Colloque of June 1981, fifteen months later. Here, the retraction is carried out with perfect dexterity, through the introduction of two others, this time let's call them "presumptive co-fathers" (and purely formal) Beilin-son and Bernstein, who enter the scene as a simple clause of style - "pouce!", when of course no one would imagine that it was either of them who would have made the child (even if both of them did benefit from it. . . ).

The analogy with "Operation Motifs" is truly striking! While the paternity of what could be presented as the "nonsense" of all things Motifs was still too notorious (especially in the early '70s) to be open to manoeuvring, there were **two crucial strands of Motifs yoga** that had never yet been the subject of a single published line, even if only in allusive form. One of these, the "yoga of the weights", had been appropriated by the Mega-father as early as 1970 without a hint of a wrinkle - what had been glossed over was in any case only "conjectural" and worth no more than a token allusion. The other part, on the other hand, had been perfectly worked out by the second half of the sixties, with nothing conjectural about it. A vague, slightly out-of-touch student was supposed to present at least the starting mechanism of yoga - not a technically arduous task, but one which (until around the moment of "death" of the natural and unwanted father, at least) seemed rather beyond the unfortunate.

□ It was this student, Saavedra, who was the ready-made surrogate father, credible enough, thanks to the p. 1173 to the provisional guarantee of the one who remains behind the scenes, to win the assent of a Congregation that is only too eager to forget the one who must be forgotten; but at the same time (and this is the point) this "father"-there obviously doesn't "fit the bill". When the time comes, it would never occur to anyone, and certainly to Saavedra less than to anyone else<sup>938</sup> (\*), to put forward the supposition that he could be the father of a new philosophy - a supposition that is quite simply preposterous, if you care to dwell on it for even a moment... Here, the evacuation of the surrogate father, who has had his day, doesn't take place until ten years later, with the publication of the memorable LN 900 in 1982. It has to be said that between 1972 (when the "surrogate father" came to the fore in Operation I, known as "The Motives") and 1980 (when the equally providential surrogate father appeared in Operation IV, known as "The Service Unknown"), a lot of water had passed under the bridge, and there was no longer any need to beat about the bush! Remarkably, here too, a "presumptive and token co-father" is introduced, to make the transition "smoothly" (and without anyone seeming to put themselves forward) between surrogate paternity (the paternity of a bungler, in short. . . ) and **real paternity**. And I'm sure Milne didn't see the invisible wires that maneuvered him at someone else's whim any more than Beilinson and Bernstein cared to see them. Everybody got their crumbs, and everybody (at least those with a say in the matter. . . ) got everything.

<sup>936</sup>(\*) (June 16) It would appear that the initiative for the pick-pocket operations on Mebkhou's work did indeed fall to the entrepreneur Kashiwara, and this as early as 1978, just a few months after Mebkhou had sent him Chapter III of his thesis, which he had just completed. See "La maffia" part (b) ("Premiers ennuis - ou les caïds d'outre-Pacifique"), b. de p. (\*) p. 1060.

<sup>937</sup>(\*\*) (June 16) In fact, it had already begun to show its face two years earlier - see the previous b. de p. note. The March 1980 episode is that of the Goulaouic-Schwartz seminar, referred to in the note quoted, as well as in the note "Carte blanche pour le pillage - ou les Hautes Oeuvres" (n° 1714 notably pages 1088-1090).

<sup>938</sup>(\*) (June 16) At the end of the "deal" that had to be made between him, Saavedra, and a Deligne (provisionally) in the wings (ready to reappear when the time was ripe. . . ), Saavedra's "share" was a state doctorate thesis in his pocket and the relative notoriety acquired by an author of the prestigious "Lecture Notes" series - which would give him the start he needed for a career in his own country, far from the arid mathematical pursuits he had only glimpsed from afar. ...

to be fully satisfied.

All this also made me think last night of the third major operation for the direct benefit of the "future father of all azimuths", the "Spread Cohomology" operation. I had previously convinced myself that the initial motivation for this operation<sup>939</sup> (\*\*) was the appropriation of a certain **fixed-point formula**,

of the fact that a certain "formula of *L-functions*" with undesirable paternity could be presented as a trivial co-roll of said formula. The trouble was that the trace formula in question was tainted by the **same p**.<sup>1174</sup>

unwanted fatherhood. Fortunately, there was also another possible father, a good friend of mine (Verdier, not to name him), who had even made two formulas, one too general (but heuristically crucial), the other a little narrow but still sufficient to "cap" what we wanted. But buddy or not, it's certainly not the buddy, nor the unwanted deceased, who is **the** appropriate "father" here, even though it's the key formula for "**the**" famous conjecture<sup>940</sup> (\*). Unfortunately, given the notoriety of the *L-function* formula and its unfortunate paternity, the delicate point here was not the friend (friends always work things out in the end. . .), but the deceased. To make matters worse, his demonstration of the "corollary" was published in black and white in a Bourbaki seminar in 1964, but at a time (fortunately) when the routine case (sorry, the crucial case, I meant!) of this formula (or of the formula of traces is kif kif, but it's better not to say it...<sup>941</sup>(\*\*)), had not yet had time to be verified.

Here, the manipulation consisted in using the friend in question to pretend to be the father of his ultra-general formula (which was the exact truth, except that he never bothered to demonstrate it...), but in the process confusing it with the **explicit** formula demonstrated by the cumbersome deceased (a formula to which no allusion is made at any point), and **debunking** the ultra-general formula (as conjectural, incomplete and, to put it bluntly, unusable). This was a way of drowning a fish, and of depriving the reader of any desire to go and look in a certain SGA 5 seminar (which, incidentally, he is made to "forget") for what he might have to say on the matter. As for the friend's explicit formula (a little narrow-minded around the edges, but perfectly valid), by mutual agreement there's no more mention of it either, except for an ambiguous and token reference, drowned at the end of a stringy and discouraging text, which no reader in the world will have had the courage to read to the end. In short, then, the

"surrogate father" (Verdier in this case) has indeed intervened, but less by his tacit agreement to a "paternity" on a result (that of **the**  $\square$  **défunct**) which it is a question here of **completely escamoter**, than by his connivance p. 1175 rather, in a game of scrambling and debunking two "children" of whom he is indeed the father, in order to conceal in the fray the third child, of an unacknowledged father, an orphan whom no one can find, nor, above all, cares to find<sup>942</sup> (\*). Illusie plays a supporting role, somewhat similar to that of the "co-presumptive fathers" from earlier - except that his paternity, like Verdier's, is never supposed to be based on the sacrosanct **Frobenius** formula of traces, the only one that counts and reserved (with all due dexterity, of course) for Deligne alone, but that it too relates to the unavowable child that needs to be concealed - something to which Illusie collaborates with that exemplary devotion that characterizes him.

<sup>939</sup>(\*\*) On this subject, see the group of notes entitled "La formule" (n° s 169 -169<sub>59</sub>). This initial aim was later considerably broadened - see in particular the notes "L'Eloge Funèbre (I) - ou les compliments" (n° 104) and the note "Les joyaux" (n° 170 (iii)).

<sup>940</sup>(\*) This is, of course, Weil's conjecture. On this subject, see the note "La Conjecture" (n° 169).<sup>4</sup>

<sup>941</sup>(\*\*) These two formulas are in fact each an immediate corollary of the other. As my authorship of one of them (the functions *L*) was notorious, Deligne managed (in the memorable text entitled "SGA 4<sup>I</sup>") to present it as the corollary of the other, doing his utmost to give the appearance of being the father of the latter, by means of prestidigitation-artifice tricks. infinitely more arduous, than my modest demonstration (and key statement) for the said formula. See the group of formulas already quoted, for this tour de force undoubtedly unique in the annals of our venerable Science (notes n° s 169 -169).<sup>59</sup>

<sup>942</sup>(\*) See on this subject the note "Les prestidigitateurs - ou la formule envolée" (n° 169<sub>8</sub>) - and also the b. de p. note (\*\*) page 1121 to the note "The family album, showing the extent to which the escamotage-enveloppe efforts of good Samaritans Deligne and

Illusie were a great success.

### 18.5.9.5. e. Monsieur Verdoux - or the cavalier servant

**Note** 176<sub>5</sub> But I'd like to come back to Saavedra's "thesis". It was around the time of my departure from the mathematical scene, at the beginning of 1970 (if my memory serves me correctly), that Saavedra had at last pretended to be really "hooked" on his work, after a year or two during which he hadn't seemed too decided. He then told me that he had worked out a formulation and a proof of the initial statement I had proposed to him, so as to apply to the case of a ring of base  $k$  **whatever**. He even gave me a sketch of a demonstration, which I had to listen to with a slightly distracted ear. Almost all my energy was taken up by the change in my life I was now experiencing. Without thinking to check carefully what Saavedra was telling me, I had the impression that he had finally started, and that he would now be able to manage on his own. Perhaps I was in a bit of a hurry to take his wishes for granted, at a time when my availability for real research direction had become almost nil<sup>943</sup> (\*\*). After that, I heard nothing from him, as far as I can remember<sup>944</sup> (\*\*\*). I

assumed until last week that he must have completed the minimum program I had proposed, and just a little beyond that perhaps in dealing with the case of the motives (from what Deligne had me written last August, with its annotated bibliography on the motifs).

I've only just realized **that this is not the case**. After three or four years spent on the subject, the unfortunate fellow has found a way of making a gross error in the very **definition of** what he calls a "Tannakian category" (the definition by intrinsic properties, I mean<sup>945</sup> (\*)), which he had to prove implies the "Galoisian" description in terms of representations of a suitable sheaf. Theorem 3, which he states in the introduction (the introduction in which he is supposed at least to **state** the four essential theorems of the theory, as I had given them to him), is therefore **trivially false**. Deligne and Milne make a point of pointing out the mundane error, proposing as a "new" definition of the categories studied the description in terms of sheaves (which it is obvious a priori is the right one, even if it means modifying the intrinsic description if necessary. . . ), and gravely question whether "Saavedra's" definition (once rid of the idiotic error) really implies "theirs" (sic)<sup>946</sup> (\*\*) - which was exactly the subject that was supposed to constitute Saavedra's thesis work!

The situation is pure Father Ubu! And in thirty-six ways at once. So, what was the subject of Saavedra's proposed work, the only part that required an original contribution, however modest (finding the right intrinsic conditions for a Galois-Poincaré category on a base ring as general as possible) has not been dealt with even in the case (which I think I had dealt with long ago<sup>947</sup> (\*\*\*) by the time I met Saavedra) where  $\square$  the base ring  $k = \text{End}(0)$  is a **body**! Saavedra's "thesis" work therefore consisted, very precisely, in piously copying the part of the theory (beyond the beginning of yoga

<sup>943</sup>(\*\*) In comparison, at least, with the availability I had before I left; but not with that which I can observe in most of my colleagues, who are in charge of research.

<sup>944</sup>(\*\*\*) My memory betrays me a tad here - see note n° 176<sub>7</sub> for unexpected revelations on this subject.

<sup>945</sup>(\*) The error stems from confusion in Saavedra's mind as to what I meant by the **basic ring** of a

It's not just any ring with respect to which the said category is "linear", and the tensor product is "bilinear", but the canonical ring  $\text{End}(1)$  (where 1 is the unit object of the category). By the time I explained the theory's ABCs to Saavedra, he must have been so "out of his depth" that it must have gone right over his head, and into oblivion. Deligne, who seems to have more or less taken over from Saavedra (obviously with an idea of his own in the back of his mind. . . ), was careful not to make him rectify the situation. This enabled him (ten years later) to discreetly bring down the Saavedrian house of cards, and to appear as the Angel Saviour and (this time again) the True Father everyone was waiting for... .

<sup>946</sup>(\*\*) Loc. cit. page 160 (I'm not making this up!).

<sup>947</sup>(\*\*\*) This was in 1964 or '65, so seven or eight years before Saavedra's famous "thesis"-sic, and seventeen or eighteen years before a Deligne-Milne tandem came to the rescue, not to **do** this modest work either - the only "original" work I had expected from the most modest of my students... ..

grothendieckien), on top of a basic body, which had already been entirely completed by myself, and to present, instead of the work that was a prerequisite for everything that was to follow, a cannulated definition and a "demonstration" of a false theorem, a demonstration reduced (as Deligne makes a point of pointing out - loc. cit. p. 160) to a simple vicious circle!

And that's not all. The thesis doesn't stand up - and the thesis jury doesn't even notice! I guess none of them really understood what it was all about. Yet that didn't encourage any of them to let me know that at least one of them was in a position to guarantee the seriousness of the work they were seriously pretending to judge<sup>948</sup> (\*). If the defense did take place, and without my involvement, it could only have been thanks to the support of Deligne, who (as Saavedra's acknowledgements make clear) must have followed his work to some extent, once I had practically disappeared from the scene<sup>949</sup> (\*\*).

It seems unimaginable to me, then, that Deligne wouldn't have noticed this error, he whose sharpness and acuity I know down to the smallest detail - and there's no question of "small detail" here! Of course, I'd told him all about the yoga I'd arrived at, and it's simply not possible that among the very first things I explained to him, there wasn't this counter-example that he and Milne pretend to bring out as the latest novelty, and which was known to me from the very beginnings of my thinking on yoga (which I'll finally call "Grothendieckian", instead of referring to Galois- Poincaré, who don't ask for so much. ...). If he has allowed such a gross error to persist in the "thesis" (sic) of his "protégé" (resic), so as to be able to purely and simply discredit the "surrogate father" (all provisional) as soon as he sees fit, it's surely not without good reason. Yesterday's reflection makes these quite obvious.

□ We may say that I'm affabulating, and that the "help and advice" Saavedra refers to, does not imply p. 1178 necessarily that Deligne had taken the trouble to read with any care the four statements in the introduction that summarize the essentials of the<sup>950</sup> theory (\*). Of course, these statements had been familiar to him long before he met the person in question, so it would have been sheer levity to endorse a work without having at least taken the trouble to check, for the space of a quarter of an hour, that the main statements announced in the introduction were correct. But in fact, there's no doubt in my mind that Deligne did indeed take the trouble. After all, this wasn't **just any work**, submitted by a slightly clueless student in need of a thesis. After me (and even before Serre), Deligne was in the best position to appreciate the full scope of the formalism presented, as a crucial part of the unwritten (or at least unpublished) legacy left by the late master. And while he may have been more than happy to take his usual casual approach to the subject<sup>951</sup> (\*\*), in the end he knew better than anyone what he was talking about. If he, the brilliant Deligne, the elitist through and through, took the trouble to follow the work of someone who was clearly mediocre, it was certainly not for his own good and with the aim of helping him obtain what, according to the current consensus (and even more so, according to the criteria of exactingness pushed to their extreme degree, which he prides himself on professing) is a **bogus thesis**.

Once that word is uttered, we are immediately confronted with a strange contradiction. On the one hand, an error so

<sup>948</sup>(\*) The composition of this lamentable jury will be revealed (to the reader who has resisted until then) in the final note 176<sub>7</sub> of "The Sixth Nail" to my coffin. ...

<sup>949</sup>(\*\*) This sudden interest on the part of a Deligne in an obscure student in need of a thesis only appeared, one wonders why, after the death of the natural (and unwanted. . . ) father of the theory that the aforementioned student (obviously overwhelmed by the task. . . ) was supposed to expound.

<sup>950</sup>(\*) Apart from the results on filtrations of fiber functors, which are more technical and harder to compress into a single, striking statement.

<sup>951</sup>(\*\*) On the subject of these tunes, and the appropriation technique they serve, see the note "Appropriation et mépris" (n° 59').

it's hard not to interpret it as a sign of fundamental incapacity - it would seem that the very problem that was being posed, even in its merely technical aspect (which wasn't all that rocket science, though), simply hadn't been grasped at the time of the defence, and at the time of publication of the book in question. On the other hand, this same student, after spending a year or two with me without doing much of anything, suddenly acquires, in less

of two years, a mathematical culture that may rightly seem impressive: structural theory of algebraic groups, both on general bodies and on the  $\mathbb{C}$ -corps of reals, theory of stranded schemes of

p. 1179

zinc, Hodge theory, motifs... . Not only that - but while I can't recall ever having read a mathematical text written in his hand, even just a few pages long, and knowing full well how difficult it is (especially for students of modest means) to learn how to write maths - I was struck, while browsing through the book published under his name, by its exceptionally high quality "dress". The thought had occurred to me that, technically speaking at least, this text, which obviously aims to be a standard reference text on a par with the EGA and SGA texts, could have been written by me, or by Deligne, or by one of the four or five other students I've had, all remarkably gifted, who are well versed in the task of presenting a complex, interwoven set of ideas and facts in precise, complete and elegant form. I am well aware that, even less than a mathematical culture, such writing virtuosity is not something that can be improvised (except in the case of exceptionally gifted individuals, such as this same Deligne and a few others), and that it can only be acquired (if at all) after many years of practice. It took me over ten years to acquire it, even though I had a very strong contact with the substance I was trying to express. Certainly, this contact was in no way comparable to Saavedra's for his thesis topic, which he still didn't understand after writing on it, and which turned out to be (at least until 1982. . . ) **the** "right reference" for a delicate and crucial formalism. Decidedly, there are two things here that simply don't "fit" with each other... .

The thought that occurred to me last night, and which now comes back with the force of evidence, once I take the trouble to recount the situation to myself in black and white, is this: it's unthinkable that it's Saavedra, whom I've known well and whose possibilities and, above all, limitations I'm well aware of - it's unthinkable, come to think of it, that he's the author of this brilliant book, setting out - in its exclusively technical aspect, it's true, but in an exhaustive and (in this respect) all-encompassing way, the foundations of a "philosophy" that was entirely beyond him, perhaps the first three chapters, two of which consist mainly of basic generalities that everyone already knew, and the third of which presents Saavedra's completely canned version of the book's central notion - these chapters, then, which were

supposed to constitute the "minimum program" he never completed - perhaps these are entirely Saavedra's own handiwork. Central Chapter III may be cannular, but it nevertheless suffices to deliver an idea of what what we were getting at - namely, the "Grothendieckian" (not to name him), or "Gerbian", vision of certain

p. 1180

⊗-categories, a vision that gives meaning to later chapters IV to VI. Once we have accepted the description by sheaves (wisely taken as a **definition** of the so-called "Tannakian" categories, in the Deligne and Milne's doubly pirated text), it's these last three chapters that constitute the heart of the formalism I was trying to appropriate. I presume that these chapters were written in toto by Deligne, or perhaps partly by him, partly by Berthelot; and in even greater detail than the notes I had passed on to Saavedra, so that he practically only had to copy them verbatim, if he was even asked to go to the trouble of this formality. He must have felt like a "winner", because he was being given the "gift" of a thesis and the title to go with it, whereas he must have felt that what he had done himself (and even under the illusion that it made sense) was probably a bit meagre for a thesis.

state doctorate. And Deligne (disguised as a Samaritan again. . . ) wins: here was the reference that was needed, if not for now at least for "later" (for those who know how to wait. . . ), and where the undesirable name no longer appeared, for all practical purposes at least.

To add to the joy, I'd like to add that the man known as Saavedra seems to have disappeared from circulation without a trace. Last year, in anticipation of the (imminent) mailing of the printed and paperback copies of *Récoltes et Semailles*, I leafed through the *Annuaire International des Mathématiciens*, which is a big one - everyone's listed (and that's what the directory's for), with the sole exception of the person concerned, who doesn't appear under Saavedra or Rivano (or even Neantro, which I looked at out of conscience). As a result, the story takes on the trappings of a dark detective story. One shudders to imagine the smiling, affable Deligne, like a second Monsieur Verdoux (alias Landru), once he'd achieved his torturous ends with this "good reference" of his own (four years before his friend Verdier's!<sup>952</sup> (\*) ) - one shudders, I say, to see him make the "evidence" of his diabolical plot disappear, namely the unfortunate Neantro Saavedra Rivano himself, by burning him at length in a coquettish fireplace from the Ormails<sup>953</sup> (\*\*), specially designed for such purposes.

□ I reassured myself that I hadn't heard that Kashiwara or Verdier had disappeared from this world - in fact, I had him on the phone as recently as the day before yesterday, to ask him (without much conviction and without success, it seems to me) if he could give me some news about another "disappeared", that everyone's talking about and that nobody seems to have ever seen - I mean, Jouanolou's thesis. I still don't know much about this thesis, but it would seem that Verdier is still alive and kicking, whatever "evidence" he may be - and I'm confident that the same is true of Neantro Saavedra Rivano.

p. 1181

### 18.5.9.6. f. Lowly jobs

**Note** 176<sub>6</sub> With all that, I haven't even finished circling the ubu aspects of the history of Saavedra's thesis - I'm definitely collecting them, theses and theses like no other! By then, I'd come to the presumption (not to say, the intimate conviction) that if Deligne (assisted by an eager, volunteer collaborator) pretended to make a serious copy of Saavedra's thesis ten years after it had been defended, he was undoubtedly only "taking back" what he had "lent" him for a time (the time it took Saavedra to pass his thesis and disappear), and that this was therefore only fair return - except that what he had "lent" for a time, he had "borrowed" from the unnamed deceased. But since it's not customary to return to the deceased what one borrows from them (that's all we need!), all's for the best in that respect too.

The best part was that even after a second ex-student came along (the brightest of all those I had, to boot), the humble problem I had given Saavedra, who had been my starting point more than twenty years ago, and the first thing I believe I solved from that moment on, in the case where the defining ring of the  $\otimes$ -category under consideration is a body - this humble problem is still only

<sup>952</sup>(\*) On this subject, see the note entitled (appropriately enough) "Les bonnes références", n° 82.

<sup>953</sup>(\*\*) "Les Ormails" is the name of the residential part of the IHES (Institut des Hautes Etudes Scientifiques), where our friend pierre - alias Monsieur Verdoux - alias Landru (and disguised as the cavalier servant) - has taken over at just the right moment from a certain deceased, ousted from the place and sent to oblivion by the kind of coup-mine-de-rien my friend has a secret for. The residential part consists of a dozen family pavilions, and a larger building of comfortable studio flats, each of which will soon have its own individual, all-purpose fireplace... .

not yet "solved", even in this case! Deligne was content to point out Saavedra's gross error (surely spotted more than ten years ago, but he was biding his time... ). He didn't care, though.

p. 1182

by copying on 128 pages the previous reference text, to repair this error. Why would he give himself This would have required something more than a simple craving for appropriation. For this to have happened, he would have had to have had **more** than just a craving for appropriation, but a keen interest, a **respect** for the mathematical substance he was dealing with, and a vision that went beyond the prospect of immediate "gain".

If I took the trouble, around the years 64-65, to derive a "Grothendieckian" yoga for the  $\otimes$ -categories representable in terms of "algebraic sheaves", instead of contenting myself with those that can be described by a scheme in groups, it's because in the example that "motivated" me most, that of patterns over a body, it was well known (by a very simple Serre argument) that when this body is of char.  $p > 0$ , there is no fiber functor "rational over  $\mathbb{Q}$ " (or even over  $\mathbb{R}$ ). This **forced my hand**, then, to express the theory in terms of something as "unserious" as the formalism of sheaves and links, and at the same time, of course, to find intrinsic criteria of a simple algebraic nature, ensuring that this "Galoisian" or "Grothendieckian" vision practically "always" worked, and in any case, at very little cost. Twenty years later, the characterization I had derived (and, if I'm not mistaken, proved), by the existence of a fiber functor on an extension of the  $k$ -field of the base  $k$ -field, has still not been established in the literature! Even today, in terms of what is written by the care of the Saavedras, the Delignes and consorts, even admitting whatever one wants about a formalism of "motivic cohomology classes" over a finite (let's say) body, it is still not established (not in the literature, at least) that the category of semi-simple (let's say) motives over such a body is "Grothendieckian" (or "Tannakian", as these gentlemen say). Here's 418 + 128 = 546 pages of text, from the pen of Saavedra (assisted by Deligne and Berthelot), then Deligne and Milne, and all this without even managing to extract what had been my starting point twenty years ago, convincing me that "motivic Galois groups" **did exist**.

Yes, why would a Deligne have bothered, when he'd long since forgotten the vision, the credit he was seeking had been earned anyway, and the bodies he was working on to make **his** theory of patterns (which has nothing to do especially with that of a certain deceased. . . ) are all bodies of zero characteristic - so that his famous so-called "Tannakian" categories are all "neutral" (or "Tannakian").

p. 1183

"trivial"). In that case, there was certainly no need to make a big fuss about wreaths and the like, which from then on was nothing but window dressing. There was no point, except **to appropriate the letter of something whose soul and spirit have been forgotten**.

And I see that the epilogue to this breathtaking and lamentable story is that, just as with the B.A.BA of the vision of patterns buried fifteen years ago, it's the crusty one again, barely finished with the tour of the brilliant Burial and its prowess, who's going to do this little job that none of his pupils after his "death" have yet had the heart to do. After all, they've been far too busy being masters to have the time, even for a few days, to be **servants**<sup>954</sup> (\*).

---

<sup>954</sup>(\*) I've been a little hasty here, pretending to lump all my students together with the brightest among them. I apologize in advance to any of them who don't feel flattered to find themselves in such brilliant company! In any case, I'm happy to remember Giraud, taking on the task (which fell to him unexpectedly) of reading Contou-Carrère's thesis, in an attitude of "service", that's for sure, towards Contou-Carrère and myself at least, and perhaps also towards the mathematical community; on this subject, see the last paragraph of the note "jésus et les douze apôtres" (n° 19, page 151).

### 18.5.9.7. g. Five theses for a massacre - or filial piety

**Note** 176<sub>7</sub> (June 19) It's now exactly two months since I set about writing the above notes (dated April 19 and 20), with the ready-made name "Le sixième clou (au cercueil)" (n° s 176<sub>1</sub> à 176<sub>6</sub> , not including this one, which is part of the batch). Zoghman Mebkhout had just brought me Saavedra's book the week before - and it only took a glance to realize what it was all about.

I must confess that this discovery was a thrill, scarcely less so than that of the "memorable volume" exhumation of the motifs (Lecture Notes n° 900), a year before to the day. To put it better, last year's emotion was rekindled, as it were, unexpectedly by the discovery of an "operation" intimately linked to this exhumation; an operation (it was obvious from the outset) that had prepared it, and of a comparable scale. I was then seized again, not to say suffocated, by the feeling of quiet impudence - **the same** impudence (this too was clear from the outset, by many unmistakable signs), attacking something intimately linked to me, something that no one else in the world had long carried and nurtured. . . It was so strong, to the point of anguish, that I myself was shaken... astonished.

□ The spontaneous reaction, and natural outlet, would have been to do as I did last year - to say my emotion while it was still fresh, and thus get to the heart of this new chapter in my burial by those who were once close to me. I held back, however<sup>955</sup> (\*), because I needed to be available for Mebkhout's visit, not to mention the fact that he had things to tell me which, even if they didn't affect me in such a neuralgic way, I felt were just as "neuralgic" for him, in any case, and just as significant for the Burial. What's more, I felt it was important to make a note of the things I'd just learned from him that I wasn't yet familiar with, while they were still fresh in my mind - whereas the ins and outs of this famous book-burial were unlikely to escape me, even if I only got around to it later. That's why, the day after my friend's departure, I set about (from April 15 to 18) recounting his misadventures, in the group of notes (n° s 171<sub>1</sub> to 171<sub>4</sub> ) that now form the end of the Apotheosis. p. 1184

So, before coming to the famous "Sixth Nail", I'd had time to compose myself. To tell the truth, looking back over the first few pages, I can't find any trace, in my sarcastic (and a tad distant) description of the new pot-aux-roses, of the emotion that had first assailed me, to the point of making me spend a sleepless night, at a time when I badly needed sleep. I actually felt it, yes, the "weight of a past"!

It was the tenth of June, three days after I'd put the famous "period" under Burial - which was now off to a flying start! Of course, I had no idea how much it had restarted - that there were still three hundred pages (give or take) left to write! By the time I'd finished with the sixth of the notes ("Les basses besognes") making up the "Sixième clou", I thought I'd come full circle, and so had the "Quatre opérations" - apart from about ten pages (for operations III and IV) to be retyped and footnoted. In a few days' time, I thought I'd be able to hand over the entire Burial III manuscript for typing.

However, in the days that followed (perhaps even the day after or the day after I thought I'd finished with the last "Clou") there was an unforeseen turn of events, which I'll come back to. Here again, my spontaneous reaction would have been to get on with it straight away. But I waited another two months

<sup>955</sup>(\*) I did write four or five pages in the heat of the moment, but there's hardly a trace of it left in the text I wrote nine days later, on April 19.

It's not that I didn't want to, of course. □ But there were more pressing things to do.

prepare for typing. Rereading the Four Operations from the beginning, it became clear that there was a great need to flesh out the details here and there - and the rest is history!

And so, today (barring any further unforeseen events - knock on wood!) is the day when I put the finishing touches to Burial, practically speaking I mean: the day when I write the very last pages, which are supposed to be part of my reflections on Burial, within Harvest and Sowing at least. After that, all that's left to do is to write this "Letter" that's supposed to take the place of a foreword to Harvest and Sowing - after which I'm thinking of taking a few days' well-deserved and much-needed rest... ..

A few days after writing the six preceding notes, I learned of the composition of Saavedra's thesis jury - the very jury I had showered with well-deserved sarcasm in the penultimate note "Monsieur Verdoux - ou le cavalier servant". The thesis was defended on February 25, 1972 at the Faculté des Sciences d'Orsay, before a jury made up of **J. Demazure** (rapporteur), **Castelle** and **A. Grothendieck**.

For a "coup de théâtre", it was a coup de théâtre! The coronation of Ubu! I found it hard to believe this information from an official source, even though I'd never had the slightest recollection of attending such a thesis defense. Monsieur Verdoux-Landru's story was getting even more complicated! I telephoned Demazure on the off-chance that he might remember sitting on a thesis jury with me for a man called Saavedra. Demazure didn't remember much either, but enough to assure me that the defense had indeed taken place (although he couldn't say when or how), and that we'd both been there, along with Castelle (whose name I couldn't even remember...). He didn't know much more than that, except that he'd been the thesis rapporteur. It was I who told him that the thesis, officially, would have consisted of a 25-page text (which must have made his job as rapporteur easier, I imagine). So it was he who was surprised. He promised to send me a copy of the thesis. I'd have been interested to know what it looked like, but I'm still waiting for it - apparently (according to what Demazure finally told me a few weeks later) this thesis is nowhere to be found; maybe he didn't make much of an effort either. In any case, he apparently has no trace of it in his papers any more than I do. But that's just a detail...

□ All of a sudden, I looked thin! With the hot sips I'd bought myself about this jury, obviously inane, "pretending docently to judge" a work he "must not have understood very well what it was all about"! You can imagine that I had a mad desire to repackage these sarcasms, to save the furniture in short, to keep a composure - but no, that would have been cheating. There's enough cheating as it is in this whole Funeral, without me putting any more effort into it. Once again, the sarcasm was entirely justified. Now that I know the composition of the jury, I can even say that it was I, above all others, who fully deserved the sarcasm. After all, what Demazure and Castelle must have remembered most of all was that Saavedra had prepared this thesis with me, or at least had started it with me, on a subject I had given him. I was supposed to be in on it, and they trusted me. Maybe those 25 pages Demazure was supposed to have reported on made sense - and even if the same monumental blunder was there, in a simple summary of a theory, Demazure, who wasn't in the loop and who trusted me, had no chance of noticing.

As for me, who'd practically given up maths two years earlier, apart from my courses, this defense, which I was probably rushing off to, between a course at Orsay and some meeting of Survivre et Vivre or some public discussion (if any) on atomic waste stored nearby (at Saclay), must have been nothing more or less than a simple administrative formality. One thing's for sure: I had no more

that I hadn't followed Saavedra's work for two years, any more than I had followed anyone else's - and that I had no doubt that Saavedra's work stood up to scrutiny. I can't say exactly where this conviction came from. Unlike all the other students I'd had up to that point, I had no direct presumption, through work already done with me, of Saavedra's seriousness. Would I have taken my academic duties in those days so lightly that I would have trusted him on his word, so to speak? If the text of the book (published the same year), of which the 25-page thesis no doubt constitutes a summary, was already ready at the time and served to give me an idea, it's true that "at a glance" it looked so good, that the idea may not even have occurred to me to check the part of the work that was supposed to constitute Saavedra's personal contribution. It's also possible and even probable (but I have no recollection of this) that I relied on the advice of Deligne, who after my departure had followed the work<sup>956</sup> (\*).

□ In either case, I have to admit that my responsibility is engaged to the same extent.

p. 1187

title, for having awarded the title of Doctor of Science on the basis of a thesis which, twenty-three years later, appears to be a **bogus thesis**, to use the expression of the note already quoted. But the fact that I myself was unwittingly an instrument in this deception, and bear responsibility for having given my (light-hearted) guarantee, does not make it any less of a deception. It only makes it all the more brilliant. After all, the real motivation (for whoever was pulling the strings) was certainly not to allow a vague PhD student in distress to have a cheap title, before changing jobs and disappearing behind the scenes - but rather to allow someone who was in no way clueless to take ownership, delicately and under the radar, of a certain vision born in me and brought to fruition before he had even heard (in mathematics) words like "sheaf" or "pattern". It was thanks to my sudden and intense activity for the survival of the species and other fine and urgent causes (from which this same ex-student and friend had told me he had to distance himself, because of his complete and absolute dedication to mathematics alone<sup>957</sup> (\*)), at a time when my energy was fully absorbed elsewhere, that my brilliant student and friend succeeded in this truly unique sleight of hand, of making me the instrument of my own dispossession! In the state I was in at the time, completely disconnected from my former mathematical interests and placing blind trust in those among my students, led by Deligne, who since the end of the SGA 5 seminar had already begun to play a little game of their own, any name (for example) that someone had concocted for his famous categories, which I now only vaguely remembered, I would have said yes and amen! Just as I said yes and amen to Verdier's announcement that there would be no book on new-style homological algebra, or to Deligne's announcement that half of the SGA 7 seminar we'd done together was suddenly going to change authorship. . . But the fact that the person who pays for a scam gives his or her benign, unsuspecting consent does not change the nature of the scam, except that it is coupled with a breach of trust. And the fact that Serre and other augurs are also in it for the money, and give in their unreserved blessing<sup>958</sup> (\*\*), gives the thing a □inhabital dimension - that of the corruption of an entire without making it honorable, however brilliant it may be, or removing one iota of its indecency.

p. 1188

As surprises never come alone, just a few days after the revelation of the composition of the jury for my ex-student Saavedra's thesis, I also received the relevant information for Jouanolou's thesis, which is also a bit special, and which I've had the opportunity to talk about so much.

<sup>956</sup>(\*) I don't even remember that Deligne was involved in Saavedra's work. This is something I learned in April, looking at the introduction to Saavedra's book.

<sup>957</sup>(\*) On this subject, see the note "Brothers and spouses - or the double signature" (n° 134), especially pages 614-615.

<sup>958</sup>(\*\*) For this most explicit blessing, see the note "L'album de famille", part d. ("l'Enterrement - ou la pente naturelle").

a copy of his famous thesis ("which everyone quotes (since the Colloque Pervers) and which no-one has ever seen"), so I ended up writing him a rather dry letter (dated April 25) to ask him a number of questions about the strange vicissitudes of this thesis. He replied practically by return" on May 1, evasively as regards questions of substance (as it was "always very painful to return to the past"), but with information that could not have been more precise as regards administrative details: the thesis was defended on July 3, 1969 at the IHES (Paris), before a jury presided over by **P. Samuel**, with **J. Dixmier**, **A. Grothendieck** and **J.L. Verdier** as examiners. My correspondent adds, with a touch of mischief: "As far as I could tell, all the members of the jury were present! (a fact also confirmed by J.L. Verdier, whom I spoke to on the phone shortly afterwards).

Here again, I had not the slightest recollection of this thesis defense, which had obviously also taken place on the sly (sorry to spoil my image in this way!)<sup>960</sup> (\*\*). If I thought that the defense had taken place in Strasbourg (and therefore placed it in the early seventies, knowing that Jouanolou had a post in Strasbourg in those years), it was probably because of a cryptic reference by J.L. Verdier to this thesis (in a Bourbaki presentation of February 1975, n° 464), quoted as "J.P..

Jouanolou Thesis, Fac. Sc. Strasbourg" (no date, no title). Yet, like me, he had been on the jury - would his memory be as faulty as mine, or rather, capricious, in placing the IHP (Institut Henri Poincaré) in Strasbourg? Comprenne qui pourra!

The same Verdier was kind enough to send me his own copy of the thesis. At first, I thought, looking at this packet of 208 loose sheets<sup>961</sup> (\*), that it was a photocopy of a draft, which I remembered holding in my hands and commenting on in detail, when Jouanolou was working with me on this thesis that was dragging on and on. But Verdier confirmed that this was indeed the definitive copy of the unfortunate thesis, which apparently never had the honor of being printed in more than three or four copies (mine, with my annotations, must have gone back into Jouanolou's hands, and I never saw it again... ), nor to be bound.

The slightly more detailed explanations Jouanolou was kind enough to give me later (in a letter dated June 3), plus the phone call to Verdier, enabled me to get back into the swing of things. Jouanolou had obviously reached a "saturation point" for his thesis work, which he had been pursuing half-heartedly from the start (but without my bothering to make myself clearly aware of the situation<sup>962</sup> (\*\*)). By 1969, he must have reached a point where he was unable to resume his work even a little, to take into account my numerous observations. So I had to face the facts and "let it go". In any case, when I looked at it again, it seemed to me that this text represented a serious and usable work of formatting, even if it was far from perfect - it was clearly better than "better than nothing", and could pass as providing an indispensable reference text, in the absence of any other that would have fully satisfied me<sup>963</sup> (\*\*\*)).

<sup>959</sup>(\*) This thesis was discussed in sub-note n° 85<sub>1</sub> (p. 349) to the note "Solidarity", and also in the note "Co-heirs. ... " (n° 91), p.387- 88. See also "The Student and the Program" (n° 25).

<sup>960</sup>(\*\*) The thesis defense took place at a time, I believe, when I had already "dropped out" of maths, to become interested in the biology (and more specifically, molecular biology).

<sup>961</sup>(\*) At the Service des Thèses de la Sorbonne, there's a registered thesis of 215 pages - apparently the Verdier copy is missing six pages. For all we know, the copy deposited with the Service is the only complete one in the world - and a stapled one at that, I'm assured. They must have a binding service for foundling theses, which arrive in pieces... ...

<sup>962</sup>(\*\*) See the aforementioned section "The student and the program", n° 25.

<sup>963</sup>(\*\*\*) In any case, this is still the only text in the world that presents the theory of *l-adic* coefficients, version derived categories - and an unobtainable text on top of that, to bring the joy to a climax. The chainsaw went through

Of course, the idea never occurred to me ("even in my dreams") that Jouanolou would take his revenge at his way, about the lack of conviction with which he had pursued this work with me, scuttling it himself and practically erasing all trace of that famous "reference" I was so keen to have! Here again, it's a "return of things" that I'd be wrong to complain about (although I don't lack the desire to do so!). In my relationship with Jouanolou, what counted for me was to find in him "arms" to push the wheels of a certain cart of imposing dimensions. I took it for granted that he, Jouanolou, was a stakeholder in my plans, without at any time stopping to consider the insistent signs that this was not the case. It's true, of course, that it was Jouanolou himself who had chosen to come and work with me (he must have enjoyed working with a prestigious "boss", without suspecting what he was getting himself into. . . ), and it was he too who had chosen to work with me. ), and it was Jouanolou himself who freely chose the subject of his work, from the wide range of subjects on which I was willing to work with him (all related, of course, to the same "cart", which no doubt, deep down, didn't mean anything to him). To put it another way: like everyone else, Jouanolou was grappling with certain contradictions within himself, in terms of his own desires and choices, in this case in his work. p. 1190

My own contradiction lay not in my relationship to my work, but in such a polarization on my tasks that I was unable to see in my students anything other than welcome arms, and to imagine that any of them could be divided in the work they did with me. With the additional hindsight afforded by long reflection on Burial, I realize that Jouanolou was far from the only one of my students to be "divided" in one way or another in this work. But he represents an extreme case, in that he is the only one among them who was unable to identify with the task he had chosen, and whose work was carried out without conviction or joy. My responsibility in this situation is not to have consented to really take note of it, preferring to put what should be accessory (the accomplishment of my tasks) **before** what is essential (that the task "chosen" by the pupil be truly **his** too, and pursued with joy).

That's why Jouanolou is probably the only one of my ex-students in whom I've ever perceived a grudge (which never says its name, of course). Cultivating such a grudge is an outlet and a diversion, which of course achieves nothing except to avoid one's own problems (and one rarely looks any further). That doesn't change the fact that it's well-founded, and that I have nothing to complain about if today (twenty years later) I reap the rewards of it. certain fruits.

□ To find myself confronted blow after blow, less than two months ago, with the unusual episodes of Saavedra's thesis, and then Jouanolou's, made it clear to me that, as I had just glimpsed in the first part of Récoltes et Semailles, even before I left and in the years immediately following, all was not well (as I took it for granted!) between me and my students. Thus, of the twelve theses that were passed by the students who worked with me at the level of a state doctorate thesis, **four** of these theses constitute, blatantly, "theses of Burial" of the master! They follow each other over a period of five years, between 1967 and 1972, and two of these burial theses take place before I leave. The first was Verdier's in 1967, a thesis reduced to a 28-page summary, a prelude to the burial of the new homological algebra I had introduced, and which Verdier had taken on the task of developing. This has already been discussed in detail at<sup>964</sup> (\*), so there's no need to go over it again. The second is that of Jouanolou in 1969, which consecrates the burial of the *l-adic* cohomology formalism, from the point of view (obviously crucial for the six operations) of the p. 1191

---

there...

<sup>964</sup>(\*) On this subject, see in particular the notes "Thèse à crédit et assurance tous risques" and "Gloire à gogo - ou l'ambiguïté" (n°s 81, 170 (ii)).

is that of Deligne in 1970 (?), a brilliant thesis that was also deeply rooted in the ideas that he took after me<sup>965</sup> (\*\*), without my name even being mentioned! The fourth is Saavedra's thesis, which has just been discussed at length, in which someone other than the presumed author<sup>966</sup> (\*\*\*) sets out, with maestria technique, the ideas and results of a third on the motivic Galois group (via a complete theory of the so-called "Tannakian" categories, and four of them!) without alluding to my modest, late self!

These four burial operations (which prelude the capitalized "Four Operations"! ) are visibly linked, and in many ways<sup>967</sup> (\*). They follow each other in the space of less than five years, beginning the very year after the end of the SGA 5 seminar. This seminar seems to have been the starting point and rallying point for the fossilizing dispositions in my ex-students, long before I left! That they predate my departure is a remarkable circumstance, concerning this "second plane" of the Burial formed by all my ex-students "from before" - a circumstance that I haven't yet really been able to integrate into an overall understanding. It's this "second plan" which, at the moment, seems to me to be the least well understood of the three. But now's not the time to start thinking about it again, surely the coming months will bring me many new elements, from my ex-students themselves. Then it will be time to assemble them into a living picture of the "second plan".

There's a fifth thesis<sup>968</sup> (\*\*) which, for me, fits into the series of theses-Enterrement, but a thesis "after", and even ten years after the previous series. It's Contou-Carrère's, written in December 1982, and special in more ways than one. It differs from the previous four in that Contou-Carrère's valiant grave-digging efforts, to please the people who count and to make a name for himself, are not enough.

forgive him for having been more or less my pupil, did not spare him from Verdier (whom he had wisely chosen as his thesis supervisor<sup>969</sup> (\*\*\*)) unexpectedly pretending to "sink" him □ without warning.

Whereupon, for want of anything better, he fell back on me again. It wasn't necessary for me to act as thesis director, given that Contou-Carrère had found his theme and developed his methods on his own.

<sup>965</sup>(\*\*) This is Deligne's "Hodge Theory II" work. I give details of the roots of this work in pattern yoga and in my vision of "coefficient theories" (including a theory of "Hodge coefficients"), in the note "Les dots on the i's" (n° 164), in particular pages 739-740, as well as sub-note n° 164<sub>1</sub> (pp. 805-806). Like M. Raynaud and C. Contou-Carrère, Deligne chose the themes of his work and, in particular, that of his thesis, without waiting for me to suggest one.

one, and pursued this work entirely independently, without even talking to me about it until it was virtually complete. Nevertheless, his work (on mixed Hodge structures) is rooted more deeply in my ideas than is the case with Raynaud and Contou-Carrère, who mostly use the language and techniques I brought to the table, whereas the problematic pursued by both is entirely original.

It's true that (depending on how the wind blows these days) ideas can blow away, especially if they're not published out of hand (as Serre peremptorily explained to me just a few days ago). ...

<sup>966</sup>(\*\*\*) This, at least, is the conviction I arrived at in my penultimate note "Monsieur Verdoux - ou le cavalier servant" (n° 176 ).<sub>5</sub>

<sup>967</sup>(\*) It would be interesting, of course, to probe these links further - but as I say a few lines further on, it's not now is the time.

<sup>968</sup>(\*\*) Out of a total of fourteen theses, written by the fourteen students (both "before" and "after") who worked with me on a state doctorate thesis. That's more than **one out of every three theses** that I've worked on - which isn't bad at all!

<sup>969</sup>(\*\*\*) At a time, moreover, when I still believed (according to what Contou-Carrère himself assured me) that I was his official thesis director. I only learned of the existence of a "parallel" thesis director (in a pair where it was rather I who was to act as "back-up" thesis director, just in case... ) until Contou-Carrère was forced to fall back on me, and at the same time (given the situation, which had become a bit too, well, shitty) to reveal Verdier's role to me. It's not surprising that, with such unbelievable shenanigans taking place over the years, Contou-Carrère ended up practically ceasing to do maths any more. It has to be said that he's not the only one...

means, and that I hadn't been following his work, which was set in a context (that of reductive group schemes) that I'd somewhat lost sight of. Nevertheless, the starting point of his work, namely a certain method of resolving "equivariant" singularities, for the adhesions of Schubert cycles, was directly inspired by an idea I had explained to him in detail (around 1975 or '76), concerning a resolution of the canonical and simultaneous singularities of the adhesions of orbits, for the adjoint representation of a reductive group on itself<sup>970</sup> (\*). Needless to say, Contou-Carrère, who has long since sensed how the wind blows in the beautiful world to which he has the legitimate desire to accede, doesn't breathe a word about this filiation. Where would we go if we again began to mention such imponderables that one **idea** (and not yet published), supposedly **sparking** another (or asking you for a bit . . .) - except, of course, when the person we're proud to mention is one of those whose name enhances the brilliance of the work presented (in which case, moreover, it's entirely superfluous to specify why we're lavishing thanks on him, which can then only be well-founded... .).

## END OF THE "FOUR OPERATIONS (ON A BODY)" SECTION

---

<sup>970</sup>(\*) Towards the end of the sixties, I was intrigued by Brieskorn's fine work on so-called "rational" (surface) singularities, and their links to certain systems of simple roots (those where the roots are all of the same length), and I asked myself the (nonsensical, needless to say) question of finding a direct description of a rational singularity, in terms of the simple algebraic group corresponding to its root diagram. That's how I came up with a very simple (even obvious, to say the least) geometrical description of the resolution of the singularities in question, using Killing couples, with a whole set of conjectures that I've since forgotten, and that I told anyone who would listen. But since I haven't published anything, and according to the new axioms that Serre has just kindly explained to me, it's the first one to pick up the prize that gets awarded - and I've noticed that there are some who pick up a lot like that, of course. It's handy sometimes to change axioms...

## 18.6. Desolate building sites

### 18.6.1. (1) What remains to be done

□

p. 1194

**Note** 176 (March 25) Last night, I spent several hours in bed getting back into the swing of "yoga". patterns", instead of falling asleep quietly as I should. And sometimes, instead of going back to my notes, I spent another hour or two scribbling out implication diagrams for the intrinsic conditions known to me on a class of De Rham cohomology (of a nonsingular projective variety over a zero-char. body, say) for it to be "algebraic". I found **twelve** variants, in all, of the Hodge and Tate conjectures<sup>971</sup> (\*). At the same time, I was able to convince myself that we must have more or less what it takes to define "the" (triangulated) category of patterns on a finite-type scheme over  $\mathbb{Z}$ , or at least a very tight approximation to it (assuming it isn't "the" one yet), provided we have a theory of the "mysterious functor", which I had postulated towards the end of the sixties<sup>972</sup> (\*\*).

This is not the place to dwell on the subject, of course. But now is as good a time as any, given the lamentable state of neglect in which I see the motivic theme fifteen years after leaving it in dubious hands, to trace some of the main lines of the ideas I arrived at a short while ago. I don't have the

coeur d'attendre encore, le temps de trouver le loisir (une fois achevé "A la Poursuite des Champs") d'écrire "le" livre systématique qu'il faudrait écrire; ce récit circonstancié d'un rêve, comme premier grand pas pour that the **dream** may take root, at last! in the soil of carefully matured (and published. . . ) formulations, and blossom according to its own nature. In addition to a first milestone already planned and announced for this book of "mathematical fiction", namely a sketch of the algebraic formalism of duality known as the "six operations", I shall therefore be attaching to volume 3 of *Réflexions*<sup>973</sup> (\*) a short work in which I intend to pose some crucial questions linked to algebraic motives and cycles. It was painful to see them languish in a tomb, and I can't wait to see them return to the light of day and participate once again in the rhythm of the seasons... ..

p. 1195

It's been more than five weeks since my thoughts returned to L'Enterrement, without leaving it. This is no doubt why the thought of "orphans", left to fend for themselves in a sick world, has come back to me of late with some insistence. The last note in which one of these orphans is mentioned in detail is "La mélodie au tombeau - ou la suffisance" (n° 167), on a theme very close to that of last night's motivic reflection and that of earlier (which I have just mentioned). That was a month ago to the day

<sup>971</sup>(\*) (March 27) Each of these twelve variants should give rise, for any basic null-characteristic scheme  $X$ , to a "category of coefficients" of a corresponding type on  $X$  (where the notion of "type of coefficients" is that discussed in the note "La mélodie au tombeau - ou la suffisance", n° 167). If the conjecture under consideration is true, this category of coefficients should contain that of the patterns on  $X$  as a full (triangulated) subcategory (the conjecture being none other than that the same assertion, in the particular case where  $X$  is the spectrum of a body. . . ). For further details, please refer to the section of Volume 3 of *Reflections* devoted to the theory of motifs ("Les motifs mes amours").

In other words, these twelve variations on well-known conjectures give rise to as many different notions (a priori at least) of a notion of "pattern" on a body of zero characteristic. In future, this will enable eleven of my friend Pierre's emulators to "discover" their own notion of pattern, while pretending to ignore those of the others and, above all (as has been de rigueur for the last fifteen years. . . ) a certain deceased (known above all for his predilection for useless details. . . ).

<sup>972</sup>(\*\*) This question of the "mysterious functor", establishing the "missing link" between crystalline cohomology in char.  $p$  (via the notion of  $F$ -cristallin,  $F$  as "Frobenius"), and  $p$ -adic cohomology in char. null, a question obviously crucial to our understanding of the cohomology of algebraic varieties, has still not been seriously addressed, almost twenty years after I raised it in the clearest terms. ...

<sup>973</sup>(\*) As my publication plans currently stand, the first four parts of *Récoltes et Semailles* (ending with the third and final part of L'Enterrement) are to form volumes 1 and 2 of *Réflexions*. Volume 3 will consist of the fifth part of R et S (reading notes on C.G. Jung's autobiography) and a number of shorter texts, most of which were announced in the Introduction. The first volume of "A la Poursuite des Champs" is thus planned as the fourth volume of *Reflections*.

day, on the eve of the day when I was going to launch myself (without yet suspecting what was in store for me!) into a note that would be called (it had already been decided in advance) "The four operations". In the end, it turned out to be sixteen notes instead of one. I thought I'd never get round to it - but I did, and in the end, I did get round to it, all those long-winded "operations"<sup>974</sup> (\*\*)!

And right now, I'd like to get back to these orphans, to at least call each of them by name, because it might do them some good, and me some good. The first time I mentioned them was a year ago, in the note of that very name, "My orphans", from the end of March last year, in one breath with the note that follows it "Refus d'un héritage - ou le prix d'une contradiction" (notes n°s 46,47). In writing these notes and when I gave them these names, as if guided by an obscure prescience, I had no idea of the extent to which the how these things I had left behind had been orphans indeed - □ in a stronger, more poignant sense p. 1196 I couldn't have imagined it, even in a dream; nor how far this "contradiction" went, of which I was then making a first, timid observation. And this memory immediately reminds me of another, from the month before, when I saw myself writing, as if it were another, more penetrating than myself, writing through my hand: "**you can't fight corruption**". It was while writing the section "The world without love" (n° 19). I still remember, seeing that word "**corruption**" in black and white, I was taken aback at first. Someone "reasonable" inside me was scolding me: really, you're not going to mince your words - "corruption" is a big word, don't kid yourself! You'd better change your tune!

I had to probe myself for a few moments, maybe minutes. Then I knew I wasn't going to change that "big" word, nor was I going to add a note to explain that the word had escaped me in the rush of the pen, and shouldn't be taken too seriously. Someone deep inside me, more perceptive than the "me" who decides on "reasonable" labels, knew what these "whiffs" of this world that had come back to me here and there meant, even before I'd bothered to try and recount them to myself<sup>975</sup> (\*). . .

I also remember well the precise moment when the reflection of that day suddenly changed quality, when that **other** in me took over to write. It was just after I had recalled the warmth of affection that had surrounded my first years in the mathematical round, thanks to the welcome I had received from my elders, and even from their families: the Schwartzes, the Dieudonné, the Godement... . The change comes when I follow up with "Obviously, for many young mathematicians today, it's being cut off... .. from any current of affection, of warmth... .. that clips the wings of work and deprives it of a deeper meaning than that of a dull and uncertain livelihood. . . "and when, at the same time, this **loveless world** suddenly appeared and came to life before my eyes, once again calling out to me...

Without having to look for it, last year the name "my orphans" came to me, for what I had left behind when I left (declared "dead" by the relatives I had entrusted them to... ). It's undoubtedly that this name □ expressed a simple, tangible **reality**: what I had "left" or "entrusted" were not p. 1197 They were not "objects" or "property", but **living things**. When I think of them, I always think of them as living things, vigorous and fertile, made to grow, to flourish and to conceive and beget other living things, vigorous and fertile. If I have a feeling of "wealth" that I've left behind, it's not the banker's wealth, but that of the gardener, or that of the bricklayer, whose hands have created these exuberant gardens and spacious, welcoming homes. This feeling of something precious (or even fragile) links me above all to the **notions, questions and major themes** I'm familiar with

<sup>974</sup>(\*\*) (May 9) Barely two weeks after writing these lines, new facts have emerged in extremis, re-launching the "four operations" investigation, which has already been augmented by a good twenty new notes and sub-notes.

<sup>975</sup>(\*) I report on this, first in March last year in the section "The note - or the new ethic" (n° 33), then two months later, after the discovery of the Burial, in the much more detailed set of notes forming the Cortège X or "Funeral Van" (with the Gravedigger), notes 93-97.

that I had left in younger hands - those things that still need work and care; far more than the finely honed tools I had fashioned, or the "houses" I had finished building and furnishing<sup>976</sup> (\*). Others will be busy cooking and lounging in them; if one turns out to be too small, they'll enlarge it according to their needs, just as I myself have often had to enlarge and enlarge again, where it had once seemed that I was "thinking big". But it's through **what's left unfinished**, through the building sites that have just begun on these splendid sites and with these beautiful stones (and already the workmen have left, having taken away what they liked and damaged the rest. . . .) - it's through this that we'll be able to see what's left. ) - this is where my mathematical past continues to have a hold on me. It's these derelict **building sites**, which I now find looted and dilapidated, that I'd like to review.

## 18.6.2. (2) The miser and the crumbler

**Note** 177 (March 27) Yesterday was taken up with housekeeping. I had to reread the first fifty pages of the third and final part of *L'Enterrement*, and entrust them to the typesetter. It took me no less than five hours, with a few minor tweaks of expression here and there, and a few more additions.

footnotes. The typing of "La clef du yin et du yang" is about to be completed. After all the trouble I went through typing that part<sup>977</sup> (\*\*), I ended up relying on the services of one of my friends.

p. 1198

secretary, who does the work outside her official job. The trouble is over, thank God - she does a conscientious and efficient job, about thirty impec pages a week. We'll get there in the end. It's about time!

Apart from that, the question of a shaped construction of the triangulated category of patterns on a finite-type scheme on the absolute basis  $E$  kept running through my head - I still spent most of the night thinking about it in bed, instead of sleeping - watch out! At first, it seemed that the idea I had would only work for schemes of zero characteristic (of finite type on the body  $Q$ , let's say), already on the  $Spec(Z)$  basis itself it didn't seem to work, then I remembered that I had determined in principle the structure of the category of patterns on a finite body, back in the sixties. Assuming that the work I'd done back then had been clarified, I finally saw the principle of at least a complete description in the general case, quite screwed up it must be said, but by no means unapproachable it seems to me. The only new ingredient compared to my ideas of the sixties is Mebkhout's philosophy, expressed in his "God's theorem" of strange memory. Apart from that, I use the "mysterious functor" theory as a hypothetical ingredient. If it's not available right now, it's certainly not because it's "unaffordable" (to use an expression I've already encountered<sup>978</sup> (\*)), but because the people I've known to work on the cohomology of algebraic varieties have lost, even in maths, the sense of essential things, too absorbed certainly by a funeral that requires all their care... ..

To be fair, Deligne's work on Weil's conjectures, in "Weil I" and especially "père II", will surely come in handy when it comes to constructing the six operations on the categories of coefficients that are supposed to express the motifs. However, after fifteen years, a "confused" and crumbling deceased had to come up with the idea of stepping out of the padded coffin in which his dear pupils and heirs had been lying

<sup>976</sup>(\*) On the subject of the impulse within me to "build houses" (mathematics), see the note "Yin the servant, and the new masters" (n° 135).

<sup>977</sup>(\*\*) On the subject of these "troubles" (to put it euphemistically), see the beginning of the note "Prayer and conflict" (n° 161), as well as those in

of the note "Jung - or the cycle of 'evil' and 'good'", which opens the fifth and final section, Harvest and Sowing.

<sup>978</sup>(\*) This is the peremptory term with which my brilliant ex-student Deligne liked to bury the "standard conjectures" - which none of my bold contemporaries dared to tackle for almost twenty years. For a complete quotation, see the note "L'Eloge Funèbre (1) - or the compliments (n° 104).

more to assign him, who knows nothing and has forgotten as much as to say the little he knew, so that the problem of describing the category of patterns above a basic schema  $S$  can only be **posed**. in full, and at the same time□as if by chance, that the principle at least of a p . 1199 construction form (which takes into account all known structural elements associated with a pattern) is finally clearly explained<sup>979</sup> (\*).

After the "memorable volume" of 1982 on motives, it would seem that the "motive hoard", which for ten or twelve years had been the reserved and secret domain of one, has become a common hoard for three or four, who communicate with each other with the air of conspirators, or like Grand Initiates of some secret and ultra-selective sect. However, it only takes a few days to ask a few simple questions in black and white and bring them to everyone's attention, and a few weeks if you want to define them with some care, clearly indicating which ingredients you have, and which others need to be developed. If in the fifteen years since 1970, and in the three years since the "memorable volume", neither one of them, first, nor any of the few afterwards, has wanted to take these few days of their admittedly precious time, let alone weeks, it's surely for excellent reasons, which none of them has cared to fathom. But this atmosphere that they like to maintain, and this spirit in which they keep themselves, are in themselves already a degradation of an adventure of discovery, which has become a simple means to elevate themselves above others, if not to despise them. Such an atmosphere is likely to spread corruption, and is the antithesis of creation, even though those who indulge in it would be the most brilliant of geniuses. By maintaining such an attitude - that of the avaricious brooding over his treasures - they cut themselves off from the creative force within themselves, just as they like to stifle it in others.

### 18.6.3. (3) Site tour - or tools and vision

**Note** 178 ( March 30) The day before yesterday was my fifty-seventh birthday, and I took a bit of a break. I made just a few typing corrections for the end of "The Key to Yin and Yang", which I continued yesterday. It's relaxing and pleasant work - provided, at least, that the person doing the typing also puts in some effort, and that a text in which I invest all my energy doesn't come back disfigured. It's a recreation I've been treating myself to two days, to reread with□soin about fifty pages on the net, to detect here and there a comma again p . 1200 that's out of place...

The work tonus is not at its zenith. For weeks now, a sadness inside me has been warning me that there are more essential things awaiting me than bringing these notes I'm writing to their natural end. I write as if against the current, and yet I know that, barring accidents and force majeure, I won't stop until I've finally put the finishing touches to Burial. But the fact of compressing and exiling this sadness, which is now as heavy as a stone, of not giving it a voice in these notes (except allusively and in passing at this very moment), is a pretty clear sign that for some time now, my reflection has no longer had the quality of "meditation". It's part of the division between those who write (without stopping to put their whole selves into it<sup>980</sup> (\*)!), and those who live and feel (without stopping, however, to "rest" on what they're experiencing and soak up its meaning). At this point, I feel it's high time to arrive at this "final point" (without

<sup>979</sup>(\*) As I announced in yesterday's reflection, I'm thinking of including this description in the next volume of Reflections, along with a (very brief) overall sketch of the "vast array of motifs" - judging that the occult motif trickery has gone on long enough. I'd like to point out right now that the construction principle envisaged does not depend on any kind of conjecture about algebraic cycles, such as "Hodge" or "Tate" (or any of the twelve variants mentioned yesterday).

<sup>980</sup>(\*) However, in the previous paragraph I just wrote (without any inner reservations) that I "put my whole self" into the texts I entrust to the typist. So the same words (or almost. . . ), depending on the context, can have a different meaning or indicate a different nuance.

As well as working on my notes, there's something else that's been distracting me in recent days. It's the resumption, as if in spite of myself, of a mathematical reflection. Over the past few days, I've come to realize that the construction of a pattern theory, with all the scope I saw for it twenty years ago, is by no means as far "on the horizon" as I had thought. It might even be that a "fully grown-up" theory, with the complete formalism of the six operations (plus biduality), is a matter of only a few years' work, for

someone who would invest his whole self in it (without degrading his creative energy through fossilizing dispositions). It also seems to me that there are two "keys"<sup>981</sup> (\*\*) to the explicit description of "the" category of motifs  $\square$  sur un

scheme, let's say of finite type on the absolute basis  $Z$  (a case we should always be able to get back to). On the one hand, there's the theory of the "mysterious functor", with sufficient generality and flexibility to pass to idiosyncratic triangulated categories, making it possible to link De Rham - Mebkhout coefficients and ordinary  $p$ -adic coefficients (in null car.). On the other hand, there's the question of the explicit construction of the category of motives over a **finite** field  $k$  (by a "purely algebraic" construction, preferably, without reference to algebraic geometry over  $k$ ), and moreover, of the "motivic cohomology" functor going from separate schemes of finite type over  $k$  (and to begin with, projective and smooth schemes) to this category. I had constructed the latter to near equivalence, heuristically using Weil's and Tate's conjectures<sup>982</sup> (\*).

<sup>981</sup>(\*\*) There is, however, a third "key", which I won't mention here because the problem in question seems to me (rightly or wrongly) less tricky. This is the correct definition of the "De Rham-Mebkhout coefficients" (initially without filtrations or  $F$ -structures) above, say, a smooth scheme on the absolute basis  $Z$ . This definition should at the same time provide the key of "the" correct definition of general crystalline coefficients as  $p > 0$ , which my dear ex-students (Berthelot in the lead this time) still haven't been able or willing to get out of the way.

When, in June 83 (two years ago), Mebkhout explained his "philosophy" around the Good God Theorem to me, I had the following idea

the impression that his "purely algebraic" ("De Rham" type) description for the category of constructible discrete coefficients (on  $C$ ) of a smooth scheme on the field  $C$  of complexes, was dual to the approach (never published) followed by Deligne in the seminar (already mentioned elsewhere) given by him at the IHES in 1969/70 (unless I'm mistaken), using connection promodules.

I assume that the transition from one point of view to the other is made by the dualizing functor  $RHom(., \mathcal{O}_X)$  with respect to the structural bundle of the scheme under consideration, which transforms  $D_X$ -Modules of finite type (which can be considered as " $\mathcal{O}_X$ -Modules ind-coherent" provided with an integrable connection) into "pro-coherent" modules (also provided with an integrable connection). The advantage of Mebkhout's point of view is that he provides a simple and deep algebraic expression ( $M$ -coherence, homology, regularity) for "good coefficients", which Deligne lacked. The advantage of Deligne's point of view is that it provides an equivalence (instead of an anti-equivalence) with the coefficients of transcendental nature that need to be expressed, and

that it lends itself better to expressing the multiplicative structure (tensor product) for the category of coefficients under consideration. I assume that, in practice, it will often be in our interest to work on both tables at the same time, mutually dual to each other.

Deligne's interpretation seems to me closer to a direct geometrical intuition, via that of an integrable connection module (or promodule). This is expressed in particular by the fact that (if the base field is  $C$ ) a constructible bundle of  $C$ -vectorials corresponds to a promodule with unique connection, instead of a complex of such promodules. This is why (in my with great regret, as you can guess. ...) I predict that this is his point of view (which he had buried without regret, as if to thereby burying the coefficient problem bequeathed by the disowned master. ...) that will be best suited to developing the six-variance formalism, and as the third key ingredient in the construction of pattern categories.

(May 9) See also the sub-note ". . . and hindrance", n° 171(viii), as well as "The five photos" (n° 171 (ix)).

<sup>982</sup>(\*) If I remember correctly, I confined myself to describing the category of semi-simple patterns. An immediate variant of the construction (following the same principle) provides a plausible candidate for the category of not necessarily semi-simple patterns. When I speak of "patterns" here, I'm actually referring to "isomotive" or isogeny-adjacent patterns. But by using the " $l$ -adic realization" functors for any prime number  $l$ , we can reconstitute the category of not-isomotive patterns from there.

(where  $Hom$  will therefore be modules of finite type on  $Z$ , not on  $Q$ ).

When I say that my construction made heuristic use of Tate's conjecture, I don't mean it literally. If it is true that there exist (over a finite body, in this case), on a smooth projective scheme, cohomology classes that are "motivic" (in a sense that remains to be clarified) without being "algebraic" (i.e. without coming from algebraic cycles), then

Tate's conjecture (like Hodge's, this time above  $C$ ) can be re-stated by replacing it with "algebraic classes" by "motivic classes". Assuming that we manage (as I suggest below) to define the canonical cohomological functor (and presumed "universal" in a suitable sense) on the category of projective and smooth patterns on the body finite  $k$ , to the category (called "semi-simple patterns on  $k$ ") already constructed, this will ipso facto provide a We'll call them "motivic" cohomology classes, such as the elements of  $Hom(T^i, H_{\text{wor}}(X))$  (in dimension  $2i$ ), where  $T$  is Tate's object, and  $H_{\text{wor}}$  is the hypothetical functor considered. This is why the construction of this

I have no doubt that this construction is correct. The work that remains to be done, no doubt clearly more delicate, consists in "pinning down" this category in terms of the given finite field  $k$ , and above all, in defining the "motivic cohomology" functor, if only first of all on the category of abelian schemes on  $k$  (this which should be enough to "pin" the category you're looking for... ). This second problem seems to me less technical, more directly "geometrical", than that of the mysterious functor. What's more, it seems to me to hold **the** key to a solution of the standard conjectures<sup>983</sup> (\*) and, by the same token, to the irritating questions of completeness that arise in cohomological theory with characteristic  $p > 0$ . For all these reasons, this question has a powerful attraction for me! This is the third evening that I've gone back to the drawing board, with the idea of rapidly reviewing the themes that seem to me to be the most burning, among those left behind by my students and by everyone else, when I left the mathematical scene fifteen years ago<sup>984</sup> (\*\*). This time I'm finally going to do it!

\*       \*

\*

□ **Project 1: Topos.** I mention them here mainly for the record, having expressed myself quite circumspectly-  
1203 p.  
I wrote about them in the note "My orphans" (n° 46). Given the disdain with which some of my former students, led by Deligne, have treated this crucial unifying notion, it has been condemned to a marginal existence since my departure. As I pointed out in the note quoted above, topos and multiplicities of all kinds are to be found at every step in geometry - but we can of course do without seeing them, just as we did without seeing groups of symmetries, sets or the number zero for millennia.

In the first two volumes of SGA 4 (the famous "gangue de non-sense" referred to by Deligne in the introduction to the first presentation of the brilliant volume entitled "SGA 4<sup>1</sup>"), a flexible and delicate language of topos was carefully developed, intimately "sticking" to topological intuition. This is the natural culmination of the language and intuitions around the notion of "faisceau" introduced by Leray; this second stage (or "second breath") in the development of the "faisceutique" intuition and tool, seems to me of comparable scope to the first (finding its provisional expression in Godement's well-known book). From the outset, it was this vision that made the appearance of the  $\ell$ -adic and crystalline cohomological tools possible, before it was buried sine die by the very people who pretended to approach these tools.

SGA 4's developments on the subject of topos do not claim to be complete and definitive, but I think they are more than sufficient for most immediate geometrical uses of the topossic view. Like general topology or ordinary beam theory, "topossic general topology" doesn't seem to me to pose any really profound questions of its own. It's a carefully crafted language in the service of a certain extension of topological and geometrical intuition of forms, which is dictated to us by things themselves. The discredit in which this vision has been held, and the **derision** which

---

It seems to me that this is **the** most crucial question of all, for the actual (and no longer hypothetical, as in the sixties) construction of a theory of motifs.

<sup>983</sup>(\*) The term "standard conjecture" is not to be taken literally here, nor is "Tate's conjecture" in the previous b. de p. note. Rather, in stating these conjectures, it would be appropriate to broaden the class of cycles envisaged (initially reduced to algebraic cycles only). In the "definitive" expression of the "readjusted" standard conjectures (and even though they would be valid as they stand), "algebraic" cohomology classes will again be replaced by "motivic" classes. I'll come back to standard conjectures in more detail, in "Les motifs mes amours" (in volume 3 of *Réflexions*).

<sup>984</sup>(\*\*) For a brief overview of these themes, see last year's note "My orphans" (n° 45).

Here, we're not talking about a "dilapidated building site" that needs to be brought back to life, but a fully completed and installed house, which those who lived in it and were called to make it a place to work and live, have chosen to leave, by unloading the workman who built it. The house is spacious and healthy, and everything is as it should be.

p. 1204 The day the worker leaves for other tasks. If she needs something, it's not

□ not from the work of his hands, or anyone else's. Perhaps the act of respect from the worker himself, for those things which these hands have made with love and which he knows to be beautiful, will he dispel these effluvia of violence and contempt, and make welcoming again that which was made to welcome.

**Project 2: Cohomology language.** This involved first and foremost the language of derived categories, and secondly the points of view I had introduced for non-commutative cohomology, both in the second half of the 1950s.

The first trend was supposed to be the subject of Verdier's famous "thesis", and Verdier's own burial of his<sup>985</sup> (\*) thesis was at the same time that of the point of view of derived categories in homological algebra. The latter had played a crucial role in the sixties flowering of the cohomological theme in algebraic geometry, notably for the duality formalism, and the development of fixed-point formulas (Lefschetz-Verdier type). Practical needs had revealed the inadequacy of the framework of triangulated categories developed by Verdier in the early sixties, a framework that has still not been renewed as it should.

On the current "non-commutative" side, we have a good foundation with Giraud's thesis, but this is limited to a 1-field formalism, lending itself to a direct geometric expression of cohomological objects up to dimension 2 only. The question of developing a non-commutative cohomological formalism in terms of *n-fields* and *n-gerbes*, urgently suggested by numerous examples, ran up against serious conceptual difficulties. Given the disaffection or, better still, the general contempt into which questions of fundamentals have fallen in a certain "beau monde", these difficulties never arose.

before I got to grips with them a little over two years ago<sup>986</sup> (\*\*).

p. 1205 □ I now see the two currents coming together in a new discipline, which I have proposed elsewhere<sup>987</sup> (\*)

to call it **topological algebra**, a synthesis of traditional homological algebra (derived categories style, of course), homotopic algebra, the formalism (still in limbo) of *n-categories*, *n-groupoids* and idiosyncratic fields and sheaves, and finally the vision of topos, which now provides the most extensive "purely algebraic" nature framework known, to implement topological intuition. The initial ideas for such a synthesis were already present in the 1960s, including that of the **derivator**, which was to replace the inadequate notion of the triangulated category, and also apply to "non-additive" contexts. Some important developments in homotopic algebra, such as the notions of homotopic limits and colimits developed by Bousfield and Kan in the early '70s, without their being aware of my ideas (treated as Grothendieckian bombast by my dear students), are to be found in the "non-additive" context.

<sup>985</sup>(\*) On this subject, see the note "Thèse à crédit et assurance tous risques" (n° 81), and "Gloire à gogo - ou l'ambiguïté" (n° 170(ii)).

<sup>986</sup>(\*\*) This is the reflection in my February 1983 letter to Daniel Quillen, in which I discover how to "jump in with both feet" at the on top of the gaping "purgatory" of increasingly screwed-in compatibility relations, which seem to creep into the description in the form of *n-categories* (not strict, or *n-fields* as I call them now), for increasing *n*. The *n* = 2 case is already no picnic, and nobody, I believe, has yet found the courage to spell them all out for *n* = 3. This letter became (as I recall below) the "kick-off" for the long journey "In Pursuit of the Fields", which began the following month on the momentum of the reflection begun.

This letter was not deemed worthy of being read by the addressee, nor of receiving a reply. I eventually received a comment from the person concerned more than a year later, on which I comment in the section "The weight of a past" (n° 50). (Cf. p. 136, second paragraph.)

<sup>987</sup>(\*) See sub-note no. ° 136<sub>1</sub> to the note "Yin the Servant - or generosity" (especially p. 638).

right in line with them.

Two years ago, with my letter to Daniel Quillen<sup>988</sup> (\*\*), I began to outline the work I see ahead. This was the kick-off for the writing of "A la Poursuite des Champs", of which a first volume ("Histoire de Modèles") is practically finished, and will probably appear as volume 4 in *Réflexions*. I foresee that I'll need one or two more volumes, and one or two years of work, to complete this preliminary exploration of a rich substance, which twenty years on I still seem to be the only one to grasp. It's a project that was abandoned for some fifteen years, but which I've been working on for almost a year. The writing of *Esquisse d'un Programme*, followed by *Récoltes et Semailles*, interrupted this work, which I nevertheless intend to resume and bring to a successful conclusion, as soon as I have finished writing *R. et S.* and the texts (all of limited dimensions) which, with the last part of *R et S.*, are to make up volume 3 of *Réflexions*.

□ **Workshop 3: Six operations, biduality.** This is the point of view I introduced into the formalism of p. 1206 duality à la Poincaré or à la Serre, with discrete or continuous coefficients. The name "six operations" that I had introduced has been carefully eradicated by my cohomology students. They confine themselves to using here and there those that suit them, while jettisoning the structure they form as a whole (along with the biduality formalism), and above all, the irreplaceable thread provided by the point of view (not least to derive good "coefficient categories", cf. below). In the more than twenty years that this formalism has existed and proved its worth, no one "in the know" has taken the trouble (except in papers destined to remain secret and of which I have no knowledge) to identify the algebraic "form" common to the many situations where such a "boilerplate" duality is available, expressed in a formalism of six operations<sup>989</sup> (\*).

We can see that this is not strictly speaking a "derelict site" (since the formalization work to be done here is derisory), but rather a fertile point of view that has been systematically avoided (as has been the case with topos). I'm sure this abandonment has had a lot to do with the lamentable stagnation I've observed (with a few exceptions<sup>990</sup> (\*\*)) on the subject of the cohomology of algebraic varieties, especially in comparison with the vigorous development I gave it between 1955 and 1970.

As I already announced in the Introduction (I 8, "The end of a secret"), following Harvost and Semesh<sup>991</sup> (\*\*\*), I intend to include a short sketch of the essential features of the "six operations" formalism. Thanks to the care of my □ pupils, its very existence is today unknown to all, with the sole exception p. 1207 of those who were directly involved in one or other of the two seminars SGA 4 (1963/64) and SGA 5 (1965/66)<sup>992</sup> (\*), and who have obviously forgotten it. In this way, I will have done what I can to bring back into the limelight (if there are workers on the lookout for good tools) a perfectly effective tool, and a fruitful point of view which, in the cohomological theme, constantly leads us straight to the crucial problems.

<sup>988</sup>(\*\*) For more on this letter, see "The weight of a past" (n° 50, page 136, 2nd paragraph).

<sup>989</sup>(\*) (May 9) In one of the first presentations at SGA 5, I took great care to explain this form in detail.

was to be the nerve-centre of the entire seminar. This talk, the most crucial of all in SGA 5, has disappeared from the massacre edition. There is not a single hint of its existence in the entire volume! See b. de p. (\*) page 942 in the note "L'ancêtre" (n° 171(i)).

<sup>990</sup>(\*\*) The "few exceptions" are mainly (before 1981) Deligne's two important works Weil I,II, and some results sporadic in crystal cohomology, and in Dieudonné theory of Barsotti-Tate groups on general char.  $p > 0$  bases (which I had initiated around 1969). As I have pointed out elsewhere, there has been a revival in the wake of the theorem of the good God - Mebkhout (one still as ignored as the other. . .), with in particular the theory of Mebkhout beams (wrongly called "perverse" instead of *qui de droit*. . .), developed by Deligne et al.

<sup>991</sup>(\*\*\*) I would remind you that this is volume 3 of *Réflexions*, which in principle also contains the last part of *Récoltes et Semailles*.<sup>992</sup>(\*) These are also the two seminars, as if by chance, that the text which presents itself as "central" and is called (oh irony!) "SGA 4<sup>1</sup>" recommends not to read. ... (May 29) For the scope of the six operations vision, see the note "Details".

useless. ... " (n° 170 (v)), part (b) ("Machines for doing nothing. . .").

The three abandoned "building sites" (or houses, or tools. . . ) I've just reviewed have more to do with a common **algebraic language** to express the most diverse geometric situations, than with a particular geometric situation, such as the cohomology of algebraic varieties. If, in the second field, the one I call "topological algebra", I happen to come into contact with questions that are undoubtedly profound (such as those linked to the homotopy groups of spheres), it's by accident, not by design. Here again, my main motivation has been, and remains, to develop algebraic tools of sufficient generality and flexibility for the development of this **arithmetical geometry**, still in its infancy, that I've spent fifteen long and fruitful years of my life nurturing, bringing into the world and nourishing, from the embryo that was Weil's conjectures. It's in this geometry that we find the geometric substance itself, which for all those years was at the very heart of my love affair with mathematics, and remains so to this day. It's this substance that I'm now going to discuss in the three "hottest" topics I've yet to review.

**Area 4: "Problem of coefficients"**. This problem was already present in the formulation of Weil's conjectures<sup>993</sup> (\*\*). It was at the heart of my interest in cohomology throughout the 1960s.

It was clearly<sup>994</sup> posed, with all the necessary generality and precision, for the main types of coefficients then glimpsed<sup>994</sup> (\*\*\*). I'm speaking about this obviously crucial problem □ for

p. 1208

an understanding of the cohomology of algebraic varieties, from the first return to my work and the act of respect that is the note "Mes orphelins" (n° 46), and I return to this subject in the note "La mélodie au tombeau

- or sufficiency" (n° 167). There are two essential threads: on the one hand, the formalism of the six operations and biduality just mentioned. On the other hand, the need to find adequate generalizations, above a more or less general basic scheme, of the types of "coefficients" already known above a basic field, which intervene (even if only tacitly) in the description of cohomological functors already known on the category of projective and smooth schemes on this field: *l-adic*, crystalline, De Rham cohomology, or finally (when  $k = \mathbb{C}$ , field of complexes) Betti or Hodge cohomology.

I don't think it's an exaggeration to say that this problematic contains in its germ<sup>995</sup> (\*), both the "Hodge-Deligne theory" "in full maturity" which is still waiting to emerge, and the "De Rham-Mebkhout coefficient theory" which is also waiting<sup>996</sup> (\*\*); and it's for one and the same reason that both

<sup>993</sup>(\*\*) On this subject, see the beginning of the note "Les manoeuvres" (n° 169), where I comment on the initial problematic of Weil's conjectures. (May 29) This beginning has become autonomous in a note "Le contexte "conjectures de Weil"" (n° 169 (i)).

<sup>994</sup>(\*\*\*) It doesn't seem that any new types of coefficient have appeared, compared to those I had already foreseen in the second half of the sixties.

<sup>995</sup>(\*) In making this observation, I have no intention of minimizing the originality or importance of the contributions in question by Deligne and Mebkhout, any more than I intend to diminish the originality and importance of my own contribution to the birth and initial impetus of arithmetic geometry, by noting that it "was already in germ" in Weil's conjectures.

<sup>996</sup>(\*\*) The contributions in question, first by Deligne (around 1969) and then by Mebkhout (after 1975), can roughly be said to address the problem of finding suitable "De Rham coefficients" (which would enable the ordinary De Rham cohomology of smooth schemes to be inserted into a six-variance formalism), in two very different directions.

different. Deligne defines a "good" category of coefficients over the  $\text{spec}(\mathbb{C})$  scheme only, and the functors  $Rf_!$ ,  $Rf^*$  in the case of the structural morphism  $X \rightarrow \text{Spec}(\mathbb{C})$  of a separated finite scheme over  $\mathbb{C}$ , and for constant coefficients (alas!) over  $X$ . Mebkhout defines a "good" category of coefficients, valid in principle for any separated  $X$  of type

finite on a field of zero characteristic  $K$  - but he doesn't go so far as to define functors  $Rf_!$  and  $Rf^*$  for a morphism  $f: X \rightarrow Y$  of such schemes on  $K$ , and to develop a duality theorem for  $Rf_!$ , and  $L_f^*$  (except for  $Y = \text{Spec}(K)$  - and even then, only in the transcendental context, undoubtedly much more difficult, of complex analytic varieties). A

Another limitation of Mebkhout's theory so far (in a very discouraging atmosphere, it has to be said) is that it is now only developed for smooth  $X$  (for want, I presume, of systematically using the crystalline point of view, which provides a satisfactory substitute for the ring bundle of differential operators, so convenient in the smooth case).

For desolate building sites, these are desolate building sites! They speak eloquently of my systematic disaffection.

It's *the* eagerness of my cohomology students, led by Deligne, to bury the problematic bequeathed by the master, at the same time as the master himself.

□ For the fragmentary steps taken on the one hand by Deligne (showered with all the facilities of the spoiled child of science), and on the other by Mebkhout (in the complete isolation imposed on him by those very people who were best placed to welcome him), they nonetheless provide invaluable guidelines for identifying certain crucial categories of coefficients. These important contributions were present in my mind when I wrote the aforementioned note "La mélodie au tombeau". Since then, I've delved a little deeper into the "yoga coefficients and patterns" that had already emerged in the sixties, and I now have a more precise and complete picture. So I plan to return to the problem of coefficients (and that of patterns at the same time) in volume 3 of *Reflections*, following the sketch of the six-variance formalism.

Suffice it to say that I see essentially three types of fundamental coefficients<sup>997</sup> (\*), on a more or less arbitrary base  $X$ :  $l$ -adic coefficients (**any** prime number),

the **De Rham-Mebkhout** coefficients<sup>998</sup> (\*\*) (of particular interest for  $X$  of finite type on a base scheme)

$S$ , the most □ important cases being those where  $S$  is the spectrum of the rings  $\mathbb{Z}$ ,  $\mathbb{Q}$ , or  $\mathbb{C}$ ), finally the coefficients of

1210

Betti (for  $X$  of finite type on  $\mathbb{C}$ ). Only the third of these categories seems to me to be determined at present without any hypothetical elements. To define the first (if only for  $X$  of finite type on the absolute basis  $\mathbb{Z}$ ), or to describe its relations with the second, the existence of a mysterious functor theory (which I had postulated as early as the end of the sixties, a problem which also seems to have sunk with the rest. . . ) seems to me to be the crucial ingredient, to which I'll have to return in greater detail in due course.

**Project 5: Motifs.** I've already said enough about the burial of motifs by my friend Pierre Deligne, with the blessing of the entire Congregation, that there's no need to dwell on the subject again here. Instead, I'd like to highlight a new fact that has just come to my attention, and which should have appeared fifteen or twenty years ago. Even a month ago, the "in form" construction of the category of patterns on top of a more or less general basic scheme (a scheme of finite type over  $\mathbb{Z}$  let's say, or only over the spectrum of an algebraically closed body. . . ) seemed to me something decidedly "on the horizon", drowned in the mists of a distant future. This state of mind was undoubtedly a tenacious inheritance from the already distant days, when motivic reflection had started on a very hypothetical basis, when the formalism of  $l$ -adic cohomology was not yet available. There's also this "mitigating circumstance" for me, which is that my tasks of writing foundations, for

---

of ex-students (and those marked by the ascendancy they may exert) vis-à-vis the main ideas I had introduced, and developed in certain directions, during the sixties.

<sup>997</sup>(\*) If I speak of "fundamental" types of coefficient, it is to suggest that all the other important types of coefficient that I can now glimpse must be describable in terms of these, either by "combining" them in a suitable way, or by adding suitable structural enrichments, or both. Among the structure enrichments envisaged on De Rham-Mebkhout coefficients, there is (in addition to "filtration by weights", which seems "internal" to the category of coefficients envisaged), a "De Rham filtration" which plays a leading role in motivic applications. It may be that this additional structure only makes sense (from the point of view of a six-operation formalism) when combined with a Betti-like "discrete" structure, which should make it possible to formulate the right properties for this filtration to satisfy. I intend to return to these questions in greater detail in "Les motifs mes amours" (in Vol. 3 of *Réflexions*).

<sup>998</sup>(\*\*) I recall that for this type of De Rham-Mebkhout coefficient, I now see two dual variants of each other, that of Mebkhout and that which I hesitate to call "de Deligne", even though it is a child repudiated by him!

(May 29) For comments on the repudiated child, see the note ". . . et entrave" (n° 171 (viii)). For details of De Rham's coefficients, see the note "Les cinq photos(cristaux et  $D$ -Modules)", n° 171 (ix).

the things that were at hand, absorbed so much of my energy between 1958 and 1970, that my motivic reflections (and others, on themes that seemed like "luxuries" in relation to my imperious tasks of the moment) were constantly reduced to the smallest portion, that I granted myself almost against the bad conscience of one who would "play hooky"! In any case, I was left with the impression that coefficient problems were what was ripe to be done right away (but by others, since I was already busy elsewhere. . .), while motifs, for me, were what was ripe to be done right away (but by others, since I was already busy elsewhere. . .), while the patterns, for the moment, were just right for a "mathematics-fiction" book, if I'd found the leisure to write it, surely, things would have changed very quickly, if I'd actually started writing it, instead of toiling away on tasks that nobody in the world then had the heart to continue, while everybody is quite happy to make use of what I've done... .

□I've come to realize that this thing, in itself self-evident yet once is that as long as we take the trouble to describe sufficiently "fine-grained" coefficients, i.e., taking into account all the known structures associated with a pattern, we end up describing **the pattern itself**. Or perhaps more correctly, we end up describing a category, which will contain the (triangulated) category of patterns as a **full subcategory** (which is already not bad) - just as the category of patterns over the field of complexes appears (if we admit a strong enough version of the Hodge conjecture) as a full subcategory of the category of Hodge-Deligne structures. As for characterizing exactly, in "algebraic" terms directly adapted to the coefficients we're working with, exactly what this full subcategory **is**, i.e. exactly **which** coefficients "are motives", we fall into questions that are likely to be much trickier. These are those concerning the **compatibilities** between various geometric-arithmetic structures associated with a pattern (compatibilities to which I have already alluded, I believe, in the quoted note "Melody at the tomb"). It's the solution to these problems (which seem to me irrelevant to the actual construction of a "theory of patterns") that may well be "a hundred years away". In any case, experience shows us again and again that such prognostications (on the more or less "unapproachable" nature of a question) make little sense, except to discourage those whose courage isn't quite up to scratch...

(April 1) A few more comments on the formalism of the **"Galois (or fundamental) motivic group"**. This notion (which I identified and began to develop in 1964, before I had the honor of knowing my future ex-student Pierre Deligne) gives rise to intuitions and a formalism of great precision and finesse. Its existence and essential features are independent of the particular construction that would have been adopted for the notion of a pattern on a body (or of a "smooth" pattern on any schema), as long as this satisfies a few reasonable conditions. I had entrusted Neantro Saavedra with the task of putting into publishable form, in as general a context as possible, the dictionary I had drawn up around 1964 between, on the one hand, geometry in categories I called "rigid tensorial" ( $k$ -linear categories with "tensorial product" operation satisfying suitable conditions,  $k$  being here a **body**), and on the other hand the theory of linear representations of pro-algebraic groups on  $k$  (or, more precisely and □ more generally, "pro-algebraic sheaves" on  $k$ ). He completed this task in his thesis, published in Lecture Notes in 1972 (LN 265)<sup>999</sup> (\*). I had taken this dictionary a step further

<sup>999</sup>(\*) (May 10) Since these lines were written, I have had the opportunity to acquaint myself with the book in question, a copy of which the author had not seen fit to send me. I was able to see that in this book, Saavedra is the brilliant inventor of the new philosophy set out in it, faithfully following the notes I had passed him, and without practically mentioning my name (neither for the notions introduced in this book and for the crucial results, nor for already known notions such as crystal, stratified module or pattern). The very name "Tannakian category", which he has renamed the main notion, is such a brilliant mystification that he surely didn't invent it himself any more than he invented the theory he presents himself as the author of. Moreover, this "parternity" was only temporary, and my friend Pierre, ten years after the publication of

(notably as regards the translation of filtered or graded structures etc. on certain fiber functors, or that of a notion of "polarization" associated with a tannakian category), than is done in Saavedra's thesis<sup>1000</sup> (\*\*), or in the "memorable volume" LN 900 (where Saavedra's thesis is redone and the notion of motivic Galois group is at the center of the problem, without my name being more pronounced on this subject than on any other concerning motives).

I would also like to point out that the first step in determining (with equivalence) the category of patterns over a finite field, discussed previously at<sup>1001</sup> (\*\*\*), was the determination of the group of Galois motives of said finite field, which must be commutative (being generated topologically by the element of Frobenius), and is in fact an extension of  $\hat{\mathbb{Z}}$  (generated by Frobenius) by a certain algebraic pro-tore on  $Q^{1002}$  (\*). The second step was the description of the element of  $H^2(Q, F)$  which (according to Giraud's theory) classifies the G-gerbe of fiber functors<sup>1003</sup> (\*\*).

As expressed in the note "Souvenir d'un rêve - ou la naissance des motifs" (n° 51), I came across the motivic Galois group while looking for the link between  $l$ -adic representations, for  $l$  variable, of a profinite Galois group  $Jal(K/K)$  in  $l$ -adic modules, obtained for example by taking the  $H^i(X_K, Q_l)$ , where  $X$  is a smooth projective scheme on  $X$  and  $i$  an integer (or possibly, a suitable submodule thereof). Serre was looking at the image of the Galois group in  $Aut(V(l))$  for any  $l$ , which is a reductive  $l$ -adic Lie group, and it did seem that its structure (in the sense of Lie theory) was independent of  $l$ . It was while searching for the deeper reason for this phenomenon (itself hypothetical to this day), and relating it to Tate's conjectures, that I discovered the notion of motivic Galois group, following on from that of "pattern" and "motivic cohomology".

If there was one simple, profound thing that I brought to light, and if there was one creative act in my life as a mathematician, it was the birth of this crucial notion, linking geometry and arithmetic. That's why, on that memorable April 19th last year, I was suffocated by a feeling of unimaginable **impudence**, seeing this thing appropriated with such superb casualness, like the last of the trifles just improvised there and then in the bend of a technical paragraph: see, it's as silly as cabbage, all you have to do is apply proposition 4.7.3 of our modest article exposing the theory of Tannakian categories. ....<sup>1004</sup> (\*\*\*). This is how mathematics is done in the 1980s, after many

---

volume, to do whatever was necessary to ensure its return (according to everyone's expectations) to the one already designated for this purpose. For details of this brilliant operation on a corpse (the first and only of this scale, prior to the "SGA 4" operation<sup>1</sup>

2

SGA 5" done in the same inimitable style), see the suite of notes "The sixth nail in the coffin" (n° s 176<sub>1</sub> to 176<sub>7</sub>).

<sup>1000</sup>(\*\*) (May 10) This presumption turned out to be wrong. It was due to my conviction that Saavedra would be absolutely to "complete" the program I had indicated to him, even though his mastery of "linear representations of pro-algebraic sheaves" alone seemed for a long time to have outstripped him, and his mathematical background was extremely limited. Given Saavedra's less-than-exceptional means, it's unthinkable to me that in the less than two years between my departure (when he had no notion of cohomology, or of the structure of algebraic groups) and the publication of the book, he should have had the opportunity to assimilate (and to do so perfectly, as the book's appearance testifies) the host of all-round notions with which it juggles. On this subject, see the note "Monsieur Verdoux - ou le cavalier servant" in the aforementioned series of notes "Le sixième clou au cercueil".

<sup>1001</sup>(\*\*\*) (May 10) I note that this determination, too, figures in Saavedra's inexhaustible book (without reference to my modest person, needless to say). It uses the cohomological theory of the global class body (determination of the group  $H^2(Q, T)$ , where  $T$  is a group of multiplicative type on  $Q$ ) - so it's also among the things my ex-student (with apparently superhuman means) would have assimilated in less than two years. ...

<sup>1002</sup>(\*) This is the motivic Galois group that classifies **semisimple** patterns. To obtain the general patterns, we need to make its product by the additive group  $G_a$  on  $Q$ .

<sup>1003</sup>(\*\*) The crucial point is that this class becomes zero (thanks to the existence of the " $l$ -adic cohomology" fiber functors) in all places  $l \neq p = \text{car.} k$ , and the existence of the crystalline functor-fiber gives us sufficient information about the fate of this class in the missing place  $p$ .

<sup>1004</sup>(\*\*\*) As I wrote these lines, the association with the very similar way of introducing the definition of the function  $L$  with coefficients in an  $l$ -adic bundle came to mind, without reference to anyone and as the last of the banalities that would come

p. 1214 brilliant antecedents in the 1970s<sup>1005</sup> (\*).

But I'm getting off topic, all right - I was supposed to be giving a tour of a building site, not sentiment. So I'll point out that, as in the case of the profinite fundamental group, if  $X$  is a geometrically connected scheme over a field  $k$ , there's a distinction to be made between the motivic fundamental group of the scheme  $X$  itself, and the "geometric" motivic fundamental group. The two do not coincide, **even** if  $k$  is algebraically closed - because the motivic fundamental group of  $k$  is not trivial (it is connected, but no more!). We must therefore introduce the "geometric" motivic fundamental group of  $X$ , which is supposed (among other things) to establish a link between the various  $l$ -adic Lie groups associated (as quotients) with the geometric profini fundamental group  $\pi_1(X_k)$ . It is defined as the kernel of the natural homomorphism

$$\pi_1^{\text{mot}}(X) \rightarrow \pi_1^{\text{mot}}(\text{Spec}(k))$$

(relating to the choice of a functor-fibre on the category of smooth patterns on  $X$ ).

The point I wanted to get to is that this kernel, which we might note  $\pi^{\text{mot}}(X/k)_1$  should be the first step towards the construction of a "motivic (geometric) homotopy type of  $X$  over  $k$ ", to which I have already alluded in passing previously<sup>1006</sup> (\*\*). The formal description of this "homotopy type"<sup>1007</sup> (\*\*\*) ,

whose "cohomology" should be none other than the motivic cohomology of  $x$ , is part of the interesting conceptual work in prospect on the "motifs" site, in a decidedly different (and broadly

The central task is the actual construction of motif categories and the formalism of the six operations for them.

**Job 6: Standard conjectures.** As I explained in a previous footnote (note(\*) p.1202), these conjectures can be understood in two different senses. Firstly, in the literal sense, as I formulated them at the Bombay Colloquium in 1967<sup>1008</sup> (\*). In this form, they seem to me to summarize the most crucial questions that now arise in the theory of algebraic cycles, at least from the point of view of "homological" equivalence for these cycles.

In formulating these conjectures, however, my main motivation was not directed towards cycles for their own sake, but towards the means they provide (perhaps. . . ) for constructing a theory of semi-simple patterns on a body, satisfying desiderata that should have been "common knowledge" for fifteen or twenty years (and yet still remain occult. . . ). In volume 3 of *Réflexions*, I shall indicate some weakened variants of these conjectures, which would suffice to build such a theory (and of which the weakest is practically necessary and sufficient for this purpose). As I've already pointed out elsewhere, even if the conjecture in its initial form were to prove valid on a given body  $k$  (for finite  $k$ , for example, or even for all  $k$ ), this would not in itself mean that the cohomology classes that we should call "motivic"<sup>1009</sup> (\*\*) (and which we can hope will make true various conjectures of the Hodge type) would be sufficient to build such a theory.

---

the same brilliant author. On this subject, see the sub-note ". . . and nonsense" (n° 169<sub>6</sub>) to the note "Les manoeuvres" (n° 169), p. 891.

<sup>1005</sup>(\*) And even as far back as the sixties - see the note "L'éviction" (n° 63).

<sup>1006</sup>(\*\*) In the note "Requiem pour vague squelette" (n° 165).

<sup>1007</sup>(\*\*\*) as an object type, I expect it to be a relative homotopy type (in Illusie's sense) in the "extension" topos (in Giraud's sense) of the  $\text{Spec}(\mathbb{C})$  topos  $\text{fpqc}$  associated with the sheaf (on this topos  $\text{fpqc}$ ) of functor-fibre on the category of smooth patterns on  $X$ . The relative cohomology (on the basic topos just described) of this type of homotopy is quasi-coherent (and even "coherent"), and can be identified with the motivic cohomology of  $X$  on  $K$ . Using a complex point of  $X$  (where  $K$  de car. nulle) to have a Betti functor-fibre, the corresponding homotopy-fibre type must be canonically isomorphic to the homotopy  $Q$ -type (neglecting torsion phenomena. . . ) associated transcendentally with  $X \otimes_K \mathbb{C}$ , at least when  $X \otimes_K \mathbb{C}$  is 1-connected.

<sup>1008</sup>(\*) Algebraic Geometry, Bombay 1968, Oxford University Press (1969).

<sup>1009</sup>(\*\*) I think I can propose a reasonable definition of motivic cohomology classes on an algebraic variety.

and Tate classes, for example) are necessarily algebraic. If it were ever discovered that there are non-algebraic motivic cohomology classes, this would undoubtedly mean that the importance of algebraic cycles in the theory of motives, i.e. in the arithmetic-geometric study of the cohomology of algebraic varieties, would be less than I had reason to believe in the early days of the theory. In any case, the actual construction of a theory of motives that I now foresee is independent a priori of common conjectures (Hodge, Tate, or "standard") about algebraic cycles.

□ This does not prevent the standard conjectures and their variants on the one hand, and those of Hodge, Tate and their p

1216

numerous variants of the other, conjectures which involve in particular statements of **existence** of algebraic cycles (i.e. of algebraicity of cohomology classes), or (in modified versions) statements of existence of so-called "motivic" cohomology classes, are intimately connected to each other, as well as to the description of the main "types of coefficients", and, in the limit, to that of the category of motives itself<sup>1010</sup> (\*).

Here again, the work of decanting, tidying and informing, which has been needed for almost twenty years, has not been done (nor, above all, made public) by those who have preferred to bury fruitful ideas (when they weren't published) or debunk them (when they were), and reserve for themselves the benefit (immediate) and the credit (later), rather than informing and making available to all the fascinating issues crucial to our understanding of the links between geometry, topology and arithmetic. I see that what is lacking here is not competence or even brilliant gifts, but simple honesty, and a certain **decency** too in the relationship to a "scientific community" that dispenses prestige and power, among those who do not feel bound by the slightest obligation, the slightest "return" in the form of even the slightest attitude of "service". That's why, although I lost touch with the subject over fifteen years ago and am no longer "in the loop" of anything, I'm going to make the effort to get back into the swing of things that were once familiar to me, at least to do my best, in volume 3 of *Réflexions*, to make up for the omissions of those younger and more gifted than myself, and to do at the end of the day what they didn't have the generosity to do.

At this point I think I've covered all these "building sites" which seem to me to be now (and already have been since the moment of

my departure from the mathematical scene) "the□most burning", with a view to building this "geometry arithmetic", the foundations of which I laid throughout the sixties. I don't mean to say that I've summarily covered **all** the substantive questions that perhaps only I can see and that are close to my heart. As far as I know, these are still at the point where I left them when I left the mathematical scene, and many have not even had the pleasure of being made explicit in the literature. Among these, I'd like to mention the **discrete Riemann-Roch conjecture** in the schematic framework<sup>1011</sup> (\*). Egale-

p. 1217

---

projective and smooth, at least when the base body is of zero characteristic. For the general case, the crucial case (discussed above) is that of a fi ni basic body. Modulo the description of motivic classes in the latter think we can advance "the" right definition of motivic classes. Compare with comments in b. de p. (\*) on page 1202.

<sup>1010</sup>(\*) This does not contradict the assertion I've just made, namely that the construction I see of the category of patterns (on a body, let's say) is "independent" (i.e. "technically" or "logically" independent) of the various conjectures envisaged. These "intimate links" I'm talking about (which mean, for example, that the twelve variants I've seen to Hodge- and Tate-type conjectures suggest as many different types of cohomological "coeffi cients") are heuristic, not technical - just like the link between the (baptized "conjectural") Lefschetz-Verdier formula, and the trace formula for the Frobenius correspondence. In the latter case, this essential heuristic link is not a logical dependency, has been duly underlined in the two sub-notes "Real maths. . . ", ". . and 'nonsense'" (n° s 169<sub>5</sub> , 169<sub>6</sub> ) to the note "Les manoeuvres".

<sup>1011</sup>(\*) This conjecture is spelled out for the first time, it seems, in sub-note n° 87<sub>1</sub> of the suggestively named note "The Massacre" - given that the conjecture is one of SGA 5's massacred things, gone without so much as a trace of a **name** in Illusia edition.

ment, there's the generalization of the theory of the **local, global geometric class body** into a **duality** statement that is essentially "geometric" in nature (while giving the classical "arithmetical" statements as corollaries). This is discussed in letters to Larry Breen from 1976, reproduced as an appendix to Chap. I of "A la Poursuite des Champs" (which will therefore appear in vol. 4 of *Réflexions*). In these statements, the main work in perspective will be in a careful description of the categories of "coefficients" in which we are working. An important role here is played by a certain autoduality, discovered by Serre<sup>1012</sup> (\*\*), in the category of unipotent algebraic groups with near radicial isogeny, over a  $k$ -body of char.  $p > 0$  (an autoduality that is still unknown, it seems to me, outside the handful of people I've happened to tell about it). The question of generalizing such statements to higher dimensions is (for me at least) a total mystery (but Milne would have some light in the case of an algebraic surface. . . ).

These questions of duality go back, I believe, to the late fifties, when I had also branched out into the construction of a "**Jacobian**" **complex** (of chains) of proalgebraic groups, associated with a finite-type scheme over a body (to begin with. . . ), in terms of suitable "local Jacobians" associated with these various local rings, in analogy with the "residual" or "dualizing" complex I had constructed some

years before in coherent duality. All these questions of duality had been relegated to second place in the sixties, by the tasks in particular of developing  $\square$ ment of the "nonsense" of stale cohomology.

and  $l$ -adic and the language of topos. A certain part of my program, concerning relative local and global Jacobians, was completed around 1977 (without any mention of my modest person) by C. Contou-Carrère, who hastened to pack up in view of the welcome he received from Deligne and Raynaud<sup>1013</sup> (\*). Today, it takes a certain amount of courage to take up and develop ideas that bear my mark all too clearly (even though one would do one's best to hide it). The only one who has persisted in doing so is Zoghman Mebkhout, and the fate that befell him, culminating in the prowess of the Colloque Pervers, clearly shows the risk we run.

If I wanted to make a list of all the great questions I'd discovered between 1955 and 1970 (and which I've talked about here and there), I'd have to go on for days, and probably weeks if I wanted to be at all explicit and go into the ins and outs. This is not the place to do it, and I doubt I ever will. Not to mention that if one day (who knows!) I want a young mathematician to get involved in one of these questions, just to get his hands dirty and make a name for himself, it would be better for him to rediscover it himself, rather than run the risk of having a certain label applied to him.

Beware of the Perverse Colloquia that the future holds... .

## 18.7. (7) Evening fruit

### 18.7.1. (1) Respect

**Note** 179 (April 2) It's been five weeks (since February 26, with the note "Le silence", opening the series of notes grouped under the name "Les quatre opérations") since I've been reviewing the main facts of a "material" or (at least) "technical" nature concerning the Burial. In "The Four Operations", I had confined myself to the "swindle" aspect in the strict sense of the term - the one where the

<sup>1012</sup>(\*\*) In addition to Serre's beautiful idea, I was also influenced by the "geometric" point of view introduced by Lang in the geometric global class body, and by Serre in the local class body.

<sup>1013</sup>(\*) See note "Cercueil 3 - ou les jacobiniennes un peu trop relatives" (n° 95), and sub-note n° 95<sub>1</sub>, about some of Contou-Carrère's misadventures in the great mathematical world.

that "threshold" mentioned in the note of the same name (n° 172), which separates **bad dispositions** (expressed in "automatic rejection" reflexes, often in spite of the most elementary mathematical instinct) from blatant **bad faith** and outright plagiarism. In the section I've just written, "Les chantiers sorry", I see myself confronted above all with the "first level" of the Burial, below the "threshold" - the burying of a vast vision□and powerful ideas-force, which certainly no one is obliged to take up, and which every the world has the right to ignore or forget - even if it means "burying itself", by condemning its work (or at least the part of it directly affected by the rejected vision) to more or less complete sterility. p. 1219

Now I feel like I've come full circle, at last! As far as the (abandoned) "tour des chantiers" is concerned, it has given me a more detailed apprehension of the Burial of my work, while at the same time getting me back in touch, if only a little, with themes I'd lost sight of fifteen years ago. Above all, it gave me a clear idea of the orders of urgency in what I intend to put down in black and white in the next volumes of *Réflexions*. My aim will certainly no longer be to lay meticulous foundations for sciences in the making - that's something I've done enough of, and if no one else can be found to give themselves to such a task, as I once did, so much the worse for one and all! Instead, my aim will be to highlight a number of key ideas, in the service of an overall vision born between 1955 and 1970, which I now find (thanks mainly to the efforts of some of my former students, and with the acquiescence of all) either forgotten, ridiculed, or shamelessly appropriated, mutilated and stripped of their essential force. By taking them up again today, I'm at last loosening the reins on a drive for knowledge within me that, during the sixties, I often kept to a minimum, for the sake of endless "service" tasks. Those days are gone - and yet, I know that in this new phase of my mathematical passion, the impulse to serve is no less present than it once was. I will "serve" no less than I once did that ideal "community" of minds eager to know<sup>1014</sup> (\*), which continues to give my mathematical investments a deeper meaning than that of a personal hobby and a means of self-aggrandizement.

□ Within these investments, "the boss" is certainly no more absent than in the past. Faced with the Malice and derision on the part of those who had been "close to me" in the mathematical world, wounded many times in an elementary sense of decency by those I had loved and trusted unreservedly, there is in me this irrepressible movement, before those who have lost the feeling of respect, to **testify to my respect for myself**, through respect for these living, vigorous and beautiful things that with my hands I have brought to the light of day. Perhaps the best testimony I can give to this respect is to make myself the servant of these things for a few years. p. 1220

<sup>1014</sup>(\*) I first wrote about the "mathematical community" in the first part of *Harvest and Sowing*, in the section "The 'mathematical community': fiction and reality" (n° 10). By referring here to an "ideal community of minds eager to know", it might seem that I'm once again falling back on something whose fictional character had become clear in the above-mentioned section. But in Part VIII of *Fatuity and Renewal*, I had already been led for the first time in my life (better late than never. . . ) to the realization of a collective dimension in my own

"(On this subject, see the two sections "L'aventure solitaire" and "Le poids d'un passé", n° s 47, 50, and more particularly, pages 134, 135). It's also clear that the "community" (or "collectivity") that lives this collective adventure is of a completely different nature to any sociological entity, embodied in a given **environment** at a given time.

This "ideal community" to which I refer, "without **frontiers in space or time**", is no less "real" to me than the **sociological entity**. This "ideal community" to which I refer, "without borders in space or time", is no less "real" to me than the sociological entity. It is more essential, in the sense that it is indeed this community (as I write in the rest of the same sentence) that "continues to give my mathematical investments a deeper meaning than that of a personal pastime and a means of self-aggrandizement". It's no more "fictional" than I am myself, who feels part of it, more lucidly than I once did. The "fiction" consisted, not in the perception of the existence of such a "community", but in the confusion between it and a milieu with which I had identified myself.

on the precious years that still remain to me. So the mathematical reflections I intend to develop over the next few years, in the continuation of *Réflexions*, will still be, at the same time as the resumption of a **child's game** and the **gift of a service**, an **act of respect**.

Before putting the finishing touches to the Burial, I'd like to take a brief look beyond the "material facts" to see what this reflection has taught me. I'll start by looking at what it has taught me about others, and end with what it has taught me about myself.

The most striking fact, of all those that have come to light in the course of this reflection, is the **degradation of morals and spirits** in the mathematical world of the 70s and 80s. This degradation is expressed, among other things, by a hundred and thousand "little nothings", such as those that have come back to me in spurts over the past eight or nine years - "little nothings" that are nonetheless sufficiently disconcerting to prompt the reflection of the first part of *Récoltes et Semailles* and its main question: how (and when) did things come to this? And what was my role and what is my place in this degradation?

that I see today?

p. 1221

This degradation culminates in operations such as ""SGA  $4_2$  " -  $\frac{1}{2}$ SGA 5" or the (even more incredible) *Colloque Pervers*, far surpassing in cynicism and contempt anything I could have imagined, the day before I unwittingly discovered them.

This is not the place to go back over these "nothings" (more than one of which has been pointed out in passing in my reflections, here and there), nor over the big operations (served by the little manoeuvres). The spirit expressed in both, the "nothings" and the vast swindles, is the same. The "threshold" that can sometimes be drawn between the acceptable and the villainous is itself very fragile and very artificial, a sort of guard-rail that, in any case, nobody (it seems) cares about anymore. I don't regret having had the opportunity, through this funeral in which my person is crucially involved, to take a closer look than ever, perhaps, at this spirit, which is certainly the privilege neither of this funeral (set in motion in honor of my modest person) nor of the world of mathematicians alone. I can only say that I'm not aware of this spirit having reigned in that world, or in any other science, at any time other than our own. This is a sign, among many others, of the terminal stage in the decomposition of a civilization and of what, in spite of everything, continued to give it meaning.

Over the last few days, my thoughts have more than once dwelt on the strange coincidence that my departure from the mathematical scene, over fifteen years ago, came under the impact of a certain corruption in the scientific world, to which I had long chosen to turn a blind eye (while believing I was staying away from it). I was suddenly confronted with it, in the very institution where I had intended to end my days<sup>1015</sup> (\*). In this case, it was a question of the almost universal self-interested connivance of scientists with military apparatuses. This insidious military stranglehold on the scientific world as a whole is also a recent phenomenon, having only emerged (at least to the extent we know it today) since the last world war. Certainly, if this "shock" disrupted my planned trajectory (planned by myself as by everyone else) to the point of triggering my departure without return from a world to which I had been

p. 1222

identified until then (with one tacit reservation. . . ), was that there was a pres- sant and urgent need for renewal within me, which I only became aware of with hindsight. I subsequently had a □ tendency to minimize what was

had been the particular opportunity to trigger this unusual departure. Yet I also know how immense (and yet invisible) are the forces of inertia that tend to keep us indefinitely on the same "trajectory", and that oppose inner renewal - and this makes me wonder how many times I've had to face up to these forces of inertia.

---

<sup>1015</sup>(\*) On this subject, see the note "L'arrachement salutaire" (n° 42), and also "Frères et époux - ou la double signature" and its sub-note (n° s 134, 134 )<sub>1</sub>

I can also tell you how powerful an inner shock it took to tear me away from a trajectory as firmly mapped out as my own.

What I'm getting at is that the "special occasion" that triggered my departure is not without **meaning**. In any case, this meaning was very strongly present in the first few months, and probably even throughout the first year, following my departure. Subsequently, under the influx of new impressions and in the very dynamic of this first, tumultuous renewal, it was only natural that this sense should recede into the background and eventually disappear from my view. But even as I cease to perceive such and such a "sense" of my past or present actions and their fruits, this sense has not disappeared for all that. And my return to mathematical activity, with the more detailed contact it implies with the world I left behind, has unexpectedly brought me back to this forgotten past. For one of the very first fruits of this "return" (a return just as unexpected as my departure had been a short while before. . . ) was the discovery, in this world that had once been mine, of another corruption, which I don't think I had ever known. If I try to give a name to this new thing, it comes to me: **the loss of respect**. I've felt this painfully more than once in recent years, when I've seen "one of those I've loved discreetly crush another whom I now love, and in whom he recognizes me". In the course of reflecting on L'Enterrement, I came across it more than once again, and in more virulent tones, this time directed against such things as I had brought into being by my hands, or against such continuators who had dared to draw inspiration from them. At such times, I've become truly acquainted with the "breath" and "smell" of this spirit, where the sense of respect has been lost. But I'm also well aware that this spirit "doesn't just breathe around my home", even though it's through its breath on me, and on those I care for, that I truly "know" it - as one only knows the taste of bitter fruit by eating it. This spirit today has become the spirit of the times... .

And I can see that these two corruptions, the one that triggered my departure and the one that awaited me at my "are not unrelated. If I try to put into words this diffuse feeling of a link, I would say that □d<sup>in</sup> the easygoing attitude of scientists towards the seductions of military money (not to

p. 1223

To speak only of this aspect) and the conveniences it offers, I detect a lack of self-respect, on both an individual and collective level<sup>1016</sup> (\*). And it is in the loss of self-respect that I recognize the root of the loss of respect for others, and for the living work that has come from their hands or those of the Creator.

I don't claim to have "understood" either "corruption". On the one hand, there is the "spirit of the times", whose particular dynamic escapes almost entirely (it seems to me) individual action. For me, this collective dynamic remains a total mystery, and one I've never thought of trying to fathom. On the other hand, there's the way in which each individual being, endowed with his or her faculties of perception and creativity, and weighed down by the weight of his or her particular conditioning, responds to this spirit of time and makes this response (knowingly or unknowingly) one of the crucial elements of his or her particular adventure.

In the course of my reflection, I tried at length to identify certain choices, and the forces at work behind these choices, in the case of the two main protagonists of the Burial: the deceased, and the Principal Funeral Officiant<sup>1017</sup> (\*\*). What's certain is that I've learned a few things along the way, but by no means have I succeeded in my task. In fact, as far as my protagonist is concerned, I'd go so far as to say that I haven't succeeded entirely. I've assembled the pieces of a puzzle, I've put them together, and I'm even convinced that the pieces are the right ones and that the assembly, more or less, is correct - but the knowledge of the **whole** makes me

<sup>1016</sup>(\*) I'm sorry to run the risk of offending some of my old friends who have adopted this "easy attitude", without, of course, feeling any lack of self-respect! It's by no means certain that scientists of other eras, had they found themselves collectively faced with "seductions" of the same order, would have reacted differently. Opportunity is often the thief!

<sup>1017</sup>(\*\*) (June 22) A third "main protagonist" appeared to me, at the "last minute", in the note "L'album de famille" (n° 173), part c. (The one of all - or acquiescence), d. and e.

still missing. It remains an assembly of parts that, at present, remain **foreign to** me - foreign to my person and my experience, and, by the same token, misunderstood. The work I've done will no doubt help me, on other occasions, to recognize myself as best I can, to be careful where it's in my interest to be careful (and the older I get, the more I realize that it's often in my interest to be careful... ). But all this falls short of true understanding.

p. 1224

And the question arises as to whether, in the end, the effort made in this direction was not a lure - or that the **goal** at least (that of "understanding others" in such and such a conflict situation) was ☐ not a lure (whereas the **path** followed has

rich in lessons learned... ). I tell myself that to truly understand the conflict in this **person** (or in any other to whom I've been closely linked and where I see similar contradictions erupt), is undoubtedly also to **understand the conflict itself**. And I know that such an understanding cannot come from meditating on others (who are forever beyond my immediate knowledge), but only from meditating on myself. If the long reflection on "The key to yin and yang" is to prove fertile, it's not through occasional escapes into other people's lives, but through looking back at my own life and experience, and the understanding I had of it.

## 18.7.2. The gift

**Note** 180 (April 3) I don't feel inclined, after all, to attempt a retrospective in a few lines, or a few pages, of what has occurred to me about my main protagonist in L'Enterrement. As things stand, it seems to me that this would be little more than an exercise in style, and not the means for a renewal of a most fragmentary understanding. For the moment, I'm rather looking forward to the end of this reflection on L'Enterrement!

I'm well aware, moreover, that this final point will not be the end of L'Enterrement itself; surely, the months to come, with the echoes of all kinds that will come to me from these notes, the fruits of solitude, will be rich in surprises and lessons that solitary reflection could not have brought me. Nor is it certain that all the surprises that come my way will have a bitter taste, and perhaps the very near future will also hold some joy for me - all the more appreciated as it will undoubtedly be rare; as I also had the joy, last year alone (a banner year!) of receiving letters full of warmth from three of my colleagues or friends of yesteryear whom I held in particular esteem or affection<sup>1018</sup> (\*).

As for the overall effect, however modest, of Récoltes et Semailles on the "spirit of the times" in the mathematical world, needless to say, I have no illusions whatsoever. Perhaps, at the very most, the publication of these notes will put an end to such unprecedented iniquity, and that it will make

to readjust some glaring anomaly - and even so, I may be optimistic. And it's also possible that the unexpected reappearance of the deceased himself, thought dead and done for ages, will ☐ une fin, or at least

p. 1225

At least a more circumspect mute to the muffled concert of derision that surrounded the work of his hands, which he had left behind. And if this reappearance does not at the same time put an end to the fashionable boycott of a vision and of strong, fertile ideas, perhaps it will at least encourage some young mathematician, more generous than others, to draw inspiration from them without reserve (at the risk of displeasing) and to make them his own with respect.

Yet, if I wrote Récoltes et Semailles, it wasn't for any of these things, some of which may come in the future, who knows! I wrote it "for me", of course, like everything else I write - as a means to an understanding that I'm still groping for. But at the same time, the thought of others, of those I have loved and left behind one day, as my adventure took me **elsewhere** - this thought hardly left me throughout the writing of Récoltes et Semailles<sup>1019</sup> (\*). These notes, as well as a reflection,

<sup>1018</sup>(\*) These are letters from D. Mumford, I.M. Gelfand and J. Murre.

<sup>1019</sup>(\*) This thought is expressed more than once in Fatuity and Renewal (the first part of Harvest and Sowing).

and sometimes a meditation, have been and remain for me a **gift to** those to whom, beyond myself, I address myself. And I know, of course, that this gift may not be received by anyone but myself. But that doesn't mean I'll regret having done it. What's more, if it isn't received today by some of those for whom it's intended, perhaps it will be tomorrow. This testimony, at once spontaneous and long matured, where each page and each word comes in its own time and place, will be no less true tomorrow than it is today. But whether it's today or tomorrow, if there's one unforeseen thing that will be welcomed with joy, it will be to learn that my gift has been received, if only by one, who would have recognized himself through me... .

### 18.7.3. (3) the messenger (2)

**Note** 181 No more than for the "foreground" of the Burial painting, do I feel prompted to give a detailed retrospective of my insights and perplexities concerning the other two foregrounds, formed one by the "bustling group of my pupils, carrying shovels and ropes", and the other by the "entire Congregation". On the subject of the latter, and its role in the Burial, I expressed myself in some detail in the note "Le Fossoyeur - ou la Congrégation toute entière" (n° 97)<sup>1020</sup> (\*\*). With regard to

As for my perplexities regarding the role and motivations of my dear ex-students, they appear most clearly in the note "Silence" (n° 84), without being seriously re-examined at any point p. 1226

of the reflection. So it's at this level, that of the "second plane" of the Burial painting, that my work leaves the most to be desired!<sup>1021</sup> (\*). There was no work here comparable to the one I did in the note quoted "Le Fossoyeur. . . .". This part of the picture is further developed in two subsequent notes, in the light of the dynamics of yin and yang: "La circonstance providentielle - ou l'Apothéose" and "Le désaveu (1) - ou le rappel" (n° s 151, 152).

This note "The Gravedigger - or the whole Congregation", which is the last of those written in the "first breath" of reflection on the Burial, is also undoubtedly its culmination. With the benefit of almost a year's hindsight, I'm no longer convinced, however, that a certain collective motivation behind the Burial of my modest self (seen as an act of "retaliation for dissent") really touches the real **nerve of** the Burial, at the level of collective will. What makes me doubt it is that this motivation seems to me to be entirely absent, or else of derisory significance compared to other forces at play, in the case of each of my students<sup>1022</sup> (\*\*). And yet, one of the most striking facts in the whole Funeral is precisely the "unanimous agreement" that exists between its three successive "plans", whose acts and omissions follow on from and complement each other (as if orchestrated by a common will of "flawless coherence"), as perfectly as in a funeral ceremony in the true sense of the word! In such remarkable unanimity, in such uniformity of disposition and action, we can also discern a common motivation, the same "nerve" that drives everyone.

I don't mean to suggest that this "diffuse resentment" I've noticed here and there, caused by my "dissidence" felt (superficially) as desertion, and (more deeply) as an inadmissible challenge - that this resentment is null and void, and that it doesn't play a certain role. But I now doubt that this role is decisive, that this is the common "nerve" - which would be common to all **except** those whose role in the Burial was the most crucial of all! (Namely, those who were my

---

It may be less apparent in later parts, but it's no less present.

<sup>1020</sup>(\*\*) (June 22) My still hazy perception of the Congregation has recently been given unexpected shape in the aforementioned note "The family album" (n° 173), parts c., d., e.

<sup>1021</sup>(\*) (June 22) For a (modest) continuation of the reflection on the "second plane" of the painting, see the note of June 19.

"Five theses for a massacre - or filial piety" (n° 176).<sup>7</sup>

<sup>1022</sup>(\*\*) This fact appears in the reflection in the note "Patte de Velours - ou les sourires" (n° s 137), p. 644-645.

students, and thus the first guardians of a certain heritage).

This (seemingly relatively rational) "cause", which is my "dissidence", seems to me to have nothing in

p. 1227

common, however, with the breath of violence that ☐ I felt in an operation like the massacre of a  
It's not that I was a "splendid seminary", under the complacent eye of the Congregation; nor is it that I could  
compare with the equally violent ini- quity of a Colloque Pervers, to the applause of the assembled crowd.  
Nor was it that I was an odious colleague or boss, and so feared that the accumulated animosity he provoked  
was discharged while he was around; that it waited until he was declared dead and buried to finally be  
discharged against him and those in whom he was "recognized" in the slightest. Nothing, in the echoes that  
reach me here and there, goes in the direction either of a **fear** that my person would have inspired and which  
would have found its belated revenge<sup>1023</sup> (\*), nor of acts or behaviors the least bit precise, of which one  
would **reproach** me and which could nourish animosity or violence (which however never says its name).

This is a typical situation for the kind of violence I've called "gratuitous", or "causeless". If this kind of  
violence has ended up at the center of my attention, in the long meditation "The key to yin and yang"  
(which itself constitutes the heart of Harvest and Sowing), it's surely not by chance. I don't just know this  
violence from yesterday, and it wasn't in my life as a mathematician that I was confronted with it for the  
first time, face to face. And if I've sometimes forgotten its existence in the world of men, it's never been  
for very long, because it's taken care of itself soon enough to remind me of it. And to talk about today - by a  
strange "coincidence" and (I'll say it myself)

often unwelcome (or at least, unwelcome. . . ), I don't recall ever having been confronted in my life with the  
☐ familiar signs of such violence in such an insistent, repetitive, harassing way, that

p. 1228

since my "return to maths" and especially since I wrote Récoltes et Semailles; and even more strongly, in  
these very last months and weeks.

Surely, there's an insistent message here, one that comes back to me again and again, and will no doubt  
keep coming back until it's heard. I began to listen to it, in the final weeks of the long meditation on yin and  
yang - knowing that I hadn't yet reached the end of what it had to say. In the two months since then,  
however, a subterranean work must have continued in silence. It seems to me that what is essential and  
hidden<sup>1024</sup> (\*) has begun to unravel into more incidental things.

<sup>1023</sup>(\*) It's true that, in "Fatuité et Renouvellement", I spoke at length about the **fear** that surrounded the "man of notoriety", from a  
moment I couldn't place, and whose signs I sometimes perceived around my person. But this was the diffuse fear attached to  
notoriety, not to my person - it disappeared as soon as a slightly personal contact had been established. I have the impression  
that, in terms of personal contact, I was perceived more as the "good guy" than as the person who would be feared.

It was no different, I'm convinced, even for the student mentioned in the section "The blunder - or twenty years later" (n°  
27), in whom a certain "stage fright" continued to manifest itself for quite a long time, with each new encounter. This stage  
fright appears to me today as the sign of a pervasive inner insecurity ("Unsicherheit"), which later  
found compensation and an outlet in attitudes of domination and contempt. Among his many students, the three I've come to  
know have each been severely tested by his apparently "gratuitous" attitudes of malice. Clearly, the spirit that has taken root and  
reigns just about everywhere in the mathematical world has encouraged the emergence of such aberrant behavior, which in  
turn contributes to shaping this spirit and imprinting it with the disconcerting mark of hushed brutality... ..

<sup>1024</sup>(\*) As I wrote this line, I was aware that the term "hidden" here was a pis-aller, a kind of concession to "Consen- sus". I've often  
found, on discovering something I'd ignored all my life, that it wasn't "hidden" at all, but on the contrary in plain sight, so  
obvious it was sometimes eye-popping, without my consenting to see it. This is most often the case in the discovery of the  
new, whether it's mathematical work or self-discovery. The cause for such blindness, for this blocking of the faculties of  
common sense or elementary intuition, is by no means a deficiency of these faculties. Rather, it lies in an almost  
insurmountable inertia of the mind to deviate from the rut of well-established consensus - whether this is accepted in society as  
a whole, or in the more limited milieu of which we are a part, or even, whether it is concluded and sealed only within  
ourselves, like the articles of a treaty that the "boss" would have concluded with himself and for his own convenience alone... ..

(or, at least, less difficult to admit). The image of the "dwarf and the giant" (provided by my friend Pierre) has continued to haunt me. Behind this image, I believe I detect an archetype of considerable strength, which would be like the shadow, or one of the shadows, of the repression suffered in early childhood. Its role would be that of an outlet, and compensation, for the repression of the creative force, a repression long since internalized in that "unspoken conviction of powerlessness"... . In this presumed archetype, I believe I sense a powerful driving force behind acts of gratuitous violence, striking at those perceived as "giants", as bearers of untouched strength - acts triggered without any "cause" other than that of a **propitious occasion**, when the risk involved seems nil, or minimal.

Perhaps I've already said too much, even though in these lines I've just touched on a tenuous intuition that's not so far-fetched. insistent, alerting me to a job that needs to be done, and that lies ahead of me. For this work, Burial is just one of the materials, along with many others that come to me from my so-called □ "private" life. This is not the

p. 1229

instead of pursuing it, or just touching on it. It doesn't belong in notes intended for publication.

#### 18.7.4. (4) Paradise lost (2)

**Note** 182 (April 4) In this promised retrospective of what my reflection has taught me about others, my thoughts, as if in spite of myself, return insistently to my own person. For me, this is a good sign - a sign of my strong need to return to what is essential. It's from knowing myself that I gain an understanding of others, not the other way round. And on more than one occasion since I've been meditating, the preoccupation with "understanding others" has been a diversion from the essential task of getting to know myself.

Before deliberately coming back to myself (and against my impatience to reach the famous "period"! ), I'd like to include one more testimonial that came to my attention recently, concerning my friend Pierre. It's the only testimony of its kind I've heard since I left the mathematical scene. It sheds a very different light on my friend than those I know of elsewhere. It also serves as a timely reminder that reality is constantly more complex and richer than the images I try to conjure up for myself<sup>1025</sup> (\*).

The testimony in question is not direct. It's about the impressions of a (more or less fortuitous) meeting between a foreign mathematician and Deligne, which this colleague told (still hot, I presume) to my correspondent, who passed on the story to me in a letter. With the permission of my correspondent and the colleague (whom I'll call "Z" in the following) who gave him the account, I give here the translation of the part of the letter concerning this encounter. My correspondent assumes that the scene must have taken place in 1981 (NB that's also the year of the Colloque Pervers, a colloquium that had not been discussed between my correspondent and myself).

□ "... One day Z. had gone to Bures for a conference, and found himself there in a room ["la salle du thé" at the IHES, obviously] where tea was served, and where there were a lot of mathematicians. Then the door opened and Deligne entered the room. Monsieur Z. describes the scene quite vividly: he looked flabby, his arms were flailing, and there was a certain iso- lem around him. All the others seemed to be staring at him, a bit like a rare bird, with no

p. 1230

<sup>1025</sup>(\*) I don't mean to suggest that the effort we make (and that I constantly make myself) to form an image of reality, as "fi del" as possible, and to adjust this image to the fi le of "information" of all kinds that comes our way - that this effort is vain or sterile. On the contrary, it's a highly effective dialectic that puts us in touch with reality and enables us to "know" it. Only insofar as the image (burdened, by the nature of things, with an inertia of its own) remains entirely inert, fi gured, does it also become an obstacle to the apprehension of reality, or better put: an effi cient **means of** thwarting our faculties of apprehension, and of "evacuating" the knowledge we do have of reality.

that no one knew how to tell him anything. Z. was sitting a little apart, near the window, and Deligne, rather indecisive, sat down next to him. Z. wasn't sure what to say. Then the thought came to him to say simply, how extraordinary he found the set of ideas around "étale topology" etc., and the new ideas you brought. ["You", here and in the following, means me, Grothendieck, to whom my correspondent is addressing himself]. Immediately Deligne's eyes began to shine, he told him, yes, this is one of the best things there is in mathematics; and how beautiful it was, listening to your<sup>1026</sup> (\*) lectures. . . and he recounted: just think about this, and that... .. enumerating a lot of things where Z. didn't understand anything (according to what he told me himself), but he could see the enthusiasm, which had suddenly appeared in his interlocutor. And Deligne added: "What a pity, that you(\*) have withdrawn! He was sure that crystalline cohomology and many other things would not be in this rather re-barbed state, but would now be standing constructions just like stellar cohomology, if you<sup>1026</sup> (\*) had really tackled it again... . "

Two things struck me about this story. There's the sense of isolation, which seems to have hit Mr. Z hard. I'd be hard pressed to say whether this impression stems from a very particular moment in Deligne's life, or whether such isolation has come to permeate his relationships with all his fellow dogs. I've heard no other evidence of the latter.

The other striking thing, and also unique among the echoes that came back to me, was the sudden appearance of this enthusiasm, this warmth, at the mention of my name and a certain past. It was a past he had long since decided to declare null and void. And the roots too, which he had in this past. And in that past, too, there was still a freshness of childhood, that freshness he'd banished from his life as an "adult" <sup>p. 1231</sup> □ an important and admired man. It must have been part of the etiquette, around him, not to do allusion to his past, when he was just another student in love with a beautiful passion... . - nor in the home of the well-to-do man, surrounded by stylish furniture, is there any talk of modest, even laborious beginnings... ..

And now this stranger, sitting next to him by the greatest of coincidences, suddenly starts talking warmly, as if it were the most natural thing in the world, about something no one ever talks about (not in front of him, at least. . . )! Surely, it was as if the selective, staid atmosphere had suddenly vanished, and the warmth of a stranger awakened the same warmth in him, and - for the space of an instant - linked him once again to a distant, raw source forever forgotten and lost...

## 18.8. Discovering a past

### 18.8.1. (1) first breath - or the observation

**Note** 183 At last, I've come to the most personal part of this retrospective-balance sheet, which I started over a month ago. It remains for me to briefly review what this reflection has taught me **about myself**.

The first thing that reflection led me to discover was a certain **past** - my mathematical past, which I had never previously bothered to dwell on, even for a moment. Behind the apparent platitude of an unproblematic surface, I once again saw the depths of everything that is commonly overlooked, removed (as if by a well-aimed sweep) from the comfortable conscious image we're accustomed to forming of ourselves and our surroundings. Among the

---

<sup>1026</sup>(\*) As before, "you" here refers to me, Grothendieck.

In addition to the "burrs" (or sweepings. . . ) never examined, at least not in my life as a mathematician, there is the insidious, and sometimes pervasive, action of fatuity in the relationship to such of my friends. Right from the start, this fatuity had taken the form of a kind of mathematical elitism, which remained unspoken and of which I was totally unaware, so much so did my attitude seem to go without saying. This elitism (or "meritocracy", as Chevalley and Guedj called it) must have hardened over the years. It crystallized into the "sporting" attitude I came to discover towards the end of the "first breath" of reflection. Underneath its good-natured exterior, this attitude sanctioned a jealous possessive attitude towards what were perceived as "guarded possessions".

for myself, and for those I was pleased to welcome, given their brilliant qualities.

□ These very "boss" provisions do not, fortunately, exhaust the content of what was, between 1948 and 1970, my relationship to my friends, colleagues and students in the mathematical world, or to mathematics itself - far from it. Nevertheless, they constituted an insidious background note, which I never bothered to note until last year, in the first part (or "first breath") of *Récoltes et Semailles*. This gradual discovery culminates in the section "La mathématique sportive" (n° 40). This seems to me to mark the moment of a qualitative change in thinking. I felt it in the moment, like the **crossing of a pass**, which opened up a sudden escape into a new panorama. ...

With the hindsight of yet another year, I now see this first long period of my life as a mathematician among mathematicians, between 1948 and 1970, as a kind of **barter** of the "birthright" that belongs to me (as it belongs to everyone), to live fully (if I so choose) a particular and unique adventure, against the "lentil dish" of an identification (that I would have liked without reservation, without ever quite achieving it...) with an idyllic and fictitious "mathematical community", and at the same time dispensing comfortable advantages. . . ) with an idyllic and fictitious "mathematical community", at the same time dispensing comfortable advantages<sup>1027</sup> (\*). With this image, I don't pretend to have said everything about this period, which is certainly too rich to be encapsulated in a cookie-cutter formula. But the image does seem to capture an important aspect that first appeared in this first phase of reflection. This aspect reappears in the name "Fatuity and Renewal" that this part of Harvest and Sowing took on (after the fact).

The most personal and profound part of this first phase is formed by the last three "chapters"<sup>1028</sup> (\*\*) VI to VII: "Récoltes", "L'enfant s'amuse" and "L'aventure solitaire". In "Récoltes", I first reconnect with certain moments in my life (not just my life as a mathematician, this time) - moments charged with the power of renewal. It was as if, moved by some unknown force, by some secret, imperious voice, I sought to rediscover those same **innocent** dispositions', □ to cross the threshold that I still felt obscurely ahead of me. Although I couldn't have predicted it at the time, of course, I still had to make the discovery of a possessive attitude towards mathematics itself. I continued up a slope, unhurried and unhesitating, as if my feet were following an invisible path that only they "saw". I knew, without having to tell myself, that it was taking me where I needed to go, as little by little, step by step, the mists dissipated.

That's how I reached this new threshold in my journey, or **pass** rather:

". . . And as soon as I reached this point, I had the impression of someone arriving at a belvedere, from which he could see the unfolding landscape he had just traversed, of which at any given moment he could only perceive a fragment.

<sup>1027</sup>(\*) This is the ambiguity referred to in a previous b. de p. note (note (\*) on p. 1219).

<sup>1028</sup>(\*\*) Of course (and as I make clear in the Introduction to R et S), these "chapters", grouping consecutive sections linked by a common theme or by particular affinities, were introduced as an afterthought, once the writing of what was to be (only) the first part of *Récoltes et Semailles* had been completed. In *Fatuité et Renouveau*, I occasionally refer to them as "parts" of R and S (not to be confused with the five parts of "Fatuité et Renouveau" etc., in which all the thinking from February 1984 to the present day has been grouped).

portion. And now there is this perception of expanse and space, which is a liberation. ... "

As soon as I reached this sensitive point in my thinking, it deepened into a meditation on myself. Already the next day, I felt the need to introduce the image of the "boss" and the "worker", aka the child, an image that had become familiar to me two or three years earlier. But little did I know how useful it would prove to be in the reflection still to come, when for almost two months now I'd been thinking I was about to come to an end, only to get right back to my mathematical notes with "A la Poursuite des Champs"!

In the four sections that make up the "chapter" "L'enfant s'amuse", I'm back in touch with certain aspects and twists of my relationship with mathematics. I had already probed them at length some three years earlier (between July and December 1981), but had had ample time since to forget them. My aim this time is above all to put myself in a position to probe the meaning of my unexpected return to a long-term mathematical investment, and to find a "place" for myself between the two seemingly mutually exclusive passions that now dominate my life: mathematics and meditation.

This mutual "exclusion" of these two passions now seems less draconian than it did two years ago. In "A la Poursuite des Champs", mathematical reflection sometimes gives way, or even becomes the occasion, for a somewhat personal reflection, where my person, as a gifted being of sensitivity and feeling, of curiosity (not just mathematical) and destiny, is no longer entirely absent. And in the opposite direction, in this reflection on myself that is Récoltes et Semailles, this reflection even brings me back in touch with old mathematical loves, and becomes the occasion here and there for the beginnings of mathematical reflection<sup>1029</sup> (\*).

It's possible that the possibilities of coexistence, or even symbiosis, between these two different expressions of the drive for knowledge in me, must, by the very nature of things, remain rather limited. But it was clear to me, in any case, during last year's reflection (and indeed, already since the long meditation pursued three years before), that these two passions are by no means antagonistic in nature, nor even different in essence. In the last part of this reflection, "L'aventure solitaire", I try to pinpoint exactly how these passions differ, and the "adventures" they open up for me. It's during this interrogation that I discover an obvious fact, which I'd pretended to ignore all my life: that mathematics is "**a collective adventure**", and that my own mathematical adventure only takes on its meaning through its links to the wider collective adventure of which it is a part.

To tell the truth, I only touched on this fact in passing, in the "Lonely adventure" section, whereas my aim at the time was rather to put into words something that was well known to me on the other hand, and which I continued to have difficulty in fully accepting: that meditation, for its part, is a **solitary adventure**. This effort to formulate something "known" was certainly not in vain, far from it! It helped me to deepen this knowledge, while at the same time helping me to discover the obvious and new (to me at least) fact of the link that connects me to **another** adventure (from which at that moment I would have liked, or someone or something in me would have liked, to distance myself... ), the mathematical adventure, which is a collective one.

The stage is now set for me to get to the heart of my perplexities the very next day, in the section entitled "Observation of a division". First of all, it's the observation that the "boss's bet", even if he'd like to delude himself (as would be his nature. . . ), can only be a collective adventure.

- the only one likely to bring him substantial "returns". "The child who is alone by nature is lonely.

the lonely child who can attract an adventure no one else in the world wants, and an acquaintance,

<sup>1029</sup>(\*) (May 10) These "food for thought" have already borne fruit, renewing my understanding of certain themes that have been neglected for fifteen years.

tangible and often self-evident, but which he won't be able to share with anyone else. And that's where the "kid's preference" in **my** "company's" case now lies, quite unhappily at the whim of the "boss".

This led to the discovery of a **division** within me, **the boss-child division**. It's the first time I've made such an observation in a state of extreme attention and rigor. It's not a **decree** that I've formulated in accordance with this or that "way of seeing" or philosophy or whatever, and which claims to be more or less universally valid. It's a simple **observation**, the result of a careful examination of a very specific case, that of my modest self, at a certain stage of my development. Perhaps this division will disappear one day, without the boss having to stop doing what's necessary, while leaving the child-worker to work as he pleases. That's not my concern today, nor should it be. One day at a time...

(April 5) It's true that this division was revealed to me nine years ago, in a dream, through a parable staged with overwhelming force. It was two days after I had discovered meditation, this long-ignored power within me, at my disposal at any moment - and it was by getting to the bottom of the meaning of this dream that I rediscovered that in me which is not divided, **the other** in me, so long silent and invisible, "a very dear being, believed dead for a long life...". The new thing, the essential thing that appeared then, was **not** the division, which I knew only too well, nor what the dream revealed to me with such force about the nature of this division, incarnating itself in two familiar and beloved beings, neither of whom had a name and yet were **the same** - but it was this **reunion**, coming after four hours of intense meditation, like the intense labors of childbirth.

I knew then, and in the days and weeks that followed, that this reunion was not the end of the division. But thanks to them, I saw this division with new eyes - as something important, of course, but all in all "accessory" to another, more essential reality, that of an **undivided** unity,

indestructible, of that in me which I had rediscovered, and later recognized as "the child". This was present then in a very vivid and acute way. It became blunter in the years that followed have followed, in that knowledge of this "accessory" yet very real and tangible division has tended to be glossed over. While "the boss" had allowed himself to be drawn into "betting" on meditation (the famous "three-legged horse". . . ), he was keen to suggest (without having the audacity, or the awkwardness, to ever say so in plain English. . . ) that with meditation and all that, division was now a thing of the past. ) that, with meditation and all that, division was now a thing of the past, that there was no division at all, that there was barely a blunder here and a blunder there, but that it was almost as if there were none at all; just look at the kid-worker so happy to have a good time, and the boss-cake tiptoeing around so as not to disturb him-the real idyll, I might add! I wonder if last year's reflection, the one before the turning point (with the "sports mathematics"), especially where I'm doing a very unexpected retrospective on "my passions" (in the section of the same name, n° 35), isn't still a little in those tones, where the lighting forces a hint of pink... ...

In any case, this "observation of a division" put me right back in touch with a reality I'd tended to lose sight of for many years. At the same time, it gave me a new perspective, new eyes, on the division I had seen so clearly eight years earlier. I can say this without the slightest reservation or doubt, because I remember well that at the time of this "realization", there was no association with the reunion episode, and with what it had taught me about a certain division and its nature! This association didn't come to the fore until a short while ago, when I picked up the thread of the previous day's notes. This just goes to show the extent to which the content

double□cognition

. 1236

The "accessory" (and undesirable!) content of the knowledge that appeared during this episode, was retracted. This must have been all the easier, given that at the time, and after the crucial turning point of the reunion, there was no reflection on this content, and that the image (which emerged years later) of the "boss" and the "worker-child", perhaps best suited to expressing this content, was still lacking.

It now seems to me that it's this renewed "realization" of the division that represents the most important thing in our lives.

p. 1237 important thing I've learned about myself in this first part of Harvest and Sowing. This observation fits into a few lines of one of the shortest sections of that part of the reflection. We pour<sup>1030</sup>rait penser que si had it come to this, there might have been no need to go on for a hundred and fifty pages about the arcane manifestations of fatuity in my life as a mathematician. Nothing could be further from the truth, in terms of common sense. But it's also true that this "common sense" is in no way suited to apprehending the delicate and profound paths of a work of discovery, be it self-discovery, or the cruder<sup>1030</sup> (\*) work of mathematical discovery. I firmly believe that in this long reflection on Harvest and Sowing, everything comes in its own time and place, prepared and matured by all that has gone before.

## 18.8.2. (2) Second wind - or the survey

**Note** 184 (April 6) With this brief observation of a division, towards the end of March last year (a little over a year ago), I thought at first that I had completed the Harvest and Sowing reflection. Little did I know that five times as many pages were still to come! In the days that followed, I kept myself busy with other things, and my thoughts began to return to mathematical themes. However, one "small point" still lingers in the back of my mind. Beyond a perplexity that might have seemed purely a matter of detail, I must have had the vague feeling that I hadn't really got to grips yet with the forces at work in "tipping" the pattern towards a long-term mathematical investment. Or, if I had uncovered the essential springs, my understanding was still pale and fleeting, for want of having "laid" enough on the thing for it to penetrate further. This "last petit point" was to become the means by which I would return to what remained imbued with an impression of vagueness. This resumption of reflection took place in the section<sup>1030</sup>which was then (and for three more weeks)

p. 1238 which was supposed to close Récoltes et Semailles, and which immediately took on the name "Le poids d'un passé" ("The weight of a past"). This name expresses the unexpected discovery of the **weight** of my past as a mathematician, as well as the strength of the link that continues to bind me to the collective adventure. And yet, what I glimpsed that day was only the modestly-proportioned tip of an iceberg, the colossal submerged part of which would gradually appear, over the course of the months and the whole year that followed. ...

This section, which brings this first breath of reflection to a close, is at the same time like a start and a call for the second. This "weight of a past" is obviously rooted in my attachment to a work, and even more than to the finished work, to the attachment to ideas and visions whose fecundity and power I feel and "know" intimately, and of which I am more or less aware.

<sup>1030</sup>(\*) If the work of scientific discovery seems to me to be "cruder" than that of self-discovery, it's for two reasons. On the one hand, it involves only our intellectual faculties, i.e. an infinite part of our being (scientific work tends, moreover, to hypertrophy this part of our faculties, at the expense of the others and of the overall balance of the person, and ultimately to transform the latter into a kind of monster-computer. . . .) On the other hand, the inner resistances (opposed to the discovery of reality) brought into play by scientific work are often out of all proportion to those opposed to self-knowledge. This is also why the "scientific adventure" is rarely, if ever, an "adventure of truth" - an adventure, therefore, that calls on our capacity for humility and courage to accept an unwelcome truth, first from ourselves, and then from the outside world.

less confusingly and for years now, that they have been vegetating in an ungrateful and arid land, secretly and insidiously hostile. ... So this reflection, "The Weight of a Past", which reminds me of both the work and my links to it, becomes the occasion for a long note in which, for the first time since my "departure", I express myself on the subject of this work and the fate that has befallen it. What had been felt in a vague way for ten or fifteen years, finally takes shape and manifests itself in words, sometimes hesitant to come, and which, once written in black and white, clearly tell me a message that until then I had avoided hearing. Later, given the length of this note written in one go, I subdivided it into two, with the names "My orphans" and "Refus d'un héritage - ou le prix d'une contradiction" (n° s 46,47).

This double note can be seen as the kick-off for the reflection on the Burial<sup>1031</sup> (\*). This was followed three weeks later, on April 19, by the emotional response to the "me- morable volume" LN 900, consecrating the exhumation of the motifs under the leadership of the "new father" Deligne. This "second wind" of reflection continues intensely until late May - mid-June, when it takes on a new dimension. end (just as I think I'm about to put the period again, the real period!) by □l' épisode-disease<sup>1032</sup> (\*).

p. 1239

This second wind is not, strictly speaking, a reflection on myself or my past, but rather an "investigation" into the Burial that I had just discovered, as well as an effort to "digest" as best I could and as I went along, the obvious and yet (given, no doubt, my ineradicable naivety!) mind-boggling, unbelievable facts. If it taught me anything about myself, it was the strength of my attachment to my past and my work. I was touched to the core, seeing the work torn to shreds, some pieces for the dustbin, others to be laughed at, and still others shamelessly appropriated, like trifles for all to see... .

I knew then that I wasn't "off the merry-go-round" yet, as much as I'd believed in the exultation that had followed the crossing of a certain "pass" and the vast panorama that had then opened up before me<sup>1033</sup> (\*\*)! Or to put it another way, I was then able to measure the full **weight of** that past, and the strength of the egotistical mechanisms that continue to bind me to it. It was a great surprise!

Yet there's something else about myself that I'm discovering in this second phase of reflection, which completes what I'd learned in the first. In the latter, I had uncovered above all a certain "other side" of an attitude of fatuity within myself, through attitudes of **exclusion** towards such colleagues or even friends whom, for one reason or another, I didn't place in the world of the "elite" of which I myself felt part (tacitly, of course!). **The other side of the** same coin is an attitude of **complacency** and ambiguity in my relationship with younger mathematicians (and, in particular, with my students), whom I had co-opted as being, so to speak, part of "my world"; either because of their brilliant means, or simply because I had accepted them as students and they were therefore perceived by me as being under my "protection". I'm beginning to put my finger on this attitude in the note "L'ascension" (n° 63') of May 10, followed by the note "L'être à part" (n° 67') of May 27, one and the other devoted to my relationship with my young and □brilliant friend Pierre. This reflection is deepened in p.

1240

note "L'ambiguïté" (n° 63") of June 1, in which she focuses on my relationships with my students in general. This is where

<sup>1031</sup>(\*) Unfortunately, this circumstance does not appear in the table of contents for Burial I (or The Robe of the Chinese Emperor), where the double-note in question forms Cortège II (The Orphans), and not Cortège I (which is The Posthumous Pupil). This is due to the sequence of references to the "notes" (n° s 44 to 47) within the final section "Le poids d'un, past" (n° 50) from Fatuity and Renewal, the section on which these notes are intended to comment.

<sup>1032</sup>(\*) On this episode of illness, see the two notes "The incident - or body and mind" and "The trap - or ease and exhaustion" (n° s 98,99).

<sup>1033</sup>(\*\*) This exultation is expressed in the section "Fini le manège!" (n° 41), and is muted five or six weeks later, in the note "Un pied dans le manège" (n° 72).

that I'm finally uncovering a certain ambiguity which, because it had never been spotted by me and examined, had followed me into recent years. I was recently confronted with this ambiguity again, in a slightly different context, in the sub-note "Eviction (2)" (n° 169<sub>1</sub>) (in the second part of the sub-note, dated March 16). In it, I note that the eviction of my person from the SGA seminar (which represents the sum total of ten years' investment in my life)<sup>1034</sup> (\*), an eviction carried out mainly by some of my closest former students, is simply the natural outcome of an ambiguous attitude I had taken pleasure in maintaining with them, concerning their rightful place and mine in the vast SGA work, in which one or other of them had invested a year or two.

### 18.8.3. (3) third wind - or the discovery of violence

**Note 185** It remains for me to review what the "third breath" of reflection has taught me about myself, beginning last September 22 (after the end of the illness-episode) and about to come to an end<sup>1035</sup> (\*\*). Above all, I'm referring to the reflections in "The key to yin and yang", which I consider to be the most personal and profound part of Harvest and Sowing. Without any deliberate intention, it is my person and my relationship to the world that is most often at the center of attention. When this attention seems to wander from time to time, to seemingly more general themes, or to linger on the person of my friend Pierre, it always returns to the center, however, to the actor-observer, the one who feels, perceives, questions and probes, as if drawn by an invisible force. Above all else, and without wishing to be, it is a **meditation on my life and myself**, approached through an unexpected angle: that of the funeral.

This is also the part of the reflection that seems to me the richest, the one through which I learned the most. Many "known" things have situated themselves in relation to each other, and things that were only glimpsed or hinted at, or "known" but neglected, drowned in the confused penumbra of the tout-venant, began to emerge from the shadows and reveal both their weight and their contours. It was like a new opening, an invitation to a great new departure into the unknown - at a time when it had seemed that this famous "long-term mathematical investment" was going to put an end to the work of self-discovery for years to come. ...

It's not my intention here to review in detail the various stages of this long reflection, nor to make a "list" of all that it has taught me. Instead, I'd like to say a few words about what seems to me to be the most important for my self-knowledge, as material for a maturing process that continues day by day, month by month and year by year.

This reflection began in the spirit of a "parenthesis" I was opening (for the space of a note or two at the most. . . ) to get the reader (and myself) "into the swing" of a dialectical yin-yang (or "feminine-masculine") vision of things. The reason for opening such a parenthesis was the need to situate, in terms of an intuition of yin and yang, a striking impression that

<sup>1034</sup>(\*) For the latest episode in this eviction, see the note "Les Pompes Funèbres - "im Dienste der Wissenschaft" (n° 175).

<sup>1035</sup>(\*\*) I'm setting aside here the fifth part of R et S, which was originally a "digression" within the Funeral Ceremony (or even, within "The Key to yin and yang"). This part has not been completed at the time of writing, and is not included in this retrospective on Harvest and Sowing.

(June 22) Over the following weeks, it became clear that the part of the reflection entitled "The Four Operations" (or Burial (3)), following "The Key to Yin and Yang", constitutes a "fourth breath" of Harvest and Sowing, which is not included in this final retrospective.

had given me the opportunity to examine a certain "Funeral Eulogy"<sup>1036</sup> (\*): that of a deliberate "reversal" of roles in an original yin-yang relationship. This "parenthesis" opens on October 2. It was only on November 10, after a hundred pages of close reflection on the interplay of yin and yang in my life in particular and in existence in general, and (finally) in the game of mathematical discovery, that the moment finally seemed ripe to **formulate** at least<sup>1037</sup> (\*\*) this association of ideas that had appeared six months earlier, in the expectation of being able to fathom it in full knowledge of the facts, fourteen days later still<sup>1038</sup> (\*\*\*). (And it was almost two months later, on January 14, that the famous parenthesis on yin and yang finally closed, I didn't even realize for a while that it had already closed... . )

□Very quickly and without having sought it or foreseen it, it is "the conflict" in human life and in the person that p.

1242

takes center stage. The egotic energy suddenly and powerfully mobilized by the discovery of the Burial, came there as an unexpected supporting force, to confront me once again, and on the spot, with the "mystery of conflict" that for years had been calling out to me<sup>1039</sup> (\*). Over the past few years, this mystery had gradually come to the forefront of things I'd wanted to probe and understand, as far as I could, without ever having "taken the plunge" and thrown myself fully into it. ...

Little by little, in the course of my reflection, I came to realize what, in my life, has been the "hard core", the formidable center of this mystery, the very heart of the "enigma of Evil": violence that can be called "gratuitous", or "causeless", violence for the sheer pleasure, one might say, of wounding, harming or devastating - a violence that never says its name, often hushed, under an air of innocent, affable ingenuity, and all the more effective at touching and ravaging - the "claw in the velvet", delicate, vivid and merciless. . . It is this violence that our attention eventually turns to, in the course of the reflections pursued in the suite of notes "La griffe dans le velours" (n° s 137-140), and it too remains the focus of attention right up to the end of the Clef. It again forms the climax, in the final note evoking the "endless chain" of karma, passed down from parents to children and from children to grandchildren, from generation to generation since the dawn of time.

This is the first time in my life that I have come face to face with the mystery of violence "without hatred or mercy". - a violence deeply rooted in human life, and which has left an indelible mark on my life since my youth. It's also the first time I've noticed this imprint on my being. At the same time, it's also the simple fact of **the existence** of this violence, of its fearsome omnipresence, in my own life as well as in the lives of others<sup>1040</sup> (\*\*). This simple fact alone also contains the seeds of an **acceptance** of this formidable fact. It is in this realization, perhaps, that lies the most important thing I□ve learned (or at least **begun** to learn), in the course of the entire Harvesting and sowing.

p. 1243

This is not the culmination of a thought process. Rather, it's yet another first step, taking me beyond a threshold into the unknown. For my development and my maturation, this humble step seems to me of greater significance than the embryonic "answers" I glimpsed (in the days that followed) to the question of the "**cause**" of the "causeless violence"<sup>1041</sup> (\*). This question itself only takes on its full meaning, which is far more significant than a simple question of "psychic mechanics", once it has been answered.

<sup>1036</sup>(\*) For this "Funeral Eulogy" (with its skilfully measured and administered compliment. . . ) see the two notes of this name (n° s 104, 105), as well as the note "Les joyaux" (n° s 170(iii)) which gives a partial summary.

<sup>1037</sup>(\*\*) In the note "Le renversement (3) - ou yin enterre yang" (n° 137).

<sup>1038</sup>(\*\*\*) At the beginning of the note "Patte de velours - ou les sourires" (n° 137).

<sup>1039</sup>(\*) This "interpellation" began to be perceived especially since my long meditation on my parents, which continued between August 1979 and March 1980.

<sup>1040</sup>(\*\*) This observation constitutes the high point of the reflection pursued in the note "Without hatred and without mercy" (n° 157).

<sup>1041</sup>(\*) See note of the same name (n° 159).

the very existence and scope of the fact being investigated.

Some will say that I'm getting off the subject, that the observation of a general psychological fact (or that I claim to be such), concerning each and every one of us, falls within the realm of objective knowledge reserved for scientific disciplines (such as psychology, psychiatry, sociology or whatever), that it's not within the realm (felt to be vague and impalpable, if not entirely far-fetched) of the famous "self-knowledge". But I see (not vaguely and impalpably, but as clearly as a familiar and patent mathematical fact. . . ) that, apart from self-discovery, such a statement loses its living meaning - it loses what makes it anything other than an exercise in philosophical-psychological style, than the development of a "thesis" (very interesting indeed and all that. . . ). This observation in itself is a **discovery**, an intimately personal discovery that no one in the world can make in my place, and that I cannot make in place of any other person in the world. This discovery is a step, the last one or so, in a journey of self-discovery. It situates me in relation to something important, something dreadful, something that has left its mark on me and that I had hitherto insisted on neglecting, as if it were by some kind of particular misfortune (perhaps due to some peculiarity or other in my modest person) that I have seen myself exposed to it throughout my life, and that I have seen others exposed to it or inflicted by it, if only I took the trouble to open my eyes and look around me.

It's no coincidence, surely, that right from the start of this reflection on violence, I've been thinking in terms of violence.

I was led, by the very inner logic of reflection, to look back (also for the first time in my life) on the few cases I can remember where it was I myself who ☐ was subjecting others, and without there think twice about this "beyond comprehension" violence<sup>1042</sup> (\*). The point of this comeback is not that it gives me an opportunity to beat myself up (and in public, no less) - something I have entirely failed to do. The point is that it has opened a door to a deeper understanding of violence - a door that is now mine to cross, at a time of my choosing,

p. 1244

#### 18.8.4. (4) La fi délité - or feminine mathematics

**Note** 186 This is what I consider to be the most important part of the journey of self-discovery. This final phase of the yin-yang reflection, centered on violence, continues throughout the last four parts: "The claw in the velvet", "Violence - or the games and the sting", "The other Self" and "Conflict and discovery - or the enigma of Evil", from December 7 to January 14 (which represent just over a third of the Key).

Looking back, it seems to me that the main role of the previous eight parts of the Key is to have finally brought me to this crucial point. Many of the things I develop in this preliminary part are things I've been familiar with for years, and yet which I had to "remind" to enable a "new" reader to follow, and to give the reflection an internal coherence, which might otherwise have been lacking, or apparent only to me. At times, the style feels like the inner disposition of someone who can't wait to get these reminders over with, so as to finally get to the "heart of the matter" - whereas often these so-called reminders were of a far greater scope, and worthy of my putting some thought into them, than the "heart" I was in such a hurry to get to (and which, hurry or not, I didn't get to until over a month later... ). These dispositions seem to me to be particularly noticeable in the three consecutive parts "The Couple", "Our Mother Death" and "Refusal and Acceptance". Even there, it's true, as I got back in touch with things that were supposed to be "known", I couldn't help but renew my acquaintance at the same time,

---

<sup>1042</sup>(\*)See the note "La violence du juste" (n° 141), which follows the "La griffe dans le velours" section of the Key.

and in a sometimes new light - even for things as impersonal, if at first sight, as the inventory of those "doors to the world" that are each group of yin-yang couples (or "keyholes") linked by immediate affinities.

But it's with the next three parts (which also precede the last four, focusing on the theme of violence) that I once again □ tackle hitherto unexplored shores: "Yin mathematics and p . 1245 yang", "The reversal of yin and yang", "Masters and Servants".

It was in the first of these parts that the "big surprise" took place, which was to shed new light on the meaning, or at least a certain meaning, of Burial. It's about the fact that in my approach to mathematics, and more generally, in my spontaneous approach to discovering the world, the basic tonality of my being is **yin**, **"feminine"**. To put it another way, while the conditioned structure of the ego, the "boss" of my business, is yang (not to say, "macho" with a zinc strand), my original nature, the "child" in me (who is also the worker who shapes what the child discovers at play. . . .) is predominantly "feminine". ) is predominantly "feminine". And it's not this particularity alone that distinguishes my personal "style" of approach to mathematics from that of anyone else. It seems to me, in fact, that even among mathematicians, it's not that uncommon for this original background note (or "dominant") to be yin. What's exceptional in my case (it seems to me), however, is that in my approach to discovery and, in particular, in my mathematical work, I've been fully faithful to this original nature all my life, without any desire to make alterations or rectifications, either by virtue of the wishes of an inner Censor (who, in any case, has never seen anything but fire, so far would one be from suspecting a "feminine" sensitivity and creative approach in a "man's" business like mathematics!), or out of a desire to conform to the canons of good taste in force in the outside world, and more particularly, in the world of science. There's no doubt in my mind that it's above all thanks to this fidelity to my own nature, in this limited area of my life at least<sup>1043</sup> (\*), that my mathematical creativity has been able to unfold fully and without hindrance, like a vigorous tree, firmly planted in the ground, unfurling freely to the rhythm of nights and days, winds and seasons. And so it has been, despite the fact that my "gifts" are rather

modest, and that the beginnings were by no means auspicious<sup>1044</sup> (\*).

p. 1246

As I make this unexpected observation about my approach to mathematics, in the note "La mer qui monte. . . ." (n° 122)<sup>1045</sup> (\*\*), it comes as a kind of unexpected curiosity, a little "on the fringe" of my life, where relationships with others all bear the mark of my yang and superyang options. It's only in the continuation of this reflection, centered on the dynamics of conflict, and on the occasion of a return to the

---

<sup>1043</sup>(\*) As I've had occasion to say over and over again in the course of R and S, one of the two strongest egotistic forces that dominated my life from the age of eight (and until 1976, when I was forty-eight), was the repression of the "feminine" traits in me, to the benefit of the traits felt to be "virile". It was only during the "Key to yin and yang" reflection that I realized that this repression was not exercised in my mathematical work (nor, later, in meditation, or work of self-discovery). The original "feminine" dominance of my being was able to have a field day, in an activity generally perceived (and rightly so) as "virile" par excellence! (On this subject, see the note "The most 'macho' of the arts," n° 119.)

<sup>1044</sup>(\*) If I speak of "modest gifts", it's in no way out of false modesty. It's something I've seen again and again I was still in contact with brilliant mathematicians who were incomparably quicker than I was to grasp the essentials and assimilate new ideas, as well as in working relationships with anonymous students with no serious mathematical background, but whose curiosity and mathematical inventiveness were momentarily aroused.

I talk a little about my "beginnings" (at least, the beginnings of my contacts with the world of mathematicians, in 1948) in the section "The welcome stranger" (n° 9). It was three years earlier, however, in 1945, that my "life as a mathematician" began, with most of my energy devoted to mathematical research. Until around 1949 or 1950, the

The prospects for me, as a foreigner in France, to find a livelihood as a mathematician, however, seemed most problematic. In the event that such a possibility didn't present itself, I planned to learn carpentry, as a livelihood that might be to my liking.

<sup>1045</sup>(\*\*) See also the later note "The arrow and the wave" (n° 130).

It's now that I realize just how much my fellow mathematicians' relationship with me, and above all with my work, has been marked by this unusual peculiarity, bringing into play reflexes of reserve (if not rejection) in the face of a style of approach obscurely felt to be "out of place" (not to say unseemly). Such reactions were common in my early days in the mathematical world, but tempered in those clement times by the atmosphere of respect for others that prevailed at the time, at least in the mathematical circles where I had the good fortune to land. Later, they had to be suppressed without further ado, in view of "the power of Grothendieck's results" (to quote a letter from Borel to Mebkhout, in which these "reservations" are evoked). On the other hand, they have become the rule, and are sometimes at ease behind a certain discretion of tone (which remains *de rigueur*) since my departure from the mathematical scene, while the respect of yesteryear has eroded and disappeared a long time ago, and the person concerned (supposedly dead and buried) is no longer present to give the reply... .. This unforeseen aspect of l'Enterrement, as the symbolic burial of the "mathematical feminine" in my modest person, is probed in the two notes "La circonstance providentielle - ou l'Apothéose" and "Le désaveu - ou le rappel" (n° s 151, 152), from December 23rd and 24th, right in the middle of the meditation on violence.

□ There

is one last aspect of myself that I would like to mention again, which came to light while writing The

Key to the

yin and yang, in the last of the parts quoted, "Maîtres et Serviteurs" (which immediately precedes the turn of thought begun with "La griffe dans le velours"). It's about the "service impulse", and the leading role it has played in my choice of investments in mathematics and as a driving force at work in vast, interminable foundational tasks, which no one else after me has yet found the courage (or the humility. . . ) to take up and pursue. This aspect, present in me with exceptional strength, is eloquent testimony to the "feminine" dominance of my original nature, which has preserved itself (or even taken refuge . . . ) in mathematical activity (where no one would have the idea of going to look for it . . . ).

It occurs to me at the moment that it's even possible that this impulse contributes its part, of a non-egotistical nature this time, to this "shift" that has taken place in favour of intense mathematical activity, pushing the work of meditation into the background, for an indeterminate period of time. The latter, by its very nature, is solitary work, work which (it seems to me), unless we are deluding ourselves, cannot be seen as an investment in the service of all, or of some "ideal community of beings eager to know". It would seem, then, that there is a deep-seated impulse, distinct from the egotistical desire for confirmation or approval, an impulse expressing a person's deep ties with the species of which he or she is a part, which must be frustrated in long-term meditation work, as I understand it. And this is perhaps another cause, in addition to those (powerful enough on their own) that come from the structure of the ego (the dispositions of the "boss", in other words), which makes such work seem such a rare thing, that I'm not sure I've ever come across any trace of it in another person.

## 18.9. De Profundis

### 18.9.1. (1) Gratitude

**Note** 187 (April 7) I think I've come to the end of this retrospective-balance sheet, on what the whole Harvest and Sowing reflection has taught me. I have only excluded from this retrospective the fifth part of Harvest and Sowing<sup>1046</sup> (\*), which has not yet been completed. It began as

<sup>1046</sup>(\*) (June 22) And also, the fourth (which I'm currently writing)! See b. de p. note (\*\*) page 1240.

a "digression" in the "Key to yin and yang", a digression that eventually extended over a whole month, and materialized in a hundred pages of "reading notes" on C.G. Jung's autobiography. Like the end of this digression was still not clearly <sup>en</sup>vue, I put it off until later. I was especially looking forward to p. 1248 to bring the Burial to a successful conclusion, so that it can be written, typed, printed and sent to right and left, finally - and let there be no more talk about it!

I have a feeling that this fifth part will shed some unexpected light on this same En- terment - but yes! - through my planned examination of Jung's relationship with Sigmund Freud, who for years had been a master to the young Jung, still seeking his own path. On first reading the chapter (of the autobiography) devoted to this relationship, I saw nothing but fire - then a number of unusual things caught my attention, I went back over some of them, I went through the chapter again. Visually, this relationship is fraught with ambiguity, which Freud himself seems to have sensed strongly, and which Jung likes to ignore completely (as the first seminarist would do. . . ), blaming Freud's malaise solely on his "neurosis" (which he takes pleasure in describing in vivid colors, perhaps even a little too vivid to be entirely true. . . ). In any case, various associations have come to mind with my friend and (also) non-student Deligne's relationship with me, associations which I intend to follow up and perhaps delve into a little. I have a feeling that what happened with the Burial, in terms of the psychic mechanisms involved, is by no means a unique and atypical set of circumstances - quite the contrary! And I have a hunch that Jung's relationship with Freud may well provide further insights in this respect.

But for me, now at least, this fifth part (which may be called "Jung - or the bogging down of an adventure"<sup>1047</sup> (\*)), it's no longer the Burial, even if it has come out of it - and I'd even go so far as to say: it's no longer Harvest and Sowing! It's "I'Après" - as are the echoes of all kinds, including the green and unripe ones, that will come back to me when I send you the three parts "Fatuité et Renouvellement", "L'Enterrement (I) - ou la robe de l'Empereur de Chine", and "L'Enterrement (III) - ou les Quatres Opérations"<sup>1048</sup> (\*\*). It's going to be a thousand pages or more, once this part's finished being typed. to the net - that's quite a lot! One day at a time...

□ This hurry to get it over with and "send it on" is undoubtedly, above all, the hurry of the warhorse who smells

1249

powder, eager to get into the fray<sup>1049</sup> (\*). But perhaps, more deeply, there's also a desire to see a certain past detached from me. These "thousand pages" are a striking materialization of the **weight** of that past - and to see this work completed, right down to the last of the housekeeping tasks (the very last of which will no doubt be sending Récoltes et Semailles to the one hundred and thirty recipients already on my provisional mailing list... <sup>1050</sup> (\*\*)), it also seems to me, almost instinctively, to be the moment when I will have **shed** this weight. An illusion? Only time will tell...

And so I come to the "final agreements" before that famous "period", which for over a year now I've thought I saw before me, and which day by day, week by week, month by month has found itself pushed back, by the influx of the unforeseen claiming its place.

<sup>1047</sup>(\*) Thinking of writing "enlissement", I found myself writing "enterrement" instead. There's no guarantee that the new name suggested by this slip of the tongue: "Jung - or the burial of an adventure" won't be just as appropriate, or even more to the point, than the one I'd intended.

<sup>1048</sup>(\*\*) Do not confuse the fourth part of Harvest and Sowing, subtitled "The Four Operations", with the series of notes grouped under this name, which appear in this part (notes n° s 167'-176 ).<sub>7</sub>

<sup>1049</sup>(\*) Such provisions are already covered in the final section "The weight of a past" (n° 50) of "Fatuity and Renewal", in a slightly different light (where the "warhorse" is replaced by the bull, chasing a piece of cloth). red that you "wave in front of your nose" . . . ).

<sup>1050</sup>(\*\*) The famous "weight" will then become even more "striking", with two hundred thousand pages (200 X 1000) instead of one thousand!

What's left to say in these final agreements? There's gratitude, expressed in "thanks". This reflection is the fruit of solitude, and yet I have been helped in many ways.

The most obvious help came from Zoghman Mebkhout, in many ways too: by the patience with which he got me "into the swing" of philosophy around the theorem of the good God-Mebkhout; by the trust he showed me by sharing with me, against all odds, the difficulties and setbacks he experienced in his dealings with those who were my students ; by the help he gave me in finding my way through a dense mathematical literature, with which I had lost touch; finally, by the friendly and unreserved interest he showed, from the moment he became aware of it, in this work in which he saw me engaged, and in which he especially (I believe) perceived and welcomed the **testimony**.

p. 1250 □ 1051 I'm also grateful to Pierre Deligne, who came to see me and get to know me better. sance (last October) of the then-written part of L'Enterrement, and to let me know about his comments (\*). This visit also helped me in more ways than one.

Finally, I was helped by the good will and friendly atmosphere I found among the USTL secretaries who did the typing: Mlle Boulet, Mme Boucher, Mlle Brun, Mme Cellier, Mlle Lacan, Mme Mori. Two of them took time out of their busy schedules to do some of the typing, without accepting any payment for their work - a gesture that touched me deeply. It was Mlle Lacan, on the other hand, who single-handedly typed the entire second half of my notes for Récoltes et Semailles, with exemplary care and efficiency. To each and every one of them, I am happy to express my gratitude.

I'm also thinking of all those who, at times during the course of my work, have seemed to disturb it and my peace of mind, often in unwelcome ways<sup>1052</sup> (\*\*). Surely, these "disturbances" themselves, which at times have tested me and some of which still leave me with the residue of sadness, also have their role to play in my work, and to bring me a message that it's up to me to listen to and assimilate. When sadness or resentment resolve themselves into gratitude, I'll know that this message has been received... .

## 18.9.2. (2) L'amie

**Note** 188 For almost a year now, these ultimate chords of burial have had their own name: De Profundis! In the Introduction (I 7, "L' Ordonnancement des Obsèques") I went even further, announcing (imprudently perhaps. . . ) that it is the "complete satisfaction" of the deceased which forms "the final note and the ultimate chord of the memorable Burial". I was excusable at the time for making this prognosis (as if it were a thing of the past) - at the time of writing (in May last year) it did indeed seem a very short-term prognosis, as I thought I was on the verge of reaching precisely those final chords of the "De Profundis".

p. 1251 □ It's true that, in a far more acute way than last year (when the "second wind" of reflection was about to come to an end), I'm realizing how far I am from having really "done the trick" of the Burial, apart from the material facts alone (which I seem to "hold" to my full smugness<sup>1053</sup> (\*)). If it's true, as it seemed to me at times, that to understand the Burial is also to "understand the

<sup>1051</sup>(\*) For this visit and the details Deligne gave me, see the two notes (n° s 163, 164) forming the "Les derniers devoirs (ou la visite)" section of L'Enterrement (III).

<sup>1052</sup>(\*\*) These "disturbances" are alluded to here and there in the notes of recent months. See, in particular, the note "Le messager (2)" (n° 181).

<sup>1053</sup>(\*) (May 10) However, after these lines were written, more than a month went by "fitting in" newcomers as best we could. facts, in a score of sub-notes added in extremis!

conflict", it's likely that the time left to me won't be enough to do this "tour" - not in depth, at least.

So I can say that I'm writing this final note in a very different frame of mind from the one I was in when I wrote Introduction à l'Enterrement. Does this mean that I'm ending this reflection without that feeling of "complete satisfaction"?

I don't think so. As soon as a vision deepens, the work that gave rise to the vision and prepared for its deepening, and which may have seemed "completed", turns out to be **unfinished, with the** appearance of something "beyond" what had been done. Yet the **meaning of** work, and of the satisfaction or dissatisfaction it gives us, does not lie in its completion, nor does it depend on whether or not the work is destined to be completed. The meaning of work is in the work itself, it's in the **present moment** - in the dispositions in which we do it, in the love we put into it (or in the absence of love. . . ).

- not in some hypothetical future beyond our reach.

In March last year, before I had even discovered Burial, I wrote in the introduction (I 1, "Dream and Fulfillment", p. iv):

" . . . I leave this work with the complete satisfaction of someone who knows he has completed a job. There is nothing, however 'small', that I have avoided, or that I would have cared to say and would not have said, and that at this moment would leave in me the residue of a dissatisfaction, of a regret, however 'small' they may be."

I know now that this work, which I thought was "finished", is not yet, and may never be. But I also know that this is, all in all, an incidental thing. This "satisfaction complete", which I felt strongly at the very moment I was writing these lines that attempt to define it.

as closely as possible, she followed me throughout the writing of Récoltes et Semailles. She's an old friend of mine, who

p. 1252

had already accompanied me throughout my life as a mathematician, letting me know in a low voice that I was on the right track. I found it again later, in my meditation work - it's the same.

When I stop hearing it, the work loses its meaning. That's why his voice is so precious to me, and why I take great care in my work never to stray from it. It's because of this that work has been a source of joy throughout my life, in the "complete satisfaction" of those who give their all to it.

It has been no different in the work that is coming to an end - the work that is "**Harvest**", and at the same time "**Sowing**".
