| <b>Presentation of Themes or PRELUDE IN FOUR MOVEMENTS</b>            | <b>23</b> |
| <b>1. En Guise d'Avant-propos</b>                                     | <b>27</b> |
| <b>2. A walk through a work or the Child and the Mother</b>           | <b>31</b> |
| 2.1. The magic of things .....  | 31        |
| 2.2. The importance of being alone .....                              | 34        |
| 2.3. The inner adventure - or myth and testimony .....                | 36        |
| 2.4. The tableau de mœurs.....  | 37        |
| 2.5. The heirs and the builder .....                                  | 38        |
| 2.6. Point of view and vision .....                                   | 40        |
| 2.7. The "big idea" - or the trees and the forest.....                | 42        |
| 2.8. Vision - or twelve themes for harmony .....                      | 44        |
| 2.9. Form and structure - or the way of things .....                  | 47        |
| 2.10. The new geometry - or the marriage of number and size.....      | 48        |
| 2.11. The magic fan - or innocence .....                              | 50        |
| 2.12. Topology - or surveying the mist .....                          | 52        |
| 2.13. Les topos - or the double bed .....                             | 54        |
| 2.14. Mutation of the notion of space - or breath and faith.....      | 56        |
| 2.15. All the king's horses.....                                      | 58        |
| 2.16. Patterns - or the heart within the heart .....                  | 58        |
| 2.17. Discovering the Mother - or both sides .....                    | 61        |
| 2.18. Child and Mother .....  | 63        |
| <b>Epilogue: Invisible circles .....</b>                              | <b>65</b> |
| 2.19. Death is my cradle (or three kids for a dying man) .....        | 65        |
| 2.20. A peek at the neighbors across the street.....                  | 66        |
| 2.21. "The unique - or the gift of solitude .....                     | 69        |
| <b>3. ONE LETTER</b>  | <b>73</b> |
| 3.1. The thousand-page letter.....                                    | 73        |
| 3.2. Birth of Récoltes et Semailles (a lightning retrospective) ..... | 74        |
| 3.3. The death of the boss - derelict building sites .....            | 76        |
| 3.4. A funeral wind. ....   | 78        |
| 3.5. The trip .....   | 81        |
| 3.6. The shadow side - or creation and contempt.....                  | 83        |

|   |                |
|---|----------------|
| 3.7. Respect and fortitude .....  | 85             |
| 3.8. "My nearest and dearest - or connivance .....                                | 87             |
| 3.9. Counting.....  | 90             |
| 3.10. Four waves in one movement .....  | 92             |
| 3.11. Movement and structure.....   | 95             |
| 3.12. Spontaneity and rigor.....  | 98             |
| <b>Epilogue en Post-scriptum - or Context and Preliminaries of a Debate .....</b> | <b>100</b>     |
| 3.13. The bottle spectograph.....   | 100            |
| 3.14. Three feet in a dish.....   | 101            |
| 3.15. Gangrene - or the spirit of the times (1).....                              | 104            |
| 3.16. Amende honorable - ou l'esprit du temps (2).....                            | 105            |
| <br><b>4. Introduction</b>  | <br><b>109</b> |
| 4.1. (I) The five-leaf clover .....   | 109            |
| 4.1.1. 1. Dream and fulfillment .....   | 109            |
| 4.1.2. 2. The spirit of a journey.....  | 111            |
| 4.1.3. 3. Compass and luggage.....  | 113            |
| 4.1.4. 4. A journey in pursuit of the obvious.....                                | 114            |
| 4.1.5. 5. A welcome debt.....   | 115            |
| 4.2. (II) An act of respect .....   | 116            |
| 4.2.1. 6. Burial .....  | 116            |
| 4.2.2. 7. Funeral arrangements.....   | 118            |
| 4.2.3. 8. The end of a secret .....   | 119            |
| 4.2.4. 9. Stage and Actors.....   | 120            |
| 4.2.5. 10. An act of respect.....   | 121            |
| <br><b>I. Part One: FATUITY AND RENEWAL</b>                                       | <br><b>123</b> |
| <br><b>5. Work and discovery</b>  | <br><b>127</b> |
| 5.1. (1) l'enfant et le Bon Dieu .....  | 127            |
| 5.2. (2) Error and discovery .....  | 128            |
| 5.3. (3) Les inavouables labeurs.....   | 129            |
| 5.4. (4) Infallibility (of others) and contempt (of self).....                    | 131            |
| <br><b>6. The Dream and the Dreamer</b>   | <br><b>133</b> |
| 6.1. (5) The forbidden dream .....  | 133            |
| 6.2. (6) Le Rêveur .....  | 135            |
| 6.3. (7) The Galois legacy .....  | 137            |
| 6.4. (8) Dream and demonstration.....   | 138            |
| 6.5. (9) The welcome stranger .....   | 139            |
| 6.6. (10) The "mathematical community": fiction and reality .....                 | 142            |
| 6.7. (11) Encounter with Claude Chevalley, or: freedom and good feelings.....     | 143            |
| 6.8. (12) Merit and contempt.....   | 145            |
| 6.9. (13) strength and thickness .....  | 147            |
| 6.10. (14) The birth of fear .....  | 150            |

|   |            |
|---|------------|
| 6.11. (15) Harvesting and sowing.....                             | 152        |
| <b>7. The double face</b>   | <b>153</b> |
| 7.1. (16) Marshes and first rows.....                             | 153        |
| 7.2. (17) Terry Mirkil.....                                       | 154        |
| 7.3. (18) Vingt ans de fatuité, or: the tireless friend.....      | 155        |
| 7.4. (19) The world without love.....                             | 156        |
| 7.5. (20) A world without conflict?.....                          | 158        |
| 7.6. (21) A well-kept secret .....                                | 160        |
| 7.7. (22) Bourbaki, or my great luck - and its downside .....     | 161        |
| 7.8. (23) De Profundis .....                                      | 163        |
| 7.9. (24) Mes adieux, or: strangers .....                         | 163        |
| <b>8. Master and students</b>                                     | <b>167</b> |
| 8.1. (25) The student and the program .....                       | 167        |
| 8.2. (26) Rigor and thoroughness .....                            | 169        |
| 8.3. (27) la bavure - or twenty years later .....                 | 172        |
| 8.4. (28) The unfinished harvest.....                             | 173        |
| 8.5. (29) The Enemy Father (1).....                               | 175        |
| 8.6. (30) The Enemy Father (2).....                               | 178        |
| 8.7. (31) The power to discourage.....                            | 179        |
| 8.8. (32) The mathematician's ethic .....                         | 183        |
| <b>9. Harvest</b>   | <b>187</b> |
| 9.1. (33) The note - or the new ethic .....                       | 187        |
| 9.2. (34) Silt and spring .....                                   | 190        |
| 9.3. (35) My passions .....                                       | 191        |
| 9.4. (36) Desire and meditation .....                             | 194        |
| 9.5. (37) Wonder .....  | 197        |
| 9.6. (38) Return impulse and renewal .....                        | 199        |
| 9.7. (39) Belle de nuit, belle de jour (or: Augias' stables)..... | 201        |
| 9.8. (40) Sports mathematics .....                                | 202        |
| 9.9. (41) Krishnamurti, or liberation turned hindrance .....      | 205        |
| <b>10. L' Enfant s'amuse</b>                                      | <b>209</b> |
| 10.1. (42) The child .....  | 209        |
| 10.2. (43) The troublemaker boss - or the pressure cooker .....   | 211        |
| 10.3. (44) We're turning the tables .....                         | 212        |
| 10.4. (45) Le Guru-pas-Guru - or the three-legged horse.....      | 214        |
| <b>11. Lonely adventure</b>                                       | <b>219</b> |
| 11.1. (46) The forbidden fruit .....                              | 219        |
| 11.2. (47) Lonely adventure .....                                 | 221        |
| 11.3. (48) Gift and hospitality .....                             | 223        |
| 11.4. (49) Determination of a division.....                       | 224        |
| 11.5. (50) The weight of a past.....                              | 225        |

|   |            |
|---|------------|
| <b>12. NOTES for the first part of "RECOLTES ET SEMAILLES</b> | <b>231</b> |
| 12.1. Ø .....   | 233        |
| Note 1 .....  | 233        |
| 12.2. Ø .....   | 234        |
| Note 2 .....  | 234        |
| 12.3. Ø .....   | 234        |
| Note 3 .....  | 234        |
| 12.4. Ø .....   | 234        |

**Presentation of Themes or  
PRELUDE IN FOUR MOVEMENTS**

# 1. En Guise d'Avant- About

□ January 30, 1986

p. A1

All that was missing was a foreword to be written, so that I could send *Récoltes et Semailles* to the printer. And I swear I had the best will in the world to write something that would do the job. Something **reasonable** this time. Three or four pages, no more, but well thought-out, to present this enormous "pavé" of over a thousand pages. Something that "hooks" the jaded reader, that makes him or her see that in these unreassuring "more than a thousand pages", there might be things that interest them (or even concern them, who knows?). That's not really my style, the hook, that's not. But I was going to make an exception for once! The "publisher foolish enough to go for it" (to publish this obviously unpublishable monster) had to make ends meet.

And then no, it didn't come. I did my best, though. And not just for one afternoon, as I'd planned, just as quickly as possible. Tomorrow I'll have been at it for three weeks on the dot, the leaves piling up. What's come, that's for sure, is not what one could decently call a "foreword". I've missed it again! You can't do things over again at my age - and I'm not cut out to sell or make people sell. Even when it comes to giving pleasure (to oneself, and to friends. . . ).

What I came up with was a sort of long, commented "walk" through my work as a mathematician. A walk aimed above all at the "layman" - those who "have never understood anything about maths". And for me, too, who had never taken the leisure of such a stroll. One thing led to another, and I found myself bringing out and saying things that until then had always remained unsaid. As chance would have it, these are also the things that I feel are most essential to my work and my oeuvre. There's nothing technical about them. It's up to you to see if I've succeeded in my naïve attempt to "get them across" - an attempt that's surely a little crazy, too. My satisfaction and pleasure would be to have been able to make you feel them. Things that many of my learned colleagues no longer know how to feel. Perhaps they've become too learned and too prestigious. It often makes you lose touch with simple, essential things.

In this "Promenade à travers une oeuvre", I talk a little about my life too. And a little bit, here and here, what we're talking about in *Harvest and Sowing*. I talk about it again, and in greater detail, in the "Letter" (dated □ de May last year) that follows the "Promenade". This Letter was intended for my ex-students p .

A2

and to my "old friends" in the mathematical world. But there's nothing technical about it either. It can easily be read by any reader interested in learning, through a "first-hand" account, the ins and outs that eventually led me to write *Harvest and Sowing*. Even more than the *Promenade*, it will also give you a taste of a certain atmosphere in the mathematical "big world". And also (like the *Promenade*), of my style of expression, which I'm told is a bit special. And also of the spirit that expresses itself through this style - a spirit that is not appreciated by everyone either.

In the *Promenade* and throughout *Harvest and Sowing*, I talk about **mathematical work**. It's work I know well, first-hand. Most of what I say about it is true, surely, for all creative work, all work of discovery. It's true, at least, for so-called "intellectual" work, that which is mostly done "in the head", and by writing. Such work is marked by the blossoming and blooming of the inner self.

We're also driven by a desire to **understand** the things we're probing. But, to take an example from the opposite end of the spectrum, the passion of love is also an impulse of discovery. It opens us up to "carnal" knowledge, which also renews itself, flourishes and deepens. These two impulses - the one that drives the mathematician at work, let's say, and the one in the lover - are much closer than we generally suspect, or are willing to admit to ourselves. I hope that the pages of *Récoltes et Semailles* will help you to feel this, in your work and in your everyday life.

During the Promenade, I'll be talking mainly about the mathematical work itself. However, I remain virtually silent on the **context** in which this work takes place, and on the **motivations** that come into play outside the work itself. This runs the risk of giving me, or mathematicians or "scientists" in general, a flattering but distorted image. Like "great and noble passion", without any kind of correction. In line, in short, with the great "Myth of Science" (with a capital S, please!). The heroic, "Promethean" myth into which writers and scientists have fallen (and continue to fall) at the drop of a hat. Only historians, perhaps, sometimes resist this seductive myth. The truth is that in the motivations of "the scientist", which sometimes lead him to invest lavishly in

p. A3

his work, ambition and vanity play as important and almost universal a role, as in any other profession. It takes on more or less coarse, more or less subtle forms, depending on the person involved. I don't in no way claim to be an exception. I hope that reading my testimonial will leave no doubt on this point.

It's also true that the most devouring ambition is powerless to discover the slightest mathematical statement, or to demonstrate it - just as it is powerless (for example) to "get a hard-on" (in the true sense of the word). Whether you're a man or a woman, what "gives you a hard-on" is not ambition, the desire to shine, to exude power, in this case sexual power - quite the contrary! But it is the acute perception of something strong, very real and very delicate at the same time. You could call it "beauty", and it's one of the thousand faces of this thing. Being ambitious doesn't necessarily mean you can't feel the beauty of a being, or a thing, sometimes. But what's certain is that it's **not** ambition that makes us feel it... .

The man who first discovered and controlled the fire was exactly like you and me. Not at all what we think of as "heroes", "demigods" and so on. Surely, like you and me, he knew the bite of anguish, and the vanity ointment experienced, which makes you forget the bite. But the moment he "knew" the fire, there was neither fear nor vanity. Such is the truth of heroic myth. Myth becomes insipid, it becomes ointment, when it serves to hide from us another aspect of things, just as real and just as essential.

My purpose in *Récoltes et Semailles* was to talk about both aspects - the drive to know, and fear and its vain antidotes. I think I "understand", or at least **know**, the drive and its nature. (Perhaps one day I'll discover, in wonder, just how deluded I've been... .) But as for fear and vanity, and the insidious blocks to creativity that derive from them, I know I haven't got to the bottom of this great enigma. And I don't know if I'll ever get to the bottom of this mystery, in the years I have left to live... .

During the writing of *Récoltes et Semailles*, two images emerged to represent these two aspects of the human adventure. They are **the child** (aka **the worker**), and the **Boss**. In the Promenade we're about to take, we'll be talking almost exclusively about the "child". He's also the one who appears in the subtitle "**L'enfant et la Mère**" ("**The Child and the Mother**"). This name will become clearer, I hope, in the course of the walk.

□ In all the rest of the reflection, it's the Boss on the other hand who mostly takes center stage. He isn't a boss for nothing! In fact, it would be more accurate to say that we're not talking about **a** Boss, but about

p. A4

Bosses of competing companies. But it's also true that all bosses are alike in most respects. And when we start talking about Bosses, it also means that there are going to be some "bad guys". In Part I of the reflection ("Fatuity and Renewal", which follows this introductory part, or the "Prelude in Four Movements"), it's mostly me who's "the villain". In the next three parts, it's mostly "the others". Each to his own!

In other words, in addition to profound philosophical reflections and (by no means contrite) "confessions", there will be "vitriolic portraits" (to use the expression of one of my colleagues and friends, who found himself a little mauled... .). Not to mention a number of large-scale "operations". Robert Jaulin<sup>1</sup> assured me (half-jokingly) that in *Récoltes et Semailles* I was doing "the ethnology of the mathematical milieu" (or perhaps the sociology, I couldn't say more). It's flattering, of course, to learn that (without even knowing it) you're doing learned things! It's a fact that, during the "investigation" part of my reflection (and to my chagrin. . .), I saw a good part of the mathematical establishment pass through the pages I was writing, not to mention a number of colleagues and friends of more modest status. And over the last few months, since I sent out the provisional print run of *Récoltes et Semailles* last October, it's been that way again. Decidedly, my testimonial was like a paving stone in the pond. There were echoes in every tone, really (except that of boredom. . .). Almost every time, it was not at all what I would have expected. And there was also a lot of silence, which spoke volumes. Clearly, I had (and still have) a lot to learn about what goes on in people's noggins, among my ex-students and other more or less well-placed colleagues - I mean, about the "sociology of the mathematical milieu"! To all those who have already come to make their contribution to the great sociological work of my old age, I would like to express my gratitude here and now.

Of course, I was particularly sensitive to echoes in warm tones. There were also a few rare colleagues who have shared with me an emotion, or a feeling (unexpressed until now) of crisis, or of degradation□within this mathematical milieu of which they feel a part.

p. A5

Outside this milieu, among the very first to give a warm, even emotional, welcome to my testimony, I'd like to mention Sylvie and Catherine Chevalley<sup>2</sup>, Robert Jaulin, Stéphane Deligeorge and Christian Bourgois. If *Récoltes et Semailles* is going to be distributed more widely than the initial provisional print run (intended for a very limited circle), it is above all thanks to them. Thanks, above all, to their shared conviction: that what I had endeavored to grasp and say, had to be said. And that it could be heard in a wider circle than that of my colleagues (who are often sullen, even surly, and not at all disposed to question themselves. . .). So it was that Christian Bourgois didn't hesitate to run the risk of publishing the unpublishable, and Stéphane Deligeorge did me the honor of including my indigestible testimony in the "Epistémé" collection, alongside (for the time being) Newton, Cuvier and Arago. (I couldn't have wished for better company!) To each and every one of you, for your repeated expressions of sympathy and confidence, at a particularly "sensitive" time, I'm happy to express my deepest gratitude.

And here we are, at the start of a Promenade à travers une oeuvre, as an introduction to a journey through a life. A long journey, yes, of a thousand pages or more, and well packed each one. It took me a lifetime to complete this journey, without exhausting it, and more than a year to rediscover it, page after page. Words sometimes

---

<sup>1</sup>Robert Jaulin is an old friend. I understand that he finds himself in a somewhat similar situation (as a "white wolf") vis-à-vis the ethnological establishment as I do vis-à-vis the mathematical "beau monde".

<sup>2</sup>Sylvie and Catherine Chevalley are the widow and daughter of Claude Chevalley, the colleague and friend to whom the central part of *Récoltes et Semailles* (ReS III, "La Clef du Yin et du Yang") is dedicated. In several places in this reflection, I mention him and the role he played in my itinerary.

have been reluctant to come, to express all the juice of an experience still evading hesitant comprehension - as ripe, plump grapes piled up in the press seem, at times, to want to evade the force that embraces them. ... But even in those moments when the words seem to jostle and flow, they don't jostle and flow at the drop of a hat. Each one of them has been weighed in passing, or even afterwards, to be carefully adjusted if found too light, or too heavy. So this reflection-testimony-travel is not designed to be read quickly, in a day or a month, by a reader.

p. A6

who can't wait for the final word. There are no "final words" or "conclusions" in Récoltes.

and Sowing, any more than there is in my life, or in yours. There is a wine, aged for a lifetime in the barrels of my being. The last glass you drink won't be any better than the first or the hundredth. They're all "the same", and they're all different. And if the first glass is spoiled, so is the whole barrel, so you might as well drink good water (if any), rather than bad wine.

But good wine can't be drunk in a hurry, or at the drop of a hat.

January 1986

## 2.1. The magic of things

□ When I was a kid, I liked going to school. We had the same teacher to teach us to read and writing, arithmetic, singing (he played a little violin to accompany us), or prehistoric man and the discovery of fire. I don't remember ever being bored at school then. He had the magic of numbers, and the magic of words, signs and sounds. The magic of **rhyme**, too, in songs and little poems. Rhyme seemed to hold a mystery beyond words. And so it was, until one day

p. P1

or someone explained to me that there was a simple "trick" to it; that rhyme is simply when you make two consecutive spoken movements end with the same syllable, which then, as if by magic, become **verses**. It was a revelation! For weeks and months on end, at home, where I could find people to talk to, I'd have fun making verses. At one point, I could only speak in rhyme. Fortunately, I got over it. But even today, on occasion, I still write poems - but I don't go looking for the rhyme anymore, unless it comes from me.

At another time, an older friend, who was already in high school, taught me negative numbers. It was another fun game, but one that was quickly exhausted. And then there were crosswords - I spent days and weeks making them, more and more interlocking. This game combined the magic of form with the magic of signs and words. But that passion left me, apparently without a trace.

In high school, first in Germany in the first year, then in France, I was a good student, but not the "brilliant one". I invested myself wholeheartedly in what interested me most, and tended to neglect what interested me less, without worrying too much about the appreciation of the "teacher" concerned. The first year of high school in France, in 1940, I was interned with my mother in the concentration camp at Rieucros near Mende. It was wartime, and we were foreigners - "undesirables", as we called them. But the camp administration kept a close eye on the camp kids, undesirables though they were. We came and went as we pleased.

wanted. I was the oldest, and the only one to go to high school, four or five kilometers away, snow or shine, with makeshift shoes which always took on water.

p. P2

I still remember my first "maths composition", when the teacher gave me a bad mark for demonstrating one of the "three cases of equality of triangles". My demonstration wasn't the one in the book, which he followed religiously. However, I knew perfectly well that my demonstration was no more or less convincing than the one in the book, the spirit of which I was following, with the endless traditional "we slide such and such a figure over such and such a figure". Clearly, the man who was teaching me didn't feel capable of judging by his own lights (in this case, the validity of a line of reasoning). He had to refer to an authority, in this case a book. It must have struck me, these dispositions, for me to have remembered this little incident. Subsequently, and to this day, I have had ample opportunity to see that such provisions are by no means the exception, but the almost universal rule. There's a lot to be said for this - a subject I touch on more than once, in one form or another, in Harvest and Sowing. But even today, whether I like it or not, I feel disconcerted every time I come across it again. . .

During the last years of the war, while my mother remained interned in the camp, I was in a "Secours Suisse" children's home for refugee children in Le Chambon sur Lignon. Most of us were Jewish, and when we were warned (by the local police) that the Gestapo would be rounding us up, we would go and hide in the woods for a night or two, in small groups of two or three, without really realizing that our lives were at stake. The region was full of Jews hiding in the Cévennes, and many survived thanks to the solidarity of the local population.

What struck me most at the "Collège Cévenol" (where I was brought up) was how little interest my fellow students took in what they were learning. As for me, I'd devour the textbooks at the start of the school year, thinking that this time we'd finally learn something **really** interesting; and the rest of the year I'd use my time as best I could, while the planned curriculum was churned out inexorably, term after term. But we had some really nice teachers. The natural history teacher, Mr. Friedel, had a remarkable human and intellectual quality. But he was incapable of "cracking down", and would get hounded to death, to the point where towards the end of the year, it became impossible to follow any more, his voice impotent

covered by the general hustle and bustle. Maybe that's why I didn't become a biologist!

□ I spent quite a bit of my time, even during lessons (shhh. . . ), doing math problems.

p. P3

Soon, the ones in the book weren't enough for me. Maybe because they tended to resemble each other a little too much; but mostly, I think, because they were falling out of the sky a little too much, just like that, without saying where they came from or where they were going. They were the book's problems, not mine. Yet there was no shortage of really natural questions. Thus, when the lengths  $a$ ,  $b$ ,  $c$  of the three sides of a triangle are known, the triangle is known (apart from its position), so there must be an explicit "formula" to express, for example, the area of the triangle as a function of  $a$ ,  $b$ ,  $c$ . The same goes for a tetrahedron where we know the length of all six edges - what's the volume? That one I think was a bit of a struggle, but I eventually got the hang of it. In any case, when something "got me", I didn't count the hours or days I spent on it, even if it meant forgetting everything else! (And that's how it is even now... )

What I found most unsatisfying in our maths books was the absence of any serious definition of the notion of length (of a curve), area (of a surface) or volume (of a solid). I promised myself to fill this gap as soon as I could. I spent most of my energy on it between 1945 and 1948, when I was a student at the University of Montpellier. I wasn't happy with the courses I was taking. Without ever having said it to myself, I must have had the impression that the teachers were just repeating their books, just like my first maths teacher at the lycée in Mende. So I only went to university from time to time, to keep up to date with the endless "program". The books were enough, but it was also clear that they didn't answer any of my questions. In fact, they didn't even **see** them, any more than my high school books did. As long as they gave recipes for calculating lengths, areas and volumes, using single, double and triple integrals (dimensions greater than three were cautiously avoided. . . ), the question of giving an intrinsic definition didn't seem to arise, either for my teachers or for the authors of the textbooks.

From the limited experience I had at the time, it might well have seemed that I was the only being in the world... gifted with a curiosity for mathematical questions. At any rate, this was my unspoken conviction during those years spent in complete intellectual solitude, which did not weigh heavily on me<sup>1</sup>. To tell the truth, I I don't think I ever thought, in all that time, of □ proving the question whether or not I was indeed the only one. p. P4 no one in the world likely to be interested in what I was doing. My energy was sufficiently absorbed in meeting the challenge I had set myself: to develop a theory that would satisfy me fully.

There was no doubt in my mind that I couldn't fail to get to the bottom of things, if only I took the trouble to scrutinize them, putting down in black and white what they were telling me as I went along. The intuition of the **volume**, let's say, was irrefutable. It could only reflect a **reality**, elusive for the moment, but perfectly reliable. It was this reality that I simply had to grasp.

- a little, perhaps, like that magical reality of "rhyme" had been grasped, "understood" one day.

---

<sup>1</sup>Between 1945 and 1948, I lived with my mother in a small hamlet about ten kilometers from Montpellier, Mairargues (by Vendargues), lost in the middle of the vineyards. (My father had disappeared in Auschwitz in 1942.) We lived meagerly on my meager student grant. To make ends meet, I harvested grapes every year, and after the harvest, I made grape wine, which I managed to sell as best I could (in contravention, it seems, of current legislation. . . ) In addition, there was a garden which, without ever having to work it, provided us with an abundance of figs, spinach and even (towards the end) tomatoes, planted by a complaisant neighbor in the middle of a sea of splendid poppies. It was a good life - but sometimes a little tight around the edges, when it came to replacing spectacle frames or a pair of worn-out shoes. Fortunately, my mother, weakened and ill from her long stay in the camps, was entitled to free medical assistance. We would never have been able to afford a doctor...

When I started, at the age of seventeen and fresh out of high school, I thought it would only take a few weeks. I stayed with it for three years. I even found a way of missing an exam at the end of my second year of university - spherical trigonometry (in the "in-depth astronomy" option, sic), because of a silly error in numerical calculation. (I was never very good at calculus, it has to be said, once I got out of high school... ) That's why I had to stay another third year in Montpellier to finish my degree, instead of going to Paris straight away - the only place, I was assured, where I'd have the opportunity to meet people in the know about what was considered important in maths. My informant, Monsieur Soula, also assured me that the last remaining problems in maths had been solved, twenty or thirty years ago, by a man called Lebesgue. He was said to have developed a theory of measurement and integration, which put an end to mathematics.

Monsieur Soula, my "calculus diff" teacher, was a kindly man, well-disposed towards me. I don't think he convinced me though. There must already have been in me the prescience that mathematics is a thing unlimited in extent and depth. Does the sea have an "end point"? The fact remains that at no time was I touched by the thought of unearthing the book by this Lebesgue that Mr. Soula had told me about, and which he must never have held in his hands either. In my mind, there was nothing in common between what a book might contain, and the work I was doing, in my own way, to satisfy my curiosity about such and such things that had intrigued me.

p. P5

## 2.2. The importance of being alone

When I finally made contact with the mathematical world in Paris, a year or two later, I learned, among many other things, that the work I'd been doing in my corner with the means at hand was (more or less) what was well known to "everyone", under the name of Lebesgue measure and integral theory. In the eyes of the two or three seniors to whom I spoke about this work (or even showed a manuscript), it was as if I'd simply wasted my time, rehashing what was already known. I don't remember being disappointed. At that point, the idea of getting "credit", or even approval, or simply the interest of others, for the work I was doing, must still have been foreign to me. Not to mention the fact that my energies were well and truly diverted to familiarizing myself with a completely different environment, and above all, to learning what was considered in Paris to be the mathematician's B.A.BA.<sup>2</sup>.

Yet, looking back on those three years now, I realize that they were by no means gas-plundered. Without even realizing it, I learned in solitude what is the essence of a mathematician's profession - what no master can truly teach. Without ever having had to say it to myself, without ever having had to meet anyone with whom to share my thirst for understanding, I nevertheless knew, "from my gut" I'd say, that I was a mathematician: someone who "does" maths, in the full sense of the word - like one "does" love. Mathematics had become my mistress, always welcoming my desire. These years of solitude laid the foundation for a confidence that has never been shaken - not by the discovery (landing in Paris at the age of twenty) of the full extent of my ignorance and the immensity of what I had to learn; nor (more than twenty years later) by the turbulent episodes of my departure without return from the mathematical world; nor, in recent years, by the often rather crazy episodes of a certain "Burial".

---

<sup>2</sup>I give a short account of this rough transition period in the first part of Harvest and Sowing (ReS I), in the section entitled "The welcome stranger" (n° 9).

(anticipated and without <sup>□</sup>burrs) of my person and my work, orchestrated by my closest companions p. P6 of yesteryear...

To put it another way: in those crucial years, I learned to **be alone**<sup>3</sup>. By this I mean approaching the things I want to know by my own lights, rather than relying on the ideas and consensuses, expressed or tacit, that would come to me from a more or less extended group of which I would feel a member, or which for any other reason would be invested with authority for me. Mute consensuses had told me, in high school as in university, that there was no need to question the very notion of "volume", presented as "well known", "obvious", "unproblematic". I had ignored it, as a matter of course - just as Lebesgue, a few decades earlier, had had to **ignore it**. It is in this act of "going beyond", of being oneself in short and not simply the expression of the consensus that makes law, of not remaining locked inside the imperative circle they set for us - it is above all in this solitary act that "**creation**" is found. Everything else comes on top.

Later, in the world of mathematicians that welcomed me, I had the opportunity to meet many people, both older and younger, more or less my own age, who were obviously much brighter, much more "gifted" than me. I admired them for the ease with which they learned new notions, as if by playing with them, and juggled with them as if they'd known them since the cradle.

- while I felt heavy and clumsy, slogging my way like a mole through a shapeless mountain of things that it was important (I was assured) for me to learn, and of which I felt incapable of grasping the ins and outs. In fact, I was in no way a brilliant student, passing prestigious competitive exams with flying colors and assimilating prohibitive curricula in no time at all.

In fact, most of my brighter classmates went on to become competent and successful mathematicians. putés. And yet, looking back over thirty or thirty-five years, I can see that they haven't left mathematics behind. of our time□a really deep imprint. They did things, beautiful things sometimes, in a p. P7 context that they would never have thought of touching. They were unknowingly trapped in those invisible, imperious circles that delimit a Universe in a given environment and at a given time. To cross them, they would have had to rediscover within themselves the capacity that was theirs at birth, just as it was mine: the capacity to be alone.

Small children have no trouble being alone. He's solitary by nature, even if he doesn't mind the occasional company, and knows how to claim his mother's totosse when it's time to drink. And he knows, without having to tell himself, that the pod is for him, and that he **knows how to** drink. But we've often lost touch with our inner child. And we constantly miss out on the best, without deigning to see it. ...

If in *Récoltes et Semailles* I'm addressing someone other than myself, it's not an "audience". I'm addressing you, the reader, as a **person**, and a person **alone**. It's to the one in you who knows how to be alone, to the child, that I would like to speak, and to no one else. The child is often far away, I know. He's seen it all, and he's seen it a long time ago. He's hidden himself away God knows where, and it's not easy, often, to get to him. You'd swear he's been dead forever, that he never existed - and yet, I'm sure he's out there somewhere, alive and well.

And I also know what the **sign** is that I'm being heard. It is when, over and above all the differences in

<sup>3</sup>This formulation is a bit of a misnomer. I never had to "learn to be alone", for the simple reason that I never **unlearned**, during my childhood, this innate ability that was in me at birth, as it is in everyone. But those three years of solitary work, in which I was able to give my best to myself, according to my own spontaneous criteria of exigency, confirmed and rested in me, in my relationship this time to mathematical work, a foundation of confidence and trust. quiet assurance, which owed nothing to the consensus and fashions that rule the day. I refer to this again in the note "Racines et solitude" (ReS IV, n° 171<sub>3</sub>, in particular p. 1080).

culture and destiny, what I say about myself and my life finds an echo and resonance in you; when you also find in it **your own life**, your own experience of yourself, in a light perhaps you hadn't paid attention to before. It's not a question of "identification", with something or someone far removed from you. But perhaps, in a small way, you're rediscovering your own life, what's **closest to** you, through the rediscovery I'm making of mine, in the pages of Harvest and Sowing and even in these pages I'm writing today.

## 2.3. The inner adventure - or myth and testimony

Above all, Harvest and Sowing is a **reflection** on myself and my life. At the same time, it is also a **testimony**, in two ways. It's a testament to my **past**, **which** carries the weight of my past.

p. P8 of reflection. But at the same time it's also a testimony to the most immediate **present** - to the very moment when I'm writing, and when the pages of Harvest and Sowing are born ☐ over the course of hours, nights and days. These pages are the faithful witnesses of a long meditation on my life, as it has really gone on (and is still going on at this very moment. . . ).

These pages have no literary pretensions. They are a **document** about myself. I have only allowed myself to touch them (for occasional stylistic alterations, in particular) within very narrow limits<sup>4</sup>. If it has any pretension, it's only that of being true. And that's a lot.

This document, moreover, is not an "autobiography". You won't learn my date of birth (which would only be of interest for astrological charting), or the names of my mother and father or what they did for a living, or the names of my wife and other women who were important in my life, or the names of the children born of these loves, and what they did with their lives. It's not that these things weren't important in my life, and remain important even now. But as this self-reflection began and continued, at no point did I feel prompted to engage in even the slightest description of the things I brush up against here and there, let alone conscientiously line up names and numbers. At no time did it seem to me that this could add anything to the purpose I was pursuing at the time. (Whereas in the few pages that precede this one, I have been led, as if in spite of myself, to include perhaps more material details about my life than in the thousand pages that follow. ... )

And if you ask me what this "purpose" is that I'm pursuing for a thousand pages, I'll answer: it's to tell the story, and thereby **discover**, of **the inner adventure** that was and is my life. This narrative-testimony of an adventure continues at the same time on the two levels I've just mentioned. There's the exploration of an adventure in the past, its roots and origins in my childhood. And there's the continuation and renewal of this "same" adventure, as I write, moment by moment and day by day. Récoltes et Semailles, in spontaneous response to a violent challenge from the outside world<sup>5</sup>.

☐ External facts provide food for thought, only insofar as they prompt and provoke  
p. P9 a twist in the inner adventure, or help to illuminate it. And the burial and plundering of my mathematical work, which will be discussed at length, was such a provocation. It aroused in me a mass outpouring of powerful egotistical reactions, and at the same time revealed to me the deep, unacknowledged links that continue to bind me to the work that grew out of me.

---

<sup>4</sup>This means that any errors (material, perspective, etc.) are not corrected in the first draft, but rather in the footnotes, or during a later "review" of the situation under examination.

<sup>5</sup>For details of this "violent interpellation", see "Letter", especially sections 3 to 8.

It's true that the fact that I'm one of the "math majors" isn't necessarily a reason (let alone a good one) for you to be interested in my particular "adventure" - nor is the fact that I've had trouble with my colleagues, after changing my environment and lifestyle. In fact, there's no shortage of colleagues and even friends who find it ridiculous to go public (as they put it) with their "states of mind". What counts are the "results". The "soul", that is to say, that part of us which **experiences** the "production" of these "results", or the repercussions of all kinds (both in the life of the "producer", and in that of his fellow human beings), is the object of scorn, even open derision. While this attitude is intended as an expression of "modesty", I see it as a sign of flight, and a strange derangement, promoted by the very air we breathe. Of course, I don't write for those struck by a kind of latent self-contempt that makes them disdain the best I have to offer. A contempt for what truly makes up his **own life**, and for what makes up mine: the superficial and profound, coarse and subtle movements that animate the psyche, this very "**soul**" that lives experience and reacts to it, that freezes or blossoms, that withdraws or learns. . .

The story of an inner adventure can only be told by the person living it, and by no one else. But even if the story is intended only for oneself, it rarely slips into the rut of **myth-building**, with the narrator as the hero. Such a myth is born, not from the creative imagination of a people and a culture, but from the vanity of one who dares not assume a humble reality, and who likes to substitute a construction, the work of his own mind. But a **true** account (if there is such a thing) of an adventure as it was really lived, is a precious thing. And this, not because of the prestige that (rightly or wrongly) surrounds the narrator, but simply because **it exists**, with its quality of truth. Such a testimony is precious, whether it comes from a man of notoriety or even fame, or from a small employee with no future and a family, or from a common criminal.

If such a story has any virtue for others, it is above all in bringing them face to face with themselves, through this testimony.

of another's experience. Or also (to put it another way) to erase perhaps in him (and if only

p. P10

than the space of time that a reading lasts) this contempt in which he holds his **own adventure**, and this "soul" which is its passenger and captain... .

## 2.4. The painting of

Talking about my past as a mathematician, and then discovering (as if unwillingly) the twists and turns of the gigantic Burial of my work, I was led, without having sought it, to paint a picture of a certain milieu and a certain era - an era marked by the decomposition of some of the values that gave meaning to men's work. It's the "tableau de moeurs" aspect, painted around a "diversionary event" undoubtedly unique in the annals of "Science". What I said earlier makes it clear, I think, that you won't find a "dossier" on a certain unusual "case" in Harvest & Sow, just to bring you up to speed quickly. A friend of mine who was looking for the file missed out on almost everything that makes up the substance and flesh of Harvest and Sowing.

As I explain in much greater detail in the Letter, the "investigation" (or "tableau de moeurs") continues mainly in Parts II and IV, "L' Enterrement (1) - ou la robe de l' Empereur de Chine" and "L' Enterrement (3) - ou les Quatre Opérations". Over the pages, I stubbornly unearth, one after the other, a multitude of juicy facts (to say the least), which I try as best I can to "fit in" as I go along. Little by little, these facts come together to form an overall picture that gradually emerges from the mists,

in increasingly vivid colors, with sharper and sharper outlines. In these day-by-day notes, the "raw facts" that have just appeared are inextricably mixed with personal reminiscences, and with comments and reflections of a psychological, philosophical, even (occasionally) mathematical nature. That's just the way it is, and there's nothing I can do about it!

Based on the work I've done, which has kept me on the edge of my seat for over a year, putting together a dossier, in the style of "investigative conclusions", should represent additional work of the order of a few hours or a few days, depending on the curiosity and requirements of the interested reader. There was a time when I did try to put it together. It was when I started writing a note that was to be called "The Four Operations"<sup>6</sup>. And then no, there was nothing to do. I couldn't do it! That's not my style of expression, ☐decidedly, and on my old age less than ever. And I now estimate, with *Récoltes et Semailles*, in  
p. P11 to have done enough for the benefit of the "mathematical community", to leave without remorse to others (if there are any among my colleagues who feel concerned) the task of putting together the necessary "dossier".

## 2.5. The heirs and the builder

It's time for me to say a few words here about my mathematical work, which has taken and still takes (to my own surprise) an important place in my life. More than once in *Récoltes et Semailles* I come back to this work - sometimes in a way that is clearly intelligible to everyone, and at other times in somewhat technical terms<sup>7</sup>. These latter passages will largely go "over the head" not only of the "layman", but even of the fellow mathematician who might not be more or less "in the know" about the maths involved. Of course, you're welcome to skip over any passages that strike you as a little too "advanced" in nature. You can also skim through them, and perhaps catch a glimpse of the "mysterious beauty" (as a non-mathematician friend wrote to me) of the world of mathematical things, popping up like so many "strange, inaccessible islands" in the vast, shifting waters of reflection. ...

As I said earlier, most mathematicians tend to confine themselves to a conceptual framework, to a "**Universe**" fixed once and for all - essentially, the one they found "ready-made" when they studied. They're like the heirs to a big, beautiful, fully-installed house, with its living rooms and kitchens and workshops, and its cookware and all kinds of tools, with which there's, my goodness, plenty to cook and tinker with. How this house has been built over the generations, and how and why certain tools (and not others. . . ) have been designed and fashioned, why rooms are arranged and laid out in such and such a way here, and in such and such a way there - these are questions that these heirs would never dream of asking themselves. This is the "Universe", the "given" in which we have to live, period! Something that seems large (and we're usually far from having seen all its parts), but at the same time **familiar**, and above all: **unchanging**. When they're busy, it's to maintain

and embellish a heritage: repair a wobbly piece of furniture, plaster a facade, sharpen a tool, or even sometimes, for the most enterprising, make a new piece of furniture from scratch in the workshop. And it happens, ☐when they

They'll do their utmost to ensure that the furniture is beautiful, and that the whole house looks better for it.  
p. P12 Even more rarely, one of them will think of making some modification to one of the tools on hand, or even, under repeated and insistent pressure of need, of imagining and making a new one. This

<sup>6</sup>The planned note to fi nieventually broke out into Part IV (of the same name "The Four Operations") of *Harvest and Sowing*, comprising 70 notes spanning well over four hundred pages.

<sup>7</sup>In addition to mathematical insights into my past work, there are also passages here and there containing new mathematical developments. The longest is "Les cinq photos (cristaux et  $D$ -Modules)" in *ReS IV*, note n° 171 (ix).

In doing so, he's hardly likely to apologize for what he feels is a kind of infringement of the piety due to family tradition, which he feels he's upsetting with an unusual innovation.

In most rooms of the house, windows and shutters are carefully closed - no doubt for fear of a wind blowing in from elsewhere. And when the beautiful new furniture, one here and the other there, not to mention the offspring, start to clutter up the now narrow rooms and invade even the corridors, none of these heirs will want to realize that their cozy, familiar Universe is starting to feel a little cramped around the edges. Rather than come to terms with this, they'll prefer to squeeze and wedge their way as best they can between a Louis XV sideboard and a rattan rocking chair, between a snotty toddler and an Egyptian sarcophagus, or, in desperation, climb as best they can over a crumbling heap of chairs and benches... ..

The little picture I've just painted is not peculiar to the world of mathematicians. It illustrates inveterate and immemorial conditioning, which can be found in all walks of life and in all spheres of human activity, and this (as far as I know) in all societies and at all times. I've already alluded to this, and I don't claim to be free of it myself. As my testimony will show, the opposite is true. It's just that, at the relatively limited level of intellectual creative activity, I've been relatively unaffected<sup>8</sup> by this conditioning, which we might call "cultural blindness" - the inability to see (and move) outside the "Universe" fixed by the surrounding culture.

As for me, I feel part of the lineage of mathematicians whose spontaneous vocation and joy is constantly building new houses<sup>9</sup>. Along the way, they can't help but also invent and de□façonner au fur et à mesure tous les outils, ustensiles, meubles et instruments requis, tant pour construire

P13

lap.

house from foundation to ridge, than to provide an abundance of space for future kitchens and workshops, and to set up the house for living and comfort. And yet, once everything has been laid, right down to the last oak panel and stool, it's rare for the workman to linger long in these places, where every stone and rafter bears the trace of the hand that worked and laid it. His place is not in the tranquility of ready-made worlds, however welcoming and harmonious they may be - whether they have been arranged by his own hands, or those of his predecessors. Other tasks are already calling him to new sites, under the imperious impulse of needs he is perhaps the only one to feel clearly, or (more often still) anticipating needs he is the only one to sense. His place is in the open air. He's a friend of the wind, and is not afraid to work alone, for months and years and, if need be, for a lifetime, unless a welcome relief comes to the rescue. He has only two hands like everyone else, to be sure - but two hands that always know what they have to do, that don't shy away from the biggest or the most delicate tasks, and that never tire of getting to know and reacquaint themselves with the innumerable things that constantly call out to them. Two hands is not much, perhaps, for the World is infinite. They can never exhaust it! And yet, two hands are a lot... .

I'm not much of a history buff, but if I had to name mathematicians in this lineage, Galois and Riemann (in the last century) and Hilbert (at the beginning of the present century) spontaneously come to mind. If I were to look for a representative among the elders who welcomed me into the mathematical world<sup>10</sup>, Jean Leray's name would come to mind first, even though my contacts with him are very long.

<sup>8</sup>I see the main reason for this in a certain favorable climate that surrounded my childhood until the age of five. On this subject, see the note "Innocence" (ReS III, n° 107).

<sup>9</sup>This archetypal image of the "house" to be built surfaces and is formulated for the first time in the note "Yin le Servant, and the new masters" (ReS III, n° 135).

<sup>10</sup>I talk about these beginnings in the section "The welcome stranger" (ReS I, n° 9).

although they have remained episodic<sup>11</sup>.

p. P14

□I've just sketched out two broad portraits: that of the "homebody" mathematician who is content to be of maintaining and embellishing a heritage, and that of the pioneer-builder<sup>12</sup>, who can't help but constantly cross those "invisible and imperious circles" that delimit a Universe<sup>13</sup>. We might also call them, by names that are a little cookie-cutter but suggestive, the "conservatives" and the "innovators". Both have their *raison d'être* and their role to play, in the same collective adventure continuing over generations, centuries and millennia. In a period of scientific or artistic blossoming, there is no opposition or antagonism between these two temperaments<sup>14</sup>. They are different and they complement each other, just as dough and leaven complement each other.

Between these two extreme (but by no means inherently opposed) types, there is of course a whole range of temperaments in between. A "homebody" who wouldn't dream of leaving a familiar dwelling, let alone going to the trouble of building another one God knows where, will nevertheless not hesitate, when things are getting decidedly cramped, to put his hand to the trowel to fit out a cellar or attic, raise a floor or even, if need be, add to the walls some new outbuilding of modest proportions<sup>15</sup>. Although he's not a builder at heart, he often looks with a sympathetic eye, or at the very least, with an eye for the future.

p. P15

at least without secret disquiet or disapproval, another who had shared the same dwelling with him, and here he is, laboring to gather beams□and stones in some impossible outback, with the airs of one who would see already a palace...

## 2.6. Point of view and vision

But let me come back to myself and my work.

If I have excelled in the mathematician's art, it is less through skill and perseverance in solving the problems bequeathed to me by my predecessors, than through that natural propensity in me which pushes me to see **questions**, obviously crucial, that nobody had seen, or to draw out the "**right notions**" that were missing (without anyone often realizing it, before the new notion appeared),

<sup>11</sup>Nevertheless, following in the footsteps of H. Cartan and J.P. Serre, I was one of the main users and promoters of one of the great innovative notions introduced by Leray, that of beam, which has been an essential tool throughout my work as a geometer. It also provided me with the key to broadening the notion of (topological) space into that of topos, discussed below.

Leray differs from my portrait of the "builder", it seems to me, in that he doesn't seem inclined to "build houses from the foundation up". Rather, he could not help but lay vast foundations, in places no one else would have thought of, while leaving it to others to finish them and build on them, and, once the house was built, to move in (if only for a while). ...

<sup>12</sup>I've just surreptitiously added two male-sounding qualifiers ("builder" and "pioneer"), which express very different aspects of the discovery drive, and of a more delicate nature. than these names can evoke. This is what will emerge from the rest of this walk-reflection, in the stage "Discovering the Mother - or the two sides" (n° 17).

<sup>13</sup>At the same time, moreover, and unintentionally, he assigns to this ancient Universe (if not for himself, then at least for his leave-holders) the role of the "new", the "old", the "new", the "new", the "new". nères less mobile than it) new limits, in new circles that are certainly wider, but just as invisible and just as imperious as those they have replaced.

<sup>14</sup>This was particularly the case in the mathematical world, during the period (1948-1969) of which I was a direct witness, when I myself was part of that world. After I left in 1970, there seems to have been a kind of wide-ranging reaction, a sort of "consensus of disdain" for "ideas" in general, and more particularly, for the great innovative ideas I had introduced.

<sup>15</sup>Most of my "elders" (mentioned, for example, in "Une dette bienvenue", Introduction, 10) correspond to this intermediate temperament. I'm thinking in particular of Henri Cartan, Claude Chevalley, André Weil, Jean-Pierre Serre and Laurent Schwartz. With the possible exception of Weil, they all gave a "sympathetic eye", without "secret concern or disapproval", to the solitary adventures they saw me embarking on.

as well as the "**right statements**" that nobody had thought of. Quite often, notions and statements fit together so perfectly that there can be no doubt in my mind that they are correct (apart from a few alterations, at most) - and often then, when it's only a "work in progress" intended for publication, I dispense with going any further, and taking the time to work out a demonstration which quite often, once the statement and its context are well seen, can be little more than a matter of "craft", not to say routine. There are countless things that demand attention, and it's impossible to follow the call of each one to its conclusion! Nevertheless, the propositions and theorems I have duly proved in my written and published work number in the thousands, and I think I can say that, with very few exceptions, they have all become part of the common heritage of things commonly accepted as "known" and commonly used in mathematics.

But even more than the discovery of new questions, notions and statements, my particular genius lies in the discovery of fruitful **points of view**, which constantly lead me to introduce, and more or less develop, entirely new **themes**. It seems to me that this is the most essential contribution I have made to the mathematics of my time. To tell the truth, the innumerable questions, notions and statements I've just mentioned only make sense to me in the light of such a "point of view" - or rather, they **emerge** spontaneously from it, with the force of evidence; in the same way that a light (even a diffuse one) that emerges in the dark of night, seems to bring out of nothingness those more or less blurred or sharp contours that it suddenly reveals to us. Without this light uniting them in a common beam, the ten or hundred or thousand questions, notions, statements would appear to be a motley, amorphous collection of "mental gadgets", each isolated from the next.

one from the other□ - and not as parts of a **Whole** which, to remain perhaps invisible, still evading p . P16 in the recesses of the night, is no less clearly prescient.

The fertile point of view is the one that reveals to us, like so many living parts of the same Whole that encompasses them and gives them meaning, those burning questions that no one had sensed, and (as if in response to these questions) those so natural notions that no one had thought to draw out, and finally those statements that seem to flow from source, and that no one certainly risked asking, as long as the questions that gave rise to them, and the notions that enable them to be formulated, had not yet appeared. Even more than what we call "key theorems" in mathematics, it is the fertile points of view that are, in our art<sup>16</sup>, the most powerful tools of discovery - or rather, they are not tools, but the very eyes of the researcher who, passionately, wants to know the nature of mathematical things.

Thus, the fruitful point of view is none other than that "eye" which both makes us **discover**, and makes us **recognize the unity** in the multiplicity of what is discovered. And this unity is truly the very life and breath that connects and animates these multiple things.

But as its very name suggests, a "point of view" in itself remains fragmentary. It reveals **one aspect of** a landscape or panorama, among a multiplicity of equally valid, equally "real" ones. It is to the extent that complementary points of view of the same reality are combined, that our "eyes" are multiplied, that our gaze penetrates further into the knowledge of things. The richer and more complex the reality we wish to know, the more important it is to have several "eyes"<sup>17</sup> to apprehend it in all its breadth and finesse.

And it sometimes happens that a cluster of converging viewpoints on the same vast landscape, through the

<sup>16</sup>This is certainly not the case in "our art" alone, but (it seems to me) in all work of discovery, at least when this is at the level of intellectual knowledge.

<sup>17</sup>Every point of view requires its own language to express it. Having several "eyes" or "points of view" to apprehend a situation also means (in mathematics at least) having several different languages to define it.

by virtue of this, by enabling us to grasp **the One** through the many, gives shape to a new thing; to a thing that surpasses each of the partial perspectives, in the same way that a living being surpasses □ each of its limbs and organs. This new thing can be called a **vision**. The vision unites the already known points of view that embody it, and reveals to us others hitherto ignored, just as the fruitful point of view makes us discover and apprehend as part of the same Whole, a multiplicity of new questions, notions and statements.

To put it another way: vision is to the points of view from which it appears to emerge and which it unites, as clear, warm daylight is to the various components of the solar spectrum. A vast and profound vision is like an inexhaustible source, made to inspire and enlighten the work not only of the man in whom it was born one day and who made himself its servant, but that of generations, fascinated perhaps (as he was himself) by those distant limits it gives us a glimpse of... .

## 2.7. The "big idea" - or trees and the forest

The so-called "productive" period of my mathematical activity, i.e. the one attested by publications in due form, stretches from 1950 to 1969, i.e. over twenty years. And for twenty-five years, between 1945 (when I was seventeen) and 1969 (when I was about forty-two), I invested practically all my energy in mathematical research. An inordinate investment, to be sure. I paid for it with a long spiritual stagnation, with a progressive "thickening", which I'll have more than one occasion to evoke in the pages of *Récoltes et Semailles*. Yet, within the limited scope of a purely intellectual activity, and through the blossoming and maturation of a vision restricted to the world of mathematical things alone, these were years of intense creativity.

During this long period of my life, almost all my time and energy was devoted to what is known as "**piecework**": the painstaking work of shaping, assembling and honing, required to build from scratch the houses that an inner voice (or demon. . . ) enjoined me to build, according to a master plan that it whispered to me as the work progressed. Taken up with the tasks of the "trade": those of stonemason, bricklayer, carpenter, plumber, joiner and cabinetmaker - I rarely took the time to note down in black and white, even if only in broad strokes, the details of my work.

master-plan invisible to all (as it later appeared. . . ) except to me, who over the days, months and years guided my hand with somnambulistic surety<sup>18</sup>. It □ must be said that the piecework, in which

---

<sup>18</sup>The image of the "sleepwalker" was inspired by the title of Koestler's remarkable book "Les somnambules" (Calman Lévy), presenting an "Essay on the history of conceptions of the Universe", from the origins of scientific thought to Newton. One of the aspects of this history that struck Koestler, and which he highlights, is how often the path from a certain point in our knowledge of the world, to some other point that (logically and with hindsight) seems very close, takes sometimes the most academic detours, which seem to defy sound reason ; and yet, through these thousand and one detours that seem destined to lead them astray forever, and with a "sleepwalker's certainty", men who set out in search of the "keys" to the Universe stumble, as if in spite of themselves and often without even realizing it, upon other "keys" that they were far from foreseeing, and which turn out to be "the right ones".

From what I've been able to observe around me, in terms of mathematical discovery, these far-reaching detours in the path of discovery are the work of some large-scale researchers, but by no means all of them. This may be due to the fact that, over the last two or three centuries, research in the natural sciences, and even more so in mathematics, has been freed from the imperative religious or metaphysical presuppositions of a given culture and era, which have been particularly powerful brakes on the unfolding (for better or for worse) of a "scientific" understanding of the Universe. It's true, however, that some of the most fundamental and obvious ideas and notions in mathematics (such as displacement, group, the number zero, literal calculus, the coordinates of a point in space, the notion of set, or that of topological "form", not to mention negative numbers and complex numbers) took millennia to appear. These are all eloquent signs of this inveterate "block", deeply implanted in the psyche, against the conception of totally new ideas, even in cases where these are childishly simple and seem

I liked to take great care with my work, which was by no means to my displeasure. What's more, the mathematical mode of expression professed and practised by my elders gave pre-eminence (to say the least) to the technical aspect of the work, and hardly encouraged "digressions" that would have dwelt on "motivations"; or even those that would have pretended to conjure up some perhaps inspiring image or vision from the mists, but which, because it has not yet been embodied in tangible constructions of wood, stone or pure, unadulterated cement hard, was more akin to dreamy shreds, than to the diligent, conscientious work of the craftsman.

p. P19

In quantitative terms, my work during these years of intense productivity took the form above all of some twelve thousand pages of publications, in the form of articles, monographs or seminars<sup>19</sup>, and of hundreds, if not thousands, of new notions, which entered the common heritage, with the very names I had given them when I had identified them<sup>20</sup>. In the history of mathematics, I believe I'm the one who has introduced the greatest number of new notions into our science, and at the same time, the one who has been led, by this very fact, to invent the greatest number of new names, to express these notions with delicacy, and as suggestively as I could.

Of course, these "quantitative" indications only give a rough idea of my work, and miss the real soul, life and vigor of it. As I wrote earlier, the best thing I've contributed to mathematics are the new "**points of view**" that I **first glimpsed**, and then patiently **drew out** and more or less developed. Like the notions I've just been talking about, these new points of view, introduced into a vast multiplicity of very different situations, are themselves almost innumerable.

There are, however, some points of view that are broader than others, and that alone give rise to and encompass a multitude of partial points of view, in a multitude of different particular situations. Such a point of view can rightly be called a "**big idea**". By virtue of its own fecundity, such an idea gives rise to a teeming progeny of ideas, all of which inherit its fecundity, but most (if not all) of which are less far-reaching than the mother idea.

As for **expressing** a great idea, or "saying" it, this is more often than not almost as delicate as its very conception and slow gestation in the person who conceived it - or to put it better, this laborious gestation and formation work **is** precisely that which "expresses" the idea: the work that consists in patiently, day after day, clear away the mists that surround it at birth, and gradually little by little to give it tangible form, in a picture that grows richer, firmer and more refined with each passing week,

p. P20

months and years. Simply **naming** the idea, with some striking formula, or with more or less technical keywords, can take a few lines, or even a few pages - but few people who don't already know it well will be able to hear this "name" and recognize a face in it. And when the idea arrives

---

impose themselves with the force of evidence, for generations, even millennia. ...

Returning to my own work, I have the impression that in it the "mistakes" (more numerous, perhaps, than among most of my colleagues) are confined exclusively to points of detail, generally quickly spotted by myself. They are mere "accidents along the way", of a purely "local" nature, with no serious impact on the validity of the essential intuitions concerning the situation under examination. On the other hand, at the level of the ideas and the great guiding intuitions, it seems to me that my work is free of any "miss", incredible as it may seem. It's this never-failing ability to grasp, at any given moment, if not the ultimate results of an approach (which more often than not remain hidden from view), then at least the most fertile directions that offer themselves to lead me straight to the essential things - it's this ability that brought back Koestler's image of the "somnambulist".

<sup>19</sup>From the 1960s onwards, some of these publications were written in collaboration with colleagues (especially J. Dieudonné) and students.

<sup>20</sup>The most important of these notions are reviewed in the Thematic Outline, and in the accompanying History Commentary, which will be included in volume 4 of Reflexions. Some of the names were suggested to me by friends or students, such as the term "smooth morphism" (J.Dieudonné) or the panoply of "site, field, sheaf, link", developed in Jean Giraud's thesis.

in full maturity, perhaps a hundred pages will suffice to express it, to the full satisfaction of the worker in whom it was born - as it may also be that ten thousand pages, laboriously worked and weighed, will not suffice<sup>21</sup> .

And in either case, among those who, in order to make it their own, have taken note of the work that at last presents the idea in full bloom, like a spacious forest that has grown there on a deserted moor - it's a safe bet that many will see all these vigorous, slender trees and make use of them (some to climb, some to draw beams and planks from them, some to light fires in their fireplaces...). ), but only a few will know how to see the forest...

## 2.8. Vision - or twelve themes for harmony

Perhaps we could say that the "big idea" is the point of view that not only reveals itself to be new and fecund, but introduces into science a new and vast **theme** that embodies it. And all science, when we understand it not as an instrument of power and domination, but as an adventure in the knowledge of our species through the ages, is nothing other than that harmony, more or less vast and richer from one era to the next, which unfolds over the course of generations and centuries, through the delicate counterpoint of all the themes that appear in turn, as if called from nothing, to join and intertwine within it.

p. P21

□ Among the many new points of view I've opened up in mathematics, there are **twelve**, along with the I'd call them "big ideas"<sup>22</sup> . To see my work as a mathematician, to "feel" it, is to see and "feel" at least some of these ideas, and the great themes they introduce, which form both the fabric and the soul of the work.

<sup>21</sup>By the time I left the mathematical scene in 1970, the totality of my publications (many of them collaborative) on the central theme of schemas must have amounted to some ten thousand pages. Yet this represented only a modest part of the vast program I saw ahead of me concerning schemas. This program was abandoned sine die as soon as I left, despite the fact that very little of what had already been developed and published and made available to the general public, became part of the common heritage of notions and results commonly used as "well known".

The part of my program on the schematic theme and its extensions and ramifications, which I had completed by the time I left, alone represents the most extensive work on foundations ever accomplished in the history of mathematics, and surely one of the most extensive in the history of science too.

<sup>22</sup>Here, for the mathematically curious reader, is a list of the twelve key ideas, or "master themes" of my work (in chronological order of appearance).

1. Topological tensor products and nuclear spaces.
2. Continuous" and "discrete" duality (derived categories, "six operations").
3. Yoga Riemann-Roch-Grothendieck(*K-theory*, relation to intersection theory).
4. Schematics.
5. Topos.
6. Spread and l-adic cohomology.
7. Motifs and motivic Galois group (  $\otimes$ -Grothendieck categories).
8. Crystals and crystal cohomology, yoga "De Rham coefficients", "Hodge coefficient" . . .
9. "Topological algebra":  $\infty$ -fields, derivators; cohomological topos formalism, as inspiration for a new homotopic algebra.
10. Moderate topology.
11. Yoga of Anabelian algebraic geometry, Galois-Teichmüller theory.
12. Schematic" or "arithmetic" point of view for regular polyhedra and regular configurations of all kinds.

Apart from the first of these themes, an important part of which is part of my thesis (1953) and was developed during my period of functional analysis between 1950 and 1955, the eleven others emerged during my period as a surveyor, from 1955 onwards.

By necessity, some of these ideas are "bigger" than others (which, by the same token, are "smaller"! ). In other words, some of these new themes are broader than others, and some plunge deeper into the heart of the mystery of mathematical things<sup>23</sup>. There are three (and no "Officially", they don't even exist, since no formal publication is available to serve as their birth certificate<sup>24</sup>). Of the nine themes that appeared before my departure, the last three, which I had left in full bloom, are still in their infancy, for lack (after my departure) of loving hands to provide for these "orphans", left to fend for themselves in a hostile world<sup>25</sup>. As for the other six themes, which reached full maturity in the two decades preceding my departure, it could be said (with one or two reservations<sup>26</sup>) that by then they had already become part of the common heritage: especially among the geometrician gentry, "everyone" nowadays intones them without even knowing it (as Monsieur Jourdain used to do with prose), all day long and all the time. They're part of the air we breathe when we're "doing geometry", or when we're doing arithmetic, algebra or analysis that's even remotely "geometric".

p. P22

These twelve major themes in my work are by no means isolated from one another. They are part of my **unity** of spirit and purpose that runs like a common, persistent background note through all my "written" and "unwritten" work. And as I write these lines, I seem to find the same note again... - like a call! - through these three years of "free", relentless and solitary work, at a time when I hadn't yet bothered to find out whether there were any mathematicians in the world apart from myself, so caught up was I then in the fascination of what was calling me... .

p. P23

This unity is not merely the mark of the same craftsman on the works that emerge from his hands. These themes are linked by innumerable connections, at once delicate and obvious, just as the different themes, each clearly recognizable, that unfold and entwine in

<sup>23</sup>Among these themes, the **widest in scope** seems to me to be that of **topos**, which provides the idea for a synthesis of algebraic geometry, topology and arithmetic. The broadest in terms of **the range of developments** to which it has already given rise, is the theme of schemas. (See b. de p. (\*) on page 20). It provides the framework "par excellence" for eight of the other themes considered (i.e., all the others excluding themes 1, 5 and 10), while at the same time providing the central notion for a fundamental renewal of algebraic geometry, and of the algebraic-geometric language. At the opposite end of the spectrum, the first and last of the twelve themes seem to me to be of more modest dimensions than the others. And yet, as for the last one, which introduces a new perspective to the age-old theme of regular polyhedra and regular configurations, I doubt that a mathematician's lifetime of dedication would be enough to exhaust it. As for the first of all these themes, that of topological tensor products, it played more the role of a new, ready-to-use tool than that of a source of inspiration for further developments. Even in recent years, however, I still receive sporadic echoes of more or less recent work, resolving (twenty or thirty years later) some of the questions I had left in abeyance.

The most profound (to my mind) of these twelve themes are that of **patterns**, and the closely related one of **Anabelian algebraic geometry and Galois-Teichmüller yoga**.

From the point of view of the **power of tools** that I have perfected and honed, and that have been in common use in various "cutting-edge" research sectors over the last two decades, it is the **"schematics"** and **"staggered and l-adic cohomology"** aspects that seem to me to be the most noteworthy. For a well-informed mathematician, I think there can be little doubt that schematics, and the l-adic cohomology that stems from them, are among the few major achievements of the century that have nourished and renewed our science over the last few generations.

<sup>24</sup>The only "semi-official" text in which these three themes are sketched out to any extent is *Esquisse d'un Programme*, written in January 1984 in response to a request for a secondment to the CNRS. This text (also referred to in Introduction 3, "Boussole et Bagages") will in principle be included in volume 4 of *Réflexions*.

<sup>25</sup>After these three orphans had been buried without fanfare on the very day after my departure, two of them were exhumed with great fanfare and no mention of the worker, one in 1981 and the other (given the unmitigated success of the operation) the following year.

<sup>26</sup>The "just about" refers above all to the Grothendieckian yoga of duality (derived categories and six operations), and that of the topos. This is discussed in detail (among other things) in Parts II and IV of *Harvest and Sowing* (Burial (1) and (3)).

a single, vast counterpoint - in a harmony that brings them together, carries them forward and gives each a meaning, a movement and a fullness in which all the others participate. Each of the partial themes seems to emerge from this larger harmony and to be reborn from it moment by moment, rather than appearing as a "sum" or "result" of pre-existing constituent themes. And to tell the truth, I can't help feeling (no doubt absurd... .) that, in a way, it is this harmony that has not yet appeared, but which surely already "existed", somewhere in the obscure bosom of things yet to be born - that it is this harmony that has in turn given rise to these themes that would only take on their full meaning through it, and that it is also this harmony that was already calling me in a low, urgent voice, in those years of ardent solitude, at the end of adolescence. ...

The fact remains that these twelve master themes of my work all, as if by a secret predestination, contribute to the same symphony - or, to use a different image, they embody so many different "points of view", all contributing to the same vast **vision**.

p. P24 This vision only began to emerge from the mists, to show recognizable contours, around the years 1957, 58 - years of intense gestation<sup>27</sup>. Perhaps strangely enough, this vision was for me so close, so "obvious", that until a year ago<sup>28</sup>, I had never thought of giving it a name. (I, whose one of passions, however, has been to constantly **name** the things that discover themselves to me, as a first means of apprehending them. . . .) It's true that I can't point to any particular moment that would have been experienced as the moment of this vision's appearance, or that I could recognize as such in retrospect. A new vision is such a vast thing, that its appearance cannot possibly be situated at a particular moment, but must penetrate and gradually take possession over many years, if not generations, of those who scrutinize and contemplate; as if new eyes had to laboriously form, behind the familiar eyes they are destined to gradually replace. And the vision is too vast for us to "grasp" it, as we would grasp the first notion to appear at the turn of the road. That's why it's probably not surprising that the idea of naming something so vast, yet so close and diffuse, only emerged with hindsight, once it had reached full maturity.

To tell the truth, until two years ago my relationship with mathematics was limited (apart from the task of teaching it) to **make** it - to follow an impulse that kept pulling me **forward**, into an "unknown" that **m'** attirait sans cesse. The idea wouldn't have occurred to me to stop in this momentum, to put down even the space

p. P25

<sup>27</sup>1957 was the year in which I came up with the "**Riemann-Roch**" theme (Grothendieck version) - which, overnight, made me a "big star". It was also the year of my mother's death, which marked a major turning point in my life. It was one of the most intensely creative years of my life, and not just mathematically. For twelve years, all my energy had been invested in mathematical work. That year, I had the feeling that I'd pretty much "come full circle" in terms of mathematical work, and that it might now be time to invest myself in something else. It was a need for inner renewal that surfaced for the first time in my life. At the time, I was thinking of becoming a writer, and for several months I stopped all mathematical activity. In the end, I decided that I would at least put the mathematical work I was already doing in black and white, for a few months probably, or a year at the most... .

The time was not yet ripe, no doubt, for the big leap. Nevertheless, once I had resumed my mathematical work, it was he who took me back. And he didn't let go for another twelve years!

The year that followed this interlude (1958) was perhaps the most fruitful of all in my life as a mathematician. It was in this year that the two central themes of the new geometry emerged, with the strong start of **schema theory** (the subject of my talk at the International Congress of Mathematicians in Edinburgh in the summer of the same year), and the appearance of the notion of "**site**", a provisional technical version of the crucial notion of **topos**. With the benefit of almost thirty years' hindsight, I can now say that this was truly the year when the vision of the new geometry was born, in the wake of the two master tools of this geometry: diagrams (which represent a metamorphosis of the old notion of "algebraic variety"), and topos (which represent an even more profound metamorphosis of the notion of space).

<sup>28</sup>I first thought of giving a name to this vision in the reflection of December 4 1984, in the sub-note (n° 136<sub>1</sub> to the note "Yin the Servant (2) -or generosity" (ReS III, page 637).

(Whether to situate it **in my life**, as something to which deep and long-ignored links continue to connect me; or to situate it in the collective adventure that is "**mathematics**").

Strangely enough, in order for me to finally "put down" and reacquaint myself with this half-forgotten work, or to even think of giving a **name** to the vision that was its soul, I suddenly found myself confronted with the reality of a Burial of gigantic proportions: the burial, through silence and derision, of both the vision and the worker in whom it was born. ...

## 2.9. Form and structure - or the way to things

Without having planned it, this "foreword" ended up becoming a sort of formal presentation of my work, intended (above all) for the non-mathematician reader. I'm already too far along to go back any further, so all that's left for me to do is complete the "introductions"! I'd like to try, as best I can, to say at least a few words about the **substance** of these mirific "big ideas" (or "master themes") that I've hinted at in the preceding pages, and about the nature of the famous "vision" into which these master ideas are supposed to converge. In the absence of any technical language, I'll probably only be able to convey an extremely blurred image (if anything is indeed "conveyed"...)<sup>29</sup>.

Traditionally, we distinguish three types of "qualities" or "aspects" of things in the Universe, which are the object of mathematical reflection: these are **number**<sup>30</sup>, **size** and **shape**. We can also  $\square$  call them the "**arithmetic**" aspect, the "**metric**" (or "analytic") aspect, and the "**geometric**" aspect of things. In most situations studied in mathematics, these three aspects are present simultaneously and in close interaction. More often than not, however, there is a marked predominance of one of the three. It seems to me that in most mathematicians, it's pretty clear (to those who know them, or are familiar with their work) what their basic temperament is, whether they are "arithmeticians", "analysts", or "geometers" - and this, even though they would have many strings to their violin, and would have worked in every conceivable register and pitch.

p. P26

My first, solitary reflections on the theory of measurement and integration fall squarely under the heading of "magnitude" or "analysis". And the same is true of the first of the new themes I introduced into mathematics (which appears to me to be of less vast dimensions than the eleven others). The fact that I entered mathematics through the "medium" of analysis seems to me to be due, not to my particular temperament, but to what might be called a "fortuitous circumstance": the most enormous gap, for my general and rigorous mind, in the teaching offered to me at high school and university, concerned the "metric" or "analytical" aspect of things.

The year 1955 marked a crucial turning point in my mathematical work: the transition from "analysis" to "mathematics".

<sup>29</sup>The fact that this image has to remain "blurred" in no way prevents it from being faithful to, and indeed restoring, something of the essence of what is being looked at (in this case, my work). Conversely, no matter how sharp an image may be, it may well be distorted, and what's more, include only the incidental and miss the essential entirely. So, if you "hang on" to what I see to say about my work (and surely then something of the image in me will indeed "get through"), you'll be able to flatter yourself that you've grasped what's essential in my work better than perhaps any of my learned colleagues!

<sup>30</sup>It's understood here that we're talking about "numbers" known as "natural integers" 0, 1, 2, 3 etc., or (at a pinch) numbers (such as fractional numbers) that can be expressed using them by operations of an elementary nature. Like "real numbers", these numbers are not suitable for measuring a variable that can vary continuously, such as the distance between two variable points on a straight line, in a plane or in space.

to "geometry". I still remember that striking impression (all subjective, of course), as if I'd left the arid, stark steppes, to suddenly find myself in a kind of "promised land" of luxuriant riches, multiplying infinitely wherever it pleases the hand to rest, to pick or to rummage... . And this impression of overwhelming wealth, beyond all measure<sup>31</sup>, has only been confirmed and expanded upon.

over the years, right up to the present day.

p. P27 □ That is to say, if there's one thing in mathematics that has always fascinated me more than

It's neither "number" nor "size", but always **form**. And among the thousand-and-one faces that form chooses to reveal itself to us, the one that has fascinated me more than any other, and continues to fascinate me, is the **structure** hidden in mathematical things.

The structure of a thing is by no means something we can "invent". We can only patiently uncover it, humbly getting to know it, "**discovering**" it. If there is inventiveness in this work, and if we sometimes act as blacksmiths or tireless builders, it is by no means to "shape" or "build" "structures". They didn't wait for us to come into being, and to be exactly what they are! But it is to **express**, as faithfully as we can, these things that we are in the process of discovering and probing, and this structure, reluctant to surrender itself, that we are groping for, and perhaps using a language still in its infancy, to define. In this way, we're constantly "**inventing**" the language capable of expressing in ever finer detail the intimate structure of the mathematical thing, and "constructing" with the help of this language, as we go along and from scratch, the "theories" that are supposed to account for what has been apprehended and seen. There's a continual, uninterrupted back-and-forth movement between **the apprehension of** things and the **expression of** what is apprehended, using a language that is refined and re-created as the work progresses, under the constant pressure of immediate need.

As the reader will no doubt have guessed, these "theories", "built from scratch", are none other than the "**beautiful houses**" mentioned above: those we inherit from our predecessors, and those we are led to build with our own hands, at the call of things. And if I spoke earlier of the "inventiveness" (or imagination) of the builder or blacksmith, I would have to add that the soul and secret nerve of it is not the superbness of the person who says: "I want this, and not that!" and who takes pleasure in deciding as he pleases; like a poor architect who has his plans all ready in his head, before having seen and felt a plot of land, and probed its possibilities and requirements. The quality of the researcher's inventiveness and imagination lies in the **quality of his attention** to the voice of things. Because things

of the Universe never tire of speaking of themselves and revealing themselves, to the one who cares to hear.

p. P28 And the most beautiful house' □ the <sup>one</sup> in which the worker's love appears, is not the one that is larger or higher than others. A beautiful home is one that faithfully reflects the hidden structure and beauty of things.

## 2.10. The new geometry - or the marriage of number and size

But here I am diverging again - I was proposing to speak of master-themes, coming together in the same mother-vision, like so many rivers returning to the Sea whose sons they are... .

<sup>31</sup>I've used the association of words "overwhelming, beyond measure", to render as best I can the German expression "überwältigend", and its English equivalent "overwhelming". In the previous sentence, the (inadequate) expression "striking impression" is also to be understood with this nuance: when the impressions and feelings aroused in us by confrontation with uncommon splendor, grandeur or beauty suddenly overwhelm us, to the point where any attempt to express what we feel seems to be annihilated in advance.

This vast, unifying vision can be described as a **new geometry**. It's the kind of geometry Kronecker dreamed of in the last century<sup>32</sup>. But the reality (which a bold dream sometimes makes us sense or glimpse, and which he encourages us to discover. . . ) is always richer and more resonant than even the boldest or most profound dream. Surely, for more than one facet of this new geometry (if not for all), no one, even the day before it appeared, would have thought of it - the worker himself no more than anyone else.

We could say that "number" is apt to grasp the structure of "discontinuous", or "**discrete**" aggregates: systems, often finite, formed of "elements" or "objects" isolated from one another, so to speak, without some principle of "continuous passage" from one to another. "Magnitude", on the other hand, is the quality par excellence, capable of "**continuous variation**"; in this way, it is able to grasp continuous structures and phenomena: movements, spaces, "varieties" of all kinds, force fields and so on. Thus, arithmetic appears (roughly speaking) as the **science of discrete structures**, and analysis as the **science of continuous structures**,

□ As for geometry, it can be said that for more than two thousand years it has existed as a science in the modern sense of the word, it "straddles" these two types of structure, the "discrete" and the "continuous"<sup>33</sup>. For a long time, moreover, there was no real "**divorce**" between **two** geometries that would have been of different kinds, one discrete, the other continuous. Rather, there were two different points of view in the investigation of the **same** geometric figures: one emphasizing "discrete" properties (and in particular, numerical and combinatorial properties), the other "continuous" properties (such as position in the surrounding space, or "magnitude" measured in terms of the mutual distances of its points, etc.).

It was at the end of the last century that a divorce appeared, with the appearance and development of what was sometimes called "**abstract** (algebraic) **geometry**". Roughly speaking, this consisted in introducing, for each prime number  $p$ , an (algebraic) geometry "of characteristic  $p$ ", modelled on the (continuous) model of the (algebraic) geometry inherited from previous centuries, but in a context that appeared to be irreducibly "discontinuous", "discrete". These new geometric objects have taken on increasing importance since the beginning of the century, particularly in view of their close relationship with arithmetic, the science par excellence of discrete structure. This would seem to be one of the guiding ideas in **André Weil's** work<sup>34</sup>, perhaps even the main thrust (which has remained more or less unspoken).

<sup>32</sup>I only know of this "Kronecker dream" through hearsay, when someone (perhaps it was John Tate) told me I was in the process of realizing it. In the education I received from my elders, historical references were rare, and I was nourished, not by reading ancient or even contemporary authors, but above all by communicating, orally or through letters, with other mathematicians, starting with my elders. The main, perhaps even the only external inspiration for the sudden and vigorous start of scheme theory in 1958, was Serre's well-known paper FAC ("Faisceaux algébriques cohérents"), published a few years earlier. That one aside, my main inspiration in the subsequent development of the theory was to be found to flow from itself, and to be renewed over the years, by the sole demands of simplicity and internal coherence, in an effort to give an account in this new context, of what was "well known" in algebraic geometry (and which I assimilated as it was transformed in my hands), and of what this "known" made me sense.

<sup>33</sup>In fact, traditionally, it was the "continuous" aspect that was the focus of the geometer's attention, while properties of a "discrete" nature, and in particular numerical and combinatorial properties, were passed over in silence or dealt with under the table. It was with wonder that I discovered, some ten years ago, the richness of the combinatorial theory of the icosahedron, whereas this theme is not even touched upon (and probably, not even seen) in Klein's classic book on the icosahedron. I see another striking sign of this (two-thousand-year-old) neglect by geometers of the discrete structures spontaneously introduced into geometry: it's that the notion of groups (of symmetries, in particular) only appeared in the last century, and that, what's more, it was first introduced (by Evariste Galois) in a context that wasn't then considered to belong to "geometry". It's true that even today, many algebraists still haven't understood that Galois' theory is, in essence, a "**geometrical**" vision, renewing our understanding of so-called "arithmetical" phenomena. . .

<sup>34</sup>André Weil, a French mathematician who emigrated to the USA, is one of the "founding members" of the "Bourbaki Group", which will be discussed at length in the first part of Récoltes et Semailles (as well as Weil himself, occasionally).

in his written work, as it should be), that "geometry" (algebraic), and especially the "discrete" geometries associated with the various prime numbers, were to provide the key for a renewal of arithmetic. It was in this spirit that, in 1949, he came up with the famous "**Weil conjectures**". These were absolutely breathtaking conjectures, in fact, which, for these new discrete "varieties" (or "spaces"), opened up the possibility of certain types of constructions and arguments<sup>35</sup> which, until then, had only seemed conceivable within the framework of the only "spaces" considered worthy of the name by analysts - namely, the so-called "topological" spaces (where the notion of continuous variation holds sway).

The new geometry can be seen as, above all else, a synthesis between these two worlds, which until then had been adjacent and closely interwoven, yet separate: the "**arithmetical**" world, in which live (so-called) "spaces" without any principle of continuity, and the **world of continuous magnitude**, where live "spaces" in the proper sense of the term, accessible to the analyst's means and (for this very reason) accepted by him as worthy of dwelling in the mathematical city. **In the new vision, these two previously separate worlds become one.**

The first embryo of this vision of an "arithmetic geometry" (as I propose to call this new geometry) can be found in Weil's conjectures. In the development of some of my main themes<sup>36</sup>, these conjectures remained my main source of inspiration, throughout the years between 1958 and 1969. Even before me, **Oscar Zariski** on the one hand, and **Jean-Pierre Serre** on the other, had developed certain "topological" methods for the lawless spaces of "abstract" algebraic geometry, inspired by those previously used for the "good-natured spaces" of the whole world<sup>37</sup>.

□ Their ideas, of course, played an important role in my first steps in building geometry. arithmetic; more, it's true, as starting points and **tools** (which I had to reshape more or less from scratch, for the needs of a much larger context), than as a source of inspiration that would have continued to nourish my dreams and projects, over the months and years. In any case, it was clear from the outset that, even reshaped, these tools fell far short of what was required to take even the very first steps in the direction of fantastic conjectures.

## 2.11. The magic fan - or innocence

The two key ideas in the launch and development of the new geometry were that of **schema** and **topos**. Appearing more or less simultaneously, and in close symbiosis with each other

<sup>35</sup>(Intended for the mathematician reader.) This section covers "constructions and arguments" related to the cohomological theory of differentiable or complex varieties, and in particular those involving Lefschetz's formula of fixed points and Hodge's theory.

<sup>36</sup>These are the four "median" themes (n°s 5 to 8), i.e. **topos** of *étale* and *l-adic* **cohomology**, **motifs**, and (to a lesser extent) **crystals**. I developed these themes in turn between 1958 and 1966.

<sup>37</sup>(For the mathematician reader.) Zariski's main contribution in this direction seems to me to be the introduction of "Zariski's topology" (which later became an essential tool for Serre in FAC), and his "principle of connectedness" and what he called his "theory of holomorphic functions" - which in his hands became the theory of formal schemes, and the "comparison theorems" between the formal and the algebraic (with, as a second source of inspiration, Serre's fundamental GAGA article). As for Serre's contribution to which I allude in the text, it is, of course, first and foremost his introduction, in abstract algebraic geometry, of the point of view of bundles (introduced by **Jean Leray** a dozen years earlier, in a quite different context), in that other fundamental article already cited FAC ("Faisceaux algébriques cohérents").

In the light of these "reminders", if I were to name the immediate "ancestors" of the new geometrical vision, the names **Oscar Zariski**, **André Weil**, **Jean Leray** and **Jean-Pierre Serre** immediately come to mind. Among them, Serre played a special role, since it was mainly through him that I became aware not only of his own ideas, but also of those of Zariski, Weil and Leray, who had a part to play in the birth and development of the new geometry.

with the other<sup>38</sup>, they were like a single **driving force behind** the spectacular rise of the new geometry, and this from the very year of their appearance. To conclude this overview of my work, I'd like to say a few words about at least these two ideas.

Schema is the most natural, the most "obvious" concept imaginable, to encompass in a single notion the infinite series of notions of "variety" (algebraic) that we previously handled (one such notion for **each**  $p$  . P32 prime number<sup>39</sup> . . . ). What's more, one and the same "pattern" (or new-style "variety") gives rise, for each prime number  $p$ , to a well-defined "(algebraic) variety of characteristic  $p$ ". The collection of these different varieties of different characteristics can then be visualized as a kind of "(infinite) fan of varieties" (one for each characteristic). The "schema" is this magical fan, which links together, like so many different "branches", its "avatars" or "incarnations" of all possible characteristics. At the same time, it provides an effective "principle of passage" for linking together "varieties" of geometries that had hitherto appeared more or less isolated, cut off from one another. Now, they are encompassed by a common "geometry" and linked by it. We could call it **schematic geometry**, the first draft of the "arithmetic geometry" into which it was to blossom in the following years.

The very idea of schematics is childishly simple - so simple, so humble, that no one before me had ever thought of stooping so low. So "silly", in fact, that for years, despite the obvious, many of my learned colleagues thought it was "not serious"! In fact, it took me months of hard, solitary work to convince myself that it really did "work".

- that the silly new language I was incorrigibly naïve enough to insist on testing was indeed adequate to capture, in a new light and with a new finesse, and in a common framework from now on, some of the very first geometrical intuitions attached to the previous "geometries of characteristic  $p$ ". It was the kind of exercise, judged foolish and hopeless in advance by any "well-informed" person, that I was probably the only one, among all my colleagues and friends, to ever have the idea of putting into my head, and even (moved by a secret demon. . . ) to bring to a successful conclusion against all odds!

Rather than allow myself to be distracted by the consensus around me about what is "serious" and what is not, I simply **trusted**, as I had in the past, the humble voice of things, and that part of me that knows how to listen. The reward was immediate, and beyond all expectations. In the space of In just a few months, without even "doing it on purpose", I had put my finger on some powerful and unsuspected tools.

They allowed me not only to find (as if playing) old, reputedly arduous results in  $p$  . P33 a more penetrating light and to go beyond them, but also to finally tackle and solve problems of " $p$ -characteristic geometry" which until then had seemed out of reach by all means then known<sup>40</sup>.

In our knowledge of things in the Universe (mathematical or otherwise), the power

<sup>38</sup>This start, in 1958, is mentioned in the b. de p. note on page 23. The notion of site or "**Grothendieck topology**" (a provisional version of that of topos) appeared in the immediate wake of the notion of schema. It in turn provides the new language of "localization" or "descent", used at every step in the development of the schematic theme and tool. The more intrinsic and geometrical notion of topos, which remained implicit for the next few years, began to emerge from 1963 onwards, with the development of étale cohomology, and gradually imposed itself on me as the most fundamental notion.

<sup>39</sup>The case of  $p = \infty$ , corresponding to algebraic varieties of "zero characteristic", should also be included in this series.

<sup>40</sup>An account of this "strong start" for schema theory is the subject of my presentation at the International Congress.

of Mathematicians in Edinburgh, 1958. The text of this talk seems to me to be one of the best introductions in terms of diagrams, likely (perhaps) to motivate a geometrician reader to familiarize himself or herself as best he or she can with the (later) imposing treatise "Elements of Algebraic Geometry", setting out in a detailed manner (and without mercy to any technical details) the new foundations and techniques of algebraic geometry.

**innocence.** It's the original innocence we were all born with, and which lies within each of us, often the object of our scorn and our most secret fears. It alone unites the humility and boldness that allow us to penetrate to the heart of things, and to let things penetrate and impregnate us.

This power is by no means the privilege of extraordinary "gifts" - of (let's say) uncommon brain power to assimilate and handle, with dexterity and ease, an impressive mass of known facts, ideas and techniques. Such gifts are certainly precious, worthy of envy for anyone (like me) who wasn't blessed with them at birth, "beyond measure".

It's not these gifts, however, nor even the most ardent ambition, served by unfailing willpower, that get us through the "invisible and imperious circles" that enclose our Universe. Only innocence crosses them, unknowingly and unconcernedly, in those moments when we find ourselves alone, listening to things, intensely absorbed in a child's game. ...

## 2.12. Topology - or the survey of mists

As we've just seen, the innovative idea behind the "schema" is that of linking together the different "geometries" associated with the different prime numbers (or different "characteristics"). These geometries, however, were still each essentially "discrete" or "discontinuous" in nature, in contrast to the traditional geometry bequeathed by past centuries (and dating back to Euclid). The new ideas introduced by Zariski and Serre restored, to a certain extent, a "dimension" to these geometries.

p. P34 ☐ continuity, immediately inherited by the "schematic geometry" that had just appeared, for the purpose of uniting them. But

as far as Weil's "fantastic conjectures" were concerned, we were way off the mark. These "Zariski topologies" were, from this point of view, so coarse-grained that it was almost as if we were still at the stage of "discrete aggregates". What was obviously missing was some new principle that would enable us to link these geometric objects (or "varieties", or "schemes") to the usual, or "bon teint" (topological) "spaces"; those, let's say, whose "points" appear to be clearly **separated** from one another, whereas in the spaces-without-law-not introduced by Zariski, the points have an annoying tendency to clump together... ..

It was the appearance of such a decidedly "new principle", and nothing less, that could consummate those "marriages of number and magnitude" or of the "geometry of the discontinuous" with that of the "continuous", a first hint of which emerged from Weil's conjectures.

The notion of "**space**" is undoubtedly one of the oldest in mathematics. It is so fundamental to our "geometric" apprehension of the world, that it has remained more or less unspoken for over two millennia. It's only over the past century that this notion has gradually come to detach itself from the tyrannical grip of immediate perception (of one and the same "space" surrounding us), and from its traditional ("Euclidean") theorization, to acquire its own autonomy and dynamic. Today, it is one of the few notions most universally and commonly used in mathematics, and is familiar to every mathematician without exception. A pro forma notion if ever there was one, with a hundred and a thousand faces, depending on the type of structures we incorporate into these spaces, from the richest of all (such as the venerable "Euclidean" structures, or the "affine" and "projective" structures, or the "algebraic" structures of the "varieties" of the same name, which generalize them and make them more flexible) to the most stripped-down: those where any "quantitative" element of information whatsoever seems to have disappeared without return,

where only the quintessential qualitative notions of "**proximity**" and "**limit**" remain<sup>41</sup>, and the most elusive version of the "topological" intuition of **form**. The most stripped-down of all these notions, the one that<sup>42</sup> up to now, over the past half-century, had taken the place of a kind of vast bosom to encompass all the others, was that of **topological space**. The study of these spaces is one of the most fascinating and lively branches of geometry: **topology**. p. P35

However elusive this structure of "pure quality" embodied by a "space" may seem at first glance, in the absence of any quantitative data (such as the distance between two points, in particular) that would enable us to cling to some familiar intuition of "size" or "smallness", we have nonetheless managed, over the past century, to finely define these spaces in the tight, supple meshes of a carefully "cut-to-size" language. Better still, we've invented and fabricated a whole range of "meters" and "toises" to serve, against all odds, as a way of attaching "me- sures" (called "topological invariants") to these sprawling "spaces" that seemed to elude all attempts at measurement, like elusive mists. It's true that most of these invariants, and the most essential ones at that, are of a more subtle nature than a simple "number" or "magnitude" - rather, they are themselves more or less delicate mathematical structures, attached (by means of more or less sophisticated constructions) to the space under consideration. One of the oldest and most crucial of these invariants, introduced as early as

in the last century (by the Italian mathematician **Betti**), is made up of the various so-called "cohomology" "groups" (or "spaces") associated with the space<sup>42</sup>. These are the ones that intervene (mostly<sup>43</sup> "between the lines", it's true) in . P36

Weil's conjectures, which give them their deepest "raison d'être" and (for me at least, "thrown into the deep end" by Serre's explanations) their full meaning. But the possibility of associating such invariants with the "abstract" algebraic varieties involved in these conjectures, in such a way as to meet the very precise desiderata required for the needs of that cause - that was a mere hope. I doubt that, apart from Serre and myself, nobody else (not even, and above all, André Weil himself!<sup>43</sup>) really believed in it... .

<sup>41</sup>Talking about the notion of "limit", I'm thinking more of "crossing the limit" than of "frontier" (more familiar to the non-mathematician).

<sup>42</sup>In fact, the invariants introduced by Betti were **homology** invariants. **Cohomology** is a more or less equivalent, "dual" version, introduced much later. This aspect took precedence over the initial, "homological" aspect, especially (no doubt) following Jean Leray's introduction of the beam point of view, discussed below. From a technical point of view, one could say that a large part of my work as a geometer consisted in identifying, and developing to a greater or lesser extent, the cohomological theories that were lacking, for spaces and varieties of all kinds, and above all, for "algebraic varieties" and schemes. Along the way, I was also led to reinterpret traditional homological invariants in cohomological terms, and in so doing, to show them in an entirely new light.

There are many other "topological invariants" that have been introduced by topologists, to define one type of property or another of topological spaces. Apart from the "dimension" of a space, and the (co)homological invariants, the first other invariants are the "homotopy groups". I introduced another of these in 1957, the so-called "Grothendieck group"  $K(X)$ , which immediately met with great success, and whose importance (both in topology and arithmetic) continues to be confirmed.

A host of new invariants, of a more subtle nature than the invariants currently known and used, but which I feel are fundamental, are envisaged in my "moderate topology" program (a very rough outline of which can be found in "Esquisse d'un Programme", to be published in volume 4 of *Réflexions*). This program is based on the notion of "moderate theory" or "moderate space", which, like that of topos, constitutes a (second) "metamorphosis of the notion of space". It is far more obvious (it seems to me) and less profound than the latter. I predict, however, that its immediate impact on topology "proper" will be far more far-reaching, and that it will fundamentally transform the geometric topologist's "profession", through a profound transformation of the conceptual context in which he works (as was also the case in algebraic geometry with the introduction of the schema point of view). Incidentally, I sent my "Esquisse" to several of my old friends and illustrious topologists, but it doesn't seem to have interested any of them. . .

<sup>43</sup>Paradoxically, Weil had a tenacious, seemingly visceral "block" against cohomological formalism - whereas it was largely his famous conjectures that inspired the development of the great cohomological theories in algebraic geometry, from the 1950s onwards (with Serre kicking things off, with his seminal paper FAC, already mentioned in a previous footnote).

It seems to me that this "block" is part, in Weil, of a general aversion against all "big stuff", against all that

Shortly before, our conception of these cohomology invariants had been enriched and profoundly renewed by the work of **Jean Leray** (pursued in German captivity during the Second World War).  
 war' □ in the first half of the forties). The essential innovative idea was that of **bundling** (abé-link) on a space, to which Leray associates a series of corresponding "cohomology groups" (with coefficients in this bundle). It was as if the good old standard "cohomological meter" we'd been using until now to "survey" a space had suddenly been multiplied into an unimaginably large multitude of new "meters" of every conceivable size, shape and substance, each one intimately adapted to the space in question, and each one providing us with perfectly precise information about it - information that only it can give us. This was the key idea in a profound transformation in our approach to spaces of all kinds, and surely one of the most crucial ideas to emerge in this century. Thanks largely to the subsequent work of Jean-Pierre Serre, the first fruits of Leray's ideas, already in the decade following their appearance, were an impressive revival in the theory of topological spaces (and in particular, of their so-called "homotopy" invariants, intimately linked to cohomology), and another revival, no less crucial, of so-called "abstract" algebraic geometry (with Serre's fundamental "FAC" article, published in 1955). My own work in geometry, from 1955 onwards, was a continuation of Serre's work, and thus of Leray's innovative ideas.

## 2.13. Les topos - or the double bed

The point of view and language of beams introduced by Leray led us to look at "spaces" and "varieties" of all kinds in a new light. They did not, however, touch on the very notion of space itself, merely helping us to apprehend more finely, with new eyes, those traditional "spaces" already familiar to us all. It turns out that this notion of space is inadequate to account for the most essential "topological invariants" that express the "form" of "abstract" algebraic varieties (such as those to which Weil's conjectures apply), or even that of general "schemes" (generalizing old varieties). For the expected "marriages", "in number and size", it was like a decidedly narrow bed, where only one of the future spouses (i.e., the bride) could find a place to nestle, but never both at once! The "new principle" that remained to be found, to consummate the marriage promised by auspicious fairies, was none other than this spacious "bed" that the future spouses lacked, without anyone having noticed until then... .

This "double bed" appeared (as if by magic wand. . . ) with the idea of the **topos**. This idea encompasses, in a □ common topological intuition, both traditional (topological) spaces, embodying the world of continuous magnitude, than the (so-called) "spaces" (or "varieties") of unrepentant abstract algebraic geometers, as well as countless other types of structures, which until then had seemed irremediably riveted to the "arithmetic world" of "discontinuous" or "discrete" aggregates.

It's the beam's point of view that has been the silent and sure guide, the effective (and by no means secret) key,

---

that resembles a formalism (when this can't be summed up in a few pages), or a "construction" that's even remotely interwoven. He was by no means a "builder", and it was clearly against his will that he was forced, in the thirties, to develop the first "abstract" foundations of algebraic geometry, which (given these provisions) turned out to be a veritable "Procrustean bed" for the user.

I don't know whether he blamed me for going beyond that, and for investing myself in building the vast mansions that enabled Kronecker's and his own dreams to be embodied in a language and tools that were both delicate and efficient. The fact remains that at no time did he say a word to me about the work he saw me doing, or the work that had already been done. Nor did I receive any response to *Récoltes et Semailles*, which I had sent him over three months ago, with a warm dedication in my own hand.

leading me without delay or detour to the bridal chamber with its vast marital bed. A bed so vast indeed (like a vast, peaceful, very deep river. . . ), that

"all the king's horses  
could drink together... "

- as an old tune tells us, which I'm sure you must have sung too, or at least heard sung. And whoever was the first to sing it felt the secret beauty and peaceful power of the topos better than any of my learned students and friends of yesteryear... ..

The key was the same, both in the initial, provisional approach (via the very convenient, but not intrinsic notion of "site"), and in that of the topos. It's the idea of the topos that I'd now like to try and describe.

Let's consider the set formed by **all the** beams on a given (topological) space, or, if you like, this prodigious arsenal formed by **all the** "meters" used to survey it<sup>44</sup>. We consider this "set" or "arsenal" to be equipped with its most obvious structure, which appears there, so to speak, "at sight of nose"; namely, a so-called "category" structure. (Let the non-mathematician reader not be troubled by not knowing the technical meaning of this term. He won't need it for what follows). It is this kind of "surveying superstructure", called the "category of beams" (on the space under consideration), that will henceforth be considered as "embodying" what is most essential to space. This is indeed lawful (for the "good mathematical sense"), because it turns out that we can "reconstruct" a topological space<sup>45</sup> from scratch in terms of this associated "beam category" (or **arsenal**  $\square$  **d'**arpentage). (To verify this is a simple exercise - once the question has been asked, of course. . . ) That's all we need to be sure that (if it suits us for whatever reason) we can now "forget" the initial space, and use only the associated "category" (or "arsenal") as the most appropriate embodiment of the "topological" (or "spatial") structure we're trying to express. . P39

As so often in mathematics, we have succeeded here (thanks to the crucial idea of "bundle", or "cohomological metre") in expressing a certain notion (that of "space" in this case) in terms of another (that of "category"). Each time, the discovery of such a **translation** of one notion (expressing a certain type of situation) in terms of another (corresponding to another type of situation), enriches our understanding of both notions, through the unexpected confluence of specific intuitions relating to either one or the other. Thus, a situation of a "topological" nature (embodied by a given space) is here translated by a situation of an "algebraic" nature (embodied by a "category"); or, if you like, the "continuum" embodied by space, is "translated" or "expressed" by the category structure, of an "algebraic" nature (and hitherto perceived as being of an essentially "discontinuous" or "discrete" nature).

But there's more. The first of these notions, that of space, appeared to us as a sort of "maximal" notion - a notion so general already, that it's hard to imagine how we can still find a "reasonable" extension to it. On the other hand, on the other side of the mirror<sup>46</sup>, these "categories" (or "arsenals") that we come across, starting from topological spaces, are of a very particular nature. They

<sup>44</sup>(To the mathematician) Actually, we're talking here about **set** bundles, not **abelian** bundles, introduced by Leray as the most general coefficients for forming "cohomology groups". In fact, I believe I was the first to work systematically with set bundles (from 1955, in my paper "A general theory of fibre spaces with structure sheaf" at the University of Kansas).

<sup>45</sup>(For the mathematician's benefit) Strictly speaking, this is only true for so-called "sober" spaces. However, these include almost all commonly encountered spaces, and in particular all the "separated" spaces so dear to analysts.

<sup>46</sup>The "mirror" referred to here, as in Alice in Wonderland, is the one that gives as an "image" of a space, placed in front of it, the associated "category", considered as a kind of "double" of the space, "on the other side of the mirror". . .

are indeed endowed with a set of strongly typed properties<sup>47</sup>, which make them a kind of "pastiche" of the simplest imaginable one - that obtained by starting from a space reduced to a single point. Having said this, a "new-style space" (or topos), generalizing traditional topological spaces, will be described quite simply as a "category" which, without necessarily coming from an ordinary space, nevertheless possesses all those good properties (explicitly designated once and for all, of course) of such a "category of bundles".

\*       \*

\*

□

p. P40

This is the new idea. Its appearance can be seen as a consequence of the almost childish observation that what really counts in a topological space is not its "points" or subsets of points<sup>48</sup>, and the relations of proximity etc. between them, but the **bundles** on this space, and the category they form. In short, all I've done is to take Leray's initial idea to its ultimate conclusion - and, in so doing, **take it a step further**.

Like the very idea of beams (due to Leray), or that of schematics, like any "big idea" that upsets an inveterate view of things, that of topos is disconcerting in its naturalness, its "obviousness", its simplicity (bordering, one might say, on the naïve or simplistic, or even the "silly" - that particular quality that so often makes us exclaim: "Oh, that's all there is to it!" with a tone of half-disappointment, half-envy; with, perhaps, the added undertone of "eccentric", "not serious", which we often reserve for anything that baffles us with an excess of unexpected simplicity. A reminder, perhaps, of the long-buried, long-denied days of our childhood... .

## 2.14. Mutation of the notion of space - or breath and faith

The notion of schema constitutes a vast extension of the notion of "algebraic variety", and as such it has thoroughly renewed the algebraic geometry bequeathed by my predecessors. The concept of topos constitutes an unsuspected extension, or rather, **a metamorphosis of the notion of space**. It holds out the promise of a similar renewal of topology, and beyond topology, of geometry. Indeed, it has already played a crucial role in the development of the new geometry (especially through the *l-adic* and crystalline cohomological themes that emerged from it, and through them, in the demonstration of Weil's conjectures). Like its elder (and near-twin) sister, it possesses the following two complementary characteristics essential to any fertile generalization.

Firstly, the new concept is not **too broad**, in the sense that in the new "spaces" (rather called "topos", so as not to offend delicate ears<sup>49</sup>), intuitions and "geometric" constructions

□

p. P41

the most essential       <sup>50</sup> familiar from the good old spaces of yesteryear, can be transposed into more

<sup>47</sup>(For the mathematician) These are properties that I have introduced into category theory under the name of "accuracy properties" (along with the modern categorical notion of general inductive and projective "limits"). See "Sur quelques points d'algèbre homologique", Tohoku math. journal, 1957 (pp. 119-221).

<sup>48</sup>In this way, you can build very "big" topos that have only one "point", or even no "points" at all!

<sup>49</sup>The name "topos" has been chosen (in association with "topology", or "topological") to suggest that it is the "object par excellence" to which topological intuition applies. By virtue of the rich cloud of mental images this name elicits, it should be seen as more or less equivalent to the (topological) term "space", simply with greater emphasis on the "topological" specificity of the notion. (So, there are "vector spaces", but no "vector topos", until further notice!) It's essential to keep the two expressions together, each with its own *spécificité*.

or less obvious. In other words, for the new objects we have at our disposal the whole rich range of mental images and associations, notions and at least some of the techniques that were previously restricted to old-style objects.

And secondly, the new notion is at the same time **broad enough** to encompass a host of situations that, until now, were not considered to give rise to intuitions of a "topologic-geometric" nature.

- intuitions, which in the past were reserved for ordinary topological spaces (and with good reason. . . ).

The crucial thing here, from the point of view of Weil's conjectures, is that the new notion is indeed vast enough, to allow us to associate with any "scheme" such a "generalized space" or "topos" (called the "étale topos" to the scheme under consideration). Certain "cohomological invariants" of this topos (all that "silly" stuff!) then seemed to have a good chance of providing "what we needed" to make sense of these conjectures, and (who knows!) perhaps provide the means to demonstrate them.

It is in these pages that I am writing that, for the first time in my life as a mathematician, I take the liberty of evoking (if only to myself) all the master themes and great guiding ideas in my mathematical work. This leads me to a better appreciation of the place and scope of each of these themes, and of the "points of view" they embody, within the great geometrical vision that unites them and from which they derive. It is through this work that the two innovative ideas central to the creamy and powerful rise of the new geometry have come to the fore: the idea of **schemas**, and that of **topos**.

It is the second of these ideas, that of topos, which now appears to me □ as the most profound of the two. If, in the late fifties, I hadn't rolled up my sleeves and stubbornly developed, day after day, over twelve long years, a "schematic tool" of perfect delicacy and power - it would seem almost unthinkable to me that in the ten or twenty years since, it would seem almost unthinkable, however, that in the ten or twenty years that have followed, anyone other than me would have eventually (albeit unwillingly) introduced the notion that was obviously necessary, and at least erected a few dilapidated "prefab" shacks, in place of the spacious, comfortable mansions that I took it upon myself to assemble stone by stone and build with my own hands. On the other hand, I can't think of anyone else on the mathematical scene, over the past three decades, who might have had the naivety, or innocence, to take (in my place) that other crucial step of all, introducing the oh-so-childish idea of topos (or even that of "sites"). And, even supposing this idea had already been graciously provided, and with it the timid promise it seemed to hold - I can't think of anyone else, either among my old friends or among my students, who would have had the breath, and above all the faith, to bring this humble<sup>51</sup> idea to fruition (so derisory in appearance, when the goal seemed infinitely distant. . . ): from its first stammering beginnings, to the full maturity of the "mastery of staggered cohomology" into which it came to be embodied in my hands, over the years that followed.

p. P42

<sup>50</sup>These "constructions" include all the familiar "topological invariants", including cohomological invariants. For the latter, I had done everything necessary in the article already cited ("Tohoku" 1955), to be able to give them a meaning for any "topos".

<sup>51</sup>(For the benefit of the mathematician reader.) When I speak of "bringing this humble idea to fruition", I mean the idea of étale cohomology as an approach to Weil's conjectures. It was inspired by this idea that I discovered the notion of site in 1958, and that this notion (or the closely related notion of topos), and the étale cohomological formalism, were developed between 1962 and 1966 under my impetus (with the assistance of a number of collaborators who will be mentioned later).

When I speak of "breath" and "faith", I'm referring to qualities of a "non-technical" nature, which seem to me to be the essential qualities here. On another level, I could also add what I would call "cohomological flair", i.e. the kind of flair that had developed in me for building cohomological theories. I thought I'd passed it on to my cohomology students. Looking back seventeen years after my departure from the mathematical world, I can see that it has not been preserved in any of them.

## 2.15. All the king's horses. . .

p. P43

Yes, the river is deep, and vast and peaceful are the waters of my childhood, in a kingdom I thought I'd left long ago. All the king's horses could drink there at ease and all their strength, without exhausting them! They come from the glaciers, fiery as those distant snows, and they have the sweetness from the clay of the plains. I've just been talking about one of these horses, which a kid had brought to drink and drank his content, long. And I've seen <sup>another</sup> □ coming to drink for a while, following in the footsteps of the same kid so but it didn't take long. Someone must have chased him away. And that's all there is to it. Yet I see countless herds of thirsty horses roaming the plains - and just this morning their whinnies roused me from bed at an ungodly hour, me being on my sixtieth birthday and loving the peace and quiet. There was nothing I could do, I had to get up. It pains me to see them like gaunt beasts, even though there's no shortage of good water or green pastures. But it's as if a malevolent spell has been cast over this land that I've known to be welcoming, and condemned access to these generous waters. Or maybe it's a trick pulled by the local horse traders, to drive down prices, who knows? Or maybe it's a country where there are no more children to lead the horses to water, and where the horses are thirsty for lack of a kid to find the way back to the river... .

## 2.16. Patterns - or the heart in the heart

The topos theme grew out of the schematics theme, in the same year that the schematics appeared - but in scope it goes far beyond the mother theme. It is the theme of topos, and not that of schemas, that is the "bed", or "deep river", where geometry and algebra, topology and arithmetic, mathematical logic and category theory, the world of continuity and that of "discontinuous" or "discrete" structures come together. If the theme of schemas is like the **heart of** the new geometry, the theme of topos is its envelope, or **dwelling place**. It's the most far-reaching thing I've conceived, to capture with finesse, through a single language rich in geometrical resonances, an "essence" common to situations as far apart as possible, from one region or another of the vast universe of mathematical things.

The theme of topos, however, is far from having enjoyed the same fortune as that of schemas. I've written on this subject on several occasions in *Récoltes et Semailles*, and this is not the place to dwell on the strange vicissitudes that have befallen this notion. However, two of the master themes of the new geometry stem from that of the topos, two complementary "cohomological theories", both conceived to provide an approach to Weil's conjectures: **the étale** (or "**l-adic**") **theme**, and the **crystalline** theme. The former took shape in my hands as the *l-adic* cohomological tool, which is now one of the most powerful mathematical tools of the century. As for the crystalline theme, reduced after my departure to a quasi-occult existence, it was finally exhumed (under pressure of necessity) in June 1981, in the limelight and under an assumed name, in circumstances even stranger than those surrounding the topos.

p. P44

□ The *l-adic* cohomological tool was, as expected, the essential tool for establishing Weil's conjectures. I've demonstrated quite a few of them myself, and the last step was masterfully taken, three years after I left, by Pierre Deligne, the most brilliant of my "cohomologist" students.

In fact, around 1968, I came up with a stronger and, above all, more "geometric" version of Weil's conjectures. These remained "tainted" (if you can call it that!) by an apparently irreducible "arithmetic" aspect, even though the very spirit of these conjectures is to express and grasp "arithmetic".

(or "the discrete") through the mediation of the "geometric" (or "the continuous")<sup>52</sup>. In this sense, my version of the conjectures seems to me to be more "faithful" than Weil's own to "Weil's philosophy" - to that unwritten and seldom-spoken philosophy, which has perhaps been **the** main tacit motivation in the extraordinary rise of geometry over the past four decades<sup>53</sup>. My reformulation consisted, essentially, in extracting a kind of "quintessence" of what was to remain valid, in the context of so-called "abstract" algebraic varieties, of the classical "Hodge theory", valid for "ordinary" algebraic varieties<sup>54</sup>. I have called this new, entirely geometric version of the famous conjectures "**standard conjectures**" (for algebraic cycles).

In my mind, this was a further step after the development of the *l*-adic cohomological tool, in direction of these conjectures. But at the same time, and above all, it was also one of the principles of the possible to what still seems to me the most profound theme I've introduced into mathematics<sup>55</sup> : p. P45

that of **motifs** (itself born of the "*l*-adic cohomological theme"). This theme is like the **heart** or soul, the most hidden part, best concealed from view, of the schematic theme, which itself is at the heart of the new vision. And the few key phenomena identified in the standard<sup>56</sup> conjectures can be seen as forming a kind of ultimate quintessence of the motivic theme, as the vital "**breath**" of this most subtle of all themes, of this "**heart within the heart**" of the new geometry.

Here's what it's all about. We have seen, for a given prime number  $p$ , how important it is (particularly in view of Weil's conjectures) to be able to construct "cohomological theories" for "(algebraic) varieties of characteristic  $p$ ". Now, the famous "*l*-adic cohomological tool" provides just such a theory, and even an **infinite number of different cohomological theories**, namely one associated with any prime number different from characteristic  $p$ . Here again, there is clearly a "missing theory", which would correspond to the case of an  $l$  equal to  $p$ . To fill this gap, I have deliberately devised another cohomological theory (already alluded to earlier), known as "crystalline cohomology". Moreover, in the important case where  $p$  is infinite, we have three other cohomological theories at our disposal<sup>57</sup> - and there's nothing to prevent us from introducing yet more cohomological theories with similar formal properties sooner or later. Contrary to the situation in ordinary topology, we find ourselves faced with a bewildering abundance of different cohomological theories. We had the impres-

sion that, in a sense that initially remained rather vague, all these theories had to "come back to the same thing", that they "gave the same results"<sup>58</sup>. It was in order to express this intuition of "kinship" between p . P46

<sup>52</sup>(For the mathematician) Weil's conjectures are conditional on assumptions of an "arithmetical" nature, due in particular to the fact that the varieties under consideration must be defined over a finite body. From the point of view of cohomological formalism, this leads us to give a special place to the **Frobenius endomorphism** associated with such a situation. In my approach, the crucial properties (of the "generalized index theorem" type) concern **any** algebraic correspondences, and make no arithmetical assumptions about a given base field.

<sup>53</sup>However, after I left in 1970, there was a clear reaction, which resulted in a situation of relative stagnation, which I've mentioned more than once in the pages of Récoltes et Semailles.

<sup>54</sup>"Ordinary" here means: "defined sur le corps des complexes". Hodge's theory of harmonic integrals was the most powerful cohomological theory known in the context of complex algebraic varieties.

<sup>55</sup>This is the most profound theme, at least in the "public" period of my mathematical activity, between 1950 and 1969, i.e. until I left the mathematical scene. I consider the theme of Ana-Babelian algebraic geometry and Galois-Teichmüller theory, developed from 1977 onwards, to be of comparable depth.

<sup>56</sup>(For the benefit of the algebraic geometer reader) These conjectures may need to be reformulated. For more detailed comments, see "Le tour des chantiers" (ReS IV note n° 178, p. 1215-1216) and the note de b. de p. p 769 in "Conviction et connaissance" (ReS III, note n° 162).

<sup>57</sup>(For the mathematician reader) These theories correspond respectively to Betti cohomology (defined by way of transcendental, using a plunge of the base body into the body of complexes), Hodge cohomology (challenged by Serre) and De Rham cohomology (challenged by me), the latter two dating back to the 1950s (and Betti's to the last century).

<sup>58</sup>(For the mathematical reader) For example, if  $f$  is an endomorphism of the algebraic variety  $X$ , inducing a

different cohomological theories, that I derived the notion of a "**motif**" associated with an algebraic variety. By this term, I mean to suggest that this is the "common motif" (or "common **reason**") underlying this multitude of different cohomological invariants associated with the variety, using the multitude of all possible cohomological theories a priori. These different cohomological theories would be like so many different thematic developments, each in its own "tempo", "key" and "mode" ("major" or "minor"), of the same "basic motif" (called a "**mo- tivic** cohomological theory"), which would at the same time be the most fundamental, or "finest", of all these different thematic "incarnations" (i.e., of all these possible cohomological theories). Thus, the motif associated with an algebraic variety would constitute the "ultimate" cohomological invariant, "par excellence", from which all the others (associated with the different possible cohomological theories) would be deduced, like so many different musical "incarnations", or "realizations". All the essential properties of **the** variety's "cohomology" would already be "read" (or "heard") on the corresponding motif, so that the familiar properties and structures on particularized cohomological invariants (*l-adic* or crystalline, for example), would simply be the faithful reflection of the **internal** properties and structures **of the motif**<sup>59</sup>.

p. P47

□ This, expressed in the non-technical language of a musical metaphor, is the quintessential idea of a childlike simplicity, delicate and audacious at the same time. I developed this idea, on the bangs of the foundational tasks I considered more urgent, under the name of "theory of motifs" or "philosophy (or "yoga") of motifs", throughout the years 1963-69. It's a theory of fascinating structural richness, much of which is still conjectural<sup>60</sup>.

I've written several times in *Récoltes et Semailles* about this "yoga of motives", which is very important to me.

---

endomorphism of the cohomology space  $H^i(X)$ , the "characteristic polynomial" of the latter had to have **integer** coefficients, not depending on the particular cohomological theory chosen (e.g.: *l-adic*, for *l* variable). The same applies to general algebraic correspondences, when *X* is assumed to be clean and smooth. The sad truth (and one that gives an idea of the lamentable state of abandonment of the cohomological theory of algebraic varieties in characteristic  $p > 0$ , since I left) is that the thing still hasn't been demonstrated to this day, even in the particular case where *X* is a projective and smooth **surface** and  $i = 2$ . In fact, to the best of my knowledge, no one after my departure has yet deigned to address this crucial question, typical of those that appear subordinate to standard conjectures. The decree of fashion is that the only endomorphism worthy of attention is the Frobenius endomorphism (which Deligne was able to treat separately, using whatever means at his disposal. . . ).

<sup>59</sup>(For the mathematical reader) Another way of looking at the category of patterns over a *k-body* is to visualize it as follows as a kind of "wraparound abelian category" of the category of separate finite type patterns over *k*. The associated pattern to such a scheme *X* (or "motivic cohomology of *X*", which I call  $H^*_{\text{wor}}(X)$ ) thus appears as a kind of "avatar" of *X*. The crucial thing here is that, just as an algebraic variety *X* is susceptible to "continuous variation" (its isomorphism class therefore depends on continuous "parameters", or "modules"), so too is the pattern associated with *X*, or more generally, a "variable" pattern, susceptible to continuous variation. This is an aspect of motivic cohomology that stands in stark contrast to all classical cohomological invariants, including *l-adic* invariants, with the sole exception of the Hodge cohomology of complex algebraic varieties.

This gives an idea of the extent to which "motivic cohomology" is a more fine invariant, encircling the "arithmetic form" (if I may venture this expression) of *X* much more tightly, than the traditional purely topological invariants. In my vision of patterns, these constitute a kind of very hidden and delicate "cord", linking the algebraic-geometric properties of an algebraic variety to properties of an "arithmetic" nature embodied by its pattern. The latter can be considered a "geometric" object in spirit, but one in which the "arithmetical" properties subordinate to geometry are, so to speak, "laid bare".

Thus, the motif appears to me as the most profound "invariant of form" that we have yet been able to associate with an algebraic variety, apart from its "motivic fundamental group". For me, both invariants are like the "shadows" of an algebraic variety.

of a "type of motivic homotopy" yet to be described (and about which I say a few words in passing in the note "Le tour des chantiers - ou outils et vision" (ReS IV, n° 178, see chantier 5 (Motifs), and in particular page 1214)). It is this last object that seems to me to be the most perfect embodiment of the elusive "arithmetic form" (or "motivic") intuition of a any algebraic variety.

<sup>60</sup>Over the years, I've explained my vision of the motives to anyone who would listen, without bothering to publish anything about it in black and white (not lacking other tasks at the service of all). This later enabled some of my students to plunder more at ease, under the watchful eye of all my old friends, who were well aware of the situation. (See b. de p. note below. )

particularly close to my heart. This is not the place to go into what I've said elsewhere. Suffice it to say that the "standard conjectures" flow most naturally from this yoga of motifs. At the same time, they provide a principle of approach for one of the possible formal constructions of the notion of motif.

These conjectures appear to me, and still do today, as one of the two most fundamental questions in algebraic geometry. Neither this question, nor the other equally crucial one (the so-called "resolution of singularities") has yet been resolved. But while

the second of these questions appears, today as it did a hundred years ago, as a prestigious and formidable one, the one I had the honor of *dégager s'est vu classer par les péremptoires décrets de la mode* (dès p. 48 the years following my departure from the mathematical scene, and just like the motivational theme itself<sup>61</sup>) as a kind of Grothendieckian smoke and mirrors. But once again I anticipate...

## 2.17. Discovering the Mother - or the two slopes

To tell the truth, my reflections on Weil's conjectures themselves, with a view to establishing them, remained sporadic. The panorama that had begun to open up before me, and which I was striving to scrutinize and capture, far exceeded in breadth and depth the hypothetical needs of a demonstration, and even all that these famous conjectures had initially been able to hint at. With the emergence of the schematic theme and that of topos, a new and unsuspected world had suddenly opened up. "Conjectures" occupied a central place, not unlike that of the capital of a vast empire or continent, with its countless provinces, most of which have only the most distant connections with this brilliant and prestigious place. Without ever having to admit it to myself, I knew I was now the servant of a great task: to explore this immense and unknown world, to grasp its contours right up to its most distant frontiers; and also, to travel in all directions and inventory with tenacious and methodical care the nearest and most accessible provinces, and draw up maps of scrupulous fidelity and precision, where the smallest hamlet and thatched cottage would have its place. ...

It was this latter work in particular that absorbed most of my energy - a patient and vast work on the foundations that only I could see clearly and, above all, "feel with my gut". It took up by far the largest part of my time, between 1958 (the year in which the schematic and topos themes appeared, one after the other) and 1970 (the year of my departure from the mathematical scene).

I often gnawed at myself for being held back like that, as if by a tenacious, sticky weight, with those interminable tasks which (once I'd got the gist of them) seemed to me more akin to "stewardship", than to a "job".

launched into the unknown. Constantly I had to hold back this impulse to rush forward - *celle du pionnier* p. P49 or the explorer, out to discover and explore unknown and nameless worlds, constantly calling me to know and name them. This impulse, and the energy I invested in it (as if by stealth, almost!), were constantly at a premium.

Yet I knew deep down that it was this energy, stolen (so to speak) from that which I owed to my "tasks", that was of the rarest and most delicate essence - that the "creation" in my work as a mathematician was above all to be found **there**: in this intense attention to apprehend, in the "creation" of my work.

<sup>61</sup>In fact, this theme was exhumed in 1982 (one year after the crystalline theme), this time under its original name (and in a narrowed form, in the sole case of a base body of zero characteristic), without the worker's name being mentioned. This is just one example, among many, of a notion or theme that was buried as a Grothendieckian phantasmagoria in the aftermath of my departure, only to be exhumed one after the other by some of my students over the following ten or fifteen years, with modest fidelity and (need I say it again) without any mention of the worker... .

the dark, shapeless, clammy folds of a warm, inexhaustible nurturing matrix, the first traces of form and outline of that which had not yet been born and which seemed to be calling me, to take shape and become incarnate and born. ... In the work of discovery, this intense attention, this ardent solicitude, is an essential force, like the warmth of the sun for the obscure gestation of seeds buried in the nourishing earth, and for their humble and miraculous blossoming in the light of day.

In my work as a mathematician, I see at work above all these two forces or impulses, equally profound, of (it seems to me) different natures. To evoke both, I've used the image of the **builder**, and that of the **pioneer** or explorer. Placed side by side, both suddenly strike me as very "yang", very "masculine", even "macho"! They have the haughty resonance of myth, or that of "special occasions". Surely they're inspired by the remnants, in me, of my old "heroic" vision of creative work, the super-yang vision. As they are, they give a strongly tinted, not to say fixed, "at attention" vision of a much more fluid, humble, "simple" reality - a **living** reality.

In this masculine "builder's" impulse, which seems to be constantly pushing me towards new building sites, I can also discern the **homebody's** impulse: that of someone deeply attached to "home". First and foremost, it's "**his**" house, the home of "**loved ones**" - the place of an intimate living entity of which he feels a part. Only then, as the circle of what is felt to be "close" widens, is it also a "home for all". And in this impulse to "make homes" (as one would "make" love. . . ) there is also, and above all, **tenderness**. There's the impulse of **contact** with these materials that we shape one by one,

p. P50 with loving care, and that we only really know through this loving contact. And, once the walls are up and the beams and roof have been laid, there's the profound satisfaction of installing one room after another, and seeing little by little

the harmonious order of the living home - beautiful, welcoming, good to live in. For **the house**, first and foremost and secretly in each of us, is also **the mother** - that which surrounds us and shelters us, both refuge and comfort; and perhaps (even more profoundly, and even while we're in the process of building it from scratch) it's also that from which we ourselves came, that which sheltered and nourished us, in those forever-forgotten times before our birth. ... It's also the **Giron**.

And the image that spontaneously appeared earlier, to go beyond the prestigious appellation of "pioneer" and identify the more hidden reality it covered, was also stripped of any "heroic" accent. Here again, it was the archetypal maternal image that came to the fore - that of the nurturing "matrix" and its shapeless, obscure labors. ...

These two impulses, which seemed to me to be "different in nature", are actually closer than I thought. Both are in the nature of a "**contact impulse**", leading us to meet "**the Mother**": the One who embodies **both what is close, "known", and what is "unknown"**. To abandon myself to one or other of these impulses is to "find the Mother". It means renewing contact with both the near, the "more or less known", and the "**far-off**", with what is "unknown" but at the same time prescient, on the verge of becoming known.

The difference here is one of tonality, of dosage, not of nature. When I "build houses", it's the "known" that dominates, and when I "explore", it's the unknown. These two "modes" of discovery, or better said, these two aspects of the same process or work, are indissolubly linked. They are both essential and complementary. In my mathematical work, I see a back-and-forth movement

constant between these two modes of approach, or rather, between the moments (or periods) when one predominates, and those when the other predominates<sup>62</sup>. But it's also clear that in every moment, both one and the other mode is present.

p. P51

---

<sup>62</sup>What I say here about mathematical work is also true of "meditative" work (which will be discussed throughout Harvest and Sowing). There's little doubt in my mind that this is something that appears in every work of

When I'm building, landscaping, clearing, cleaning, ordering, it's the "mode" or "yang" or "masculine" side of my work that sets the tone. When I'm groping for the elusive, the formless, the nameless, I'm the "yin" or "feminine" side of my being.

There's no question of me minimizing or denying either side of my nature, both are essential - the "masculine" that builds and begets, and the "feminine" that conceives and shelters the slow, obscure gestations. I "am" both - "yang" and "yin", "male" and "female". But I also know that the most delicate, delicate essence in creative processes lies on the side of the "yin", "feminine" side - the humble, obscure, and often poor-looking side.

I think it's this side of work that has always held the most powerful fascination for me. The prevailing consensus, however, encouraged me to invest most of my energy in the other side, that which is embodied and asserted in tangible, not to say finished and completed "products" - products with clear-cut contours, attesting to their reality with the evidence of carved stone... .

Looking back, I can see how this consensus weighed on me, and also how I "bore the brunt" of it. - flexible! The "conception" or "exploration" part of my work was kept to a minimum, right up until the moment of my departure. And yet, as I look back on my work as a mathematician, it's strikingly clear that the essence and power of this work lies in the neglected, if not derided or condescended-to side of the equation: that of "**ideas**", or even "**dreams**", not "results". In these pages, as I try to pinpoint the most essential contribution I have made to the mathematics of my time, with a view that embraces a forest, rather than lingering on trees - I have seen, not a list of "great theorems", but a lively array of fertile ideas<sup>63</sup>, all contributing to the same vast vision.

## 2.18. The child and Mother

□ When this "foreword" began to turn into a stroll through my work as a mathematician, p. p52 with my little talk about "heirs" (good-natured) and "builders" (incorrigible), a name also began to emerge for this missed foreword: it would be "L'enfant et le bâtisseur" ("The child and the builder"). Over the following days, it became increasingly clear that "the child" and "the builder" were one and the same character. The name thus became, more simply, "L'enfant bâtisseur". A name, I must say, that was not lacking in allure, and one that had everything to please me!

But reflection reveals that this haughty "builder", or (more modestly) the child-who-played-at-making-houses, was just one face of the famous child-who-played, who had **two**. There's also the child-who-likes-exploring-things, snooping and burrowing in sands and mud.

---

discovery, including that of the artist (writer or poet, let's say). The two "sides" I'm describing here can also be seen as being, on the one hand, that of **expression** and its "technical" demands, and on the other, that of **reception** (of perceptions and impressions of all kinds), becoming **inspiration** through the effect of intense attention. Both are present at every moment of the work, and there is a constant to-and-fro between the "times" when one predominates, and those when the other predominates.

<sup>63</sup>It's not that what might be called "great theorems" are lacking in my work, including theorems that solve questions posed by others than myself, that no one before me had been able to solve. (I review some of them in the b. de p. note (\*\*\*) page 554, from the note "The rising sea. ... " (ReS III, n° 122).) But, as I pointed out at the outset of this "walk" (in the "Points of view and vision" stage, n° 6), these theorems only make sense to me through the nourishing context of a great theme, initiated by one of these "fertile ideas". Their demonstration then follows, as from The waves of the river seem to spring gently from the very depth of its waters, without rupture or effort. I express myself in a very similar sense, but with other images, in the note already quoted "La mer qui monte. ...".

## 2. A walk through a work or the Child and Mother

muddy and nameless, the most impossible and bizarre places. . . No doubt to give the impression (if only to myself. . . ), I began by introducing him under the flamboyant name of "pioneer", followed by the more down-to-earth but still prestigious "explorer". It made you wonder, between the "builder" and the "pioneer-explorer", which was the more masculine, the more alluring of the two! Heads or tails? And then, on closer inspection, our intrepid "pioneer" turned out to be a **girl** (whom I'd been happy to dress as a boy) - a sister of ponds, rain, drizzle and night, silent and almost invisible by dint of fading into the shadows - the one we always forget (if we don't pretend to laugh at her. . . ). And I too found a way, for days and days, to forget her - to forget her doubly, I might add: at first, I'd only wanted to see the boy (the one who plays at making houses...) - and even when I couldn't stop myself from seeing **the other one**, I still saw her as a boy too...

As for the beautiful name for my walk, well, it doesn't hold up at all. It's an all-in-one name. yang, all macho, a nom-qui-boite. To keep it straight, you'd have to include **the other**

p. P53

as well. But, strangely enough, "**the other**" **doesn't really have a** ☐ **name**. The only one that fits at all is "explorer", but it's still a boy's name, nothing to do with it. Language is a bitch here, trapping us without our even realizing it, obviously in cahoots with age-old prejudices.

Perhaps we could get away with "L'enfant-qui-bâtît et l'enfant-qui-explore". Leaving unsaid that one is a "boy" and the other a "girl", and that it's one and the same boy-girl child who, in building, explores, and in exploring, builds... . But yesterday, in addition to the double yin-yang aspect of what contemplates and explores, and what names and builds, another aspect of things had appeared.

The Universe, the World, even the Cosmos, are basically foreign and very distant things. They don't really concern us. It's not towards **them** that our deepest impulse for knowledge leads us. What attracts us is their tangible and immediate **Incarnation**, the closest, the most "carnal", charged with deep resonance and rich in mystery - the One who merges with the origins of our being of flesh, as with those of our species - and the One who has always waited for us, silent and ready to welcome us, "at the other end of the road". It is **from her**, the Mother, the One who gave birth to us as she gave birth to the world, that the impulse is born and that the paths of desire take off - and it is to **her** that they lead us, to **her** that they take off, to return unceasingly and to sink into her.

And so, at the bend in the path of an unplanned "walk", I unexpectedly come across a parable that was once familiar to me, but which I had somewhat forgotten - the parable of **the Child and the Mother**. It can be seen as a parable for "**Life, in search of itself**". Or, on the more humble level of individual existence, a parable for "**Being, in search of things**".

It's a parable, but it's also the expression of an ancestral experience, deeply rooted in the psyche - the most powerful of the original symbols that nourish the deepest creative layers. I believe I recognize in it, expressed in the immemorial language of archetypal images, the very breath of creative power in man, animating his flesh and spirit, in its humblest and most ephemeral manifestations, as well as its most dazzling and enduring ones.

This "breath", like the carnal image that embodies it, is the most humble thing in the world. It is also the most fragile thing, the most ignored by all and the most despised... ..

p. P54

☐ And the story of the vicissitudes of this breath over the course of your existence is none other than **your** adventure, the "adventure of knowledge" in **your** life. The wordless parable that expresses this is that of the Child and the Mother.

You are the child, born of the Mother, sheltered in Her, nourished by Her power. And the child rises from the Mother, the

Nearby, the Well-Known - to meet the Mother, the Unlimited, forever Unknown and full of mystery. ...

End of the "Walk through a work of art" tour

## Epilogue: Invisible circles

### 2.19. Death is my cradle (or three little ones for a dying )

Until the emergence of the topos point of view, towards the end of the 1950s, the evolution of the notion of space seems to me to have been essentially "**continuous**". It seems to have proceeded smoothly, starting with the Euclidean theorization of the space that surrounds us, and the geometry bequeathed to us by the Greeks, focusing on the study of certain "figures" (straight lines, planes, circles, triangles etc.) living in this es- pace. Admittedly, there have been profound changes in the way the mathematician or "natural philosopher" conceives of "space"<sup>64</sup>. But these changes all seem to me to be in the nature of an essential "continuity" - they never placed the mathematician, attached (like everyone else) to familiar mental images, before a sudden **disorientation**. They were like the changes, profound perhaps but pro- gressive, that take place over the years in a being we would have known as a child, and whose evolution we would have followed from its first steps to adulthood and full maturity. Changes that are imperceptible in certain long periods of calm, and tumultuous perhaps in others. But even in the most intense periods of growth or ripening, and even when we've lost sight of it, we're still able to see it.

months, even years, at no time could there be the slightest doubt, however, that the

□no hesitation: it was indeed him again, a well-known and familiar being, that we were meeting up with, albeit with p .

P55

changed features.

In fact, I think I can say that by the middle of this century, this familiar creature had already aged considerably. - like a man who had finally worn himself out, overwhelmed by an influx of new tasks for which he was in no way prepared. Perhaps he'd already died a natural death, without anyone bothering to take note and acknowledge it. "Everyone" was still so busy in the house of a living person, that it was almost as if he were still very much alive indeed.

And so, judge the unfortunate effect, for the regulars of the house, when in place of the venerable old man, frozen, straight and stiff in his armchair, we suddenly see a vigorous kid, no taller than three apples, and who claims in passing, without laughing and as a matter of course, that Monsieur Espace (and you can even drop the "Monsieur", at your ease. . . ) is **him**! If only he looked like he had the family traits, a natural child perhaps, who knows... but not at all! From the looks of it, nothing like the old Father Espace we'd known so well (or thought we'd known...), and of whom we were sure, in any case (and that was the least we could do...) that he was eternal...

**This is** the famous "mutation of the notion of space". This is what I must have "seen", as a matter of course, from at least the early sixties, without ever having had the opportunity to formulate it to myself before this very moment when I'm writing these lines. And I suddenly see with new clarity, by the very virtue of this

<sup>64</sup>My initial intention in writing the Epilogue had been to include a very brief sketch of some of these "profound changes", and to bring out the "essential continuity" I see in them. I've decided against it, so as not to overextend this Promenade, which is already much longer than planned! I intend to come back to it in the Historical Commentaries planned for volume 4 of "Reflections", this time for a mathematician reader (which totally changes the task of exposition).

The traditional notion of "space", like the closely related "variety" (of all kinds, including "algebraic variety"),

had become so old by the time I came around, it was as if they were dead. <sup>65</sup>. And I could say that it's with the appearance of stroke after stroke from the point of view of the

p. P56

schemas (and its offspring<sup>66</sup>, plus ten thousand pages of foundations), and then of topos, that a situation of crisis-which-doesn't-say-its-names was finally resolved.

In today's image, we're not talking about one kid, as the product of a sudden mutation, but two. Two kids, moreover, who have an unmistakable "family resemblance" to each other, even if they bear little resemblance to the late old man. And if you look closely, you could even say that the Schémas toddler is like a "kinship link" between the late Père Espace (aka Variétés-en-tous-genres) and the Topos toddler<sup>67</sup>.

## 2.20. A look at our neighbors face

The situation seems to me very similar to that which arose at the beginning of this century, with the appearance of Einstein's theory of relativity. There was an even more glaring conceptual cul-de-sac in the form of a sudden **contradiction**, which seemed irresolvable. Fittingly, the new idea that would bring order to the chaos was one of childlike simplicity. The remarkable thing (and in keeping with a most repetitive scenario. . . ) was that, of all the brilliant, eminent, prestigious people who were suddenly on their toes, trying to "save the furniture", no one had thought of the idea. It had to be an unknown young man, fresh (if that's possible) from the benches of the student amphitheatres, who came (perhaps a little embarrassed by his own audacity. . . ) to explain to his illustrious elders what had to be done to "save the furniture".

"save the phenomena": just separate space from time<sup>68</sup> ! Technically, everything was in place for this idea to emerge and be accepted. And it's to the credit of Einstein's predecessors that they knew how to do it.

p. P57

Indeed, they welcomed the new idea without too much mortification. A sign that it was still a great time... .

From a mathematical point of view, Einstein's new idea was trivial. From the point of view of our conception of **physical space**, on the other hand, it was a profound mutation, and a sudden "change of scenery". The first

<sup>65</sup>This assertion (which will seem preemptory to some) should be taken with a "grain of salt". It is no more or less valid than the assertion (which I take up again below) that the "Newtonian model" of mechanics (terrestrial or celestial) was "moribund" at the beginning of this century, when Einstein came to the rescue. It's a fact that even today, in most "common" situations in physics, the Newtonian model is perfectly adequate, and it would be madness (given the admitted margin of error in the measurements made) to go looking for relativistic models. Similarly, in many mathematical situations, the old familiar notions of "space" and "variety" remain perfectly adequate, without going in search of nilpotent elements, topos or "moderated structures". But in both cases, for a growing number of contexts involved in cutting-edge research, the old conceptual frameworks have become inadequate to express even the most "common" situations.

<sup>66</sup>(For the mathematician's benefit) In this "progeny", I include formal diagrams, "multiplicities" of all kinds (and in particular, schematic or formal multiplicities), and the so-called "rigid-analytic" spaces (introduced by Tate, following a "master plan" provided by me, inspired by the new notion of topos, as well as that of formal diagram). This list is by no means exhaustive. ...

<sup>67</sup>In addition to these two toddlers, there's a third, younger one, who has appeared in less clement times: the Espace Modéré brat. As I've pointed out elsewhere, he wasn't entitled to a birth certificate, and it's in total illegality that I've nevertheless included him among the twelve "master themes" I've had the honor of introducing into mathematics.

<sup>68</sup>It's a bit short, of course, as a description of Einstein's idea. On a technical level, it was necessary to show what structure to put on the new space-time (although this was already "up in the air", with Maxwell's theory and Lorenz's ideas). The essential step here was not technical, but "**philosophical**": the realization that the notion of simultaneity for distant events had no experimental reality. This was the "childish realization", the "but the Emperor is naked!", that broke through the famous "imperious and invisible circle that limits a Universe". . .

mutation of its kind, since the mathematical model of physical space devised by Euclid 2,400 years ago, and taken up unchanged for the needs of mechanics by all physicists and astronomers since antiquity (including Newton), to describe terrestrial and stellar mechanical phenomena.

Einstein's initial idea subsequently deepened, becoming embodied in a subtler, richer and more flexible mathematical model, drawing on the rich arsenal of mathematical notions already in existence<sup>69</sup>. With the "theory of generalized relativity", this idea expanded into a vast **vision** of the physical world, embracing in a single view the subatomic world of the infinitely small, the solar system, the Milky Way and distant galaxies, and the path of electromagnetic waves in a space-time curved at every point by the matter within it<sup>70</sup>. This is the second and last time in the history of cosmology and physics (following Newton's first great synthesis three centuries ago) that a vast unifying vision has emerged, in the language of a mathematical model, of all physical phenomena in the Universe.

This Einsteinian vision of the physical Universe was in turn overtaken by events.

The "set of physical phenomena" we're trying to account for has had time to grow, since the beginning of the century! A multitude of physical theories have appeared, each one to account for, □with more p. P58 or less successful, of a limited set of facts, in the immense hodgepodge of all the "observed facts". And we're still waiting for the daring kid who will playfully find the new key (if there is one. . .), the dreamed-of "model-cake" willing to "work" to save all the phenomena at once. . .<sup>71</sup>

<sup>69</sup>It's all about the notion of "Riemannian variety", and tensor calculus on such a variety.

<sup>70</sup>One of the most striking features that distinguishes this model from the Euclidean (or Newtonian) model of space and time, and also from Einstein's very first model ("special relativity"), is that the **overall topological form** of space-time remains undetermined, rather than being imperatively prescribed by the very nature of the model. As a mathematician, the question of what this global form is seems to me to be one of the most fascinating in cosmology.

<sup>71</sup>Such a hypothetical theory, which would "unify" and reconcile the multitude of partial theories mentioned above, has been called a "unitary theory". I have the feeling that the fundamental reflection that awaits us will have to take place on two different levels.

1° ) A "philosophical" reflection on the very notion of a "mathematical model" for a portion of reality. Since the success of Newtonian theory, it has become a tacit axiom for physicists that **there is** such a thing as a mathematical model. (indeed, a single model, or "**the**" model) to express physical reality perfectly, without "detachment" or burrs. This consensus, which has been the law for over two centuries, is a kind of fossilized vestige of Pythagoras' vivid vision that "All is number". Perhaps this is the new "invisible circle", which has replaced the old metaphysical circles to limit the physicist's Universe (while the race of "philosophers of nature" seems defiantly extinct, superseded hands down by that of computers... ). However, it's clear that the validity of this consensus is far from self-evident. There are even very serious philosophical reasons to doubt it a priori, or at least to set very strict limits on its validity. This would be the perfect time to subject this axiom to a close critique, and perhaps even to "demonstrate", beyond any possible doubt, that it is unfounded: that there is no single rigorous mathematical model that accounts for all the so-called "physical" phenomena recorded to date.

Once the very notion of a "mathematical model" has been satisfactorily defined, as has the "validity" of such a model (within the limits of such "margins of error" admitted in the measurements made), the question of a "unitary theory" or at least that of an "optimum model" (in a sense yet to be specified) will be clearly posed. At the same time, we'll no doubt have a clearer idea of the degree of arbitrariness involved (by necessity, perhaps) in choosing such a model.

2° ) It seems to me that it's only **after** such reflection that the "technical" question of identifying an explicit model, more satisfactory than its predecessors, takes on its full meaning. It would be a good time, then, perhaps, to take up a second axiom. The physicist's unspoken assumption, dating back to antiquity, is deeply rooted in our very way of perceiving space: it's the **continuous nature** of space and time (or space-time), the "place" where "physical phenomena" take place.

Fifteen or twenty years ago, while leafing through the modest volume constituting Riemann's complete works, I was struck by a remark he made "in passing". In it, he observed that the ultimate structure of space may well be "discrete", and that the "continuous" representations we make of it may well be a simplification (excessive, perhaps, in the long run. . . ) of a more complex reality; that for the human mind, "the continuous" was easier to grasp than "the discontinuous", and that it serves us, therefore, as an "approximation" to apprehend the discontinuous. This is a remark of surprising penetration from a mathematician, at a time when the Euclidean model of physical space

## 2. A walk through a work or the Child and Mother

p. P59

□The comparison between my contribution to the mathematics of my time, and Einstein's to physics, came to me for two reasons: both works are accomplished through a **mutation of our conception of "space"** (in the mathematical sense in one case, in the physical sense in the other); and both take the form of a **unifying vision**, embracing a vast multitude of phenomena and situations that until then had appeared as separate from one another. I see an obvious **kinship of spirit** between his work<sup>72</sup> and mine.

I don't think this kinship is in any way contradicted by an obvious difference in "**substance**". As I suggested earlier, the Einsteinian mutation concerns the notion of physical space, whereas Einstein drew on the arsenal of mathematical notions already known to him, without ever needing to expand or even overturn it. His contribution consisted in identifying, from among the mathematical structures known at the time, those that were best suited to<sup>73</sup> serving as "models" for the world of physical phenomena, in place of, and in addition to, the mathematical structures of his time.

the moribund model bequeathed by his predecessors. In this sense, his work was indeed that of a **physicist**, and beyond that, that of a "**philosopher of nature**", in the sense understood by Newton and his contemporaries

p. P60

This "philosophical" dimension is absent from my mathematical work, where I've never been led to question the possible relationships between the "ideal" conceptual constructions taking place in the Universe of mathematical things, and the phenomena taking place in the physical Universe (or even, the lived events taking place in the psyche). My work has been that of a **mathematician**, deliberately turning away from the question of "applications" (to other sciences), or the "motivations" and psychic roots of my work. A mathematician, moreover, driven by his very particular genius to constantly expand the arsenal of notions at the very basis of his art. In this way, I was led, without even realizing it and as if at play, to overturn the most fundamental notion of all for the geometer: that of **space** (and that of "variety"), i.e. our conception of the very "**place**" where geometric beings live. The new notion of space (as a kind of "generalized space", but where the points that are supposed to form "space" have more or less disappeared) bears no resemblance in substance to the notion brought by Einstein to physics (which is by no means confusing for the mathematician). By contrast, the comparison is with **quantum mechanics** as discovered by **Schrödinger**<sup>74</sup>. In this new mechanics, the traditional "material point" disappears, to be replaced by a kind of "probabilistic cloud", more or less dense from one region of the surrounding space to another, depending on the "probability" that the point is in that region.

---

had never yet been called into question; in a strictly logical sense, it is rather the discontinuous that has traditionally served as the technical approach to the continuous.

Developments in mathematics over the last few decades have shown a much closer symbiosis between continuous and discontinuous structures than was imagined in the first half of this century. The fact remains that finding a "satisfactory" model (or, if necessary, a set of such models, "connecting" as satisfactorily as possible. . . ), whether "continuous", "discrete" or of a "mixed" nature - such a task will surely require a great deal of conceptual imagination, and a consummate flair for apprehending and uncovering mathematical structures of a new kind. This kind of imagination or "flair" seems to me to be a rare thing, not only among physicists (where Einstein and Schrödinger seem to have been among the rare exceptions), but even among mathematicians (and here I speak with full knowledge of the facts).

To sum up, I predict that the expected renewal (if it is still to come. . . ) will come more from a mathematician at heart, well-informed about the great problems of physics, than from a physicist. But above all, it will require a man with the "philosophical openness" to grasp the crux of the problem. This is by no means a technical problem, but a fundamental one of "natural philosophy".

<sup>72</sup>I make no claim to be familiar with Einstein's work. In fact, I haven't read any of his work, and know his ideas only by hearsay and very roughly. Yet I seem to be able to discern "the forest", even though I've never made the effort to peer into any of its trees... ..

<sup>73</sup>For comments on the qualifier "moribund", see a previous footnote (note page 55 ).

<sup>74</sup>I understand (from echoes that have come back to me from various quarters) that this century is generally considered to have seen three "revolutions" or major upheavals in physics: Einstein's theory, the Curies' discovery of radioactivity, and Schrödinger's introduction of quantum mechanics.

region. From this new perspective, we can sense an even more profound "mutation" in the way we conceive of mechanical phenomena, than that embodied by Einstein's model - a mutation that doesn't simply consist of replacing a mathematical model that's a little tight around the edges, with another similar one, but cut wider or with a better fit. This time, the new model bears so little resemblance to the good old traditional models, that even the mathematician who is a great specialist in mechanics must have felt suddenly out of place, even lost (or outraged. . . ). For a mathematician, switching from Newtonian mechanics to Einstein's must be a bit like switching from the good old Provençal dialect to the latest Parisian slang. On the other hand, switching to quantum mechanics, I imagine, is like going from French to Chinese.

And these "probabilistic clouds", replacing the reassuring material particles of yesteryear, remind me strangely of the elusive "open neighborhoods" that ☐ populate the topos, like evanescent ghosts, to surroundp . P61  
imaginary "points" to which a recalcitrant imagination continues to cling against all odds... .

## 2.21. "L'unique" - or the gift of solitude

This brief excursion to the "neighbors across the street", the physicists, may serve as a point of reference for a reader who (like most people) knows nothing of the world of mathematicians, but who has surely heard of Einstein and his famous "fourth dimension", or even of quantum mechanics. After all, even if it wasn't foreseen by the inventors that their discoveries would result in Hi- roshimas, and later in both military and (supposedly) "peaceful" atomic bombs, the fact remains that discoveries in physics have a tangible, almost immediate impact on the human world in general. The im- pact of mathematical discoveries, especially in so-called "pure" mathematics (i.e., with no "applications" in view), is less direct, and certainly trickier to pin down. I'm not aware, for example, that my contributions to mathematics have been "used" to build anything, let's say any kind of machine. I don't deserve any credit for that, of course, but it does reassure me. As soon as there are applications, you can be sure that it's the military (and after them, the police) who are the first to get hold of them - and as far as industry (even so-called "peaceful" industry) is concerned, it's not always so much better. ...

Certainly for my own sake, or for that of a mathematician reader, it would be better to try and situate my work by "landmarks" in the history of mathematics itself, rather than looking for analogies elsewhere. I've been thinking about this over the last few days, within the limits of my rather vague knowledge of the history in question<sup>75</sup> . Already during the "Promenade", I had the opportunity to mention a "lineage" of mathematicians, of a temperament in which I recognize myself: Galois, Riemann, Hilbert. If I were better acquainted with the history of my art, chances are I'd find it ☐ prolong this lineage more

p. P62

The only thing that struck me was that I can't recall ever hearing of a mathematician, even by hint, from friends or colleagues better versed in history than myself. The thing that struck me is that I don't recall being aware, even if only by hint from friends or colleagues better versed in history than myself, of a mathematician apart from myself who contributed a multiplicity of innovative ideas, not more or less disjointed from one another, but as part of a vast unifying vision (as was the case with Newton and Einstein in physics and cosmology),

<sup>75</sup>Ever since I was a kid, I've never been too keen on history (or geography, for that matter). (In the fifth part of *Récoltes et Semailles* (written only in part), I have the opportunity "en passant" to detect what seems to me the deepest reason for this partial "block" against history - a block that is being resolved, I believe, in recent years). The mathematical education received by my elders in the "Bourbach circle" didn't help matters any.  
- the occasional historical reference was more than rare.

and for Darwin and Pasteur in biology). I'm only aware of two "moments" in the history of mathematics when a vast new vision was born. One is the birth of mathematics as a science in the sense we understand it today, 2500 years ago in ancient Greece. The other is, above all, the birth of infinitesimal and integral calculus, in the seventeenth century, a period marked by the names of Newton, Leibnitz, Descartes and others. As far as I know, the vision born at either moment was not the work of a single individual, but the collective work of an era.

Of course, between the time of Pythagoras and Euclid and the beginning of the seventeenth century, mathematics had had time to change its face, and likewise between that of the "Calcul des infiniments petits" created by the mathematicians of the seventeenth century, and the middle of the present nineteenth. But as far as I know, the profound changes that took place during these two periods, one over two thousand years and the other three centuries, never materialized or condensed into a new vision expressed in a given work<sup>76</sup>, in a similar way to what happened in physics and cosmology with the great syntheses of Newton, then Einstein, at two crucial moments in their history.

p. P63 □ It would seem that as the servant of a vast unifying vision born in me, I am "unique in my kind" in the history of mathematics from its origins to the present day. I'm sorry if I seem to be trying to single myself out more than I should! To my own relief, however, I think I can discern a sort of potential (and providential!) **brother**. I've already had occasion to mention him, as the first in the line of my "temperament brothers": **Evariste Galois**. In his short and dazzling life<sup>77</sup>, I think I can discern the beginnings of a great vision - that of the "marriage of number and greatness", in a new geometric vision. Elsewhere in *Récoltes et Semailles*<sup>78</sup>, I describe how, two years ago, this sudden intuition appeared in me: that in the mathematical work that at the time held the most powerful fascination for me, I was in the process of "taking up the legacy of Galois". This intuition, rarely mentioned since, has nevertheless had time to mature in silence. The retrospective reflection on my work that I've been pursuing for the past three weeks will surely have contributed to this. The most direct filiation I now recognize with a mathematician of the past is with Evariste Galois. Rightly or wrongly, it seems to me that the vision I developed over fifteen years of my life, and which has continued to mature within me and to grow richer in the sixteen years since I left the mathematical scene - that this

<sup>76</sup>Hours after writing these lines, it struck me that I hadn't thought here of the vast synthesis of contemporary mathematics that Mr. Bourbaki's (collective) treatise endeavors to present. (The Bourbaki group will be discussed at length again in the first part of *Récoltes et Semailles*). There are, it seems to me, two reasons for this.

On the one hand, this synthesis is limited to a sort of "tidying-up" of a vast body of ideas and results already known, without adding any new ideas of its own. If there is a new idea, it would be that of a precise mathematical definition of the notion of "structure", which has proved to be a valuable thread running through the entire treatise. But this idea seems to me to be more akin to that of an intelligent and imaginative lexicographer, than to an element of language renewal, giving a renewed apprehension of reality (here, that of mathematical things).

On the other hand, from the 1950s onwards, the idea of structure was overtaken by events, with the sudden influx of "categorical" methods into some of the most dynamic parts of mathematics, such as topology and algebraic geometry. (Thus, the notion of "topos" refuses to fit into the "Bourbachian bag" of structures, which is decidedly narrow to the entours!) In deciding, admittedly with full knowledge of the facts, not to embark on this "galley", Bourbaki thereby renounced his initial ambition, which was to provide the foundations and basic language for the whole of contemporary mathematics.

He did, however, fix a language and, at the same time, a certain style of writing and approach to mathematics. This style was originally a (very partial) reflection of a certain spirit, a living and direct inheritance from Hilbert. Over the course of the fifties and sixties, this style came to the fore - for better and (above all) for worse. In the last twenty years or so, it has become a rigid "canon" of purely facade "rigor", whose original spirit seems to have disappeared without return.

<sup>77</sup>Evariste Galois (1811-1832) died in a duel at the age of twenty-one. There are, I believe, several biographies of him. As a young man, I read a fictionalized biography written by the physicist Infeld, which really struck me at the time.

<sup>78</sup>See "L'héritage de Galois" (ReS I, section 7).

vision is also one that Galois could not have refrained from developing<sup>79</sup>, had he been in the vicinity at my place, and without an early death brutally cutting short a magnificent momentum.

There's another reason, surely, that contributes to my feeling of "essential kinship".

- of a kinship that cannot be reduced to a mere "mathematical temperament", nor to the striking aspects of a work. Between his life and mine, I also feel a kinship of destinies. Of course, Galois died stupidly, at the age of twenty-one, whereas I'm going on sixty, and determined to live to a ripe old age. However, Evariste Galois remained a **"marginal"** in the official mathematical world during his lifetime, just as I did a century and a half later. In Galois's case, it might seem to a superficial observer that this marginality was "accidental", that he simply hadn't yet had the time to "make his mark" with his innovative ideas and work. In my case, my marginality, during the first three years of my life as a mathematician, was due to my ignorance (deliberate perhaps. . . ) of the very existence of a world of mathematicians, with which I would have to confront myself; and since my departure from the mathematical scene, sixteen years ago, it has been the consequence of a deliberate choice. It is this choice, surely, that has provoked in retaliation an "unfailing collective will" to erase from mathematics all trace of my name, and with it the vision too, of which I had made myself the servant.

But beyond these accidental differences, I believe I can discern a common cause to this "marginality", which I feel is essential. I don't see this cause in historical circumstances, nor in particularities of "temperament" or "character" (which are undoubtedly as different from him to me as they can be from one person to another), and even less in "gifts" (obviously prodigious in Galois, and comparatively modest in me). If there is indeed an "essential kinship", I see it at a much more humble, elementary level.

I've felt such a kinship on a few rare occasions in my life. It is also through her that I feel "close" to yet another mathematician, who was my senior: **Claude Chevalley**<sup>80</sup>. The link I mean is that of a certain "naïveté", or "innocence", which I've had occasion to talk about. It is expressed by a propensity (often unappreciated by those around us) to look at things through our own eyes, rather than through patented glasses, graciously offered by some larger or smaller human group, invested with authority for one reason or another.

This "propensity", or inner attitude, is not the privilege of maturity, but of childhood. It's a gift received at birth, along with life - a gift both humble and formidable. It's a gift that's often buried deep down, but which some people have managed to preserve, or perhaps rediscover. ...

It can also be called **the gift of solitude**.

---

<sup>79</sup>I'm convinced that a Galois would have gone much further than I did. On the one hand, because of his exceptional gifts (which I did not share). On the other hand, it's likely that he wouldn't have allowed most of his energy to be distracted, as I did, by endless tasks of meticulously shaping, as we go along, what is already more or less acquired...

<sup>80</sup>I mention Claude Chevalley here and there in *Récoltes et Semailles*, particularly in the section "Rencontre avec Claude Chevalley - ou liberté et bons sentiments" (ReS I section 11), and in the note "Un adieu à Claude Chevalley" (ReS III, note n° 100).

## 3.1. The thousand-page letter

□ The text I'm sending you here, typed and printed in a limited number of copies by my université, is neither a separate edition nor a preprint. Its name, Récoltes et Semailles, makes that clear enough. I'm sending it to you as I would send a long letter - a very personal letter, at that. If I'm sending it to you, instead of being content for you to read it one day (if you're curious enough) in some volume on sale in bookshops (if there's a publisher foolish enough to go for it. . . ), it's because I'm addressing it to you more than to others. More than once I've thought of you as I've written this letter - I must say, I've been writing it for more than a year, putting my heart and soul into it. It's a gift I'm giving you, and I've taken great care in writing it to give you the best I have (at any given moment) to offer. I don't know if the gift will be received - your answer (or non-answer. . . ) will let me know. . .

p. L1

Along with you, I'm sending Harvest and Sowing to all my colleagues, friends and (ex-) students in the mathematical world, to whom I've been closely linked at some point, or who figure in my thinking in one way or another, by name or not. Chances are, you're among them, and if you read this with

your heart and not just with your eyes and head, surely you'll recognize yourself even where you're not named. I'm also sending Harvest and Sowing to a few more friends, scientific and otherwise.

This "introductory letter" you are now reading, which announces and introduces you to a "thousand-page letter" (for starters. . . ), will also serve as a Foreword. The latter has not yet been written at the time of writing. *Récoltes et Semailles* consists of five parts (not counting an introduction with "drawers"). I'm sending you parts I (Fatuity and Renewal), II (Burial (1) - or the Robe of the Chinese Emperor), and IV (Burial (3) - or the Four Operations)<sup>1</sup>. These are the ones that I felt particularly concerned you. Part III (Burial (2) - or the Key to Yin and Yang) is undoubtedly the most personal part of my testimony, and the one which, even more than

p. L2 □ les autres, paraît moi avoir une valeur "universelle", au delà des circonstances particulières qui ont entouré sa birth. I refer to this part here and there in Part IV (The Four Operations), which however can be read independently, and even (to a large extent) independently of the three preceding parts<sup>2</sup> (\*). If reading what I've sent you here prompts you to reply (as is my wish), and if it makes you want to read the missing part too, please let me know. I'll be happy to send it to you, provided your reply makes me feel that your interest goes beyond superficial curiosity.

### 3.2. Birth of *Récoltes et Semailles* (a retrospective - )

In this pre-letter, I'd now like to tell you in just a few pages (if I can) what *Récoltes et Semailles* is all about - telling you in more detail than the subtitle alone suggests: "Reflections and testimony on a mathematician's past" (mine, as you may have guessed. . . ). There are many things in *Récoltes et Semailles*, and some will no doubt see in it many different things: a **voyage** of discovery into a past; a **meditation** on existence; a **portrait of the mores of a milieu** and an era (or the picture of the insidious and implacable slide from one era to another. . . ); an **investigation** (at times almost detective-like, at others verging on the cloak-and-dagger novel in the underbelly of the mathematical megalopolis. . . ); a vast **mathematical rambling** (which will sow more than one seed. . . ); a practical treatise on applied psychoanalysis (or, as the case may be, a book of "**psychoanalysis-fiction**"); a panegyric of **self-knowledge**; "**My Confessions**"; a diary; a psychology of **discovery** and **creation**; an **indictment** (merciless, as it should be. . . ), even a **settling of scores** in "the beautiful mathematical world" (and without giving any gifts. . . ). What's certain is that at no time did I feel

bored writing it, when I've learned and seen so much. If your important tasks leave you the leisure to read it' □ I'd be surprised if you got bored reading me. Unless you force yourself, who knows...

p. L3 Obviously, it's not just for mathematicians. It's also true that, at times, it's aimed more at mathematicians than at others. In this pre-letter to the "Harvest and Sowing Letter", I'd like to summarize and highlight what may be of particular interest to you as a mathematician.

---

<sup>1</sup>I'd like to single out those colleagues who feature in my reflections in one capacity or another, but whom I don't know personally. I'm simply sending them "Les Quatre Opérations" (which concerns them in particular), together with the "fascicule O" consisting of this letter, and the Introduction to *Récoltes et Semailles* (plus the detailed table of contents of all the first four parts).

<sup>2</sup>(\*)Generally speaking, you'll find that each "section" (in Fatuity and Renewal) or "note" (in any of the following three parts of Harvest and Sowing) has its own unity and autonomy. It can be read independently of the rest, just as we can find interest and pleasure in looking at a hand, a foot, a finger or a toe, or any other large or small portion of the whole body, without forgetting that it is part of a Whole, and that it is this Whole alone (which remains unsaid) that gives it its full meaning.

tician. The most natural way to do this is to tell you how I came, one thing leading to another, to write these four or five "pavés" one after the other.

As you know, I left the mathematical "big world" in 1970, following a story about military funds in my home institution (the IHES). After a few years of anti-militarist and ecological activism, "cultural revolution" style, which you've no doubt heard about here and there, I practically disappeared from circulation, lost in a provincial university God knows where. Rumor has it that I spend my time herding sheep and drilling wells. The truth is that, apart from many other occupations, I bravely went, like everyone else, to do my lectures at the University (that was my little original livelihood, and still is today). Occasionally, for a few days, weeks or months at a time, I'd even do a bit of zinc-studded math - I've got boxes full of my scribbles, which I'm probably the only one who can decipher. But it was very different, at first sight at least, from what I'd done in the past. Between 1955 and 1970, my favorite theme had been cohomology, and more specifically, the cohomology of varieties of all kinds (algebraic, in particular). I felt I'd done enough in that direction for others to manage without me, and as long as I was doing maths, it was time to change discs... ..

In 1976, a new passion appeared in my life, as strong as, and closely related to, my former passion for mathematics. It was a passion for what I called "meditation" (since things need names). This name, like any other name here, is bound to give rise to innumerable misunderstandings. As in mathematics, this is a work of discovery. I've written about it here and there in Récoltes et Semailles. Still, it was clear that there was plenty to keep me busy for the rest of my life. And more than once, in fact, I thought that mathematics was a thing of the past and that from now on, I was only going to occupy myself with more serious things - that I was going to "meditate".

□ I finally came to the conclusion (four years ago) that mathematical passion was not p . L4 extinguished. And even, without really knowing how and to my own surprise, I, who (for almost fifteen years) hadn't thought of publishing a line of maths in my life, suddenly found myself embarking on the writing of an obviously never-ending maths book that was going to have volumes and volumes; and while I was at it, I was going to throw what I thought I had to say about maths into an (infinite?) of books called "Réflexions Mathématiques", and leave it at that.

It was two years ago, spring 1983. At the time, I was too busy writing (volume 1 of) "A la Poursuite des Champs", which was also to be volume 1 of "Réflexions" (mathematics), to wonder what was happening to me. Nine months later, as it should be, this first volume was finished, so to speak, there was only the introduction to write, reread the whole thing, annotations - and to print... .

The volume in question is still not finished - it hasn't moved a muscle in a year and a half. The remaining introduction has passed the twelve-hundred-page mark (typed), so when it's actually finished it will be fourteen hundred. As you may have guessed, the "introduction" is none other than Harvest and Sowing. At last count, it's supposed to form volumes 1 and 2, plus part of volume 3 of the planned "series". The latter is now called "Réflexions" (for short, not necessarily mathematical). The rest of volume 3 will be made up mainly of mathematical texts, which are now more burning issues for me than the Poursuite des Champs. The latter will have to wait until next year, for annotations, indexes and, of course, an introduction... .

End of Act One!

### 3.3. The death of the boss - building sites at abandonment

It's time, I feel, to give some explanations: why I left so abruptly a world in which, apparently, I had felt at ease for more than twenty years of my life; why I had the strange idea of "coming back" (like a revenant. . .) when I had been quite happily dispensed with for those fifteen years; and why, finally, an introduction to a mathematical work of six or seven hundred pages has ended up being twelve (or fourteen) hundred. And here, too, as I get to the heart of the matter, I'm bound to upset you (sorry!), or even make you angry. Because no doubt, like me once upon a time, you like to see the world you're part of, where you belong, your name and all that, as "rosy". I know what it's like... . And now it's going to squeak a little... .

p. L5     □ I talk here and there in Harvest and Sowing about the episode of my departure, without dwelling on it too much. This "departure"

It is in relation to this "point" that the events of my life as a mathematician are constantly situated, as "before" and "after". It took a powerful **shock** to tear me away from an environment in which I was firmly rooted, and from a "trajectory" that had been firmly mapped out for me. This shock came when I was confronted, in an environment with which I was strongly identified, with a certain form of corruption<sup>3</sup> to which, until then, I had chosen to turn a blind eye (by simply refraining from participating). Looking back, I realize that beyond the event, there was a deeper force at work within me. It was an intense **need for inner renewal**. Such a renewal could not be achieved and sustained in the lukewarm scientific incubator of a prestigious institution. Behind me lay twenty years of intense mathematical creativity and inordinate mathematical investment - and, at the same time, twenty long years of spiritual stagnation, in "isolation"... . Without realizing it, I was suffocating - what I needed was fresh air! My providential "departure" marked the sudden end of a long stagnation, and a first step towards balancing the deep forces in my being, bent and screwed into a state of intense, frozen imbalance... . This departure was, truly, a **new beginning** - the first step on a new journey. ...

As I said, my mathematical passion was not extinguished for all that. It found expression in reflections that remained sporadic, in paths quite different from those I had mapped out for myself "before". As for **the work** I'd left behind, the work "before" - both the work published in black and white and the more essential work, perhaps, that hadn't yet found its way into writing or published text - it could well seem, and indeed did seem, that it had detached itself from me. Before last year, with Récoltes et Semailles, I'd never had the idea of "putting down" any of the scattered echoes that I'd heard of it.

p. L6     came back, here and there. I was well aware that everything I had done in maths, and more particularly, in my □ "geometric" period from 1955 to 1970, were things that **had to be** done - and the things I had things that **had to be** brought out into the open. And also, that the work I'd done, and the work I'd had done, was work well done, work into which I'd put my whole self. I had put all my strength and all my love into it, and (so it seemed to me) it was now autonomous - a living, vigorous thing - that no longer needed me to mother it. From that point of view, I left with perfect peace of mind. I had no doubt that these written and unwritten things I was leaving behind were in good hands, who would see to it that they unfolded, grew and multiplied according to their proper nature as living, vigorous things.

In these fifteen years of intense mathematical work, a vast **vision** had blossomed, matured and grown within me.

---

<sup>3</sup>We're talking here about the unreserved collaboration of the entire scientific establishment in all countries with the military apparatus, as a convenient source of funding, prestige and power. This issue is barely touched upon in once or twice in Récoltes et Semailles, for example in the note "Le respect" of April 2 (n° 179, pages 1221 - 1223).

The vision was of an "arithmetic geometry", a synthesis of topology, geometry (algebraic and analytic) and arithmetic. The vision was that of an "arithmetic geometry", a synthesis of topology, geometry (algebraic and analytic) and arithmetic, the first embryo of which I found in Weil's conjectures. She has been my main source of inspiration in these years, which for me are above all those in which I have developed the key ideas of this new geometry, and shaped some of its principal tools. This vision and these key ideas have become second nature to me. (And after having ceased all contact with them for almost fifteen years, I can see today that this "second nature" is still alive in me!) They were so simple and obvious to me, that it went without saying that "everyone" had assimilated them and made them their own, along with me. It's only recently, in these last few months, that I've come to realize that neither the vision, nor these few "key ideas" that had been my constant guide, are to be found written out in full in any published text, except at most between the lines. And, above all, that the vision I thought I was communicating, and the key ideas that underpinned it, remain unheard of even today, twenty years after reaching full maturity. It is I, the worker and servant of these things I had the privilege of discovering, who am also the only one in whom they are still alive.

This and that tool I'd fashioned is used here and there to "fracture" a reputedly difficult problem, like breaking into a safe. The tool is apparently solid. Yet I know it to have even more "strength" than a pair of monseigneur pliers. It's part of a Whole, like a limb □ is part of the body - p .L7 a Whole from which it springs, which gives it meaning and from which it draws strength and life. You can use a bone (if it's big) to fracture a skull, that's a given. But that's not its real function, its *raison d'être*. And I see these scattered tools that some people have seized upon, rather like bones, carefully butchered and cleaned, that they have torn from a body - from a living body that they pretend to ignore... .

What I'm saying here in carefully considered terms, at the end of a long reflection, must have been perceived by me little by little and diffusely, over the years, at the level of the unformulated which is not yet trying to take shape in conscious thought and images, and through clearly articulated speech, I had decided that this past, basically, no longer concerned me. The echoes that came back to me from afar, filtered as they were, were nevertheless eloquent, if I dwelt on them just a little. I had thought of myself as just another worker, busying myself on five or six<sup>4</sup> "construction sites" in full swing - a more experienced worker perhaps, the older one who had once worked alone on these very premises for many years, before a welcome relief arrived; the older one, yes, but basically no different from the others. And now, with him gone, it was like a masonry firm declaring bankruptcy, following the unexpected death of the boss: overnight, as it were, the building sites were deserted. The "workers" left, each taking under his arm the odds and ends he thought he could use at home. The cash register was gone, and there was no longer any reason for him to go on working himself to exhaustion. ...

Once again, it's a formulation that has emerged from more than a year's reflection and investigation. But surely, it was something I had already perceived "somewhere", from the very first years after my departure. Leaving aside Deligne's work on the absolute values of Frobenius eigenvalues (the "prestige question", as I've come to understand it lately. . . ) - when I would come across one of my old acquaintances, with whom I'd worked on the same sites, and that I'd asked him and so...?", it was always the same eloquent gesture, arms up □ as if to ask for mercy... . Visible- p .L8 ment, everyone was busy with more important things than I cared about - and obviously, too, while everyone was busy looking busy and important, not much was getting done. The main thing

---

<sup>4</sup>I write about these deserted "building sites", and review them in detail, in the series of notes entitled "Les chantiers désolés" (n° s 176' to 178), dated three months ago. A year earlier, and before the discovery of L'Enterrement, I had already mentioned them, in the first note in which I reconnected with my work and its fate, in the note "Mes orphelins" (n° 46).

had disappeared - a **unity** that gave meaning to the partial tasks, and a **warmth** too, I think. What remained was a scattering of tasks detached from a whole, each in his own corner, brooding over his little hoard, or making it grow as best he could.

As much as I would have liked to defend myself, it pained me to realize that everything had come to a screeching halt; to hear no more about motives, topos, the six operations, De Rham's coefficients, Hodge's coefficients or the "mysterious functor" that was to link them together in a single fan around De Rham's coefficients, the  $l$ -adic coefficients for all primes, nor the crystals (except to learn that they are still at the same point), nor the "standard conjectures" and others that I had identified and which clearly represented crucial questions. Even the extensive groundwork begun with the *Eléments de Géométrie Algébrique* (with Dieudonné's tireless assistance), which it would have been almost enough to continue on the momentum already gained, was left to one side: everyone was content to settle into the walls and furniture that someone else had patiently assembled, mounted and bricked up. With the worker gone, it would never have occurred to anyone else to roll up their sleeves and get their hands on a trowel, to build the many buildings that remained to be constructed - **houses**, good to live in, for themselves and for everyone else... .

Once again, I couldn't help but follow up with fully conscious images, which emerged and surfaced by virtue of reflective work. But there's no doubt in my mind that these images must already have been present, in one form or another, in the deepest layers of my being. I must have already sensed the insidious reality of a **Burial** of my work as well as of myself, which imposed itself on me suddenly, with irrefutable force and with this very name, "L' Enterrement", on April 19 last year. On a conscious level, however, I would hardly have thought of taking offence, or even grieving. After all, "close" or not, it was up to the individual to decide what to do with his time. If what had once seemed to motivate or inspire him no longer did, that was his business, not mine.

mine. If the same thing seemed to happen, in perfect unison, to all my ex-students without exception, that was still a matter for each of them separately and I had other things to worry about than going looking for what sense it made, period! As for the things I'd left behind, to which a deep, unacknowledged link continued to bind me - even though they were visibly abandoned on those desolate building sites - I knew they weren't the kind of things that fear "the ravages of time" or the fluctuations of fashions. If they hadn't yet become part of our common heritage (as I had once thought), they were bound to take root there sooner or later, in ten years or a hundred, it really didn't matter. ... .

p. L9

### 3.4. A burial wind. . .

And yet, while I've been happy to evade the diffuse perception of a large-scale funeral over the years, it has stubbornly come back to haunt me, in other and less anodyne guises than that of simple disaffection with a work of art. Little by little, I came to realize that several notions that were part of the forgotten vision had not only fallen into disuse, but had become, in a certain beau monde, the object of condescending disdain. Such was the case, in particular, of the crucial unifying notion of topos, at the very heart of the new geometry

- the same one that provides the common geometric intuition for topology, algebraic geometry and arithmetic - the same one that enabled me to develop both the étale and  $l$ -adic cohomological tools, and the key ideas (more or less forgotten since, it's true. . . ) of crystalline cohomology. To tell the truth,

it was my very name, over the years, that had insidiously, mysteriously, become an object of derision - like a synonym for endless muddy bombast (such as the famous "topos", or the "motifs" he was raving about that no one had ever seen. . . ), of splitting hairs over a thousand pages, and of gigantic chatter about what, in any case, everyone had already known all along and without having expected it... . A little in those tones, but muted, in undertones, with all the delicacy that is appropriate "among people of high flight and exquisite company".

In the course of my reflections in *Récoltes et Semailles*, I think I've put my finger on the deep forces at work in some and others, behind those airs of derision and condescension in the face of a work whose scope, life and breath escape them. I also discovered (apart from the traits that have marked my work and my destiny) the secret "**catalyst**" that prompted

□ces forces to manifest themselves in this form of casual contempt before the eloquent signs of a creative p. L10

He was, in short, the Grand Officiant at the funeral, a funeral muffled by derision and contempt. Strangely enough, he's also the one who's been closest to me - the only one who's ever assimilated and made his own a certain vision, full of life and intense strength. But I anticipate...

To tell the truth, these "puffs of discreet derision" that came back to me here and there, didn't affect me too much. Until three or four years ago, they remained somewhat anonymous. I certainly saw them as an unhappy sign of the times, but they didn't really call me into question, nor did they arouse any anxiety or concern in me. What did affect me more directly, however, were the signs of distance from myself that came here and there from a good number of my old friends in the mathematical world, friends to whom (notwithstanding my departure from a world we once shared) I continued to feel linked by bonds of sympathy, in addition to those created by a common passion and a certain shared past. Here again, although each time I was saddened by this, I hardly ever stopped to think about it, and the thought never occurred to me (as far as I can remember) to make a connection between these three series of signs: the abandoned building sites (and the forgotten vision), the "wind of derision", and the distancing of many of those who had been friends. I wrote to all of them, and received no reply from any of them. In fact, it was not uncommon from then on for letters I wrote to former friends or students, on matters close to my heart, to go unanswered. New times, new customs - what could I do? I simply refrained from writing to them again. And yet (if you're one of them) this letter I'm writing will be the exception - a word offered to you once again - it's up to you to see whether you welcome it this time, or close yourself off to it once more... ..

If I'm not mistaken, the first signs of some old friends distancing themselves from me date back to 1976. That was also the year when yet another "series" of signs began to appear, which I'd like to talk about before returning to Harvest and Sowing. In other words, these last two series of signs appeared at the same time. As I write, it seems to me that they are in fact inseparable, that they are in fact two different aspects or "faces" of the same reality, bursting into the field of my own experience that year. For the aspect I was about to discuss speaking just now, this is a systematic, □discrete and unanswerable "fin de non recevoir", reserved by p. L11 a "flawless consensus"<sup>5</sup> to the few post-1970 students and assimilates who, through their work, their style

<sup>5</sup>This "flawless consensus" is sporadically evoked here and there in *Fatuité et Renouvellement*, and eventually becomes the subject of detailed testimony and reflection in the following section, *L'Enterrement* (1), with the "Cortège X" or "Le Fourgon Funèbre", made up of the "coffin notes" (n° s 93-96) and the note "Le Fossoyeur - ou la Congrégation toute entière". This concludes this part of Harvest and Sowing, and at the same time marks the first culmination of this "second wind" of the reflection.

and their inspiration, clearly bore the stamp of my influence. Perhaps it was also on this occasion that, for the first time, I perceived this "breath of discreet derision" that, through them, was aimed at a certain style and **approach** to mathematics - a style and vision that (according to a consensus that had apparently already become universal by then in the mathematical establishment) **had no place**.

Here again, it was something clearly perceived on an unconscious level. It even came to my conscious attention that same year, after the same aberrant scenario (illustrating the impossibility of getting an obviously brilliant thesis published) had been repeated five times in a row, with the burlesque obstinacy of a circus gag. Thinking back on it now, I realize that a certain reality was "beckoning" me at the time with benevolent insistence, while I pretended to turn a deaf ear: "Hey, look, big guy, pay a little attention to what's going on right under your nose, it concerns you, but yes ... . !". I shook my head a little, looked (for a moment), half bewildered and half distracted: "ah yes, well, a bit strange, it looks like someone's holding a grudge here, something that's definitely not going down well, and with such a perfect ensemble, it's scarcely believable!

It was so unbelievable, in fact, that I was quick to forget both the gag and the circus. True, I had plenty of other interesting things to do. That didn't stop the circus from coming back to my memory in the years that followed - no longer in the tones of a gag now, but in those of a secret delight in humiliating, or that of a punch in the face; except that we're among distinguished people here, and the punch takes more distinguished forms too, of course, but all equally effective, left to the inventiveness of the distinguished people in question... .

p. L12 □ The episode that felt like "a punch in the face" (from another) was in October 1981<sup>6</sup>. That time, and for the first time since the insistent signs of a new mind had reached me, I was hit - more strongly, no doubt, than if it had hit me, instead of someone else, whom I'd grown fond of. He was a bit of a student, and a remarkably gifted mathematician, who had just done some great things - but that's a detail, after all. What wasn't a detail, however, was the fact that three of my "former" students were directly involved in an act that was received (and not without reason) as a humiliation and an affront. Two of my former pupils had already had occasion to treat him with condescension, as well-to-do people who would send a scholarly tramp packing<sup>7</sup>. Yet another pupil was to follow suit three years later (and in the "punch in the face" style again) - but I didn't know that yet, of course. What appealed to me then was more than enough. It was as if my mathematical past, never examined, suddenly taunted me with a hideous sneer, in the person of five of my students, who had become important, powerful and disdainful figures... ..

It would have been the perfect moment to ask, to probe the meaning of what was suddenly calling out to me with such violence. But somewhere inside me, it had been decided (without ever having to be said. . . ) that this past "before" no longer concerned me, that there was no need for me to dwell on it; that if it seemed to be calling out to me now in a voice I recognized only too well - that of the time of contempt - it was decidedly wrong. And yet, for days, perhaps weeks, I was tied up in anguish, without even acknowledging it. (It was only last year, when I wrote *Récoltes et Semailles*, which brought me back to this episode, that I finally became aware of this anguish, which had been taken under control as soon as it appeared). Instead of taking stock of it and probing its meaning, I became agitated, writing to

---

<sup>6</sup>This episode is recounted in the note "Cercueil 3 - ou les jacobiennes un peu trop relatives" (n° 95), in particular pages 404-406.

<sup>7</sup>It is mentioned in passing in the note cited in the previous footnote.

right and left, "the right letters". Those concerned even took the trouble to reply to me - evasive letters, of course, which got to the bottom of nothing. Eventually the waves subsided, and everything returned to normal. I didn't have to think about it again until last year. This time, however, it was as if a wound, or ☐like a painful splinter, rather, that one avoids touching; a splinter that **maintains p** . L13 this wound that just wants to close...

It was surely the most painful and distressing experience I've had in my life as a mathematician - when I saw (without really consenting to **be aware** of what my eyes were seeing) "one of my former students or companions, whom I loved, taking pleasure in discreetly crushing another whom I love and in whom he recognizes me". It left a stronger impression on me then, surely, than the crazy discoveries I made last year, which (to the casual observer) may seem quite different... .... It's true that this experience had resonated with several others, in the same vein but less violent, and which at the time had been a little "forgotten".

It reminds me, too, that 1981 was also the year of a drastic turning point in my relationship with the only one of my former students with whom I remained in regular contact after my departure, and the one who for some fifteen years had been a "privileged interlocutor" for me, mathematically speaking. That was the year when "the signs of disdain" that had been apparent for some years<sup>8</sup> "suddenly became so brutal" that I ceased all mathematical communication with him. This was a few months before the episode that took place earlier. In retrospect, the coincidence seems striking, but I don't think I made the slightest connection at the time. It was stored in separate "lockers"; lockers which, incidentally, someone had said were of no real consequence - the case was made!

And it reminds me, too, that as long ago as June 1981, a certain brilliant **colloquium** had already taken place, memorable in more ways than one - a colloquium that has well deserved to go down in history (or in what's left of it. . . ) under the indelible name of "Colloque Pervers". I made his acquaintance (or rather, he came down on me!) on May 2 last year, two weeks after the discovery (on April 19) of l'Enter- rement in the flesh - and I immediately understood that I had just stumbled upon "**l'Apothéose**". The apotheosis of a funeral, certainly, but also, an **apotheosis** of **contempt for** what, for over two thousand years of our science's existence, has been the tacit and immutable foundation of the mathematician's ethic: namely, this rule

elementary, not to present as one's own the ideas and results taken from another. And taking note just now of ☐this remarkable coincidence in time, between two events that may seem of na- p . L14

I'm struck by the deep and obvious link between **respect** for the **individual** and respect for the basic ethical rules of an art or science, which make its practice something other than a "jockeying match", and the group of people known to excel in it and who set the tone, something other than an unscrupulous "mafia". But again, I anticipate...

### 3.5. Le voyage

I think I've pretty much covered the background to my "return to maths" and, one thing leading to another, to the writing of Récoltes et Semailles. It was at the end of March last year, in the very last section of Fatuité et Renouvellement ("Le poids d'un passé" (n° 50)), that I finally thought about the reasons for and the meaning of this unexpected return. As for the "reasons", surely the strongest of all was the impression, diffuse and compelling at the same time, that these strong and vigorous things, which I had believed

<sup>8</sup>This episode is mentioned in the note "Two turning points" (n° 66).

once entrusted to loving hands - it was in a tomb, cut off from the blessings of wind, rain and sun that they languished for the fifteen years I'd lost sight of them"<sup>9</sup>. I must have understood, little by little and without ever having thought of telling myself before today, that it would be none other than myself who would finally blow up these worm-eaten boards, holding captive living things made, not to rot in closed coffins, but to flourish in the open air. And these airs of false compunction and insidious derision around these padded and plethoric coffins (in the image of the late lamented, no doubt. . . ), must also have "ended up awakening in me a fighting spirit that had become somewhat dormant over the last ten years" and the desire to throw myself into the fray. . .<sup>10</sup>.

And so, two years ago, what was initially intended as a quick survey, lasting a few days or a few weeks at the most, of one of those "building sites" left to one side, became a major mathematical serial in N volumes, part of the famous new series of "Réflexions" ("mathématiques", until that useless qualifier is pruned). From the moment I found out I was

p. L15 writing a mathematical work for publication, I also knew that I was going to include, in addition to a more or less standard "mathematical" introduction, another "introduction" <sup>"□ again"</sup>, from more personal nature. I felt it was important to explain my "return", which was by no means a return to a **milieu**, but only a "return" to an intense mathematical investment and to the publication of mathematical texts from my pen, for an indeterminate period of time. I also wanted to explain the spirit in which I was now writing maths, very different in some respects from the spirit of my writings before I left - the "logbook" spirit of a voyage of discovery. Not to mention that there were other things on my mind, related to these no doubt, but which I felt were even more essential. It was understood that I would take my time to say what I had to say. These things, still diffuse, were inseparable for me from the meaning of the volumes I was about to write, and the "Reflections" into which they were to be inserted. There was no question of slipping them in there on the sly, as if to excuse myself from taking up the precious time of a hurried reader. If there were things in "A la Poursuite des Champs" of which it was good, for him and for everyone, that he should become acquainted, they were precisely those that I reserved to say in this introduction. If twenty or thirty pages weren't enough, I'd write forty or even fifty - and I didn't force anyone to read me...

Thus was born Récoltes et Semaines. I wrote the first pages of the planned introduction in June 1983, at a low point in the writing of the first volume of La Poursuite des Champs. Then I did it again in February last year, when my volume had been practically finished for several months<sup>11</sup>. I was counting on this introduction as an opportunity to clarify a couple of things that were still a little hazy in my mind. But I had no inkling that it was going to be, like the volume I'd just written, a **voyage of discovery**; a voyage into a world even richer and wider in scope than the one I was about to explore, in the volume I'd written and in those that were to follow. As the days, weeks and months went by, without really realizing what was happening,

that this new journey continued, with the discovery of a certain past (stubbornly eluded for more than three decades. . . ) and of myself and the links that connect me to this past; with <sup>"□"</sup>the discovery also of some of those who were close to me in the mathematical world, and whom I have known so poorly; and lastly, even, in the

p. L16

<sup>9</sup>Quoted from the note "La mélodie au tombeau - ou la suffi sance" (n° 167), page 826.

<sup>10</sup>See "The weight of a past" (section n° 50), especially p. 137. (\*\*).

<sup>11</sup>In the meantime I'd spent a good month thinking about the "structural surface" for a system of pseudo-straight lines, obtained in terms of

of all the possible "relative positions" of a pseudo-right in relation to such a system. I have also written "L'Esquisse d'un Programme", which will be included in volume 3 of Réflexions.

a journey of mathematical discovery, while for the first time in fifteen or twenty years<sup>12</sup>, I took the time to revisit some of the questions I had left burning at the time of my departure. In short, I can say that these are **three** closely intertwined journeys of discovery that I'm pursuing in the pages of *Récoltes et Semailles*. And none of them ends with the period, on page twelve hundred and something. The echoes that my testimony will gather (including the echo of silence. . . ) will be part of the "continuation" of the journey. As for its completion, this journey is surely one of those that are never completed - not even, as it happens, on the day we die....

And here I am, back where I started: telling you in advance, if I can, "what Harvest and Sowing is all about". But it's also true that, without even looking for it, the preceding pages have already told you more or less what it's all about. Perhaps it will be more interesting to continue on my path and **tell**, rather than "announce".

June 1985

### 3.6. The shadow side - or creation and contempt

The preceding pages were written during a brief "lull" last month. In the meantime, I've finally put the finishing touches to the "Four Operations" (the fourth part of Harvest and Sowing).

- All that's left is to finish this letter or "pre-letter" (which is also pretending to be prohibitively large. . . ) so that everything is finally ready for typing and duplication. I couldn't believe it any more, after nearly a year and a half of being "on the verge of finishing" these famous notes! When I set about this somewhat unusual "introduction" to a mathematical work in February last year (and the year before that, in June), there were (I think) three main things I wanted to say. First of all, I wanted to explain my intentions and the spirit in which I wrote the first volume of "A

la Poursuite des Champs" (which I had just declared finished), and on the spirit  also in which I intended to continue on an even wider journey of mathematical exploration and discovery, with "Réflexions". From now on, it would no longer be a matter of meticulously laying the foundations for some new mathematical universe in the making. Rather, they would be "logbooks", in which the work would be carried on day by day, as it **really** is, with its missteps and blunders, its insistent backtracking and also its sudden leaps forward - a work drawn forward irresistibly day after day (and notwithstanding innumerable incidents and unforeseen events), as if by an invisible thread - by some elusive, tenacious and sure vision. It's often a groping process, especially in those "sensitive moments" when some as yet nameless and faceless intuition emerges, barely perceptible; or at the start of some new journey, in the call and pursuit of some first ideas and intuitions, often elusive and reluctant to let themselves be grasped in the meshes of language, when it's precisely the language adequate to grasp them delicately that is often still lacking. It is this kind of language, above all else, that needs to be condensed out of an apparent nothingness of impalpable mists. What is still only hinted at, before it is even glimpsed, let alone "seen" and touched with the finger, gradually decants from the imponderable, emerges from its cloak of shadows and mists to take shape and flesh and weight... .

It's this part of the work, which looks shoddy if not (quite often) shoddy, that's the most important.

<sup>12</sup>In the fifties and sixties, I had often suppressed my urge to launch myself into the pursuit of such juicy and burning questions, preoccupied as I was with interminable foundation tasks, which nobody would have known or wanted to pursue in my place, and which nobody after my departure had the heart to continue either. ...

It's also the most delicate and essential part - the part where, truly, something new comes into being, through intense attention, concern and respect for this fragile, infinitely delicate thing about to be born. This is the creative part of all - that of conception and slow gestation in the warm darkness of the nurturing womb, from the invisible original double gamete, becoming formless embryo and transforming over the days and months, through obscure and intense, invisible and seemingly invisible work, into a new being in flesh and blood.

This is also the "dark", "yin" or "**feminine**" part of the work of discovery. The complementary aspect, the "light" or "yang" or "**masculine**" part, is more akin to working with a hammer or sledgehammer, a well-sharpened chisel or a wedge of good, hardened steel. (Tools already ready for use, and a proven efficiency. ... ) Both aspects have their *raison d'être* and their function, in

p. L18 □ symbiosis inseparable from each other - or, to put it better, they are the **wife** and **husband** of the indissoluble couple.

luble of the two original cosmic forces, whose ceaselessly renewed embrace constantly resurrects the obscure creative labors of conception, gestation and birth - the birth of **the child**, of the new thing.

The second thing I felt the need to talk about, in my famous personal and "philosophical" "introduction" to a mathematical text, was the very nature of creative work. I'd been aware for years that this nature was generally ignored, obscured by all kinds of clichés, repressions and ancestral fears. How true this is, I discovered only afterwards, gradually, over the course of days and months, throughout the reflection and "investigation" pursued in *Récoltes et Semailles*. It was at the very "kick-off" of this reflection, in the course of the few pages dated June 1983, that I was first seized by the significance of this seemingly trivial, yet astonishing fact, if only you stop to think about it for a moment: that this "most creative of all" parts of the work of discovery I've just been talking about, **is practically nowhere to be found** in the texts or speeches that are supposed to present such work (or at least, its most tangible fruits); be they textbooks and other didactic texts, or original articles and dissertations, or oral lectures and seminar presentations and so on. For millennia, it would seem, since the very origins of mathematics and the other arts and sciences, there has been a kind of "conspiracy of silence" surrounding the "**unavowable labours**" that prelude the birth of any new idea, large or small, that renews our knowledge of a portion of this world, in perpetual creation, in which we live.

In fact, it would seem that the repression of knowledge of this aspect or this stage, the most crucial of all in any work of discovery (and in creative work in general), is so effective, so internalized by those who know such work first-hand, that one would often swear that even they have eradicated all trace of it from their conscious memory. Rather as in a puritanical society, a woman would have eradicated from her memory, in relation to each of those children she makes it her duty to wipe and wipe, the moment of the embrace (reluctantly endured) that made him conceive, the long months of pregnancy (experienced as an impropriety), and the long hours of childbirth (endured as an unpleasant ordeal, followed at last by deliverance).

p. L19 □ This comparison may seem outrageous, and perhaps it is indeed, if I apply it to what I'm I'm reminded today of the spirit I experienced in the mathematical milieu of which I was a part, even twenty years ago. But in the course of my reflections in *Récoltes et Semailles*, I've come to realize - most strikingly in these last few months (with the writing of "Quatre Opérations") - that since my departure from the mathematical scene, there has been an astonishing **deterioration in the spirit** that today prevails in the circles I knew, and (it seems to me, to a large extent at least) in the world of mathematics.

mathematics in general<sup>13</sup>. It's even possible, both because of my very particular mathematical personality and because of the conditions surrounding my departure, that it acted as a catalyst in an evolution that was already taking place<sup>14</sup> - an evolution of which I was then unaware (nor were any of my colleagues and friends, with the possible exception of Claude Chevalley). The aspect of this degradation that I'm thinking of here (which is just one aspect among many<sup>15</sup>) is the **tacit contempt**, if not unequivocal derision, of what (in mathematics, in this case) is not akin to a "scientific" approach.

not the pure work of hammer on anvil or chisel - disregard for the most delicate creative processes

(and <sup>□</sup> often of lesser appearance); of all that is **inspiration, dream, vision** (so powerful and fertile p. L20

This applies to everything that is not written and **published in black and white**, in the form of pure and hard statements, indexable and indexed, ripe for the "data banks" engulfed in the inexhaustible memories of our mega-computers.

There has been (to borrow a phrase from C.L. Siegel<sup>16</sup>) an extraordinary "**flattening**", a "**narrowing**" of mathematical thought, stripped of an essential dimension, of its "shadow side", its "feminine" side. It's true that, thanks to an ancestral tradition, this side of the work of discovery remained largely hidden, and nobody (as far as I know) ever **talked about** it - but living contact with the deep sources of dreams, which nourish great visions and grand designs, had never yet (as far as I know) been lost. It would seem that we have already entered an **era** of **desiccation**, in which this source is not dried up, but access to it is condemned, by the final verdict of general contempt and the reprisals of derision.

We are approaching the time, it seems, when the **memory of** any work close to the source, of "feminine" work (ridiculed as "muddy", "soft", "inconsistent" - or at the opposite end as "trivialities", "childishness", "bombast" . . .), but also where the work itself and its fruits will be extirpated: where new notions and visions are conceived, elaborated and born. It will also be the time when the exercise of our art will be reduced to arid and futile displays of cerebral "weights and dumbbells", to one-upmanship to "crack" the problems in the competition ("of proverbial difficulty") - the time of a feverish and sterile "supermacho" hypertrophy, taking over from more than three centuries of creative renewal.

## 3.7. Respect and fortitude

But again I digress, anticipating what reflection has taught me. I had started with a double purpose, clearly present in me even before the beginning of this one: the purpose of a "declaration of in-

<sup>13</sup>This deterioration is by no means confined to the "mathematical world". It can also be observed in scientific life as a whole, and even beyond that, in the contemporary world on a planetary scale. A starting point for observation and reflection along these lines can be found in the note entitled "Muscle and gut", which opens the discussion on yin and yang (note no. ° 106).

<sup>14</sup>This is the development examined in the note cited in the previous b. de p. note. Links between this and Burial (from my person and my work) make their appearance and are examined in the notes "Les Obsèques du Yin (yang enterre yin (4))", "La circonstance providentielle - ou l'Apothéose", "Le désaveu (1) - ou le rappel", "Le désaveu (2) - ou la métamorphose" (n° s 124, 151, 152, 153). See also the more recent notes (in RS IV) "Les détails inutiles" (n° 171 (v), part (c) "Des choses qui ressemblent à rien - ou le dessèchement") and "L'album de famille" (n° 173, part c. "Celui entre tous - ou l'acquiescement").

<sup>15</sup>The aspect that is most often at the center of attention in Harvest and Sowing, and more particularly in the two sections "investigation" (RS II or "The Robe of the Chinese Emperor", and RS IV or "The Four Operations"), and the one too, perhaps, that most "flabbergasted" me, was the degradation of the ethics of the profession, expressed in shameless plundering, debunking and scheming, practiced among some of the most prestigious and brilliant mathematicians of the day, and this (to a very large extent) in full view of everyone. For other more delicate aspects, directly related to this one, I refer you to the note already quoted (n° 173 part c.) "Things that look like nothing - or desiccation".

<sup>16</sup>This expression is quoted and commented on in the note just quoted in the previous b. de p. note.

tentions", and (intimately linked to this, as has just become clear) that of expressing myself on the subject of: the nature of creative work. There was, however, a third purpose, less clearly present at the level of the "creative work".

p. L21

conscious, but responding to a deeper, more essential need<sup>17</sup>. It was aroused by these "interpellations" sometimes disconcerting, coming to me from my mathematical past through the voices of those who had been my students or friends (or at least, of many of them). On an epidermal level, this need translated into an urge to "speak my mind", to tell a few "unpleasant truths". But more profoundly, surely, there was the need to finally **come to terms** with a certain past that I'd chosen to evade until then. It was from this need, above all, that *Récoltes et Semailles* was born. This long reflection was my "response", day by day, to this impulse for knowledge within me, and to the constantly renewed interpellation that came to me from the outside world, from the "mathematical world" that I had left with no spirit of return. Apart from the very first pages of "Fatuité et Renouveau", the first two chapters ("Travail et découverte" and "Le rêve et le Rêveur"), and right from the chapter that follows "Naissance de la crainte" (p. 18), with a "testimony" that was by no means part of the program, it was this need to get to know my past and to come to terms with it fully, that (I believe) was the main force at work in the writing of *Récoltes et Semailles*.

The interpellation that had come to me from the world of mathematicians, and which came back at me with renewed force throughout Harvest and Sowing (and above all, during the "investigation" pursued in Parts II and IV), had from the outset taken on the mask of smugness, if not that of disdain ("delicately dosed"), derision or contempt, whether towards me (sometimes) or (above all) towards those who had dared to draw inspiration from me (without suspecting, of course, what was in store for them) and who were "classified" as having ties with me, by some tacit and implacable decree. And here again I see the "obvious" and "profound" link between **respect** (or lack of respect) for the person of others; respect for the act of creation and for some of its most delicate and essential fruits; and respect for the most obvious rules of scientific ethics: those rooted in a basic respect for oneself and for others, and which I would be tempted to call the "**rules of decency**" in the exercise of our art. These are all aspects, surely, of a basic and essential "**self-respect**". If I try, in a single lapidary formula, to put it in a nutshell

p. L22

the assessment of what Harvest and Sowing taught me about a certain world that was mine, a world with which I had identified myself for more than twenty years of my life, I would say: <sup>□</sup>it's a world that has **lost** the **respect**<sup>17</sup>.

This was something that had already been strongly sensed, if not formulated, in the preceding years. It was only confirmed and clarified, always in unexpected and sometimes astonishing ways, throughout the course of *Récoltes et Semailles*. It is clearly apparent from the very moment when a "philosophical" and general reflection suddenly becomes a personal testimony (in the section "L'étranger bienvenu" (n° 9, p. 18) opening the aforementioned chapter "Naissance de la crainte").

Yet this perception does not appear in the tone of bitter or acerbic recrimination, but (through the internal logic of the writing and the different attitude it elicits) in that of a **question**: what has been my own part in this degradation, in this loss of respect that I see today? This is the main interrogation that runs through and carries this first part of Harvest and Sowing, until it finally resolves itself into a clear and unequivocal observation<sup>18</sup>. Previously, this degradation had been

<sup>17</sup>Here again, it's a formulation that doesn't just apply to a certain limited milieu, where I've had ample opportunity to see the thing up close, but it seems to me to sum up a certain degradation in the contemporary world as a whole. (Compare with the b. de p. note on page L 19.) In the more limited framework of the assessment of an "investigation" pursued in *Récoltes et Semailles*, this

wording appears in the April 2 note, "Respect" (n° 179).

<sup>18</sup>In the "Sports math" and "No more merry-go-round" sections (n° s 40, 41).

appeared as if it had suddenly "fallen from the sky", inexplicably and all the more outrageously, intolerably. In the course of reflection, I discovered that it had continued insidiously, undetected by anyone around him or in himself, throughout the fifties and sixties, **including in my own person**.

The realization of this humble fact, surely quite obvious and without appearance, marked a first crucial turning point in the testimony, and an immediate qualitative change<sup>19</sup>. This was the first essential thing I had to learn, about my past as a mathematician and about myself. This knowledge of my **share of responsibility** for the general deterioration (a knowledge that varies in severity depending on the type of mathematics involved) was the first essential step.

moments of reflection) remained as a background note and a reminder, throughout Récoltes and Semailles. It was so, especially, at times when my reflection□took on the allure of an investigation into p. L23 disgraces and iniquities of an era. Together with the desire to understand, the curiosity that drives and drives forward all true work of discovery, it is this humble knowledge (often forgotten along the way and resurfacing in spite of everything, where it was least expected. . . ) that has kept my testimony from ever turning (I believe) into sterile recrimination about the ungratefulness of the world, or even into a "settlement". ) that kept my testimony from ever veering (I think) into sterile recrimination about the world's ingratitude, or even into "settling scores" with some of those who had been my students or friends (or both). This lack of self-indulgence also gave me an inner calm, or fortitude, that preserved me from the pitfalls of complacency towards others, or even those of false "discretion". Whatever I felt I had to say, at one time or another, about myself, or about one of my colleagues, ex-students or friends, or about an environment, or about an era, I said it, without ever having to shake my reticence. As for the latter, all I had to do was examine them carefully, and they vanished without a trace.

### 3.8. "Mes proches" - or connivance

It is not my intention in this letter to review all the "highlights" (or all the "sensitive moments") in the writing of Récoltes et Semailles, or in any of its stages<sup>20</sup>. Suffice it to say that there were, in this work, four clearly marked stages, or four "breaths" - like the breaths of a breath, or like the successive waves in a train of waves arising, I cannot say how, from those vast, mute masses, motionless and moving, boundless and nameless, from an unknown and bottomless sea that is "me", or rather, from a sea infinitely vaster and deeper than the "me" it carries and nourishes. These "breaths" or "waves" have materialized in the four parts of Récoltes et Semailles now written. Each wave came without my calling it or planning it in the least, and at no time could I have said where it would take me or when it would end. And when it had ended and a new wave had already taken its place, for a while I thought I was still at the end of a journey (which would also be, at the end of all ends, the end of Harvest and Sowing!

lifted and carried towards another breath of the same vast movement. It's only with hindsight that

□celui apparaît clairement et que se révèle sans équivoque une **structure** dans ce qui avait été vécu comme p. L24 act and as a movement.

And it certainly didn't end with my (very provisional!) finale to Récoltes et Se-.

<sup>19</sup>From the very next day, the testimony deepens into a meditation on myself, and retains this particular quality in the weeks that follow, right up to the end of this "first breath" of Harvest and Sowing (with the section "The weight of a past", n° 50).

<sup>20</sup>You'll find a brief retrospective of the first three parts of Harvest and Sowing in the two groups of notes "Evening fruits" (n° s 179-182) and "Discovery of a past" (n° 183-186).

Nor will it end with the completion of this letter to you, which is one of the "times" of this movement. And it wasn't born on a day in June 1983, or February 1984, when I sat down at my typewriter to write (or rewrite) a certain introduction to a certain mathematical work. It was born (or rather, re-born. . . ), the day meditation came into my life. . .

But once again I digress, letting myself be carried (and carried away. . . ) by the images and associations born of the moment, instead of wisely sticking to the thread of a "propos", of the planned. My intention today had been to follow up with an account, however succinct, of the "discovery of the Burial" last April, at a time when two weeks ago I thought I'd finished *Récoltes et Semailles* - how they came cascading down on me, in the space of just three or four weeks, discoveries, some bigger and more incredible than the others - so big and so crazy, in fact, that for months afterwards, I had the greatest difficulty "to believe the testimony of my healthy faculties", to free myself from an insidious **incredulity** in the face of the obvious<sup>21</sup>. This secret, tenacious incredulity only finally dissipated last October (six months after the discovery of "L'Enterrement dans toute sa splendeur"), following a visit to my home by my friend and ex-student (admittedly occult) Pierre Deligne<sup>22</sup>. For the first time, I was confronted with L'Enterrement not through **texts**, telling me (in eloquent terms!) of the debunking, pillage and massacre of a work, and of the burial (in the person of the absent master) of a certain style and approach to mathematics - but in a direct and tangible way this time, under familiar features and by a well-known voice, with affable and ingenuous intonations. L'Enterrement was there before me at last, "in the flesh", under those busy, anodyne features that I now well recognized, but which I'd never seen before.

p. L25

for the first time I was looking with new eyes, new attention. Here, then, unfolded before me the one who, in the course of my reflection over the preceding months, had revealed himself as the Grand Officiant at my solemn funeral, as the "Priest in a pinafore" as well as the main architect and "beneficiary" of an unprecedented "operation", the hidden heir to a work of art handed over to derision and pillage...

This encounter took place at the beginning of the "third wave" in *Récoltes et Semailles*, when I had just embarked on the long meditation on yin and yang, in pursuit of an elusive and tenacious association of ideas. At the time, this short episode only left the trace of an echo of a few lines, in passing. Yet it marked an important moment, the fruits of which would only become clear months later.

There was a second such moment of confrontation at "L'Enterrement en chair et en os". This time, it was a simple phone call to Jean-Pierre Serre<sup>23</sup>. This "off-the-record" conversation confirmed, in a striking way and beyond all expectations, what (just a few days before) I had just explained to myself at length<sup>24</sup>, and almost unwillingly, about Serre's role in my Burial and about his "secret acquiescence" to what was happening "right under his nose", without him pretending to see or feel anything.

Here again, as usual, the conversation was cool and friendly, and obviously Serre's friendliness towards me was sincere and genuine. All the same, this time I was able to really see, or "touch" I would have liked to write, this "acquiescence" that I had finally admitted to myself; "secret" no doubt (as I had written earlier) but above all

---

<sup>21</sup>I try to express this difficulty, through the tale "The robe of the Chinese Emperor", in the note of the same name (n° 77'), and come back to it again in the note "Duty done - or the moment of truth" (n° 163).

<sup>22</sup>I give an account of this visit in the note I just quoted (in the previous b. de p. note).

<sup>23</sup>This is a quote from the note "Le Fossoyeur - ou la Congrégation toute entière" (n° 97, page 417).

<sup>24</sup>In part c. ("The one among all - or acquiescence") of the same note (n° 173).

as I was then able to see without any possibility of doubt. An eager and unreserved acquiescence, so that what needs to be buried can be buried, and so that, wherever desirable and whatever the means, real (which Serre knows first-hand) and undesirable paternity can be replaced.

<sup>25</sup> □ This was a striking confirmation of an intuition that had appeared one p. L26 year ago, when I wrote<sup>26</sup> :

"Seen in this light<sup>27</sup> , the principal official Deligne appears no longer as one who would have fashioned a fashion in the image of the profound forces that determine his own life and actions, but rather as the all-designated **instrument** (by virtue of his role as "legitimate heir"<sup>28</sup> ) of a **collective will** of flawless consistency, committed to the impossible task of erasing both my name and my personal style from contemporary mathematics."

If Deligne appeared to me at the time as the designated "instrument" (as well as the first and principal "beneficiary") of an "unfailing coherent collective will", Serre now appears to me as **the embodiment of** this same collective will, and as the **guarantor of** its unreserved acquiescence; acquiescence to all the innumerable schemes and swindles and to the vast "operations" of collective mystification and shameless appropriation, as long as they contribute to this "impossible task" with regard to my modest and deceased person, or with regard to any other<sup>29</sup> who dared to claim to be the "beneficiary" of this "collective will". I'd like to be seen, against all odds, as a "Grothendieck continuator".

□ It is one of the paradoxical and disconcerting aspects, among many others in Burial, that it- p. L27

This is the work above all, not to say exclusively, of those who had been my friends or my pupils, in a world where I had never known any enemies. It is for this reason above all, I believe, that Récoltes et Semailles concerns you more than anyone else, and that this letter I am writing to you is intended as an **interpellation** in its own right. For if you're a mathematician, and if you're one of my students or friends, you're no doubt no stranger to the Burial, whether by deed or connivance, and if only by your silence towards me about something that's taking place on your doorstep. And if (extraordinarily) you welcome my humble words and the testimony they bear to you, rather than remaining closed behind your closed doors and sending away these unwelcome messengers, you will then learn, perhaps, that what has been buried by all and with your participation (active, or by tacit acquiescence), is not only the work of another, the fruit and living testimony of streets in love with mathematics; but that at an even more secret level than this burial (which never says its name . . . ) and deeper, it's a living and essential part of your own being, of your original power to know, to love and to create, that you were pleased to bury with your own hands in the person of another.

<sup>25</sup>This is a quote from the note "Le Fossoyeur - ou la Congrégation toute entière" (n° 97, page 417).

<sup>26</sup>This quotation is taken from the same note (see previous b. de p. note), on the same page 417.

<sup>27</sup>"In light" of this deliberate intention, just mentioned, to eliminate "undesirable" (indeed, "intolerable", to use the expression employed in the quoted note) paternities at all costs.

<sup>28</sup>This role of Deligne's "heir" is a role that is both concealed (while not a single published line of Deligne's could give rise to the suspicion that he might have learned something from me), and at the same time clearly felt and accepted by all. It's one of the typical aspects of Deligne's double game and his particular "style" that he was able to masterfully play on this ambiguity, cashing in on the benefits of this unspoken role of heir, while disowning the late master and taking the lead in large-scale burial operations.

<sup>29</sup>I'm thinking here of **Zoghman Mebkhout**, first mentioned in the Introduction, 6 ("L'Enterrement"), then in the note "Mes orphelins" (n° 46), and in the notes (written later, after the discovery of L'Enterrement) "Echec d'un enseignement (2) - ou création et fatuité" and "Un sentiment d'injustice et d'impuissance" (n° s 44', 44"). I discover the iniquitous operation to conceal and appropriate Mebkhout's pioneering work, at the end of the eleven notes forming Cortère VII of L'Enterrement, "Le Colloque - ou faisceaux de Mebkhout et Perversité" (n° s 75-80). A more detailed investigation and account of this (fourth and final) "operation" forms the most substantial part of the investigation "The Four Operations", under the appropriate title "**The Apotheosis**" (notes n° s 171 (i) to 171).

Of all my pupils, Deligne occupied a very special place, which I'll expand on at length in the course of my reflection<sup>30</sup>. He was, by far, the "closest", the only one (student or not) to have intimately assimilated and made his own<sup>31</sup> a vast vision that had been born and grown within me long before we met. And of all my friends who shared a common passion for mathematics, it was Serre, who had also been a bit of an elder, who was the closest (also by far),

p. L28

as the one (in particular) who for a decade had played a unique "detona- teur" role in my work for some of my major investments, and for the □ plurality of the great ideas-force that inspired my mathematical thinking in the fifties and sixties, right up to the time of my departure. This very special relationship that both of them had with me is not unrelated, of course, to their exceptional means, which ensured them an equally exceptional ascendancy over the mathematicians of their generation and those that followed. Apart from these points in common, Serre's and Deligne's temperaments and ways of doing things seem to me to be as dissimilar as it is possible to be, and in many ways poles apart.

In any case, if ever there were mathematicians who, in one way or another, were "close" to me and my work (and, what's more, known for it), it's Serre and Deligne: one, an elder and a source of inspiration in my work during a crucial period of gestation of a vision; the other, the most gifted of my students, for whom I was in turn (and have remained, Burial or not. . . ) his main (and secret. . . ) source of inspiration. . . ) his main (and secret. . . ) source of inspiration<sup>32</sup>. If a Burial was set in motion in the aftermath of my departure (which became a "death" in due form), and materialized in an interminable procession of "operations" large and small in the service of the same end, this could only have happened with the combined and closely interdependent assistance of one and the other, the ex-senior and the ex-pupil (see, ex-"disciple"): one taking the discreet and effective lead in operations, while sounding the rallying call for some of my pupils<sup>33</sup>, craving the slaughter of the **Father** (under the grotesque and derisory effigy of a plethoric and bombastic **super-nana**); and the other giving an unreserved, unconditional and unlimited "green light" to the continuation of the (four) operations (of debunking, carnage, butchering and sharing of an inexhaustible corpse. . . ).

### 3.9. counting

As I've already hinted, I had to overcome considerable inner resistance - or rather, to overcome it through patient, meticulous and tenacious work - in order to separate myself from certain familiar, solidly-based images of considerable inertia, which for decades had taken the place of a direct, unbiased perception in me (as in everyone else, and surely in you too).

p. L29

nuanced reality - in this case, that of a certain mathematical world, to which I continue to be linked □ by a past and by a work. One of the most strongly anchored of these images, or ready-made ideas, is that it seems out of the question for an internationally-renowned scientist, or even a man with a reputation as a great mathematician, to be able to afford (even if only exceptionally, and even less so as an expensive

<sup>30</sup>On this subject, see above all the group of seventeen notes "Mon ami Pierre" (n° s 60-71) in RS II.

<sup>31</sup>This "vast vision", which Deligne had indeed "intimately assimilated and made his own", had exerted a powerful fascination on him.

He was fascinated by his own work, and continues to be fascinated by it in spite of himself, while at the same time a compelling force drives him to destroy it, to shatter its fundamental unity and seize the scattered pieces. Thus, his occult antagonism towards a disowned and "dead" master is the expression of a division in his being, which profoundly marked his work after my departure - work that remained far below the rather prodigious means I had known him to have.

<sup>32</sup>On this subject, see the previous b. de p. note.

<sup>33</sup>These are exactly the five other students who (like Deligne) have chosen cohomology of varieties as their main theme.

habit. . . ) of swindles large and small; or if he refrains (out of old habit again) from dipping his hand in it himself, let him nevertheless welcome with open arms such operations "(defying all sense of decency, at times)" set up by another, and where, for one reason or another, he finds his profit.

Such was the inertia of my mind, that it was only less than two months ago, at the end of a long reflection that had already lasted a whole year, that I finally came to the timid realization that Serre might also have had something to do with this Burial - something that now seems obvious to me, even independently of the eloquent conversation I had with him recently. As with all the members of the "Bourbaki milieu" that had welcomed me so graciously in my early days, and especially in his case, there was for me a kind of unspoken "taboo" around his person. He represented the very embodiment of a certain "elegance" - an elegance that is by no means limited to form, but also includes rigor and scrupulous probity.

Before I discovered l'Enterrement on April 19 last year, I could not have dreamt that any of my students would be capable of dishonesty in the exercise of their profession, whether towards me or anyone else. And it was for the most brilliant of them, the one who had been closest to me, that such a supposition would have seemed the most aberrant! And yet, from the very moment of my departure and throughout the years that followed, right up to the present day, I'd had ample opportunity to realize just how divided his relationship with me was. More than once, too, I've seen him use (for the sheer pleasure of it, it would seem) the power to discourage and humiliate, when the occasion was right. Each time, I was deeply affected (more, no doubt, than I would have liked to admit to myself. . . ). These were eloquent signs of a deep-seated disturbance, which (I'd had ample opportunity to observe) was by no means confined to him alone, even in the most limited circle of those who had been my pupils. The loss of respect for the person of others is no less flagrant, and no less obvious, than the loss of respect for the person of others.

that which manifests itself in so-called "professional dishonesty". Still, the discovery of such dishonesty came as a complete surprise and shock to me. p. L30

In the weeks following this breathtaking revelation, followed by a whole "cascade" of others of the same kind, I gradually came to realize that a certain amount of scheming, among some of my students<sup>34</sup>, had already begun in the years leading up to my departure. This was particularly obvious in the case of the most brilliant of them - the one who, after my departure, set the tone and (as I wrote earlier) "quietly and efficiently took the lead". With the benefit of almost twenty years' hindsight, this scheming is now obvious to me - it was "plain to see". While I chose to turn a blind eye to what was going on, all in pursuit of the "white whale" in a world "where all is order and beauty" (as I liked to imagine it), I realize today that I failed to assume the responsibility that was incumbent on me at the time, with regard to students learning from me a trade that I love; a trade that is something other than simple know-how, or the development of a certain "flair". Through my complacency towards brilliant students, whom I was pleased (by tacit decree) to treat as "beings apart" and above suspicion, I contributed my share<sup>35</sup> to the corruption (unprecedented, it seems to me) that I see spreading today in a world and among people who were once dear to me.

Admittedly, given their immense inertia, it took intense and sustained work to separate myself from what we used to call "illusions" (not without a hint of regret. . . ), and which I'd rather call "illusions".

---

<sup>34</sup>See previous b. de p. note.

<sup>35</sup>This "contribution" appears notably in the note "L'être à part" (n° 67'), as well as in the two notes "L'ascension" and "L'ambiguïté" (n° s 63', 63"), and again (in a slightly different light) at the end of the note "L'éviction" (n° 169). Another type of "contribution" appears in "Fatuité et Renouveau", with attitudes of fatuity towards young less brilliantly gifted mathematicians. This awareness of a share of responsibility for a general deterioration culminates in the section on "Sports mathematics" (n° 40).

about myself, about an environment with which I'd once identified, about people I've loved and perhaps still love - to "separate" myself from these ideas, or rather, to **let them detach themselves from me**. It's been work, yes, but never a struggle - work that has brought me, among many other things

of price, moments of sadness sometimes, but never a moment of regret or bitterness. Bitterness is one of the ways to evade ☐ une knowledge, to evade the message of an experience; to maintain oneself in a certain

p. L31

A tenacious illusion about oneself, at the cost of another "illusion" (in negative, as it were) about the world and others.

It's without bitterness or regret that I see these ready-made ideas that had been "dear" to me, out of old habit and because they'd been there "forever", being detached from me one by one, like so many cumbersome, even crushing, weights. They had become, of course, like second nature. But this "second nature" is not "me". Separating myself from them piece by piece is not the heartbreak or even frustration of someone who would see himself stripped of things that are precious to him. The "stripping" of which I speak comes as the reward and fruit of **work**. Its sign is an immediate and beneficial relief, a welcome **liberation**.

### 3.10. Four waves in one movement

As expected, this letter is not at all what I had planned when I started writing it. Here's what happened in broad outline, you'll believe me or not (I found it hard to believe myself. . . ), but that's what it is, unmistakable, even, whether you like it or not, black publications. ), but that's what it is, unmistakable, even, whether you like it or not, published in black and white in such and such a periodical or book, such and such a date, such and such a page, all you have to do is look - in fact, everything in *Récoltes et Semailles* is stripped down to the bare essentials; see "Quatre Opérations" such and such notes - take it or leave it! And if you prefer not to read me, others will do it for you... . In the end, none of this happened - and yet this letter is already at the thirty-page mark, although I had planned for five or six pages in all.

Unintentionally, these are the essential things I've been led to tell you, as the pages go by, while the "bag"

I've been so eager to empty (right there in plain sight, on the first pages!) still hasn't been unpacked! It doesn't even tickle me anymore

in my fingers, the desire dissipated along the way. I realized that this was not the place. . .

In fact, Part IV of *Harvest and Sowing* (and the longest of all), entitled "The Burial", is the longest of all. (3)" or "The Four Operations", is the result of a "note" originally intended as a "brief summary" of what last year's surprise investigation had revealed to me, and continued in Part II ("The Burial (1)", or "The robe of the Chinese Emperor"). I thought

p. L32

that there would be enough for a "note" of five or ten pages, no more. Eventually, one thing led to another, and the investigation got under way again, and there were nearly four hundred pages of it - almost double ☐ the part I was supposed to have written.

to summarize or take stock! As a result, there's still no report on the subject, even though the six hundred pages of *Récoltes et Semailles* are devoted to the investigation of the Burial. It's a bit silly, it's true. But there's always time to add it in a third part to the Introduction (which is no more than ten or twenty pages long), before handing over my notes to a printer.

The five parts of *Récoltes et Semailles* (the last of which is not yet finished, and probably won't be for a few months) represent an alternation of (three) waves of "meditation" and (two) waves of "investigation". It's like an abbreviated reflection of my life over the last nine years, which has also consisted of alternating "waves" arising from the two passions that now dominate my life, the passion for meditation and the passion for mathematics. In fact, the two parts (or "waves") of *Récoltes et*

The seeds I've just called "investigation" are those that have sprung directly from my roots in my mathematical past, driven by my mathematical passion and the egotistical attachments that have taken root in it.

The first wave, "Fatuity and Renewal", is a first encounter with my past as a mathematician, leading to a meditation on my present, whose roots I have just discovered. Although not in the least premeditated, this part sets the "basic tone" for the rest of *Récoltes et Semailles*, and is a providential and indispensable inner preparation for the discovery of "L'Enterrement dans toute sa splendeur" (Burial in all its splendor), which follows closely on its heels in the second wave, "L'Enterrement (1) - ou la robe de l'Empereur de Chine" (Burial (1) - or the dress of the Chinese Emperor). More than an "investigation", in fact, it's the story of this day-to-day discovery, of its impact on my being, of my efforts to face up to what was tumbling down on me without warning, to situate the unbelievable in terms of my experience, of what ended up becoming familiar to me, making it intelligible as best I could. This movement led to a first provisional outcome, in the note "Le Fossoyeur - ou la Congrégation toute entière" (n° 97), a first attempt to discern an explanation and a meaning in something which, for years already and now more acutely than ever, was taking on the appearance of a formidable challenge to common sense!

This same second movement also leads to a "sick episode"<sup>36</sup>, □me forcing a absolute rest and put an end to all intellectual activity for more than three months. This was at a time when I thought I was once again on the verge of completing Harvest and Sowing (apart from some final "housekeeping" tasks. . . ). When I resumed normal activity towards the end of September last year, and was about to put the finishing touches to my notes, I still thought I'd have two or three final notes to add, including one about the "health incident" I'd just been through. In fact, week after week and month after month, another thousand pages were added - more than double what had already been written - and this time, it's quite clear that I still haven't finished<sup>37</sup> ! In fact, this long interruption, during which I had practically lost contact with a substance that was hot (and even burning!) when I left it, practically forced me to return to this substance with new eyes, if I didn't want to limit myself to foolishly "wrapping up" the final end of a "program" with which I had lost living contact.

p. L33

Thus is born the third wave in the vast movement that is *Récoltes et Semailles* - a long "wave-meditation" on the theme of yin and yang, the "shadow" and "light" sides in the dynamics of things and in human existence. Stemming from a desire for a deeper understanding of the profound forces at work in Burial, this meditation nonetheless acquires an autonomy and unity of its own from the outset, and focuses from the outset on what is most universal, as well as what is most intimately personal. It was during this meditation that I discovered something (quite obvious, in fact, if you ask me): that in my spontaneous approach to the discovery of things, whether in mathematics or elsewhere, the "basic tone" is "yin", "feminine"; and also, and above all, that contrary to what most often happens, I have remained faithful to this original nature in me<sup>38</sup>, without ever bending or correcting it in order to "make the most of it".

<sup>36</sup>This episode is the subject of two notes, "L'incident - ou le corps et l'esprit" and "Le piège - ou facilité et épuisement" (n° s 98, 99), opening the "Cortège XI" entitled "Le défunt (toujours pas décédé)".

<sup>37</sup>"Still not finished" - if only because there's still a Part V to come, unfinished at the time of writing.

<sup>38</sup>This "fidelity to my original nature" was by no means total. For a long time, it was confined to my mathematical work, while everywhere else, and particularly in my relationships with others, I followed the general trend of valuing and giving primacy to traits in me felt to be "virile", and repressing "feminine" traits. It's all about quite detailed in the group of notes entitled "Histoire d'une vie: un cycle en trois mouvements" (n° 107-110), which practically opens the *Clef du Yin et du Yang*.

to conform to the dominant values of the surrounding environment. This discovery

p. L34

□d'abord comme une simple curiosité. Only gradually, however, does it reveal itself as a key to the future. essential for an understanding of the Burial. Moreover - and this is something that seems to me of even greater significance - I now see very clearly and without residue of the slightest doubt this: that if, with by no means exceptional intellectual gifts, I have nonetheless been able to consistently give my full measure in my mathematical work, and to produce a work and give birth to a vision that is vast, powerful and fertile, it is to nothing other than this fidelity that I owe it, to this absence of any concern to conform to standards, thanks to which I abandon myself with total confidence to the original impulse for knowledge, without carving it up or amputating it in any way from what makes its strength and finesse and its undivided nature.

However, it's not creativity and its sources that are at the center of attention in this meditation "Burial (2) - or The Key to Yin and Yang", but rather "conflict", the state of blocked creativity, or the dispersion of creative energy by the confrontation, in the psyche, of antagonistic (usually occult) forces. The aspects of **violence**, of (seemingly) "gratuitous" violence, "for the sake of it", had disconcerted me more than once in Burial, and brought back a host of similar real-life situations. The experience of this violence has been in my life like "the hard, irreducible core of the experience of conflict". Never before had I confronted the formidable mystery of the very existence and universality of this violence in human existence in general, and in my own in particular. It is this mystery that is the focus of attention throughout the second half (the "yin" or "decline" side) of the meditation on yin and yang. It is during this part of the meditation that a deeper insight into the meaning of the Burial, and the forces at work within it, gradually emerges. It's also the part of Harvesting and Sowing that has been the most fruitful, it seems to me, in terms of self-knowledge, bringing me into contact with neuralgic questions and situations, and making me feel precisely this "neuralgic" character, which until last year had remained elusive.

Once I'd finished this interminable "digression" on yin and yang, I was still left, more or less, with my "two or three notes" to write (plus one or two more, at most, one of which already had its ready-made name "The four operations". . . ), to finish with Récoltes et Semailles.

p. L35

We know the rest: these "last few notes" ended up making up the longest part of Récoltes et Semailles, running to almost □five hundred pages. This, then, is the "fourth wave" of the movement. It is also the third and final part of L'Enterrement, and I've given it the name "Les Quatre Opérations" (The Four Operations), which is also the name of the group of notes ("Les quatre opérations (sur une dépouille)") that form the heart of this fourth breath of reflection. Here, in Récoltes et Semailles, is the "investigation" part in the strictest sense of the term - with the added twist, however, that this investigation is not confined to the purely "technical" aspect, to the "detective" aspect in short, but that the reflection here is driven above all, as elsewhere in Récoltes et Semailles, by the desire to know and understand. The tone is more "muscular" than in the first part of Burial, where I was still rubbing my eyes and wondering if I was dreaming or what! Nevertheless, the facts uncovered in the course of the pages often come at just the right moment, to illustrate on the spot many things that had only been hinted at in passing here and there, embodied in precise and striking examples. It's in this section, too, that the mathematical digressions take on an important role, stimulated by renewed contact (through the necessities of inquiry) with a substance I'd lost sight of for fifteen years. At the other end of the spectrum, there are also first-hand accounts of the misadventures of my friend Zoghman Mebkhout (to whom this section is dedicated), at the hands of a high-flying, unscrupulous "mafia" that he had never dreamed of when he embarked on the (admittedly fascinating, and seemingly innocuous) subject of the cohomology of varieties of all kinds. For a thread

For a brief guide through the intricate maze of notes, sub-notes, sub-sub-notes... of this entire "investigation" section, I refer you to the table of contents (notes 167' to 176<sub>7</sub>), and to the first of the notes in the package, "Le détective - ou la vie en rose" (n° 167'). I should point out, however, that this note, dated April 22, was then a little "overtaken by events", since, from one twist to another, this investigation, which I then thought (practically) completed, continued to brin de zinc for another two months.

This fourth breath lasted over four months in a row, from mid-February to the end of June. It's in this part of the reflection above all, through meticulous and obstinate "work on parts", that I've gradually established, as the days and pages go by, a concrete, tangible contact with the reality of the Burial; that I've managed to "familiarize" myself with it, in short, to some extent, notwithstanding the visceral reactions of refusal that it had mentioned above (and that it continues to arouse) in me, standing in the way of a true acquaintance. This lengthy reflection begins with a retrospective on Deligne's visit (mentioned above).

already in this <sup>□</sup>lettre), and it ends with the "last-minute" reflection on my relationship with Serre and on Serre's role in l'Enterrement<sup>39</sup>. It was to have tacitly put Serre "off the hook", in favor of that "taboo" I've already mentioned, which now seems to me perhaps the most serious gap remaining in my understanding of l'Enterrement, until last month - and it's this "last-minute" reflection that now seems to me to be the most important thing that this "fourth breath" of Harvest and Sowing has given me, for a less tenuous, more fleshed-out apprehension of Burial and the forces that express themselves within it. p. L36

### 3.11. Movement and structure

I think I've covered the most important things I wanted to tell you about Harvest and Sowing, so that you already know "what it's all about". Surely, I've said more than enough to enable you to judge whether you consider the (more than) thousand-page letter that follows to be "about you", or not - and consequently, whether or not you're going to read on. In the event of a "yes", I think it would be useful to add a few more explanations (of a practical nature, in particular) about the **form of Récoltes et Semailles**.

This form is the reflection and expression of a certain **spirit**, which I have tried to "convey" in the preceding pages. Compared with my previous publications, if there's one new quality that stands out in Récoltes et Semailles, and also in A la Poursuite des Champs from which it stems, it's undoubtedly **spontaneity**. Admittedly, there are some common threads, and some big questions, which give coherence and unity to the whole reflection. However, this process continues from day to day, without any pre-established "program" or "plan", without there ever being any question of fixing for me in advance "what had to be demonstrated". My aim is not to demonstrate<sup>□</sup> but to **discover**, to penetrate further into an unknown substance, to condense<sup>□</sup> what is still only sensed, suspected, glimpsed. I can say, without any exaggeration really, that in this work, there is not a single day or night of reflection that has taken place in the field of the "foreseen", in terms of the ideas, images, associations that were present at the moment I sat down. . L37

<sup>39</sup>In parts c, d, e, of the note "L'album de famille" (n° 173), the last of which is dated June 18 (exactly ten days ago). There is only one note or part of a note with a later date (namely, "Cinq thèses pour un massacre - ou la piété filiale", n° 176<sub>7</sub>, dated the following day, June 19). You will note that in this fourth part of Récoltes et Semailles, or "investigation part", unlike the others, the notes often follow each other in a logical rather than chronological order. For example, the last two notes of l'Enterrement (forming the final "De Profundis") are dated April 7, two and a half months before the note I just quoted. I would point out, however, that apart from the "investigation" part of l'Enterrement (3) (notes n° s 167'-176<sub>7</sub>), forming the "fifth beat" of the funeral ceremony (of which the Key of Yin and Yang is the second), the notes follow each other in the order in which they were written, with rare exceptions.

in front of a blank sheet of paper, stubbornly pursuing a stubborn "thread", or picking up another that has just appeared. Each time, what emerges from the reflection is different from what I would have predicted, had I ventured to try and describe in advance what I thought I saw before me. More often than not, reflection takes paths that are entirely unforeseen at the outset, leading to new, equally unforeseen landscapes. But even if it sticks to a more or less planned itinerary, what the journey reveals to me as the hours go by differs as much from the image I had when I set off as a real landscape, with its play of cool shade and warm light, its delicate perspective changing with the hiker's footsteps, and its countless sounds and nameless fragrances carried by a breeze that makes the grasses dance and the trees sing... - that such a living, elusive landscape differs from a postcard, however beautiful and successful, however "right" it may be.

p. L38 It's the thought pursued in one go, over the course of a day or night, that constitutes the undivided unit, the living, individual cell, as it were; in the whole of the reflection (Harvest and Sowing, in this case). The latter is to each of these units (or "notes"<sup>40</sup>, forming a melody . . . ) what the body of a The living organism is each of its individual cells, infinitely diverse, each fulfilling a place and function that belongs to it alone. Sometimes, however, in a single reflection, after the fact, we perceive important breaks, which make it possible to distinguish several such units or messages, each of which then receives its own name and thus acquires its own identity and autonomy. At other times, on the other hand, a reflection that had been cut short for one reason or another (usually fortuitous), is spontaneously extended the next day or the day after that; or a reflection pursued over two or more consecutive days appears, in retrospect, as if it had been continued in one go; it seems as if only the need to sleep has forced us, unwillingly, to include some (as it were "physiological") caesura, marked only by a lapidary indication of the date.

<sup>40</sup>Originally, when I wrote *Fatuité et Renouveau*, the word "note" was synonymous with "annotation", playing the role of a footnote. For reasons of typographical convenience, I preferred to reject these annotations at the end of the text (notes 1 to 44, pages 141 and 171). One of the reasons for this was that some of these "notes" or "annotations" extend over one or more pages, and become longer even than the text they are supposed to comment on. As for the undivided "units" of the "first draft" of the reflection, for want of a better name I called them "sections" (less off-putting than "paragraphs").

This situation, and the structure of the text, changes with the next part, which was originally called "L'Enterrement", and became "L'Enterrement (1)" (or "La robe de l'Empereur de Chine"). This reflection led to the double-note "Mes orphans" and "Refusal of an inheritance - or the price of a contradiction" (notes n°s 46, 47, pages 177, 192), coming as annotations to the ultimate "section" of Harvest and Sowing (or rather, of what was to be its Part I, or Fatuity and Renewal), "The weight of a past" (n° 50, p. 131). Subsequently, other annotations were added to this same section (notes n°s 44' and 50), and still other notes were added as annotations to "Mes orphelins", which in turn gave rise to new notes. not to mention, this time, real footnotes, when the planned annotations were (and remained, once black on white) of modest dimensions. So, theoretically, this whole part of *Récoltes et Semailles* (which was then supposed to constitute the second and final part) appeared as a set of "notes" to the "Weight of a Past" "section". Through acquired inertia, this subdivision into "notes" (instead of "sections") was maintained in the following three parts, where I use both the footnote (when its size allows) and the subsequent note referred to in the text, as a means of annotating a "first draft" of the reflection.

Typographically, the "note" is distinguished from the "section" (used in RS I as the basic unit of the "first draft" of the reflection) by a sign such as (1), (2) etc. (including the number of the note placed between brackets and "in the air", following a widespread usage for cross-references to annotations), placed either at the beginning of the note in question, or as a cross-reference to the appropriate place in the text that refers to it. Sections are designated by Arabic numerals from 1 to 50 (to the exclusion of annoying subscripts and superscripts, as I have been led to use for notes, by imperatives of a practical nature). That said, there is no essential difference between the function of the "sections" in the first part of Harvest and Sowing and that of the "notes" in the later parts. The comments I make about this function in the present part of my letter ("Spontaneity and structure") apply equally well to the "sections" of RS I, even though I use the common noun "notes".

For further details and conventions, including how to read the table of contents of L'Enterrement (1), please refer to Introduction, 7 (L'Ordonnement des Obsèques), especially pages xiv - xv.

(or even several) between consecutive paragraphs of the "note" in question, which is then distinguished as such by a unique name.

□ And so, each of the notes in *Récoltes et Semailles* has its own individuality, a face and a function that distinguish it from any other. For each one, I've tried to express its own particularity through its **name**, which is supposed to capture or evoke the essence, or at least something essential, of what it "has to say". I truly recognize each one, above all else, by name, and it's by that name that I call her whenever I need her assistance.

p. L39

Often the name has presented itself to me spontaneously, before I've even thought about it. It's its unexpected appearance that signals to me that this note I'm still writing is about to be finished - that it has said what it had to say, by the time I finish the paragraph I'm writing. ... Often, too, the name appears, just as spontaneously, as I reread the notes from the day before or the day before, before continuing my reflection. Sometimes, it changes somewhat in the days or weeks following the appearance of the new note, where it is enriched by a second name I hadn't thought of at first. Many notes have a double name, expressing two different, sometimes complementary, perspectives on their message. The first of these double-names that presented itself to me, right from the start of "*Fatuité et Renouveau*", was "*Rencontre avec Claude Chevalley - ou liberté et bons sentiments*" (n° 11).

Only twice have I already had a name in mind before starting a note - and both times, moreover, it was jostled by what happened next!

It's only with the benefit of hindsight, the hindsight of weeks or even months, that an **overall movement** and **structure** emerges in the set of notes that follow one another from day to day. I've tried to capture both through various groupings and sub-groupings of notes, each with its own name, giving it its own existence and function or message; a bit like the organs and limbs of the same body (to use the image from earlier), and such and such parts of its limbs. Thus, in "the Whole" of Harvest and Sowing, there are has the five "parts" I've already mentioned, each with its own structure: *Fatuity and Renewal*

is grouped into eight "chapters" I to VIII<sup>41</sup>, and all three parts forming □ I, *Enterrement* (which, themselves ...which have also gradually emerged over the months... .) consists of a long, solemn Procession of twelve "Cortèges" I to XII. The last of these, or rather the "**Funeral Ceremony**" (that's its name) towards which the eleven preceding Processions had been heading (without really suspecting anything, surely. . .) of the eleven preceding Cortèges, is of truly gigantic dimensions, commensurate with the Work whose solemn funeral it consecrates: it encompasses almost the entirety of RS III (L' *Enterrement* (2)) and the entirety of RS IV (L' *Enterrement* (3)), with its nearly eight hundred pages and one hundred and fifty notes (although initially, this famous ceremony was only intended to comprise two!). Tactfully conducted (and with his well-known modesty. . .) by the great officiant himself, the ceremony continues in nine separate "beats" or liturgical acts, opening with the **Funeral Eulogy** (as one would have expected), and concluding (as it should) with the final **De Profundis**. Two other of these "times", one called "**The Key of Yin and Yang**", the other "**The Four Operations**", each constitute (by far) the largest part of the part (III or IV) of Harvest and Sowing into which it is inserted, and indeed give the latter its name.

p. L40

Throughout Harvest and Sowing, I took great care (as if it were the apple of my eye!) with the table of contents, constantly reworking it to accommodate the ever-renewed influx of unexpected notes<sup>42</sup>, and

<sup>41</sup>In *Fatuity and Renewal*, I occasionally refer to these chapters as "parts" of Harvest and Sowing, not to be confused, of course, with the five parts already mentioned, which only appeared later.

<sup>42</sup>Among these unexpected notes are those that are "derived from a footnote that has grown prohibitively large". In most cases, I've placed it immediately after the footnote to which it refers, giving it the same number.

to reflect as accurately as I could the overall movement of thought and the delicate structure that emerges. It is in Parts III and especially IV (just mentioned), "The Key" and "The Four Operations", that this structure is at its most complex and interwoven.

p. L41 To preserve the spontaneity of the text, and the unforeseen aspects of thinking as it is continued and that it was actually experienced, I didn't want to preface the notes with their names, even though the latter each time only appeared after the fact. This is why I ☐te advise, at the end of When reading each note, refer to the table of contents to learn what the note is called; and also, on occasion, to be able to appreciate at a glance how it fits into the thinking already pursued, or even, into that yet to come. Otherwise, you run the risk of getting hopelessly lost in a seemingly indigestible and heterogeneous collection of notes with sometimes bizarre, not to say off-putting, numbering<sup>43</sup> ; like a traveller lost in a foreign city (pushed there strangely at the whim of generations and centuries... . ), without a guide or even a map to help him find his way. In the manuscript intended for printing, I intend to include the names of "chapters" and other groupings of notes and sections throughout the text, to the exclusion of the notes (or sections) themselves. But even then, the occasional recourse to the table of contents seems indispensable, to avoid getting lost in a jumble of hundreds of notes, following each other like a tail over more than a thousand pages... .

## 3.12. Spontaneity and rigor

Spontaneity and rigor are the two "shadow" and "light" sides of the same undivided quality. It is only from their marriage that that particular quality of a text, or of a being, is born, which we can try to evoke by an expression like "quality of truth". If spontaneity has been (if not absent, at least) at a minimum in my past publications, I don't think that its late blossoming in me has made me any less rigorous. Rather, the full presence of its yin companion gives rigor a new dimension, a new fruitfulness.

This rigor is exercised in relation to itself, ensuring that the delicate "sorting" it must perform in the multitude of things that pass through the field of consciousness, to constantly decant the significant or essential from the incidental or accessory, does not thicken and congeal into automorphisms of censorship and complacency. Only curiosity, only our thirst for knowledge, can awaken and stimulate such vigilance without heaviness, such vivacity, against the immense, omnipresent inertia of "natural" slopes, carved out by ready-made ideas, expressions of our fears and conditioning.

p. L42 And this same rigor, this same vigilant attention is also directed towards spontaneity as towards this which takes on its aspects, in order to take into account, here again, these natural "slopes", and to distinguish them ☐ from what truly springs from the deepest layers of being, from the original impulse of knowledge and action, taking us out into the world.

In terms of writing, rigor manifests itself in a constant concern to use language to define as precisely and faithfully as possible the thoughts, feelings, perceptions, images, intuitions... ... that need to be expressed, without settling for a vague or approximate term where the thing to be expressed has clear-cut contours, or for a term of artificial precision (and therefore just as distorting) to express something that is not clear-cut.

---

with a superscript ' or ", or even "" if necessary - thus avoiding the prohibitive task of renumbering all subsequent notes already written at the same time! These notes, from one footnote to another, are preceded in the table of contents by the sign ! (at least in L'Enterrement (1)).

<sup>43</sup>For the rationale behind such seemingly bizarre numbering, I refer you to the previous footnote to this inexhaustible letter.

thing that remains shrouded in the mists of what is still only presentiment. When we try to capture it as it is in the moment, and only then, the unknown thing reveals its true nature to us, and into the full light of day perhaps, if it is made for the day and our desire incites it to strip itself of its veils of shadow and mist. Our role is not to pretend to describe and fix what we don't know and what escapes us, but to humbly, passionately take note of the unknown and the mystery that surround us on all sides.

In other words, the role of writing is not to record the results of a search, but the very process of the search - the labors of love and the works of our loves with Our Mother the World, the Unknown, who unceasingly calls us into herself to know her again in her inexhaustible Body, wherever in her the mysterious ways of desire take us.

In order to render this process, backtracking, which nuances, clarifies, deepens and sometimes corrects the "first draft" of the writing, or even a second or third, is part of the very process of discovery. They form an essential part of the text and give it meaning. This is why the "notes" (or "annotations") placed at the end of *Fatuité et Renouveau*, and referred to here and there throughout the fifty "sections" that make up the "first draft" of the text, are an inseparable and essential part of it. I urge you to refer to them as you go along, and at least at the end of each section where there are one or more references to such "notes". The same applies to footnotes in other parts of *Harvest and Sowing*, or references in a given "note" (here constituting the "main text") to a subsequent note, which then acts as a "return" to it, or as an annotation. This, along with my advice not to separate yourself from the table of contents while reading, is the main reading recommendation I have for you.

□ One last, practical question, which will close (somewhat prosaically) this letter that it's time to end. p. L43  
There's been a bit of "panic" at times, to get the various *Harvest and Seed* fascicles ready for printing by the Duplication Department at the Fac, in time for the print run to take place (if possible) before the summer vacations. In the rush, a whole sheet of last-minute footnotes to fascicule 2 (*L'Enterrement* (1) - or *La robe de l'Empereur de Chine*) was "skipped". It was mainly a matter of rectifying certain material errors that had only recently come to light, in the course of writing the *Four Operations*. One of these footnotes is more substantial than the others, and I'd like to mention it here. It's an annotation to the note "*La victime - ou les deux silences*" (n° 78', page 304). This note, in which I tried, among other things, to define my impressions (all subjective, admittedly) of the way in which my friend Zoghman Mebkhout "internalized" at the time the iniquitous spoliation of which he was the victim, was felt by him to be unfair to him, whereas I seemed almost to be putting him "in the same bag" with his spoliators. What is certain is that in this note, which does not pretend to give anything other than impressions linked to a particular "moment", I am only presenting one sound of the bell, leaving unsaid (and as a matter of course, no doubt) certain other sounds just as real (and less debatable perhaps). The fact remains that, a year on, the reflections on this delicate subject are considerably deepened in the note "*Racines et Solitude*" (n° 171). Zoghman had no reservations about it. Further food for thought on the same subject can also be found in the two notes "*Trois jalons - ou l'innocence*", and "*Les pages mortes*" (n° s 171 (x) and (xii)). These three notes are part of "*L'Apothéose*", which is the section of *Quatre Opérations* devoted to the appropriation and misappropriation of Zoghman Mebkhout's work.

All that's left for me to do is wish you happy reading - and I look forward to reading you too!

Alexandre Grothendieck

## Postscript epilogue - or context and prerequisites for a debate

February 1986

### 3.13. The spectograph at bottles

p. L44     □ It's been a full seven months since this Letter was written, and nearly four months since it was sent, with the "pavement" that goes with it. And with a dedication from my hand in each<sup>44</sup>. Like a "bottle to the sea", or rather, like a whole flock of such wandering bottles, my message landed and circulated to the furthest corners of this mathematical microcosm with which I was once familiar. And through the direct and indirect echoes that come back to me over the days, weeks and months, here I am, unexpectedly, like a vast X-ray of the mathematical milieu, taken by a sprawling spectograph, of which my innocent "bottles" are so many travelling antennae. And so (noblesse oblige!), even though I'm not short of things to do, I find myself faced with the new task of deciphering the radio and reporting, as best I can, on what I've read there. This will be the sixth (and last, I promise!) part of Récoltes et Semailles. This will crown, God willing, "the great sociological work of my old age". For now, a few initial comments.

When it comes to greeting my modest, hand-crafted flotilla, what seems to dominate by far is the half-snidey, half-snarky tone, along the lines of "here's Grothendieck getting paranoid in his old age", or "here's one who takes himself very seriously" - and there you have it! However, I've only had one letter in that style<sup>45</sup>, plus two more in the vein of hushed, self-pleasured derision<sup>46</sup>. Most of my mathematician addressees, including some of my former students, responded with silence<sup>47</sup> - a silence that tells me a lot.

p. L45     □ That doesn't stop me from having already had a voluminous correspondence. Most of the letters are in the tones of polite embarrassment, which is often intended to be friendly, as if for the sake of propriety. Two or three times I've felt, behind this embarrassment and as if sifted by it, the warmth of an ever-living feeling. More often than not, when the embarrassment isn't expressed by protestations of good feeling (on one's own behalf, or on behalf of others), it's expressed by compliments - I've never received so many in my life! To the tune of "great mathematician", "superb pages" (on creativity "and all that". . .), "indisputable writer", and so on. For good measure, I even received a heartfelt (and by no means ironic) compliment on the richness of my inner life. Needless to say, in all these letters, my correspondent is careful not to go into the heart of any matter, and even less, to get personally involved; the tone is more that of one who has been "asked to give his opinion" (to use the words of one of these letters), on a rather scabrous and, what's more, hypothetical or even imaginary affair, and in any case and above all, one that doesn't **concern him personally**. Whenever he even pretends to touch on one of these issues, it's with his fingertips and in order to keep it as far away from him as he can - whether it's with the help of some good advice I've given myself, or with cautious conditionals, or with the usual commonplaces when one doesn't know too much.

<sup>44</sup>There are a few rare exceptions, mostly comprising colleagues I don't know personally, who received only issues 0 and 4 of the provisional print run, as a bonus for their active participation in my Funeral.

<sup>45</sup>This letter comes from one of my former students, and also one of my co-internees.

<sup>46</sup>From two of my former colleagues at Bourbaki, one of whom is one of the elders who warmly welcomed me when I started out.

<sup>47</sup>For one hundred and thirty-one items sent to mathematicians, fifty-three of the recipients have so far given some sign of life, even if only to acknowledge receipt. These include six of my ex-students - I haven't heard from any of the other eight.

what to say, or in any other way. Still, some of them hinted that there might have been some not-so-normal things going on - all the while taking care to leave what and who they were about as vague as possible. ...

I also received some frankly warm feedback from fifteen or sixteen of my old and new friends. Some of them expressed emotion, with no desire to hide it or keep it quiet. These echoes, and others just as warm from outside the mathematical world, have been my reward for a long and solitary work, done not only for myself, but for all.

And of the hundred and thirty or so colleagues who received my Letter, three responded to it, in the full sense of the word, by getting involved themselves, rather than confining themselves to a distant commentary on the events of the century. I received yet another such response from a non-mathematical correspondent. These were real **responses** to my message. And that, too, was my greatest reward.

### 3.14. Three feet in a flat

□ Many of my mathematician colleagues and friends have expressed the hope that Harvest and Sowing will open up p.  
L46

a wide-ranging **debate** in the mathematical community, on the state of mores in this milieu, on the ethics of the mathematician, and on the meaning and purpose of his work. For the moment, the least we can say is that it's not going that way. As of now (and to make the pun de rigueur), the debate on a funeral looks set to be replaced by the burial of a debate!

However, whether we like it or not, and despite the silence and apathy of many, a debate is well and truly underway. It is unlikely that it will ever take on the scale of a real public debate, or even (heaven forbid!) the pomp and stiffness of the "official" debate. In any case, there are many who have already jumped the gun, shutting it down in their own minds before they've even heard about it, on the strength of the eternal, unchanging consensus that "all's for the best in the best of all possible worlds" (mathematics, in this case). Perhaps, however, a challenge will eventually come from the **outside**, gradually, from "witnesses" who, not being part of the same milieu, are not prisoners of its group consensus, and who therefore don't feel (even inwardly) personally challenged.

In almost all the feedback I've received, I've noticed the same confusion over the two preliminary questions: **what does** the "debate" posed (at least tacitly) by Récoltes et Semailles concern; and who is qualified to take cognizance of it and give an opinion on it, or else: to form an opinion in full knowledge of the facts. In this connection, I'd like to make **three points of reference**. Of course, this will not prevent those who want to remain confused from continuing to do so. At least, for those who would like to know what it's all about, perhaps it will help them not to be distracted by all kinds of noise (even the best-intentioned. . . ).

a) Sincere friends assure me that "everything will work out in the end" (or "everything", I suppose, means "things" that have been damaged... . ); all I had to do was go back to school, "make my mark with new work", give lectures etc. - and the others would do the rest. We'll generously say "We has been a bit unfair with this Grothendieck fellow", and to discreetly rectify the situation with more or less convincingly<sup>48</sup> (\*); □ voire, patting him on the shoulder with a paternal air and giving him "big p. L47 mathematician", just to calm down a respectable quidam who, alas, is pretending to get angry and make unwanted waves.

---

<sup>48</sup>(\*) I've already noticed several such discreet signs, showing that the lion has woken up. ...

It's not a question, as these friends suggest, of "letting go of ballast" or making others let go of ballast. I, for one, have no need of compliments or even of sincere admirers, nor of "allies", for "my" cause or for any cause whatsoever. It's not about me, who's doing just fine, nor about my work, which speaks for itself, even to the deaf. If this debate also concerns, among others, my person and my work, it's simply as **revelations of** something else, through the reality of a Funeral (most revelatory indeed).

If there is "someone" who I feel should inspire a sense of alarm, concern and urgency, it is by no means myself, nor any of my "co-interred". But it is a collective being, at once elusive and very tangible, often spoken of but never examined, who is not "**the mathematical community**".

Over the past few weeks, I've come to see her as a flesh-and-blood person, whose body is stricken with a deep-seated gangrene. The best food, the choicest dishes, in her turn into poison, causing the evil to spread and become more entrenched. And yet, there's an irresistible bulimia to gorge herself on more and more, as a way of giving herself the slip, surely, about an evil she wouldn't want to know anything about. Anything we say to her is wasted - even the simplest words have lost their meaning. They cease to carry a message, and serve only to trigger the triggers of fear and refusal. . .

b) Most of my colleagues or former friends, however well-disposed, when they hazard an opinion, surround themselves with cautious conditionals, like "if it were true that... .. it would indeed be inadmissible" - just so they can sleep soundly again. I thought I'd made myself clear...

With the benefit of seven months' hindsight, I can now state that **for almost all the facts** reported and commented on in Récoltes et Semailles, **their reality is uncontroversial**. I'll come back later to the few exceptions, which will be noted as such, each in its own place, for all the other facts, after writing the primitive version of □ Récoltes et Semailles, a confrontation careful discussions with some of the main people involved (namely, Pierre Deligne, Jean-Pierre Serre and Luc Illusie) enabled us to eliminate errors of detail, and reach unambiguous agreement on the material facts themselves<sup>49</sup> (\*).

p. L48

Thus, the debate is not about the reality of the facts, which is not in question, but about **whether the practices and attitudes described by these facts should be considered as accepted and as "normal", or not**.

We're talking here about practices that in my testimony I describe (perhaps wrongly. . . ) as scandalous; as abuses of trust or power and as blatant dishonesty, reaching on more than one occasion the dimension of the iniquitous and the shameless. The unimaginable thing I had yet to learn, after having been made aware of these facts (unthinkable even fifteen years ago), was that the vast majority of my mathematical colleagues, and even those who were once my students or friends, now consider these practices to be normal and perfectly honourable.

c) There is a second way in which many of my colleagues and former friends maintain confusion. It's to the tune of "sorry, but we're not specialists in this field - don't ask us to take cognizance of facts, which (providentially. . . ) go right over our heads. . .".

On the contrary, I assert that you don't need to be a "specialist" (sorry about that!), or even know your multiplication table or the Pythagorean theorem, to get the main facts.

---

<sup>49</sup>(\*) I am pleased to express my gratitude to all three for the goodwill they have shown on this occasion, and acknowledge their complete good faith in all matters of material fact.

Not even having read "Le Cid" or the Fables de la Fontaine. A normally-developed ten-year-old is just as capable of this as the most renowned specialist (or even better than him. . . )<sup>50</sup> (\*\*).

Allow me to illustrate this point with just one example, the "first come" from l'Enterrement<sup>51</sup> (\*\*\*) .

There's no need to know the ins and outs of the multifaceted and highly delicate mathematical concept of p . L49 of "motive", nor of having only his school certificate, to take note of the following few facts, and to pass judgment on them.

1° ) Between 1963 and 1969, I introduced the notion of "pattern" and developed a "philosophy" and "theory" around it, which have remained partially conjectural. Rightly or wrongly (it doesn't matter here), I consider motif theory to be the most profound contribution I have made to the mathematics of my time. Indeed, the importance and depth of "motivic yoga" is no longer disputed by anyone (after ten years of almost complete silence on the subject, immediately after my departure from the mathematical scene).

2° ) In my first and only book (published in 1981), devoted essentially to the theory of motives (and in which this name, introduced by me, appears in the title of the book), the one and only passage that could lead the reader to suspect that my modest person is in any way connected with any theory that might resemble the one developed at length in this book, is on page 261. This passage (two and a half lines long) consists of explaining to the reader that the theory developed there has nothing to do with that of a man called Grothendieck (a theory mentioned there for the first and last time, without any further reference or precision).

3° ) There's a famous conjecture, the so-called "Hodge conjecture" (never mind what it's actually about), whose validity would imply that the so-called "other" pattern theory developed in the brilliant volume, is identical to (a very special case of) the one I had developed, in plain sight, nearly twenty years before. I

might add a 4° ) that the most prestigious of the book's four co-authors was my student,

and that it is from none other than me that he has learned over the years the brilliant ideas he presents here

as if he had just found them<sup>52</sup> (\*), and 5° ) that these two circumstances are public knowledge among well-informed people, but that it would be futile to look in literature for a written trace attesting

that said brilliant author might have learned something from my mouth<sup>53</sup> (\*), and that 6° ) the delicate issue p. L50 of arithmetic which (according to what the main author himself explained to me) constitutes the central problem of the book (and without my name being mentioned), had been worked out by me in the sixties, in the wake of the "yoga of patterns", and that it was through me that the author became aware of it; and I could pile on more 7° and 8° etc (which I certainly don't fail to do in its place ).

The foregoing will suffice for my purpose, which is this. You don't need any special "skills" to take note of such facts and pass judgment on them - **that's not "where it's at"**. The faculty at stake here, apart from sound reason (which in principle is available to everyone), is what I would call a **sense of decency**.

The book in question is now one of the most cited in mathematical literature, and its "principal author" one of the most prestigious mathematicians of the time. That said, the most remarkable thing about this story, in my view, is that no one among the countless readers of

---

<sup>50</sup>(\*\*) Of course, I didn't write Récoltes et Semailles for ten-year-olds, and I'd use language they're familiar with.

<sup>51</sup>(\*\*\*) This was the first "great operation" of Burial that I discovered, on a certain April 19, 1984, when the name "l'Enterrement" also imposed itself on me. On this subject, see the two notes written on the same day, "Souvenir d'un rêve - ou la naissance des motifs", and "L'Enterrement - ou le Nouveau père" (Res III, n° s 51, 52). The full reference of the book is also included.  
we're going to talk about.

<sup>52</sup>(\*) I don't mean to say that there aren't ideas in this book, and even fine ones, due to this author or the other co-authors. But the whole problematic of the book, and the conceptual context that gives it its meaning, up to and including the delicate theory of *X-categories* (wrongly called "Tannakian"), which technically constitutes the heart of the book, are my work.

<sup>53</sup>(\*) With the exception of one line in a report by Serre in 1977, which will be discussed later.

I'm sure that I've **never seen anything wrong with** this book, even among those who know first-hand what it's about, and who were my students or friends. In any case, not one of them, even today as I write these lines, has made himself known to me to express the slightest reservation about this prestigious book<sup>54</sup> (\*\*).

As for those of my colleagues and former friends who have never held this book in their hands and use it to plead incompetence, I say to them: you don't need to be a "specialist" to ask for the volume in the first mathematical library you come across, leaf through it, and see for yourself what nobody disputes... .

### 3.15. Gangrene - or the zeitgeist (1)

p. L51

15. This "pattern operation" is only one of four "large operations" of the same water, and among them a host of others on a lesser scale and in the same spirit. This is by no means the "biggest" of the collective mystifications that fill out my "tableau de moeurs" of an era, nor especially the most iniquitous.

It only consisted in plundering the rich man's flock, in his absence (or death. . . ), and not in coming (with general indifference) to strangle the poor man's sheep for his own pleasure and before his very eyes. And even in the mathematical language now in common use, the seemingly innocuous names of books, notions or statements quoted at any given moment are in themselves already a mystification or imposture<sup>55</sup> , and bear witness in their own way to the disgrace of an era.

If I think I've ever done anything useful for the "mathematical community", it's that I've brought to the light of day a number of less-than-glamorous facts that were lurking in the shadows. The kind of facts, surely, that everyone comes into contact with every day, from near or far. But how many of them took the time to stop, even for a moment, to smell the air and look around?

He who found himself the victim of some people's arrogance and others' (or the same people's) dishonesty, perhaps flattered himself that this was a very special misfortune that had fallen to him. If he were to compare his experience with my own, he might well realize that this "misfortune" is also a name he has given to a **zeitgeist** that weighs on him as it does on everyone else. And (who knows!) perhaps this will encourage him to get involved in a debate that concerns him as much as it concerns me.

p. L52

But if this "dirty laundry" that I'm "airing in the public square" elicits nothing more than mirthless sneers of some and the polite embarrassment of others, in the indifference of all, a situation that was murky will have become very clear. (At least for those who still care to use their eyes.) Traditional consensus of good faith and decency<sup>56</sup> , in the relationship between mathematicians and in that of the mathematician to his art, are now things of the past, "outdated". Although it has yet to be solemnly proclaimed by any international association of mathematicians, the fact is that it is now a matter of course, and virtually official: the "cooptation fraternity" of those who wield power in the mathematical world **is now allowed to pull all the stops**, without any reservations or limitations. All the shenanigans of ideas

<sup>54</sup>(\*\*) In all, two colleagues (including Zoghman Mebkhout) have expressed such "reservations" to me. Neither of them can be considered "readers" of this book. They looked at it out of curiosity, just to see for themselves... ..

<sup>55</sup>I'm thinking here, in particular, of the unusual acronym "SGA 4<sup>1</sup>" (fractional numbers are useful!), which is a double imposture in itself (and one of the most quoted acronyms in contemporary mathematical literature), and of the names "Verdier duality" or "dual".

de Verdier", "Deligne-Grothendieck conjecture", or "Tannakian categories" (where Tannaka is not involved, as he was never consulted). . . ). We'll discuss this in more detail later.

<sup>56</sup>When I speak of these "consensuses of good faith and decency", I do not mean to imply that they were never transgressed. But even when they were transgressed, they were indeed "transgressions", and the consensus itself was nonetheless accepted.

to lead the apathetic reader, who only wants to believe, by the nose, all the paternity deals, and the bogus quotations between accomplices and the silence for those condemned to silence, and the cronyism and falsifications of all kinds and even the crudest plagiarism in plain sight - **yes and amen to everything**, with the blessing, by word or by silence (if not by active and eager participation), of all the "big names" and all the big and small bosses in the mathematical public arena. Yes and amen to the "**new style**" that's all the rage! What was once an art form has now become, with (almost) unanimous assent, a muddle-headed fair under the paternal eye of the bosses.

There was a time when the exercise of power in the world of mathematicians was limited by unanimous, intangible consensus, the expression of a collective sense of **decency**. Today, these consensuses and this sentiment are outdated and unworthy of the glorious era of computers, space cells and the neutron bomb.

It would be a foregone conclusion: power, for the brotherhood of those who wield it, is a means to an end. **discretionary power**.

### 3.16. Amende honorable - ou l'esprit du temps (2)

16. In the Lettre, I explained sufficiently the spirit in which I wrote Récoltes et Semailles, to make it clear that I make no claim to be a historian. It is an honest account of first-hand experience, and a reflection on that experience. Testimony and reflection are available to all, including the historian, who can use it as one of several types of material. It is then up to the historian to subject this material to critical analysis, in accordance with the rigorous canons of his art.

We must, of course, distinguish between facts in the narrow sense ("brute **facts**" or "material facts"), and the "evaluation" or ☐ "**interpretation**" of these facts, which gives them a **meaning**, which is not the same, for p.

L53

one observer (or co-actor) and for another. Roughly speaking, we can say that the "testimony" aspect of Récoltes et Semailles concerns the facts, and that its "reflection" aspect concerns their interpretation, i.e. my work to give them meaning. Among the "facts" that make up the testimony, I also include the "psychic facts", and in particular the feelings, associations and images of all kinds that my testimony reflects, whether these took place in the more or less distant past, or at the very moment of writing.

For the events I describe or report in Récoltes et Semailles, I distinguish three kinds of **sources**. There are the facts recounted to me by **memory**, more or less precise or blurred from one occasion to the next, and sometimes distorted. I can vouch for their truthfulness at the time of writing, but by no means for their absence of error. On the contrary, I have had occasion to point out a number of them, errors of detail which I point out in their place in later footnotes. On the other hand, there are **written documents**, in particular letters and, above all, scientific publications in due form, to which I refer from time to time with all due precision. Finally, there is the **testimony of third parties**. Sometimes they complement my own memories, allowing me to revive, clarify and, sometimes, correct them. On rare occasions (to which I'll return shortly), this testimony brings me entirely new information compared to what I already knew. When I happen to echo such testimony, it doesn't mean that I've had the opportunity to verify its accuracy and validity down the line, but simply that it fits plausibly enough into the rich tapestry of facts that were known to me first-hand, to lead me to believe (rightly or wrongly. . . ) that it was essentially true.

For an attentive reader, I don't think there will be any difficulty, at any point, in "distinguishing" between an account of the facts and an interpretation of them, and (in the former case) in discerning which of the three sources I've just described comes into play.

\*       \*

\*

□  
p. L54 When I alluded a moment ago to the testimony of a third party, which I echoed without having been able to "verify its validity on all counts", I was referring to that of **Zoghman Mebkhout**, concerning the vast cover-up operation surrounding his work. Of the "material facts" I mention in *Récoltes et Semailles*, the only ones that are now subject to controversy, or which, in my own judgment at present, require rectification, are some of the facts attested by Mebkhout's testimony alone. To conclude this postscript, I would like to present here some critical comments on the version of the "Mebkhout affair" presented in the provisional printing of *Récoltes et Semailles*. More detailed comments and corrections will be included, each in his or her own place, in the printed edition (constituting the definitive text of *Récoltes et Semailles*).

The "Mebkhout version", which I have tried to interpret, seems to me to consist essentially of the following two theses:

1. Between 1972 and 1979, Mebkhout was the only<sup>57</sup>, in the general indifference and inspired by my work, to develop the "philosophy of  $D$ -Modules", as a new theory of "cohomological coefficients" in my sense.
2. There would have been a unanimous consensus, both in France and internationally, to disregard his name and his role in this new theory, once its scope began to be recognized.

This version was well documented, firstly by Mebkhout's own convincing publications, and secondly by numerous publications by other authors (in particular, by the **Actes** du Colloque de Luminy of June 1981), where the deliberate intention of concealment cannot be doubted. Finally, the more detailed details Mebkhout provided me with later (and which I echo in the section "L'Enterrement (3) - ou les Quatre Opérations"), while not directly verifiable, were nonetheless concordant entirely with a certain general mood, the reality of which I could no longer doubt.

p. L55 □ I have just become aware of several new facts<sup>58</sup>, which show that there is reason to nuance strongly- See point 1°) above. The isolation in which Mebkhout found himself<sup>59</sup> was indeed real, but it was a relative isolation. In France, there was the work of **J.P. Ramis** on the same subject (work of which Mebkhout said nothing to me), and above all, it appears that certain important ideas developed and brought to fruition by Mebkhout, and of which he takes credit, could be due to Kashiwara<sup>60</sup>. This, in turn, renders the

<sup>57</sup>With the exception of Kashiwara's 1975 constructibility theorem, whose importance in the theory is by no means disputed. But according to Mebkhout's version, this was Kashiwara's one and only contribution to the emerging theory. This (inaccurate) version was corroborated by the absence of other publications by Kashiwara, in which he would have alluded to at least some of the key ideas.

<sup>58</sup>I am grateful to Pierre Schapira and Christian Houzel for drawing my attention to these facts, and to the tendentious nature of my presentation of the Mebkhout-Kashiwara dispute.

<sup>59</sup>This isolation stemmed above all from my ex-students' indifference to Mebkhout's ideas and work, which stubbornly pretended to draw inspiration from an "ancestor" doomed to oblivion by unanimous consensus... ..

<sup>60</sup>The most important of these ideas is the so-called "Riemann-Hilbert correspondence" (to use the new-style jargon) for  $D$ -Modules. The relevant conjecture was proved by Mebkhout, and also (as Schapira tells me) by Kashiwara (although Mebkhout assured me that his was the only published proof). The question of priority for

blable or dubious some of the episodes in the Kashiwara-Mebkhout dispute, as recounted in the Mebkhout version whose (overly) faithful interpreter I have made my own.

There's no doubt that Mebkhout was one of the main pioneers of the new D-Modules theory, perhaps even **the** main pioneer, in terms of his "work on the pieces" and the conception of some of the ideas he was able to bring to fruition; in any case, he was the only one to put his heart and soul into this task, the true scope of which still eluded him, just as it eluded everyone else. And it's also true that the cover-up that took place around this work, culminating in the Colloque de Luminy, remains for me one of the great disgraces of the century in the mathematical world. But it would be wrong to claim (as I have done in good faith) that Mebkhout was alone in his task. On the other hand, he was the only one to have the honesty and courage to state clearly the importance of my ideas and my work in his work and in the emergence of the new theory.

This postscript is not the place to go into more detail on this affair - I shall do so in its place, including comments that may shed light on the psychological context of the "Mebkhout version". If the "Mebkhout-Kashiwara dispute" is of interest to me, it is only insofar as it sheds light on the general atmosphere of an era. And for me, the "Mebkhout version", right down to its very distortions and the forces that played a part in bringing them about, also appears to be, among other lesser-known materials, the most important one. to the "record of an era", an eloquent "sign of the times".

□ It remains for me to make amends for levity, presenting of the Mebkhout-Kashiwara dispute a picture that took into account only the testimony and documents provided by Mebkhout, as if there could be no doubt about this version. This version presented a third party in a ridiculous, even odious light, all the more reason to exercise caution. For my thoughtlessness and for this lack of healthy caution, I gladly offer Mr. Kashiwara my sincerest apologies.

p. L56

---

demonstration is still a mystery to me, and I've given up on spending the rest of my life trying to get to the bottom of it. ...

As for the sister-statement in terms of  $D^\infty$  Modules, there doesn't seem to be the slightest doubt that Mebkhout is responsible for both the idea and the demonstration.

## 4.1. (I) The five-leaf clover

### 4.1.1. 1. Dream and fulfillment

□ Three years ago in July, I had an unusual dream. When I say "unusual", I meanp  
I'm talking about an impression that came to me only after the fact, when I thought about it when I woke up. The dream itself came to me as the most natural, obvious thing in the world, without fanfare - so much so that when I woke up, I almost didn't pay any attention to it, just pushed it into oblivion and moved on to "the order of things".  
of the day". Since the day before, I had been reflecting on my relationship with mathematics. It was the first time in my life that I'd taken the trouble to look into it - and even then, if I'd gone into it at all, it was because I'd really been forced to! So many strange, not to say violent, things had happened in the preceding months and years - explosions of mathematical passion bursting into my life out of the blue - that it was no longer possible to ignore what was going on.  
The dream I'm talking about had no scenario or action of any kind. It consisted of a single image, motionless but at the same time very much alive. It was the head of a person, seen in profile. He could be seen looking from right to left. It was a middle-aged man, beardless, his wild hair forming a halo of strength around his head. The impression given off by this head was that of a youthful, joyful strength, which seemed to spring from the supple, vigorous arch of the nape of the neck (which we guessed more than we saw). The expression on his face was more that of a mischievous little boy, delighted by whatever blow he might come upon.

or meditate to do, than that of a mature man, or of one who has grown in stature, mature or not. Above all, it exuded an intense, restrained joie de vivre, bursting into play. . .

There was no second person present, no "I" looking at or contemplating this other person, whose head was all we could see. But there was an intense perception of this head, of what emanated from it. Nor was there anyone to feel impressions, to comment on them, to name them, or to stick a name to the perceived person, designating him or her as "so-and-so". There was only this living thing, this man's head, and an equally vivid, intense perception of this thing.

p. II      As for waking up, without deliberate purpose, I remembered the dreams of the night gone by, the vision of that head

man didn't stand out on the number with any particular intensity, it didn't thrust itself forward to shout at me or whisper to me: it's me you've got to look at! When this dream appeared in the field of my quick glance at the night's dreams, in the warm stillness of the bed, I naturally had the reflex of the waking mind to put a name to what had been seen. All I had to do was ask, and I knew at once that the man's head that had been there in the dream was none other than my own. That's not a bad one, I thought, it's got to be done, seeing yourself in a dream like that, as if it were someone else! This dream came to me a little as if I'd stumbled across a four-leaf clover, or even a five-leaf clover, while out for a walk, and I'd marvelled at it for a few moments.

and carry on as if nothing had happened.

At least, that's how it almost happened. Fortunately, as has happened to me many times in situations of this kind, I made a mental note of this little "not bad" incident, starting a reflection that was supposed to build on the previous day's. Then, one thing led to another, and that day's reflection was confined to exploring the meaning of this unpretentious dream, this "not bad" incident. Then, one thing leading to another, that day's reflection was limited to immersing myself in the meaning of this unpretentious dream, this unique image, and the message about myself that it brought me.

This is not the place to dwell on what this one-day meditation taught and brought me. Or rather, what the **dream** taught me and brought me, once I'd put myself in the mood of attention and listening that enabled me to accept what it had to say. The first immediate fruit of the dream and this listening was a sudden influx of new energy. This energy supported the long-term meditation that continued over the following months, against stubborn inner resistance, which I had to dismantle one by one through patient, obstinate work.

In the five years since I started paying attention to some of the dreams that came to me, this was the first "messenger dream" that didn't present itself in the now-recognizable guise of such a dream, with impressive scenic means and an exceptional, sometimes overwhelming intensity of vision. This one was all about "cool", with nothing to force attention, discretion even - take it or leave it, with no fuss.

p. III      □A <sup>few</sup> weeks earlier, a messenger dream had come to me in the old style, on the dramatic diapason and even savage, which put a sudden and immediate end to a long period of mathematical frenzy. The only similarity between the two dreams was that in neither was there an observer. In a parable of lapidary force, this dream showed something that was going on in my life at the time, without my taking the trouble to pay attention to it - something I was even taking great care to ignore, to tell the truth. It was this dream that made me realize the urgency of a process of reflection, which I embarked upon a few weeks later, and which then continued for almost six months. I'll have a chance to talk a little about it in the last part of this reflection-testimony, "**Récoltes et Semailles**", which opens the present volume and gives it its name<sup>1</sup>.

---

<sup>1</sup>See section 43, "The troublemaker boss - or the pressure cooker".

If I have begun this introduction by evoking this other dream, this image-vision of myself ("Traumgesicht meiner selbst" as I called it in my German notes), it's because in recent weeks the thought of this dream has come back to me more than once, as the meditation "on a mathematician's past" drew to a close. In retrospect, the three years since the dream appear to me as years of decantation and maturation, towards a fulfillment of its simple, limpid message. The dream showed me "**as I am**". It was also clear that in my waking life I was not fully who the dream showed me to be - weights and stiffnesses from afar often prevented (and still prevent) me from being fully and simply myself. During those years, when the thought of that dream rarely came back to me, it must have acted in some way. It was by no means a kind of model or ideal to which I would have strived to resemble, but a discreet reminder of a joyful simplicity that "was me", that manifested itself in many ways, and that was called upon to free itself from what continued to weigh upon it and to blossom fully. This dream was both a delicate and vigorous link, between a present still weighed down by many past burdens, and a very near "tomorrow" that this present contains in germ, a "tomorrow" that is me right now, and that has surely always been in me. ...

Surely, if in these last few weeks this rarely evoked dream has been very present again, it is because at some level that is not that of a ☐thought that probes and analyzes, I must have "known" that the work I wasp . iv  
work, which took up and deepened that other work of three years ago, was a new step towards fulfilling the message about myself that it brought me.

For me, this is now the main meaning of Harvest and Sowing, of this intense work of almost two months. Only now that it's finished, do I realize how important it was for me to do it. During the course of this work, I experienced many moments of joy, often mischievous, joking, exuberant joy. And there have also been moments of sadness, and times when I've relived frustrations or sorrows that have hit me painfully in recent years - but there hasn't been a single moment of bitterness. I leave this work with the complete satisfaction of one who knows he has completed a job. There is nothing, no matter how "small", that I have avoided, or that I would have cared to say but didn't, and which at this moment would leave me with the residue of dissatisfaction, of regret, no matter how "small".

When I wrote this testimonial, it was clear to me that it would not please everyone. It's even possible that I've found a way to displease everyone, without exception. But that wasn't my intention at all, or even to upset anyone. My purpose was simply to look at the simple and important things, the everyday things, from my past (and sometimes from my present too) as a mathematician, to discover at last (better late than never!) and without the shadow of a doubt or reservation, what they were and what they are; and, along the way, to say in simple words what I saw.

#### 4.1.2. 2. The spirit of a trip

This reflection, which eventually became "Récoltes et Semailles", had begun as an "introduction" to the first volume (now nearing completion) of "**A la Poursuite des Champs**", the first mathematical work I've been intending to publish since 1970. I had written the first few pages at a low point, in June last year, and resumed this reflection less than two months ago, at the point where I had left it. I realized that there was a lot to look at and a lot to say, so I expected an introduction

thirty or forty pages. Then, for the nearly two months that followed, up to now even ☐o where I'm writing this new introduction to what was first an introduction, I believed everyp . v

day that it was the day I'd finish this work, or that it would be the next day, or the day after that at worst. When, after a few weeks, I began to approach the hundred-page mark, the introduction was promoted to "introductory chapter". After a few more weeks, when the dimensions of this "chapter" far exceeded those of the other chapters in the volume in preparation (all completed at the time of writing, except for the last one), I finally understood that it didn't belong in a maths book, that this reflection and this testimony would definitely be cramped. Their true place was in a separate volume, which will be volume 1 of these "**Mathematical Reflections**" that I intend to continue in the years to come, following on from the *Poursuite des Champs*.

I wouldn't say that *Récoltes et Semailles*, this first volume in the *Réflexions Mathématiques* series (to be followed by two or three volumes of *Poursuite des Champs*, to start with) is an "introduction" volume to the *Réflexions*. Rather, I see this first volume as the foundation for what's to come, or rather, as the one that sets the tone, the **spirit** in which I'm embarking on this new journey, which I intend to pursue in the years to come, and which will take me I can't say where.

To conclude these clarifications concerning the main part of the present volume, a few indications of a practical nature. The reader will not be surprised to find in the text of *Récoltes et Semailles* occasional references to the "present volume" - by which I mean the first volume (*Histoire de Modèles*) of *Poursuite des Champs*, whose introduction I believe I am still writing. I didn't want to "correct" these passages, as I wanted above all to preserve the text's spontaneity, and its authenticity as a testimony not only to a distant past, but also to the very moment I'm writing.

It's for the same reason, too, that my reworking of the first draft of the text was limited to correcting stylistic clumsiness or a sometimes confused expression that interfered with the understanding of what I wanted to express. In some cases, these alterations led me to a clearer or more refined understanding than when I wrote the first draft. Slightly substantial modifications to the text, to nuance, clarify, complete or (sometimes) correct it, are the subject of some fifty numbered **notes**, grouped together at the end of the reflection, and which make up more than a quarter of the text<sup>2</sup>. I refer to them by acronyms such as (1) etc. . Among these notes, I have singled out twenty or so that seemed to me of comparable importance (in length or substance) to any of the fifty "sections" or "paragraphs" into which the reflection was spontaneously organized. These longer notes have been included in the table of contents, after the list of fifty sections. Not surprisingly, for some of the longer notes, there was a need to add one or more notes to the note. These are then included following the note, with the same type of cross-references, except for shorter notes, which then appear on the same page as "footnotes", with cross-references such as or.

I took great pleasure in naming each of the sections of the text, as well as each of the more substantial notes - not to mention the fact that, later on, this proved to be indispensable for finding my way around. It goes without saying that these names were found after the fact, whereas when I began a section or a note that was a little long, I wouldn't have been able to tell for any of them what the essential substance would be. The same applies a fortiori to the names (such as "Work and Discovery", etc . . . ) by which I have designated the eight parts I to VIII, into which I have grouped the fifty sections that make up the text.

I'll confine myself to brief comments on the content of these eight parts. The first two, I (Work and Discovery) and II (The Dream and the Dreamer), contain elements of a reflection on mathematical work, and on the work of discovery in general. I'm involved in them in a very personal way.

---

<sup>2</sup>(May 28) This is the text of the first part of *Récoltes et Semailles*, "Fatuité et Renouveau". The second part had not been written at the time of writing.

more episodic and much less direct than in the following sections. It is these parts in particular that have the quality of testimony and meditation. Parts III to VI are above all a reflection and testimony on my past as a mathematician "in the mathematical world", between 1948 and 1970. The motivation behind this meditation was above all the desire to understand this past, in an effort to understand and assume a present in which certain aspects are sometimes disappointing or confusing. Parts VII (*L'Enfant s'amuse*) and VIII (*L'aventure solitaire*) are more concerned with the evolution of my relationship with mathematics from 1970 to the present day, i.e. since I left "the world of mathematicians" and never returned. I

examines in particular the motivations, and the forces and circumstances, that led me (to my own surprise) to resume "public" mathematical activity (writing  $\square$  and having *Réflexions Mathématiques* published), p. vii after an interruption of more than thirteen years.

### 4.1.3. 3. Compass and luggage

I'd like to say a few words about the other two texts that, along with *Harvest* and *Sowing*, make up the present volume of the same name.

**Esquisse d'un Programme**" outlines the main themes of mathematical reflection that I have pursued over the last ten years. I intend to develop at least a few of them in the years to come, in a series of informal reflections that I've already had occasion to mention, the "Mathematical Reflections". This outline is the verbatim reproduction of a report I wrote last January in support of my application for a research post at the CNRS. I have included it in the present volume, because obviously this program far exceeds the possibilities of my modest person, even if I were given another hundred years to live and chose to use them to pursue the themes in question as far as I can.

The "**Esquisse thématique**" was written in 1972 to coincide with another application (for a professorship at the Collège de France). It contains a thematic sketch of what I then considered to be my main mathematical contributions. This text reflects the circumstances in which it was written, at a time when my interest in mathematics was marginal, to say the least. So this sketch is little better than a dry, methodical enumeration (though fortunately not intended to be exhaustive. . . ). It doesn't seem to be carried by a vision or the breath of a desire - as if the things I review here as if by conscience (and these were indeed my dispositions) had never been touched by a living vision, nor by a passion to bring them to light when they were still only sensed behind their veils of mist and shadow... .

If I've decided to include this uninspiring report here, I'm afraid, it's mainly to put an end (if that's even possible) to certain high-flying colleagues and a certain fashion, who since my departure from a world we once shared, seem to look down their noses at what they kindly call

grothendieckeries". This, it seems, is synonymous with bombast about things too trivial for a serious mathematician  $\square$  of good taste to consent to wasting admittedly precious time on them. Perhaps this "digest" p. viii will seem more "serious" to them! As for the texts from my pen, which are driven by a vision and a passion, they are not for those whom a fashion maintains and justifies in complacency, making them insensitive to the things that enchant me. If I write for others than for myself, it's for those who don't find their time and their person too precious to pursue without ever tiring of the obvious things that no one deigns to see, and to rejoice in the intimate beauty of each of the things discovered, distinguishing it from any other that was known to us in its own beauty.

If I wanted to situate the three texts that make up this volume in relation to one another, and the

The role of each in this journey on which I've embarked with *Réflexions Mathématiques*, I could say that the reflection-testimony *Récoltes et Semailles* reflects and describes the **spirit** in which I'm undertaking this journey and which gives it meaning. The Program Outline describes my sources of inspiration, which set a **direction**, if not a destination, for this journey into the unknown, rather like a compass, or a strong Ariadne's thread. Finally, the *Esquisse thématique* (Thematic Outline) briefly reviews the **baggage** I acquired as a mathematician before 1970, at least some of which will be useful and welcome in this or that stage of the journey (just as my cohomological and topological algebra reflexes are indispensable to me right now in the *Poursuite des Champs*). And the order in which these three texts follow one another, as well as their respective lengths, reflect well (without any deliberate intention on my part) the importance and weight I attach to them in this journey, the first stage of which is nearing its end.

#### 4.1.4. 4. A journey in pursuit of the obvious

I'd still have to say a few more detailed words about this journey I've been on for just over a year, the *Réflexions Mathématiques*. I explain myself in some detail, in the first eight sections of *Récoltes et Semailles* (i.e. in parts I and II of the *Réflexions*), about the **spirit** in which I'm undertaking this journey, and which, I think, is already apparent in the present first volume, as well as in the one that follows it (the *Histoire de Modèles*, which is volume 1 of the *Poursuite des Champs*), now nearing completion. I don't think it's worth expanding on this in this introduction.

p. IX

□ I certainly can't predict what the journey will be like, something I'll discover as it unfolds. will continue. At present, I don't have an itinerary planned, even in outline, and I doubt that one will emerge any time soon. As I said earlier, the main themes that will undoubtedly inspire my thinking are sketched out more or less in the "Esquisse d'un Programme", the "texte-boussole". Among these themes, there's also the main theme of *La Poursuite des Champs*, i.e. the "fields", which I hope to cover (and leave it at that) again this year, in two or perhaps three volumes. On this theme, I write in the *Esquisse*: ". . . it's a bit like a debt I owe to a scientific past in which, for some fifteen years (between 1955 and 1970), the development of cohomological tools was the constant leitmotiv in my work on the foundations of algebraic geometry". So, of all the planned themes, this is the one most strongly rooted in my scientific "past". It is also the one that has remained as a regret throughout these past fifteen years, as perhaps the most glaring gap of all in the work I left to do when I left the mathematical scene, and which none of my students or friends of yesteryear bothered to fill. For more details on this work-in-progress, the interested reader may refer to the relevant section in *Esquisse d'un Programme*, or to the introduction (the real one this time!) to the first volume, now nearing completion, of *Poursuite des Champs*.

Another legacy of my scientific past that is particularly close to my heart is the notion of **motif**, which is still waiting to emerge from the darkness in which it has been kept, even though it has been around for a good fifteen years. It's not out of the question that I'll end up working on the foundations that need to be laid here, if nobody better placed than me (by virtue of my younger age, as well as the tools and knowledge at my disposal) decides to do so in the next few years.

I'd like to take this opportunity to point out that the fortune (or rather, misfortune. . . ) of the notion of motif, and of a few others among those I've uncovered and which seem to me to be (potentially) the most fruitful of all, are the subject of a retrospective reflection of almost twenty pages, forming the most

long (and one of the very last) "notes" to Récoltes et Semailles<sup>3</sup>. I have subsequently subdivided this note in two parts ("My orphans" and "Refusal of an inheritance - or the price of a contradiction"), in addition to the three p. x

"sub-notes" that follow<sup>4</sup>. Taken together, these five consecutive notes are the only part of Récoltes et Semailles where mathematical notions are evoked in anything other than passing allusions. These notions become the occasion for illustrating certain contradictions within the world of mathematicians, which themselves reflect contradictions within the people themselves. At one point, I considered separating this sprawling note from the text from which it comes, and attaching it to the Thematic Outline. This would have had the advantage of putting the latter into perspective, and breathing a little life into a text that looks a little too much like a catalog. I have refrained from doing so, however, out of a concern to preserve the authenticity of a testimony of which this meganote, whether I like it or not, is indeed a part.

To what is said in Récoltes et Semailles about the dispositions in which I approach the "Réflexions", I would like to add just one thing here, which I have already expressed in one of the notes ("Le snobisme des jeunes - ou les défenseurs de la pureté"), when I write: "My lifelong ambition as a mathematician, or rather my joy and passion, have been constantly to discover the obvious things, and this is my only ambition also in the present work" (A la Poursuite des Champs). This is also my sole ambition for this new journey I've been pursuing for the past year with Réflexions. It was no different in Récoltes et Semailles, which (for my readers at least, if there are any) opens this journey.

#### 4.1.5. 5. A welcome debt

I'd like to conclude this introduction with a few words about the two dedications to the present volume "Récoltes et Semailles".

The dedication "to those who were my students, to whom I gave the best of myself - and also the worst" has been present in me at least since last summer, and in particular when I wrote the first four sections of what was still supposed to be an introduction to a mathematical book. In other words, I'd known for some years that there was a "worst" to consider - and now was the time! (But I had no idea that this "worst" would eventually lead me through a meditation of almost two hundred pages).

On the other hand, the dedication "to those who were my elders" only appeared along the way, as did the very name of this reflection (which also became the name of a volume). It revealed to me the important role p. xi that they played in my life as a mathematician, a role whose effects are still very much alive today. This will no doubt become clear enough in the pages that follow - so there's no need to dwell on it here. These "elders", in (approximate) order of appearance in my life when I was twenty, are Henri Cartan, Claude Chevalley, André Weil, Jean-Pierre Serre, Laurent Schwartz, Jean Dieudonné, Roger Godement and Jean Delsarte. The ignorant newcomer that I was was welcomed with kindness by each of them, and many of them later gave me lasting friendship and affection. I must also mention Jean Leray, whose kind welcome during my first contact with the "world of mathematicians" (in 1948/49) was also a precious encouragement. My reflection has revealed a debt of gratitude to each of these men "from another world and another destiny". This debt is by no means a burden. Its discovery came as a joy, and made me feel lighter.

Late March 1984

---

<sup>3</sup>This double note (n°s 46, 47) and its sub-notes have been included in the second part "L'Enterrement" of Récoltes et Semailles, which is a direct continuation of it.

<sup>4</sup>These are sub-notes n°s 48, 49, 50 (note n° 48' was added later).

## 4.2. (II) An act of respect

(- May 4 - . . . June)

### 4.2.1. 6. The Funeral

An unforeseen event rekindled a process of reflection that had already been completed. It inaugurated a cascade of discoveries, large and small, over the course of the past few weeks, gradually revealing a situation that had remained unclear and sharpening its contours. In particular, this led me to enter in detail and in depth into events and situations that had previously only been mentioned in passing or by allusion. As a result, the "fifteen-page retrospective reflection" on the vicissitudes of a work, mentioned earlier (Introduction, 4), has taken on unexpected dimensions, expanding by some two hundred additional pages.

By force of circumstance and by the inner logic of a reflection, I was led along the way to involve others as much as myself. The one who is involved more than anyone else (apart from myself) is a man to whom I have had a friendship for nearly twenty years. I wrote of him (euphemistically<sup>5</sup>) that he had "made  $\square$  un peu figure

p. XII

student", in the very early years of this affectionate friendship rooted in a shared passion, and for a long time in my heart of hearts I saw in him a kind of "legitimate heir" to what I believed I could contribute in mathematics, beyond a fragmentary published body of work. Many of you will already have recognized him: he's **Pierre Deligne**.

I make no apology for making public with these notes, among others, a personal reflection on a personal relationship, and thus implicating him without having consulted him. I think it's important, and healthy for everyone, that a situation that has long remained hidden and confused should finally be brought out into the open and examined. In so doing, I am providing a subjective account, which does not claim to exhaust a delicate and complex situation, nor to be free from error. Its first merit (like that of my past publications, or those on which I am currently working) is that it exists, available to those who may find it of interest. My concern has been neither to convince, nor to shield myself from error or doubt behind the only so-called "patent" things. My concern is to be true, by saying things as I see or feel them, in each moment - as a means to deepen them and to understand.

The name "**L' Enterrement**", for all the notes relating to the "Weight of a past", came to the fore with increasing force in the course of reflection<sup>6</sup>. In it, I play the role of the anticipated deceased, in the mournful company of the few (much younger) mathematicians whose work takes place after my "departure" in 1970 and bears the mark of my influence, through a certain style and approach to mathematics. Foremost among these is my friend **Zoghman Mebkhout**, who had the heavy privilege of having to face all the handicaps of being treated as Grothendieck's "pupil after 1970", without having had the benefit of contact with me and my encouragement and advice, whereas he was only a "pupil" of my work through my writings. This was at a time when (in the world he haunts) I was already such a "defunct" figure that for a long time the very idea of a meeting apparently did not present itself, and an ongoing relationship (both personal and mathematical) was only finally established last year.

7

---

<sup>5</sup>On the meaning of this "euphemism"; see the note "Being apart", n° 57'.

<sup>6</sup>Towards the end of this reflection, another name came to the fore, expressing another striking aspect of a certain painting that had come to the fore.

gradually revealed to my eyes over the past five weeks. It's the name of a tale, to which I'll return in its place: "The robe of the Emperor of China". . .

<sup>7</sup>Towards the end of this reflection, another name came to the fore, expressing another striking aspect of a certain painting that had come to the fore.

□ This didn't stop Mebkhout, against a tyrannical fashion and the disdain of his elders (quip were my students) and in near-complete isolation, from making an original and profound work, through an unforeseen synthesis of the ideas of the Sato school and my own. This work provides a new insight into the cohomology of analytic and algebraic varieties, and holds the promise of a far-reaching renewal in our understanding of this cohomology. There can be no doubt that this renewal would have been accomplished now and years ago, if Mebkhout had found the warm welcome and unreserved support he once received from me. At least, since October 1980, his ideas and work have provided the inspiration and technical means for a spectacular revival of the cohomological theory of algebraic varieties, finally emerging (apart from Deligne's results on Weil's conjectures) from a long period of stagnation.

Incredibly, his ideas and results have been used by "everyone" for almost four years now (just like mine), while his name remains studiously ignored and hushed by the very people who know his work first-hand and use it as an essential part of their work. I don't know of any other time when mathematics has been so disgraced, when some of the most influential or prestigious of its followers set an example, in the midst of general indifference, of disregard for the most universally accepted rule in the ethics of the mathematical profession.

I see four men, mathematicians of brilliant means, who had and have the right with me to the honors of this burial through silence and disdain. And I see in each of them the bite of contempt on the beautiful passion that had animated him.

Apart from these, I see two men in particular, both in the limelight in the mathematical public arena, who officiate at funerals in large company and who at the same time (in a more hidden sense) are buried with their own hands, along with those they deliberately bury. I've already named one of them. The other is also a former student and friend, **Jean-Louis**.

**Verdier**. After my "departure" in 1970, contact between him and me was not maintained, apart from a few hasty meetings on a professional level. This is probably why he □ only appears in this reflection atp . XIV through certain acts in his professional life, while the possible motivations for these acts, in terms of his relationship with me, are not examined and, moreover, escape me entirely.

If there's one pressing question that has imposed itself on me over the last few years, which was a profound motivation for *Récoltes et Semailles* and which has also followed me throughout this reflection, it's that of my part in the advent of a certain spirit and certain mores that make possible disgraces such as the one I've mentioned, in a world that was once mine and with which I had identified myself for more than twenty years of my life as a mathematician. Reflection has led me to discover that certain attitudes of fatuity within me, expressed in a tacit disdain for colleagues of modest means, and in complacency towards myself and certain mathematicians with brilliant means, were no strangers to this spirit that I see spreading today among the very people I had loved, and among those too whom I taught a profession I loved; those whom I disliked and taught badly, and who today set the tone (when they don't make the law) in this world that was dear to me and which I have left.

I feel a wind of smugness, cynicism and contempt. "It blows without concern for "merit" or "demerit", burning with its breath humble vocations as well as the most beautiful passions... .". I've realized that this wind is the prolific harvest of careless, blind sowing that I've helped to sow. And if its breath comes back on me and on what I had entrusted to other hands, and on those I love today and in the future, I'm sure that it will be a great help.

---

gradually revealed to my eyes over the past five weeks. It's the name of a tale, to which I'll return in its place: "The robe of the Emperor of China". . .

who have dared to claim me as their own, or even to draw inspiration from me, I have no reason to complain, and much to learn from it.

### 4.2.2. 7. Scheduling Funerals

Under the name "L'Enterrement" (Burial), I have therefore grouped together in the table of contents the imposing procession of the main "notes" relating to this seemingly innocuous section "Le poids d'un passé" (s.50), thus giving full meaning to the name that had immediately imposed itself on me for this ultimate section of the "first draft" of Récoltes et Semailles.

In this long procession of related notes<sup>8</sup>, those that have joined over the past four<sup>9</sup> weeks elapsed (notes (51) to (97)) stand out as the only dated ones (from April 19 to May 24). It p. XV I thought it most natural to list them in the chronological order in which they follow one another in the<sup>10</sup> reflection, rather than in any other "logical" order; or in the order in which references to these notes appear in earlier notes. In order to trace this latter (by no means linear) order of filiation between participating notes, I have followed (in the table of contents) the number of each note by that of the note (among those preceding it) where it is first referred to<sup>11</sup>, or (failing that) by the number of the note of which it constitutes an immediate continuation<sup>12</sup>. (This latter relationship is indicated in the text itself by a reference abbreviation placed at the end of the first note, such as (⇒ 47) placed at the end of the last line of the note (46), which refers to the note (47) that continues it). Lastly, certain technical details are grouped together at the end of a note in sub-notes numbered by consecutive indices in the number of the original note - as in sub-notes (46<sub>1</sub>) to (46<sub>9</sub>) of note (46) "My orphans". p. XVI

□ To give some structure to the overall order of the Burial, and to enable re-

In order to make the most of the multitude of notes that crowd together, I thought it would be appropriate to include a few highly suggestive subtitles in the procession, each preceding and leading a long or short procession of consecutive notes linked by a common theme.

I had the pleasure of seeing ten<sup>13</sup> processions gather one by one, in a long, solemn procession to honor my funeral - some humble, others imposing, some contrite and others secretly jubilant, as cannot be otherwise on such an occasion. Here come the **posthumous pupil** (whom everyone makes a point of ignoring), the **orphans** (freshly exhumed for the occasion), **Fashion** and its **Illustrious Men** (I've earned that), the **motifs** (the last born and last exhumed of all my

<sup>8</sup>To these should be added note no.° 104, dated May 12, 1984. Notes n° 98 and following (with the exception of the previous note n° 104) constitute the "third breath" of reflection, from September 22 1984 onwards. They are also dated.

<sup>9</sup>In a series of consecutive notes written on the same day, only the first is dated. The other undated notes are n° s 44' to 50 (forming cortèges I, II, III). Notes n° s 46, 47, 50 are from March 30 or 31, notes n° s 44', 48, 48', 49 from the first half of April, and note n° 44" is dated (May 10).

<sup>10</sup>I've sometimes made a small inversion in this chronological order, in favor of a "logical" order, when it's been I felt that this did not distort the overall impression of the thought process. As the only exceptions, however, I would like to point out eleven notes (preceded by the number !) taken from b. de p. notes subsequent to a note and which have grown to prohibitive dimensions, and which I have placed each following the note to which it refers (except note n° 98, see see° 47).

<sup>11</sup>When the reference to a note (such as (45)) is found in the "Weight of a past" section itself; it's number (50) of which is **placed in brackets** after the note, as in 46 (50).

<sup>12</sup>The number of a note that is an immediate continuation of a previous note (which numbers then follow each other) is preceded by the sign \* in the table of contents. Thus \*47, 46 indicates that note n° 47 is an immediate continuation of note n° 46 (which in this case is not the note that immediately precedes it, which is note n° 46 ).<sup>9</sup>

I have **underlined** in the t. des m. the numbers of the notes which are not followed by another number, i.e. those which are not

represent a "new departure" in our thinking, and do not fit into any particular part of our existing thinking.

<sup>13</sup>(September 29) In fact, there are finally twelve processions, including the Funeral Van (x), and "The deceased (still not deceased)." (XI), who has just managed to sneak back into the procession...

orphans), **my friend Pierre** modestly leading the largest of the processions, closely followed by **the Accord Unanime** des notes (silencieusement) concertantes and by the **Colloque** (known as the "Pervers") in its entirety (distinguishing itself from the posthumous pupil, alias the Unknown Pupil, by interposed funeral processions bearing flowers and wreaths) ; finally, to bring the imposing procession to a fitting close, here comes **the Pupil** (by no means posthumous and even less unknown) aka the **Boss**, followed by the bustling troop of my **pupils** (armed with shovels and ropes) and finally the **Funeral Van** (bearing four beautiful oak coffins firmly screwed together, not to mention the Gravedigger). . . ten processions at last in full force (it's about time), slowly making their way to the **Funeral Ceremony**.

The highlight of the Ceremony is the Eulogy, delivered with perfect skill by none other than my friend Pierre himself, presiding over the funeral in response to everyone's wishes and general satisfaction. The Ceremony concludes with a final and definitive De Profundis (or so we hope), sung as a heartfelt thanksgiving by the deceased himself, who unbeknownst to all has survived his impressive funeral and leads from it, to his **complete satisfaction** - which satisfaction forms the final note and final chord of the memorable Funeral.

### 4.2.3. 8. The end of a secret

In the course of this (hopefully) final stage of reflection, it occurred to me that it would be worthwhile to add the following in an "Appendix".

to the present volume 1 of *Réflexions Mathématiques* □ two other texts, of a mathematical nature, in addition to p. xvii three previously mentioned<sup>14</sup>.

The first is the reproduction of an annotated two-part **report** I wrote in 1968 and 1969 on P. Deligne's work (some of which remains unpublished to this day), corresponding to mathematical activity at the IHES during the three years 1965/67/68.

The other text is a sketch of a "**six-variance form**", bringing together the features common to a duality formalism (inspired by Poincaré's and Serre's duality) that I had worked out between 1956 and 1963, a form that proved to be "universal" for all cohomological duality situations encountered to date. This formalism seems to have fallen into disuse with my departure from the mathematical scene, to the extent that to my knowledge no one (apart from myself) has yet taken the trouble to write down even the list of fundamental operations, the fundamental canonical isomorphisms to which these operations are linked and the fundamental isomorphisms to which they are linked. and the essential compatibilities between them.

□ This sketch of a coherent form will be for me the first obvious step towards this "vast array of en- p. XVIII  
of the **dream of motives**", which for more than fifteen years "has been waiting for the bold mathematician who will

<sup>14</sup>In addition, I'm thinking of adding a "commentary" to the *Esquisse Thématique* (see "Boussole et bagages", Introduction, 3), giving some details about my contributions to the "themes" that are summarily reviewed there, and about the influences that played a part in the genesis of the main ideas-force in my mathematical work. The retrospective of the last six weeks has already revealed (to my own surprise) Serre's role as "detonator" for the start of most of these ideas, as well as for some of the "big tasks" I set myself between 1955 and 1970.

As a further text of a mathematical nature (in the usual sense), and the only one to appear (incidentally) in the non-technical text "Harvest and Sowing", I refer to sub-note no.° 87 to the note "The Massacre" (no.° 87), where I explain with the care it deserves a "discrete" (conjectural) variant of the Riemann-Roch-Grothendieck theorem familiar in the context.

coherent. This conjecture appeared (among many others) in the closing lecture of the SGA 5 seminar in 1965/66, a lecture of which no trace remains (any more than many others) in the volume published eleven years later under the name SGA 5. The vicissitudes of this crucial seminar in the hands of some of my students, and their links with a certain "operation

SGA 4<sub>2</sub>", are gradually revealed in the course of the reflections in notes n° s 63''', 67, 67', 68, 68', 84, 85, 85', 86, 87, 88.

As a further note giving fairly extensive mathematical comments on the desirability of a common "topossical" framework (as far as possible) for known cases where a duality formalism known as "six operations" is available, I would also point out sub-note no.° 81<sub>2</sub> to the note "Credit thesis and comprehensive insurance", no.° 81.

brush". To all appearances, this mathematician will be none other than myself. It's high time that what was born and entrusted intimately almost twenty years ago, not to remain the privilege of one but to be available to **all**, finally emerges from the night of secrecy, and is born once again into the full light of day.

It's true that only one of them, apart from me, had an intimate knowledge of this "yoga of patterns", having learned it from me in the days and years leading up to my departure. Of all the mathematical things I'd had the privilege of discovering and bringing to light, this reality of patterns still appears to me as the most fascinating, the most charged with mystery - at the very heart of the profound identity between "geometry" and "arithmetic". And the "yoga of patterns" to which this long-ignored reality has led me is perhaps the most powerful instrument of discovery I have unleashed in this first period of my mathematical life.

But it's also true that this reality, and the "yoga" that strives to capture it as closely as possible, had by no means been kept secret from me. Absorbed by the imperative task of writing the basics (which everyone has since been happy to use as they are in their everyday work), I didn't take the few months necessary to write a vast outline of this yoga of motives, and thus make it available to everyone. Nevertheless, in the years leading up to my sudden departure, I spoke about it at random and to anyone who would listen, starting with my students, who (apart from one) have forgotten it, as they all have. My reason for mentioning it was not to put forward "inventions" that would bear my name, but to draw attention to a reality that manifests itself at every step, as soon as one becomes interested in the cohomology of algebraic varieties and, in particular, in their "arithmetic" properties and the relationships between them of the various cohomological theories known to date. This reality is just as tangible

as that of the "infinitely small" was, perceived long before the appearance of the rigorous language that allowed us to apprehend it perfectly and "establish" it. And to apprehend the reality of  $\square$  motifs, we

p. XIX

Today, we are by no means short of a flexible and adequate language, nor of consummate experience in the construction of mathematical theories, which our predecessors lacked.

If what I once shouted from the rooftops has fallen on deaf ears, and if the disdainful silence of one has echoed the silence and lethargy of all those who pretend to be interested in cohomology (and yet have eyes and hands just like me. . . ), I can't hold the one person responsible who chose to keep the "benefit" of what I had entrusted to him for the benefit of all. It has to be said that our age, whose unbridled scientific productivity rivals that invested in armaments or consumer goods, is a long way from the "bold dynamism" of our seventeenth-century predecessors, who "didn't beat about the bush" to develop a calculation of the infinitely small, without worrying whether it was "conjectural" or not ; nor did they wait for some prestigious man among them to deign to give them the green light, before grabbing hold of what everyone could see with their own eyes and feel at first hand.

#### 4.2.4. 9. The stage and Actors

By virtue of its own internal structure and particular theme, "L'Enterrement" (which now forms over half the text of Récoltes et Semailles) is to a large extent and logically independent of the long reflection that precedes it. But this independence is superficial. For me, this reflection on a "funeral" gradually emerging from the mists of the unspoken and the prescient, is inseparable from the one that preceded it, from which it springs and which gives it its full meaning. Begun as a quick glance "en passant" at the vicissitudes of a work I'd somewhat (very much) lost sight of, it's a work I'd never seen before.

As I saw it, without planning or seeking it, it became a meditation on an important relationship in my life, leading me in turn to reflect on the fate of this work at the hands of "those who were my students". To separate this reflection from the one from which it spontaneously sprang seems to me a way of reducing it to a mere "tableau de mœurs" (or even, a settling of scores in the mathematical "beau monde").

It's true that, if we insist on it, the same reduction to a "tableau de mœurs" can be made for *Récoltes et Semailles* as a whole. Certainly, the mores that □ prevalent in a given time and milieu and that contribute to shape the lives of the men who are part of it, have their importance and deserve to be described. However, it will be clear to an attentive reader of *Harvest and Sowing* that my aim is not to describe mores, i.e. a certain **scene**, changing over time and from place to place, on which our actions take place. To a large extent, this stage defines and delimits the **means** available to the various forces within us, enabling them to express themselves. While the stage and the means it provides (and the "rules of the game" it imposes) vary ad infinitum, the nature of the forces deep within us that (at the collective level) shape the stages and that (at the level of the individual) express themselves on them, seems to be the same from one milieu or culture to another, and from one era to another. If there's one thing in my life, apart from mathematics and the love of a woman, whose mystery and attraction I've sensed (admittedly late in life), it's the hidden nature of those few forces that have the power to make us act, for "better" or "worse", to bury and to create.

. XX

#### 4.2.5. 10. An act of respect

This reflection, which eventually took on the name "L'Enterrement", had begun as an **act of respect**. A respect for things that I had discovered, that I had seen condense and take shape in a void, whose taste and vigor I was the first to know, and to which I gave a name, to express both the knowledge I had of them, and my respect. To these things, I gave the best of myself. They have fed on the strength that lies within me, they have grown and flourished, like multiple, vigorous branches sprouting from a single living trunk with multiple, vigorous roots. These are living and present things, not inventions that can be made or not made - things closely interwoven in a living unity that is made of each of them and gives each its place and meaning, an origin and an end. I had left them a long time ago and without any worry or regret, because I knew that what I was leaving behind was healthy and strong and didn't need me to grow and flourish and multiply, according to its own nature. It wasn't a bag of gold I was leaving behind that could be stolen, nor a pile of tools that could rust or rot.

And yet, as the years went by and I thought I was far away from a world I'd left behind, I found myself back here. and there even in my retreat like □ bouts of insidious disdain and discreet derision, pointing such things I knew to be strong and beautiful, to have a unique place and function that nothing else could ever fulfill. I felt they were orphans in a hostile world, a world sick with the disease of contempt, lashing out at the unarmored. It was with this in mind that I began this reflection, as an act of respect for these things, and thus for myself.

p. XXI

- as a reminder of the deep connection between these things and me: whoever delights in showing disdain for any of these things that have been nurtured by my love, it is **I** whom he delights in scorning, and all that comes from me.

And the same applies to the person who, knowing at first hand the link that connects me to such and such a thing that he has learned from none other than me, pretends to consider this link negligible or to ignore it, or to claim (albeit tacitly and by omission) for himself or for others a fictitious "paternity". I see

clearly an act of contempt for a thing born of the worker, as well as for the obscure and delicate work that brought it into being, **and** for the worker, and above all (in a more hidden and essential way) for himself.

If my "return to maths" was only to serve as a reminder of this link and to arouse in me this act of respect in front of all - in front of those who affect to disdain and in front of indifferent witnesses - this return will not have been in vain.

It's true that I'd really lost touch with the written and unwritten (or at least unpublished) work I'd left behind. As I began this reflection - I could see the branches quite clearly, but without really remembering that they were all part of the same tree. Strangely enough, it took the picture of the **ransacking of** what I'd left behind to gradually reveal itself to me, for me to regain a sense of the living unity of what was thus ransacked and dispersed. One took away a few écus, the other a tool or two to use - but the unity that makes up the life and true strength of what I had left eluded each and every one of them. I do know one person, however, who deeply felt this unity and strength, and who at the

It is in this living unity that we find beauty and beauty, and in this living unity, that we find ourselves. It is in this living unity that beauty and

the creative virtue of the work. Despite the destruction, I find them as intact as if I'd just left them - except that I've matured and now see them with new eyes.

If anything, however, is ransacked and mutilated, and disarmed of its original power, it is in those who forget the power that lies within themselves and imagine they are ransacking something at their mercy, when they are only cutting themselves off from the creative virtue of that which is at their disposal as it is at the disposal of all, but by no means at their mercy or in anyone's power.

So this reflection, and through it this unexpected "return", will also have put me back in touch with a forgotten beauty. It's having fully felt this beauty that gives full meaning to the act of respect awkwardly expressed in the note "My orphans"<sup>15</sup>, and which I have just reiterated here in full knowledge of the facts.

---

<sup>15</sup>This note (n° 46) is chronologically the first of all those that appear in the Burial.

## 5.1. (1) the child and the good God

□The mathematical notes on which I am now working are the first in thirteen years that I intended for publication. The reader will not be surprised that, after a long silence, my style of expression has changed. This change of expression is not, however, the sign of a change in style or working method<sup>1</sup> (1), still less that of a transformation that has taken place in the very nature of my work. of my mathematical work. Not only did it remain the same - I became convinced that the nature of the work of discovery is the same from one discoverer to the next, that it is beyond the differences created by infinitely varying conditioning and temperament.

Discovery is a child's privilege. It's the little child I'm talking about, the child who isn't yet afraid of making mistakes, of looking stupid, of not being serious, of not being like everyone else. Nor is he afraid that the things he looks at have the bad taste of being different from what he expects them to be, from what they should be, or rather: from what it is well understood that they **are**. He ignores the mute, flawless consensus that is part of the air we breathe - the air of all right-thinking people, well known as such. God knows, there have been many sensible people, well known as such, since the dawn of time!

Our minds are saturated with a heterogeneous "knowledge", a tangle of fears and laziness, cravings and prohibitions; of information at every turn and push-button explanations - a closed space where information, cravings and fears pile up without ever letting in the wind from the open sea. With the exception of routine know-how, it would seem that the main role of this "knowledge" is to evacuate a living perception, an awareness of the things of this world. Its effect is above all one of immense inertia, of an often crushing weight.

<sup>1</sup>(1)  
(Added in March 1984) It's probably an overstatement to say that my "style" and "method" of working have not changed, whereas my style of expressing myself in mathematics has been profoundly transformed. Most of the time devoted over the last year to "La Poursuite des Champs" has been spent on my typewriter, typing out reflections that are destined to be published virtually as they are (apart from the addition of relatively short notes added later to facilitate reading by cross-referencing, error correction, etc. . ). No scissors or glue to painstakingly prepare a "definitive" manuscript (which, above all, must reveal nothing of the process that led to it) - that's a lot of changes in "style" and "method"! Unless you dissociate the mathematical work itself from the writing and presentation of results, which is artificial, because it doesn't correspond to the reality of things, since mathematical work is indissolubly linked to writing.

The little child discovers the world as it breathes - the ebb and flow of its breath makes it welcome the world into its delicate being, and projects itself into the world that welcomes it. Adults also discover, in those rare moments when they have forgotten their fears and their knowledge, when they look at things or themselves with eyes wide open, eager to know, new eyes - the eyes of a child.

\*       \*

\*

p. 2

□ God created the world as he discovered it, or rather he **creates** the world eternally, as he discovers it - and he discovers it as he creates it. He created the world and creates it day after day, repeating himself millions and millions of times, without respite, groping his way, making millions and millions of mistakes and then rectifying his aim, without tiring. ... Each time, in this game of probing into things, responding to things ("that's not bad", or: "you're really messing up", or "it's going like clockwork, keep it up"), and the new probe rectifying or taking up the previous probe, in response to the previous response... . . . every time we go back and forth in this infinite dialogue between Creator and Things, which takes place at every moment and in every place of Creation, God learns, discovers and becomes more intimately acquainted with things, as they take on life and form and are transformed in His hands.

Such is the process of discovery and creation, such has it been from all eternity it seems (as far as we can tell). It has been like this, without man having to make his late entrance on the scene, barely a million or two years ago, and get his hands dirty - with, of late, the unfortunate consequences we know about.

Occasionally, one or other of us discovers one thing or another. Sometimes we rediscover in our own lives, with wonder, what it is to **discover**. Each of us has everything it takes to discover whatever attracts us in this vast world, including this marvellous capacity within us - the simplest, most obvious thing in the world! (A thing, however, that many have forgotten, just as we have forgotten to sing, or to breathe as a child breathes... .)

Everyone can rediscover what it is to discover and create, and no one can invent it. They were there before us, and they are what they are.

## 5.2. (2) Error and discovery

To return to the style of my mathematical work itself, or its "nature" or "approach", they are now as before those that the good Lord himself taught us all wordlessly, God knows when, long before we were born perhaps. **I do as he did**. It's also what everyone does instinctively, as soon as curiosity pushes them to know such and such a thing of all things, a thing invested from that moment on in the knowledge of all things. by this desire, this thirst...

p. 3

□ When I'm curious about something, mathematical or otherwise, I **question it**. I question it, without worrying about

if my question is perhaps stupid, or if it will appear so, without being carefully weighed. Often the question takes the form of an assertion - an assertion which, in truth, is a sounding board. I believe my assertion more or less, depending of course on where I am in my understanding of the things I'm looking at. Often, especially in the early stages of a research project, the assertion is downright false - but you had to make it to be convinced. Often, all I had to do was write it down.

It's obvious that it's not true, whereas before writing it there was a blur, like a malaise, instead of this obviousness. Now it's possible to come back to the charge with less ignorance, with a question-assertion that's perhaps a little less "off the mark". Even more often, the assertion taken literally turns out to be wrong, but the intuition that, clumsily still, tried to express itself through it is right, though still vague. Little by little, this intuition will be decanted from an equally shapeless gangue of false or inadequate ideas, it will gradually emerge from the limbo of the misunderstood that only asks to be understood, of the unknown that only asks to be known, to take on a form of its own, refining and sharpening its contours, as the questions I ask these things in front of me become more precise or more pertinent, to define them more and more closely.

But it can also happen that, through this process, repeated probing converges on a certain image of the situation, emerging from the mists with sufficiently marked features to give rise to the beginnings of a conviction that this image does indeed express reality - when, however, it does not, when this image is tainted by a major error, likely to distort it profoundly. The work, sometimes laborious, which leads to the detection of such a misconception - starting with the first "take-offs" observed between the image obtained and certain obvious facts, or between this image and others which we also trusted - is often marked by a growing tension, as we approach the crux of the contradiction, which at first becomes more and more vague - until finally it explodes, with the discovery of the error.

and the collapse of a certain vision of things, coming as an immense relief, as a liberation. **The discovery of error is one of the most crucial moments** <sup>□</sup> **ciaux, a creative moment of all, in p** . 4  
**all work of discovery**, whether mathematical or self-discovery. It's a moment when our knowledge of the thing being probed is suddenly renewed.

**Fear of error and fear of truth are one and the same thing.** He who fears error is powerless to discover. It's when we fear being wrong that the error within us becomes immovable as a rock. For in our fear, we cling to what we once thought "true", or to what has always been presented to us as true. When we are moved, not by the fear of seeing an illusory security vanish, but by a thirst for knowledge, then error, like suffering or sadness, passes through us without ever becoming fixed, and the trace of its passage is renewed knowledge.

### 5.3. (3) The unspeakable labours

It's surely no coincidence that the spontaneous process of true research never appears in the texts or discourse that are supposed to communicate and transmit the substance of what has been "found". More often than not, texts and speeches confine themselves to recording "**results**", in a form that must appear to ordinary mortals as so many austere and immutable laws, inscribed from all eternity on the granite tables of some sort of giant library, and dictated by some omniscient God to the initiated-scribes-savants and assimilated; to those who write learned books and no less learned articles, those who transmit knowledge from the pulpit, or in the more restricted circle of a seminar. Is there a single textbook, a single manual for schoolchildren, high-school students, university students, or even "our researchers", that can give the unfortunate reader the slightest idea of what research is all about - apart from the universally accepted idea that research is something you do when you're really good at it, when you've passed lots of exams and even competitions, the big shots, Pasteur and Curie and the Nobel Prize winners and all that...? The rest of us, readers or listeners, are just doing our best to swallow up the knowledge that these great men have so willingly consigned to the good of humanity, and we're just good enough (if we work hard) to pass our exams at the end of the year.

again...

p. 5 How many there are, including among the unfortunate "researchers" themselves, in need of theses or articles, including even among the most "learned" □ the most prestigious among us - who then has the simplicity to see that "to seek" is no more and no less than to **question** things, passionately - like a child who **wants to know** how he or his little sister came into the world. That seeking and finding, that is, questioning and listening, is the simplest, most spontaneous thing in the world, and one that no one in the world has the privilege of doing. It's a "gift" we've all been given from the cradle - made to express itself and blossom under an infinite number of faces, from one moment to the next and from one person to the next... .

When you dare to say such things, you'll get the same half-sad, half-understanding smiles from all sides, from the dunce who's sure he's a dunce, to the scholar who's sure he's a scholar and well above the common man, as if you've just made a joke that's a bit too big for words, as if you're displaying a naivety that's been stitched together with white thread; It's all very well to spit on no-one, of course - but don't push it - a dunce is a dunce, and not Einstein or Picasso!

In the face of such unanimous agreement, I'd be remiss if I didn't insist. Incurable as I am, I've lost yet another opportunity to keep quiet...

No, it's surely no coincidence that, in perfect harmony, instructive or edifying books and manuals of all kinds present "Knowledge" as if it had emerged fully dressed from the brilliant minds that recorded it for our benefit. Nor can this be said to be bad faith, even in those rare cases where the author is "in the know" enough to know that this image (which his text cannot fail to suggest) in no way corresponds to reality. In such cases, the presentation may be more than a collection of results and recipes, it may be infused with a breath of fresh air, animated by a living vision that is sometimes communicated from the author to the attentive reader. But an unspoken consensus, of considerable force it seems, ensures that the text leaves no trace of the **work of** which it is the product, even when it expresses with lapidary force the sometimes profound vision of things that is one of the true fruits of this work.

p. 6 To tell the truth, there have been times when I myself have felt the weight of this force, of this silent consensus, on the occasion of my project to write and publish these "Mathematical Reflections". If I try to fathom the tacit form that this consensus takes, or rather the one taken by the resistance within me to my □ project, triggered

by this consensus, the term "indecent" immediately comes to mind. The consensus, internalized in me I can't say for how long, tells me (and this is the first time I've taken the trouble to draw into the light of day, into the field of my gaze, what it's been mumbling to me with some insistence for weeks, if not months): "It's indecent to flaunt before others, even publicly, the ups and downs, the messy gropings around the edges, the "dirty laundry" in short, of a work of discovery. It's a waste of the reader's precious time. What's more, it's going to add up to pages and pages and pages of typesetting and printing - what a waste, at the price of scientific printed paper! You've got to be really vain to flaunt things that are of no interest to anyone, as if my own screw-ups were something remarkable - an opportunity to strut your stuff, in short". And even more secretly: "It's indecent to publish the notes of such a reflection, as it **really** goes on, just as it would be indecent to make love in a public square, or to expose, or just leave lying around, the blood-stained sheets of the labors of childbirth.... ".

The taboo here takes the insidious yet imperious form of the sexual taboo. It is as I write this introduction that I begin to glimpse its extraordinary force, and the scope of this extraordinary fact itself, attesting to this force: that the true process of discovery, so simple in its simplicity, is to be found in the very fact of the taboo.

This is the case even in the relatively innocuous field of scientific discovery, not that of his willy or anything like that, thank God. This is the case even in the relatively innocuous field of scientific discovery, not that of his willy or anything like that, thank God - a "discovery" in short, fit to be placed in everyone's hands, and which (one might think) has nothing to hide... ..

If I wanted to follow the "thread" that's there - a thread that's by no means tenuous, but very thick and strong - surely it would take me much further than the few hundred pages of homologic-homotopic algebra that I'll eventually finish and deliver to the printer.

## 5.4. (4) Infallibility (of others) and contempt (of oneself)

Decidedly this was an understatement, when at times I cautiously observed that "my style of expression" had changed, even suggesting that there <sup>□</sup>was nothing there to be surprised about: you understand well, p. 7  
when you haven't written for thirteen years, it's not the same as before, your "style of expression" has to change, of course. ... The difference is that I used to "express myself" (sic) like everyone else: I'd do the work, then do it again in reverse, carefully erasing all the erasures. Along the way, I'd make new erasures, disrupting the work and sometimes making it worse than the first draft. So it had to be done again - sometimes three or even four times, until everything was perfect. Not only were there no dubious corners or sweepings surreptitiously pushed under a suitable piece of furniture (I've never liked sweepings in corners, as long as you take the trouble to sweep); but above all, when reading the final text, the admittedly flattering impression that emerged (as with any other scientific text) was that **the author** (my modest self in this case) **was infallibility incarnate**. Infallibly, he would come across "the" right notions, then "the" right statements, with a well-oiled engine purring along, with demonstrations that "fell" with a dull noise, each at exactly the right moment!

Let's judge the effect on an unsuspecting reader, a high-school pupil learning Pythagoras' theorem or equations of the second degree, or even one of my colleagues in research institutions or so-called "higher education" (hello!) shouting (let's say) about reading such and such an article by such and such a prestigious colleague! As this kind of experience is repeated hundreds and thousands of times over the course of a pupil's, or even a student's or researcher's, life, amplified by the appropriate concert in the family and in the media of every country in the world, the effect is what you'd expect. You can see it in yourself as well as in others, if you take the trouble to pay attention: **it's the intimate conviction of your own nullity**, in contrast to the

competence and importance of people "who know" and people "who do". This intimate conviction is sometimes compensated for, but by no means resolved or defused, by the development of an ability to memorize things that are misunderstood, or even by the development of a certain operative skill: multiplier matrices, "editing" a French composition with "thesis" and "antithesis"... . It's the ability of the parrot or the learned monkey, more popular today than ever before, sanctioned by

coveted diplomas, rewarded by comfortable careers' □ But the very one sewn with diplomas p. 8  
and well-connected, covered in honors perhaps, is not fooled, deep down, by these factitious signs of importance, of "value". Nor, more rarely, is the person who has invested his or her all in the development of some genuine gift, and who in his or her professional life has been able to give his or her all and be creative - he or she is not convinced, deep down, by the brilliance of his or her notoriety, by which he or she often wants to give the impression to himself or herself and to others. The same unexamined doubt inhabits both of them, just as it does the first dunce who comes along, the same conviction they may never dare to acknowledge.

It's this doubt, this deep, unspoken conviction, that drives both of them to constantly surpass themselves.

in the accumulation of honors or works, and to project onto others (above all those over whom they have some power. . . ) the self-contempt that gnaws at them in secret - in an impossible attempt to escape it, by accumulating "proofs" of their superiority over others<sup>2</sup> (2).

---

<sup>2</sup>(2)

(Added in March 1984) When I reread these last two paragraphs, I had a certain feeling of unease, due to the fact that in reading them

In writing, I involve others, not myself. Obviously, the thought that my own person might be involved didn't occur to me when I was writing. I certainly didn't learn anything when I confined myself to putting down in black and white (no doubt with a certain satisfaction) things that for years I have perceived in others, and seen confirmed in many ways. As I continue my reflection, I'm led to remember that there has been no shortage of contemptuous attitudes towards others in my life. It would be strange if the link I've grasped between contempt for others and contempt for oneself were absent in the case of myself; sound reason (and also the experience of similar situations of blindness towards myself, which I've come to realize) tell me that this must surely not be the case! For the time being, however, this is no more than a deduction, the only possible use of which would be to encourage me to see with my own eyes what's going on, and to see and examine (if it does indeed exist, or has existed) this as yet hypothetical contempt for myself, so deeply buried that it has totally escaped my gaze until now. It's true that there's been no shortage of things to look at! This one suddenly strikes me as one of the most crucial, because precisely because it is so hidden... . [(August 1984) *On this subject, however, see the last two paragraphs of the note "The Massacre", n° 87.*].

## 6.1. (5) The forbidden dream

I'm taking the opportunity of a three-month break in the writing of *La Poursuite des Champs*, to take the Introduction back to where I left it last June. I've just reread it carefully, more than six months later, and added a few subtitles.

When I wrote this Introduction, I was well aware that such reflections would inevitably give rise to many "misunderstandings" - and it would be pointless to try to anticipate them, as that would simply mean piling more on top of the first! The only thing I would add in this connection is that I have no intention of going to war against the scientific writing style that has been established by millennia of usage, and which I myself have practised assiduously for over twenty years of my life, and taught to my students as an essential part of the mathematician's craft. Rightly or wrongly, I still regard it as such and continue to teach it. I'd probably even be old-fashioned, with my insistence on a job done right to the end, hand-sewn from start to finish, and with no mercy shown to anyone.

dark corner. If I've had to put water in my wine over the last ten years or so, it's by necessity! For me, "writing in form" remains an important stage in mathematical work, both as an instrument of discovery, to test and deepen an understanding of things that would otherwise remain approximate and fragmentary, and as a means of communicating such an understanding. From a didactic point of view, the deductive mode of exposition, which in no way excludes the possibility of painting vast pictures, offers obvious advantages in terms of conciseness and ease of reference. These are real advantages, and significant ones at that, when it comes to presentations aimed at the general public.

p. 9

mathematicians, let's say, and more specifically, to mathematicians who are already sufficiently familiar with some of the ins and outs of the subject at hand, or others close by.

These advantages, on the other hand, become entirely illusory when the presentation is aimed at children, young people or adults who are not at all "in the loop" beforehand, whose interest is not yet aroused, and who, moreover, are more often than not (and will remain, and for good reason. . . ) in total ignorance of what the real process of discovery is. Readers, to put it better, who are unaware **of the** very **existence of** such work, which is within **the reach of anyone** gifted with curiosity and common sense - the work from which our intellectual knowledge of the Universe is constantly born and reborn, including that expressed in such imposing ordinances as Euclid's "Elements", or Darwin's "Origin of Species". Complete ignorance of the existence and nature of such work is almost universal, including among teachers at all levels of education, from schoolteacher to university professor. It's an extraordinary fact, and one that first came to light in the reflection I began last year with the first part of this Introduction, at the same time as I glimpsed the deep roots of this puzzling fact. ...

Even though it's aimed at readers who are perfectly "in the know" in every respect, there's still one important thing that the "de rigueur" mode of exposure refuses to communicate. It's also something that's totally frowned upon in the circles of serious people, like us scientists in particular! I

want to talk about **dreams**. The dream, and the visions it breathes into us - impalpable like itself at first, and often reluctant to take shape. Long years, even a lifetime of intense work may not be enough ☐ pas perhaps

p. 10

to see a dream vision fully manifest, to see it condensed and polished to the hardness and brilliance of a diamond. This **is** our work, done by hand or by mind. When the job is done, or a part of it, we present the tangible result in the brightest light we can find, rejoice in it, and often take pride in it. Yet it's not in this diamond, which we've cut at great length, that we find the inspiration for cutting it. We may have fashioned a tool of great precision, an efficient tool - but the tool itself is limited, like all things made by human hands, even when they seem great to us. A vision, unnamed and unoutlined at first, tenuous as a shred of mist, has guided our hand and kept us bent over the work, without feeling the passing hours or perhaps years. A flap that noiselessly detached itself from a bottomless sea of mist and gloom. ... What is limitless in us is Her, this Sea ready to conceive and give birth unceasingly, when our thirst fecundates Her. The Dream is born of these marriages, like the embryo nestled in the womb, awaiting the obscure labours that will lead it to a second birth, in the light of day.

Woe betide a world where dreams are scorned - it's also a world where what's deep inside us is scorned. I don't know if any other culture before ours - the culture of television, computers and transcontinental rockets - has professed such contempt. It must be one of the many ways in which we distinguish ourselves from our predecessors, whom we have so radically supplanted, eliminated as it were from the face of the planet. I know of no other culture where the dream is not respected, where its deep roots are not felt by all and recognized. And is there any major work in the life of a person or a people that was not born of a dream and nourished by it before coming to light? In our country (or should we say everywhere?), respect for dreams is called "superstition", and it's well known that our psychologists and psychiatrists have taken the measure of dreams in great length and breadth - hardly enough to clutter the memory of a small computer, surely. It's also true that no-one "back home" knows how to light a fire, or dares to watch their child being born or their mother or father dying in their own home.

have clinics and hospitals for that. Thank God for that. ... Our world, so proud of its power in atomic megatons and in the amount of information stored in its libraries ☐ and in its computers, is undoubtedly also the one in which everyone's **powerlessness**, fear and contempt for the simple, essential things in life reached its peak.

p. 11

Fortunately, dreams, like the original sex drive in even the most repressive society, have a way of enduring! Superstition or not, they continue to obstinately whisper to us knowledge that our waking minds are too heavy, or too pusillanimous, to grasp, and to give life and wings to the projects they have inspired.

I suggested earlier that dreams are often reluctant to take shape, but that's just an appearance, and doesn't really get to the heart of the matter. The "reluctance" would rather come from our waking mind, in its ordinary "plate" - and "reluctance" is a euphemism! Rather, it's a deep-seated mistrust, covering up an ancestral fear - **the fear of knowing**. Speaking of dreams in the true sense of the word, this fear is all the more powerful, all the more effective as a screen, because the message of the dream touches us more closely, because it carries with it the threat of a profound transformation of our very being, should it happen to be heard. But it seems that this mistrust is present and effective even in the relatively innocuous case of the mathematical "dream"; so much so that all dreams seem to be banned not only from texts (I don't know of any in any case where there is any trace of them), but also from discussions between colleagues, in small groups, or even one-on-one.

The reason for this apparent absence, this conspiracy of silence, is certainly not that the mathematical dream doesn't exist or no longer exists - our science would then have become sterile, which is by no means the case. Surely, the reason for this apparent absence, this conspiracy of silence, is closely linked to that other consensus - that of carefully erasing all trace and mention of the work through which our knowledge of the world is discovered and renewed. Or rather, **it is one and the same silence that surrounds both the dream and the work it inspires and nourishes**. So much so, in fact, that the very term "mathematical dream" will seem nonsensical to many of us, so often driven by push-button clichés, rather than by the direct experience we can have of a simple, everyday, important reality.

## 6.2. (6) The Dreamer

☐ In fact, I know from experience that when the mind is eager to get to know it, instead of running away from it (or approaching it with a patented grid in hand, which amounts to the same thing), the dream is in no way reluctant "to take shape" - to let itself be delicately described and deliver its message, always simple, never silly, and sometimes overwhelming. On the contrary, the Dreamer in us is an incomparable master at finding, or creating from one occasion to the next, the most appropriate language to circumvent our fears, to shake our torpor, with scenic means varying infinitely, from the absence of any visual or sensory element whatsoever, to the most breathtaking stagings. When He shows up, it's not to evade Himself, but to encourage us (almost always to no avail, but His benevolence never tires...) to get out of ourselves, out of the heaviness in which He sees us stuck, and which He sometimes takes the slightest pleasure in parodying in comical colors. Lending an ear to the Dreamer within us means communicating with ourselves, against the powerful barriers that would like to prevent us from doing so at all costs.

. 12

But who can do more, can do less. If we can communicate with ourselves through the dream, revealing ourselves to ourselves, surely it must be possible in an equally simple way to communicate to others the by no means intimate message of the mathematical dream, let's say, which does not involve forces of

resistance of comparable power. And to tell the truth, what else have I done in my mathematical past, if not follow, "dream" to the end, until their most manifest, most solid: irrefutable manifestation, shreds of dream detaching themselves one by one from a heavy, dense fabric of mists? And how many times did I tremble with impatience at my own obstinacy in jealously polishing to the last facet each precious or semi-precious stone in which my dreams condensed - rather than following a deeper impulse: that of following the multiform arcana of the mother fabric - to the indecisive confines of the dream and its patent incarnation, "publishable" in short, according to the canons in force! In fact, I was about to follow this impulse, to embark on a work of "mathematical science fiction", "a kind of daydream" about a theory of "patterns" that remained purely hypothetical at the time - and has remained so to this day.

p. 13 even today, and for good reason, for want of another "daydreamer" to embark on this adventure. It was towards the end of the sixties, when my life  $\square$  (without my suspecting it in the slightest) was about to change. took a completely different turn, which for the next ten years or so would relegate my mathematical passion to the sidelines.

But all things considered, "A la Poursuite des Champs", this first publication after fourteen years of silence, is very much in the spirit of that "waking dream" which was never written, and of which it seems to have been the provisional sequel. Admittedly, the themes of these two dreams are as dissimilar, at least at first glance, as it is possible for two mathematical themes to be; not to mention that the first, that of motifs, would seem to lie more on the horizon of what might be "feasible" with the means at hand, whereas the second, the famous "fields" and consorts, appear to be entirely within reach. These are dissimilarities that could be called fortuitous or accidental, and which will perhaps fade away much sooner than we expect<sup>1</sup> (3). They have relatively little impact, it seems to me, on the kind of work to which the two themes can give rise, since it's all about "daydreaming", or, to put it in less provocative terms: continuing the work of conceptual rough-casting until an overall vision of sufficient coherence and precision is achieved, to bring about the more or less complete conviction that the vision does indeed correspond, in essence, to the reality of things. In the case of the theme developed in this book, this should mean, more or less, that the detailed verification of the validity of this vision becomes a matter of pure craft. This may well require a considerable amount of work, with its share of astuteness and imagination, and no doubt also unexpected twists and perspectives, which will make it something other than a purely routine task (a "long exercise", as André Weil would say).

It's the kind of work, in short, that I've done over and over again in the past, that I've got at my fingertips and that there's no need for me to do again in the years still ahead of me. Insofar as I'm once again investing myself in mathematical work, it's on the fringes of "daydreaming" that my energy will surely be best employed. In this choice, it's not a concern for profitability that inspires me (assuming that such a concern could inspire anyone), but a dream, or dreams. If this new impetus within me is to prove a source of strength, it will have been drawn from the dream!

---

<sup>1</sup>(3)

I am thinking in particular of the famous conjectures of Mordell, Tate and Shafarevich, all of which have been proven. three last year in a forty-page manuscript by Faltings, at a time when the well-established consensus of those "in the know" was that these conjectures were "out of reach"! As it happens, "the" fundamental conjecture that serves as the keystone of the "Anabelian algebraic geometry" program I'm so fond of, is close to Mordell's conjecture. (It would even seem that the latter is a consequence of the former, which just goes to show that this program is not a story for serious people. ...). )

## 6.3. (7) The legacy of Galois

□ It would seem that of all the natural sciences, it is only in mathematics that what I have called "dreaming", or "daydreaming", is subject to a seemingly absolute ban, more than twice a millennium old. In the other sciences, including reputedly "exact" sciences such as physics, dreaming is at least tolerated, even encouraged (depending on the era), under admittedly more "outlandish" names such as: "speculations", "hypotheses" (such as the famous "atomic hypothesis", the result of a dream, pardon the pun, of a speculation by Democritus), "theories"... . The transition from the status of a dream-which-dare-not-say-its-name to that of "scientific truth" takes place by insensible degrees, through a gradually widening consensus. In mathematics, on the other hand, it is almost always (these days at least) a sudden transformation, by virtue of the magic wand of a **demonstration**<sup>2</sup> (4). At a time when the notion of mathematical definition and demonstration was not, as it is today, clear and the object of a (more or less) general consensus, there were nonetheless visibly important notions that had an ambiguous existence - such as that of a "negative" number (rejected by Pascal) or that of an "imaginary" number. This ambiguity is reflected in the language still in use today.

p. 14

The gradual clarification of the notions of definition, statement, demonstration and mathematical theory has been extremely beneficial in this respect. It has made us aware of the power of the tools we have at our disposal to formulate with perfect precision what might otherwise have seemed unformulate - by virtue of a sufficiently rigorous use of everyday language, that is. If there's one thing that has fascinated me about mathematics since I was a child, it's precisely this power to capture in words, and to express perfectly, the essence of such mathematical things that at first glance present themselves in such elusive, or mysterious, form that they seem beyond words. ...

However, an unfortunate psychological side-effect of this power, of the resources offered by perfect precision and demonstration, is that they have further accentuated the traditional taboo on the "thematic dream"; that is, on anything that does not present itself under the conventional aspects of precision (albeit at the expense of a broader vision), guaranteed to be "right" thanks to well-designed demonstrations, or else (and increasingly so □ plus these days. . . ) by sketches of demonstrations, supposedly able to form. Occasional **conjectures** are tolerated in a pinch, as long as they satisfy the conditions of precision of a questionnaire, where the only accepted answers would be "yes" or "no". (And, needless to say, on condition that the person who makes them is well known in the mathematical world). To my knowledge, there has been no example of the development, on an "experimental" basis, of a mathematical theory that would be explicitly conjectural in its essential parts. It's true that, according to modern standards, the entire calculus of the "infinitely small" developed from the seventeenth century onwards, which has since become the differential and integral calculus, would appear to be a daydream, eventually transformed into a

p. 15

<sup>2</sup>(4)

Even today, we come across "demonstrations" of uncertain status. For years, this was the case with Grauert's demonstration of the fi nite theorem that bears his name, which nobody (and there was no shortage of good-willers!) could read. This perplexity was resolved by other, more transparent demonstrations, some of which went further, taking over from the initial one. A similar, more extreme situation is the "solution" to the so-called "four-color problem", the computational part of which was solved with a computer (and a few million dollars). This is a "demonstration" that is no longer based on the intimate conviction that comes from understanding a mathematical situation, but on credit given to a machine devoid of the faculty of understanding, and whose structure and operation the mathematician user is unaware of. Even supposing that the calculation is confirmed by other computers, following other calculation programs, I don't consider the four-color problem to be closed. It will only have changed its face, in the sense that it will no longer be a question of looking for a counter-example, but only a demonstration (readable, of course!).

serious mathematics only two centuries later, thanks to the magic wand of Cauchy. And I'm reminded of **Evariste Galois'** daydream, which had no luck with Cauchy himself; but this time it took less than a hundred years for another wand, this time from Jordan (if I remember correctly), to give the dream a new name, "Galois theory".

The observation that emerges from all this, and which is not to the advantage of "Mathematics 1984", is that it's fortunate that people like Newton, Leibnitz, Galois (and I'm sure many others, as I'm not well versed in history...) were not encumbered by our current canons, at a time when they were content to discover without taking the trouble to canonize!

The example of Galois, who came here without my calling him, strikes a chord with me. I seem to recall that a feeling of fraternal sympathy for him was awakened the first time I heard about him and his strange destiny, when I was still a high school or university student, I think. Like him, I felt a passion for mathematics - and like him, I felt like an outsider, a stranger in the "beautiful world" that (it seemed to me) had rejected him. Yet I ended up being part of this beautiful world myself, only to leave it one day, without regret... . This somewhat forgotten affinity reappeared to me quite recently, and in a whole new light, as I was writing "Esquisse d'un Programme" (on the occasion of my request for a

admission as a researcher at the Centre National de la Recherche Scientifique). This report is mainly devoted to a sketch of my main themes of reflection over the last ten years or so. Of all

p. 16

Of these themes, the one that fascinates me the most, and which I intend to develop in particular over the next few years, is the very type of mathematical dream, which, incidentally, is similar to the "dream of patterns", for which it provides a new approach. In writing this sketch, I was reminded of the longest mathematical reflection I've pursued in one go in the last fourteen years. It lasted from January to June 1981, and I called it "The Long Walk through Galois Theory". One thing led to another, and I realized that the daydream I'd been pursuing sporadically for several years, which had come to be known as "Anabelian algebraic geometry", was nothing other than a continuation, "an ultimate culmination of Galois' theory, and no doubt in the spirit of Galois".

When this continuity became apparent to me, as I was writing the passage from which the quoted line is taken, a joy came over me that has not dissipated. It was one of the rewards of working in complete solitude. Its appearance was as unexpected as the more than fresh welcome I had received from two or three colleagues and old friends who were well "in the know", one of whom, incidentally, was my pupil, and to whom I had had the opportunity to talk, still "hot off the press" and in the joy of my heart, about these things I was in the process of discovering. ...

It reminds me that to take up Galois' legacy today is surely also to accept the risk of the solitude that was his in his time. Perhaps times are changing less than we think, but this "risk" often doesn't feel like a threat to me. While I am sometimes saddened and frustrated by the indifference or disdain of those I have loved, I have never been weighed down by loneliness, mathematical or otherwise, for many years. If ever there was a faithful friend I long to find again when I leave her, it's her!

## 6.4. (8) Dream and demonstration

But let's get back to the dream, and the prohibition that has plagued mathematics for millennia. This is perhaps the most inveterate of all the a-priorities, often implicit and rooted in habit, decreeing that one thing is "math" and another is not. It took millennia for such childish things to become accepted.

and ubiquitous that the symmetry groups of certain geometric figures, the topological forms of certain others, the number zero, the sets find admission in the sanctuary! re!

W  
. 17

hen I talk to desp

students of the topology of a sphere, and the shapes that can be deduced from a sphere by adding coves - things that don't surprise young children, but which baffle them because they think they know what "maths" is - the first spontaneous echo I get is: but that's not maths! Maths, of course, is the Pythagorean theorem, the heights of a triangle and second-degree polynomials... . These students are no more stupid than you or I. They're reacting as all the world's mathematicians have reacted from time immemorial to the present day, except for people like Pythagoras or Riemann and maybe five or six others. Even Poincaré, who wasn't the first to come along, managed to prove with a well-felt philosophical A plus B that infinite sets weren't math! Surely there must have been a time when triangles and squares weren't maths - they were drawings that kids or craftsmen traced on the sand or in the clay of vases, not to be confused...

This fundamental inertia of the mind, suffocated by its "knowledge", is certainly not peculiar to mathematicians. I'm straying a little from the point I'm trying to make: **the ban on mathematical dreams**, and through them, on anything that doesn't present itself in the usual guise of a finished product, ready for consumption. The little I've learned about the other natural sciences is enough to make me realize that a similarly rigorous ban would have condemned them to sterility, or to a tortoise's progress, rather like in the Middle Ages when there was no question of dehornifying the letter of the Holy Scriptures. But I'm also well aware that the deep source of discovery, just as the process of discovery in all its essential aspects, is the same in mathematics as in any other region or thing in the universe that our body and mind can experience. **To banish the dream is to banish the source** - to condemn it to an occult existence.

And I'm also well aware, from an experience that has not wavered since my first, juvenile love affair with mathematics, that in the unfolding of a vast or profound vision of mathematical things, it is this unfolding of a vision and understanding, this progressive penetration, that constantly **precedes** the demonstration, that makes it possible and gives it meaning. When a situation, from the humblest to the broadest, has been understood in its essential aspects, the demonstration of what is understood (and of the rest) falls like a ripe fruit at the right moment. Whereas the demonstration **plucked like** a still-green fruit from the treep . 18  
of knowledge leaves an aftertaste of dissatisfaction, a frustration of our unquenchable thirst. Two or three times in my life as a mathematician, for want of anything better, I've had to pluck the fruit rather than pick it. I'm not saying I did wrong, or that I regret it. But what I did best and what I liked best, I took willingly, not by force. If mathematics has given me joy in profusion and continues to fascinate me in my middle age, it's not because of the demonstrations I've been able to wring out of it, but because of the inexhaustible mystery and perfect harmony I sense in it, always ready to reveal itself to a loving hand and gaze.

## 6.5. (9) Strangers welcome

I think the time has come to say something about my relationship with the world of mathematicians. This is quite different from my relationship with mathematics. The latter existed and was strong from an early age, long before I even suspected that there was a world and a milieu of mathematicians. A complex world, with its learned societies, periodicals, meetings, colloquia, congresses, primas-donnes and tâcherons, its power structure, its eminences grises, and the no less grey mass of the taillables et corvéables, in need of a thesis or articles, and of those too, rarer still, who are rich in means and ideas and

come up against closed doors, desperate to find the support of one of those powerful, pressurized and feared men who have that magic power: to get an article published... ..

I discovered the existence of a mathematical world when I arrived in Paris in 1948, at the age of twenty, with a Licence es Sciences from the University of Montpellier in my meagre suitcase, and a tightly-written, double-sided manuscript with no margins (paper was expensive!), representing three years of solitary reflection on what (I later learned) was then well known as "measurement theory" or "Lebesgue's integral". Since I'd never met anyone else, until the day I arrived in Paris, I thought I was the only person in the world "doing math", the only **mathematician**. (It was the same for me, and remains so to this day). I had juggled with sets that I called measurable (without ever having met a set that wasn't. . . ) and with the almost everywhere, but didn't know what a topological space was. I remained a little lost in a dozen non-equivalent notions of "abstract space" and compactness, sinned in a little booklet (by someone called Appert

p. 19 I think, in *Actualités Scientifiques et Industrielles*), on which I had stumbled: God knows how. I'd never heard before, in a mathematical context at least, such strange or barbaric words as group, body, ring, module, complex, homology (and the list goes on!), which suddenly, without warning, came crashing down on me all at once. It was a rude shock!

If I "survived" this shock, and went on to do maths and even make a living of it, it's because in those early days, the mathematical world hardly resembled what it has since become. It's also possible that I'd been lucky enough to land in a more welcoming corner of this unsuspected world. I had a vague recommendation from one of my professors at the Faculty of Montpellier, Monsieur Soula (no more than any of his colleagues, he had not seen me often in his classes!), who had been a pupil of Cartan (father or son, I couldn't say). As Elie Cartan was already "out of the game" by then, his son Henri Cartan was the first "fellow student" I had the pleasure of meeting. I had no idea how auspicious this was! I was greeted by him with the kindly courtesy that distinguishes him, well known to the generations of Normaliens who had the good fortune to make their very first acquaintance with him. He must not have realized the extent of my ignorance, judging by the advice he gave me to guide my studies. Be that as it may, his benevolence was obviously directed at the person, not at the background or potential gifts, nor (later) at a reputation or notoriety. . .

In the year that followed, I was host to one of Cartan's lectures at "l'Ecole" (on differential formalism on varieties), to which I clung firmly; and to the "Séminaire Cartan", witnessing in amazement the discussions between him and Serre, with "Suites Spectrales" (brr!) and drawings (called "diagrams") full of arrows covering the whole board. Those were the heroic days of the theory of "beams", "cara-paces" and a whole arsenal whose meaning totally escaped me, even though I was trying so hard to make sense of it.

to swallow definitions and statements and check demonstrations. At the Séminaire Cartan there were also periodic appearances by Chevalley, Weil, and the days of the Bourbaki Seminars (bringing together une

p. 20 In the early hours of the morning, when the crowd was still in its early twenties or thirties (participants and listeners at most), the other members of the famous Bourbaki gang - Dieudonné, Schwartz, Godement and Delsarte - would turn up like a group of noisy friends. They were all on a first-name basis, spoke the same language that almost totally escaped me, smoked a lot and laughed a lot, and the only thing missing was the crates of beer to complete the atmosphere - which was replaced by chalk and sponge. It was a very different atmosphere from Leray's lectures at the Collège de France (on Schauder's theory of topological degree in infinite-dimensional spaces, poor me!), which I went to listen to on Cartan's advice. I had gone to see Monsieur Leray at the Collège de France to ask him (if I remember correctly) what his lecture would be about. I don't remember what he told me,

or whether I understood anything at all - only that here, too, I felt a benevolent welcome, addressed to the first stranger who came along. It was this and nothing else, surely, that made me go to this course and bravely hold on to it, as I had done at the Cartan Seminar, even though the meaning of what Leray was expounding there almost totally escaped me at the time.

The strange thing was that, in this world to which I was a newcomer and whose language I hardly understood and spoke even less, I didn't feel like a stranger. While I hardly ever had the opportunity to speak (and with good reason!) with one of those cheerful fellows like Weil or Dieudonné, or with one of those more distinguished gentlemen like Cartan, Leray or Chevalley, I nevertheless felt **accepted**, I'd almost say: **one of them**. I can't recall a single occasion when I was treated with condescension by one of these men, or when my thirst for knowledge, and later, again, my joy in discovery, was dismissed with smugness or disdain<sup>3</sup> (5). If it hadn't been so, I wouldn't have "become a mathematician" as they say - I'd have chosen another profession, where I could give my all without having to face scorn. ...

Although I was "objectively" a stranger to this world, just as I was a stranger to France, a link united me to these men from another background, another culture, another destiny: a shared passion. I doubt that, in that crucial year when I was discovering the world of mathematicians, any one of them, not even Cartan, of whom I was a bit of a pupil but who had many others (and some who weren't so clueless!), perceived in me the same passion that <sup>them</sup>habited. For them, I had to be one among a mass of course listeners and seminars, taking notes and obviously not quite up to speed. If I perhaps stood out in any way from the other listeners, it was that I wasn't afraid to ask questions, which more often than not had to do with my phenomenal ignorance of both language and mathematics. The answers could be brief, or even astonished, but never did the bemused oddball that I was then encounter a rebuff, a "putting in my place", either in the informal milieu of the Bourbaki group, or in the more austere setting of the Leray course at the Collège de France. In those years, ever since I arrived in Paris with a letter to Elie Cartan in my pocket, I've never had the impression of finding myself in front of a clan, a closed or even hostile world. If I've ever experienced this inner contraction in the face of contempt, it wasn't in that world; at least not in those days. Respect for the individual was part of the air I breathed. You didn't have to earn respect, prove yourself before you were accepted, and treated with any kind of kindness. Strangely enough, it was enough to be a person, to have a human face.

p. 21

<sup>3</sup>(5)

This fact is all the more remarkable given that up until 1957, I was regarded with a certain reserve by more than one member of the company.

of the Bourbaki Group, which, I believe, co-opted me with some reluctance. A good-natured quip put me among the "dangerous specialists" (in Functional Analysis). At times, I sensed a more serious, unspoken reserve in Cartan - for some years, I must have given him the impression of someone inclined towards gratuitous, superficial generalization. I saw him quite surprised to find in the first (and only) rather long essay I wrote for Bourbaki (on differential formalism on varieties) a reflection of any substance - he hadn't been too keen when I'd offered to take it on. (This reflection came in handy again years later, when I developed the residue formalism from the point of view of coherent duality). I was more often than not left in the lurch during Bourbaki congresses, especially during the joint readings of the essays, being quite unable to keep up with the readings and discussions at the rate they were going. Maybe I'm just not cut out for collective work. In any case, the difficulty I had in integrating myself into the common work, or the reservations I may have aroused for other reasons in Cartan and others, never drew sarcasm or rebuff, or even a shadow of condescension, except at most once or twice from Weil (definitely a case apart!). At no time did Cartan deviate from an equal kindness towards me, imbued with cordiality and also with that distinctive touch of humor that for me remains inseparable from his person.

## 6.6. (10) The "Mathematical Community": fiction and reality

So it's hardly surprising that, perhaps from that year onwards, and more and more clearly in any case over the years that followed, I felt part of this world, to which I was happy to refer under the meaningful name of "**mathematical community**". Before writing these lines, I never had the opportunity to examine the meaning I gave to this name, even though I identified with this "community" to a large extent. It's clear now that this community represented for me nothing more and nothing less than a kind of ideal extension, in space and in time, of the benevolent world that had welcomed me and accepted me as one of their own; a world, moreover, to which I was linked by one of the great passions that have dominated my life.

p. 22 This "community", with which I gradually became identified, was not an entirely fictitious extrapolation of the mathematical milieu that had initially welcomed me. The initial milieu gradually expanded, by which I mean: the circle of mathematicians I was led to frequent regularly, driven by themes of common interests and personal affinities, has gone from strength to strength in the ten or twenty years since that first contact. In concrete <sup>termes</sup>, it's the circle of colleagues and friends, or rather this structure concentric, ranging from the colleagues with whom I was most closely associated (first Dieudonné, Schwartz, Godement, later above all Serre, later still people like Andreotti, Lang, Tate, Zariski, Hironaka, Mumford, Bott, Mike Artin, not to mention the people in the Bourbaki group, which was also gradually expanding, and the students who came to me from the 1960s onwards...), to other colleagues I'd met here and there and with whom I had more or less close affinities - it was this microcosm, formed by chance encounters and affinities, that represented the concrete content of this name, charged with warmth and resonance for me: the mathematical community. When I identified with it as a warm, living entity, it was in fact this microcosm with which I identified.

It was only after the "great turning point" of 1970, the first **awakening** I should say, that I realized that this cozy, friendly microcosm represented only a tiny portion of the "mathematical world", and that the traits I liked to attribute to this world, which I continued to ignore and had never thought of taking an interest in, were fictitious traits.

Over the past twenty-two years, this microcosm itself had changed its face, in a world that was also changing. Certainly, over the years, I too had changed, without suspecting it, as had the world around me. I don't know if my friends and colleagues were more aware of this change than I was, in the world around them, in their own microcosm, and in themselves. Nor can I say when or how this strange change came about - it probably came about insidiously, in fits and starts: **the man of notoriety was feared**. I myself was feared - if not by my students, then by my friends, or by those who knew me personally, at least by those who knew me only through notoriety, and who did not feel themselves protected by comparable notoriety.

p. 23 I only became aware of the fear that is rife in the mathematical world (and just as much, if not more, in other scientific circles) than in the aftermath of my "awakening" nearly fifteen years ago. Over the preceding fifteen years, I had gradually and unsuspectingly assumed the role of the "great boss", in the world of mathematical Who is Who. <sup>Without</sup> also suspecting it, I was a prisoner of this role, which isolated me from all but a few "peers" and a few students (and still... ) who decidedly "wanted it". It was only when I stepped out of this role that at least some of the fear surrounding it fell away. Tongues were loosened that had been silent before me for years.

The testimony they brought me was not only one of fear. It was also the testimony

**taken.** The contempt of those in power towards others, a contempt that creates and fuels fear.

I didn't have much experience of fear, but of contempt, in times when a person's persona and life didn't carry much weight. It had pleased me to forget the time of contempt, and here it was again! Perhaps it had never stopped, when I'd simply moved on to another world (as it seemed to me), or looked the other way, or simply pretended not to see or hear anything, apart from the fascinating and interminable mathematical discussions? These were the days when I finally accepted the fact that contempt was rampant all around me, in the world I'd chosen as my own, with which I'd identified, which I'd vouched for and which had pampered me.

## 6.7. (11) Meeting with Claude Chevalley, or: freedom and good feelings

Perhaps the preceding lines give the impression that I was overwhelmed by the testimonials that poured in almost overnight. Not so. These testimonies were recorded at a superficial level. They were simply added to other facts that I had just learned, or that I had known but avoided paying attention to until then. Today, I would ex-prime the lesson I learned then as follows: "scientists", from the most illustrious to the most obscure, are people just like everyone else! I had deluded myself into thinking that "we" were something better, that we had something extra - it took me a good year or two to get rid of that stubborn illusion!

Among the friends who helped me, only one was part of the milieu I'd just left, with no desire to return.<sup>4</sup>

(6). It's Claude Chevalley. While he didn't make speeches and wasn't interested in mine, I think I can say that I learned more important and more hidden things from him than the one I've just said.

In the days when I used to see him quite regularly (the days of the "Survivre" group, which he had joined with a mixed conviction), he often baffled me. I don't know how, but I felt he had a special gift for me. p. 24

---

### <sup>4</sup>(6) My friends from Survivre et Vivre

Among these friends, I should probably also count Pierre Samuel, whom I had previously known mainly through Bourbaki, just like Chevalley, and who (like Chevalley) played an important role in the Survivre et Vivre group. It doesn't seem to me that Samuel was so much into this illusion of the superiority of the scientific queue. Above all, I feel he contributed a great deal through the common sense and smiling good humor he brought to joint work, discussions and relations with others, as well as gracefully taking on the role of "ugly reformer" in a group inclined towards radical analyses and options. He stayed with Survivre et Vivre for some time after I withdrew, acting as editor of the newsletter of the same name, and left with good grace (to join Friends of the Earth) when he felt that his presence in the group had ceased to be useful.

Samuel belonged to the same restricted milieu as I did, which didn't prevent him from being one of the friends I made during those bubbling years, from whom I believe I learned something (as bad a student as I was. . . ). These ways of being, just like Chevalley's even though they hardly resemble each other, were a better antidote for my "meritocratic" inclinations than the sharpest analysis!

It now seems to me that for all the friends from that period from whom I learned something, it was more through their way of being and their sensitivity, which differed from mine, and from whom "something" was communicated, than through explanations, discussions, etc. ... . In this respect, I especially remember, in addition to Chevalley and Samuel, Denis Guedj (who had a great influence on the Survivre et Vivre group), Daniel Sibony (who kept his distance from this group, while pursuing its evolution with a half-disdainful, half-narcotic eye), Gordon Edwards (who was a co-actor in the birth of the "movement" in June 1970 in Montreal, and who for years did prodigious feats of energy to maintain an "American edition" of the Survivre et Vivre newsletter in English), Jean Delord (a physicist about my age, a fine and warm-hearted man, who took a liking to me and the Survivien microcosm), Fred Snell (another US-based physicist from Buffalo, whose country house I stayed in for a few months in 1972).

Of all these friends, five are mathematicians, two are physicists, and all are scientists - which seems to show that the milieu closest to me in those years remained a milieu of scientists, and especially mathematicians.

knowledge that eluded me, an understanding of certain essential and simple things, which can certainly be expressed in simple words, but without the understanding "passing" from one to the other. I realize now that there was a difference in maturity between him and me, which meant that I often felt at odds with him, in a kind of dialogue of the deaf that was not due to a lack of mutual sympathy or esteem. Although he didn't express himself in these terms (as far as I can remember), it must have been clear to him that the "questioning" (of the "social role of the scientist", of science, etc. . . ) to which I was then arriving, either on my own, or through the logic of joint reflection and activity within the "Survivre" group (which later became "Survivre et Vivre")-that questioning remained basically superficial. They concerned the world in which I lived, and even the role I played in it - but they didn't really involve me in any profound way. My vision of myself, during those heady years, didn't change a bit. It wasn't then that I began to get to know myself. It was only six years later that, for the first time in my life, I got rid of a persistent illusion, not about others or the world around me, but about myself. It was another awakening, more far-reaching than the first that had prepared it. It was one of the first in a whole "cascade" of successive awakenings, which I hope will continue in the years that remain to me.

I don't recall Chevalley ever alluding to self-knowledge, or "self-discovery" for that matter. In retrospect, however, it's clear that he must have started getting to know himself a long time ago. He sometimes spoke about himself, just a few words on the occasion of this or that, with disconcerting simplicity. He's one of the two or three people I've never heard come up with a cliché. He spoke very little, and what he said expressed not ideas that he had adopted and made his own, but a personal perception and understanding of things.

That's why I'm sure he often baffled me, even back in the days when we were still meeting in the Bourbaki group. What he was saying often upset ways of seeing that were <sup>dear</sup> to me, and that for That's why I considered them "true". There was an inner autonomy in him that I lacked, and which I began to perceive obscurely at the time of "Survivre et Vivre". This autonomy is not a matter of intellect or discourse. It's not something you can "adopt", like ideas, points of view, etc. ... . Fortunately, the idea would never have occurred to me to want to "make my own" this autonomy perceived in another person. I had to find my own autonomy. That also meant learning (or relearning) to be myself. But in those years, I had no idea of my lack of maturity, of inner autonomy. If I eventually discovered it, it must have been the encounter with Chevalley that was one of the leavenings that silently worked within me, while I was embarking on major projects. It wasn't speeches or words that sowed that seed. To sow it, it was enough for a person I met along the way to dispense with speeches, and just be himself.

It seems to me that in those early seventies, when we met regularly to publish the bulletin "Survivre et Vivre", Chevalley was trying, without insistence, to communicate a message to me that I was then too clumsy to grasp, or too wrapped up in my militant tasks. I was dimly aware that he had something to teach me about freedom - about inner freedom. Whereas I tended to operate on the basis of high moral principles, and had begun to sound that trumpet in the early issues of Survivre as a matter of course, he had a particular aversion to moralizing. I think that was the thing that most baffled me about him in the early days of Survivre. For him, such discourse was just an attempt at constraint, superimposed on a multitude of other external constraints stifling the individual. Of course, you can spend your whole life discussing a

such a way of seeing, the pros and cons. It completely overturned my own, which (as you might imagine) was driven by the noblest and most generous feelings. It was incomprehensible to me that Chevalley, for whom I had the highest esteem and with whom I felt a bit like a comrade-in-arms, should take such malicious pleasure in not sharing these feelings! I didn't understand that the truth, the reality of things, is only one thing.

It's not a question of good feelings, points of view or preferences. Chevalley **saw** one thing, everything simple and real, and I couldn't see it. It wasn't that he'd read it somewhere; there's nothing

p. 26

What do seeing something and reading about it have in common? You can read a text with your hands (in Braille) or with your ears (if someone reads it to you), but you can only see the thing itself with your own eyes. I don't think Chevalley had better eyes than me. But he used them, and I didn't. I was too caught up in my good feelings and everything else to have the leisure to look at the effect of my good feelings and principles on myself and others, starting with my own children.

He must have seen that I often didn't use my eyes, that I didn't even want to. Strange that he never let me know. Or did he, without my hearing? Or did he refrain, judging it a waste of time? Or maybe the idea didn't even occur to him - it was my business after all, not his, whether I used my eyes or not!

## 6.8. (12) Merit and contempt

I'd like to take a closer look, in the light of my own limited experience, at when and how contempt took hold in the world of mathematicians, and more particularly in that "microcosm" of colleagues, friends and students that had become like my second home. And at the same time, to see what part I played in this transformation.

It seems to me I can say, without reservation, that in 1948-49, in the circle of mathematicians I mentioned earlier (whose center for me was the original Bourbaki group), I didn't encounter the slightest trace of contempt, or simply disdain or condescension, towards myself or any of the other young people, French or foreign, who came there to learn the mathematical profession. The men who played a leading role, through their position or prestige, such as Leray, Cartan and Weil, were not feared by me, nor I believe by any of my fellow students. With the exception of Leray and Cartan, who were very "distinguished gentlemen", it took me quite a while to realize that each of these louts, who barged in with Cartan like a friend and obviously "in the know", was a university professor just like Cartan himself, didn't aim from hand to mouth like me, but received what I considered astronomical emoluments, and was, what's more, a mathematician of international stature and influence.

Following a suggestion from Weil, I spent the next three years in Nancy, which at that time was a Bourbaki's headquarters, along with Delsarte, Dieudonné, Schwartz, Godement (and a little later also Serre) taught at the University. There was only a handful of four or five young people there with me (including Lions, Malgrange, Bruhat and Berger, unless I'm mistaken), so we were much less "drowned in the crowd" than in Paris. The atmosphere was all the more familiar, everyone knew each other personally, and I think we were all on first-name terms. When I look back, however, this is the first and only time I saw a mathematician treat a student with undisguised contempt. The unfortunate fellow had come for the day from another town to work with his boss (he was to prepare a doctoral thesis, which he eventually passed with flying colors, and has since acquired a degree in mathematics).

p. 27

a certain notoriety, I think). I was quite taken aback by the scene. If someone had used that kind of tone with me for even a second, I'd have slammed the door in their face! As it was, I knew the "boss" well, I was even up to you with him, not the student I only knew by sight. My eldest had, in addition to an extensive culture (not only mathematical) and an incisive mind, a kind of peremptory authority that impressed me at the time (and for quite a long time afterwards, right into the early 70s). He exerted a certain ascendancy over me. I don't remember whether I asked him a question about his attitude, only the conclusion I drew from the scene: this unfortunate pupil must really be a loser, to deserve to be treated like that - something like that. It didn't occur to me then that if the student did indeed suck, that was a reason to advise him to do something else, and to stop working with him, but by no means to treat him with contempt. I had identified myself with the "math whizzes" such as this prestigious elder, at the expense of the "nobodies" whom it would be licit to despise. So I followed the ready-made path of connivance with contempt, which suited me, by emphasizing the fact that I was accepted into the brotherhood of deserving people, the math whizzes!<sup>5</sup> (7)

Of course, I wouldn't have said to myself any more than anyone else: people who try to make maths without getting there are good to despise! I would have heard someone say something of this water, around this time or any other, I would have taken it back beautifully, sincerely sorry for a□ignorance spiritual.

p. 28

phenomenal. The fact is, I was bathed in ambiguity, playing both sides of the fence: on the one hand, fine principles and feelings, on the other: poor guy, you'd have to be a real loser to be treated like that (the implication being: this kind of misadventure couldn't happen to me, that's for sure!).

In the end, it seems to me that the incident I reported, and above all the (seemingly harmless) role I played in it, is in fact typical of an ambiguity in me that has followed me throughout my life as a mathematician in the twenty years that followed, and which only dissipated in the aftermath of the "awakening" of 1970<sup>6</sup> (8), without me clearly detecting it until today, when I'm writing these lines. It's a pity I didn't notice it then. Perhaps the time wasn't ripe for me. In any case, the evidence I was receiving at the time about the reign of contempt to which I had chosen to turn a blind eye, did not implicate me personally, nor indeed any of my colleagues and friends in the part of my dear microcosm closest to me<sup>7</sup> (9). It was more to the tune of: ah! how sad it is to have to

<sup>5</sup>(7)

The preceding paragraph is the first in the entire introduction to be heavily crossed out on my original manuscript, and provided with

numerous overloads. At first, the description of the incident and the choice of words went against the grain.

- a force was clearly pushing him to get over the incident as quickly as possible, as if to clear his conscience and "get down to business". These are the familiar signs of **resistance**, here against the elucidation of this episode, and its significance as a revelation of an inner attitude. The situation is very similar to that described at the beginning of this introduction (par. 2), that of the "crucial" moment of discovery of a contradiction and its meaning, in mathematical work: it is then **the inertia** of the mind, its reluctance to part with an erroneous or insufficient vision (but in which our person is in no way involved), which plays the role of "resistance". Resistance is active in nature, inventive if necessary to succeed in drowning a fish even without water, whereas the inertia I spoke of is simply a passive force. In this case, even more than in the case of mathematical work, the discovery that has just appeared in all its simplicity, in all its obviousness, is followed in the instant by a feeling of relief from a weight, a feeling of **liberation**. It's not just a feeling - it's rather an acute, grateful perception of what has just happened, which **is** a liberation.

<sup>6</sup>(8)

As will become clear in the following pages, this ambiguity in no way "dissipated in the aftermath of the 1970 awakening". This is typical of the strategic retreat of the "self", which abandons to profit and loss the period "before the awakening", which immediately becomes the demarcation line for an irreproachable "after"!

<sup>7</sup>(9)

That's not entirely true; there is at least one exception among my closest colleagues, as will become clear later on. There was a typical "laziness" of memory, which often tends to "pass over" facts that don't "fit" with a familiar, long-established view of things.

To learn (or: to teach you) such things, who'd have thought it, you'd really have to be a bastard (I was going to say: null, sorry!) to treat living beings that way! Not so different from the other air after all, just replace "nul" by "salaud" and "se faire traître" by "traître" and you're done! And honor, of course, is intact, for the champion of good causes!

What's clear from this is my connivance with attitudes of contempt. At the very least, it goes back to the very beginnings of the 1950s, in other words, to the years following the warm welcome I received from Cartan and his friends. If I didn't "see anything" later on, when contempt was becoming commonplace just about everywhere, it's because I didn't want to see - any more than in this isolated and particularly flagrant case, where you really had to pull out all the stops to pretend not to see or feel anything!

This connivance was in close symbiosis with my new identity, that of a respected member of a group, the group of deserving people, the math whizzes. I remember feeling particularly satisfied, proud even, that in this world I'd chosen for myself, which had co-opted me, it wasn't social position, nor the fact that I'd become a member of it, that I'd become a member of it.

even (but no!) the only reputation that counted, still had to be deserved - you could be a University professor or academician or whatever, if you were just a mediocre mathematician (poor p. 29

guy!) we were nothing, what counted was merit, profound, original ideas, technical virtuosity, vast visions and all that!

This ideology of merit, with which I had identified wholeheartedly (even though it remained, of course, implicit and unspoken), still took a heavy toll on me in the aftermath, as I said, of the famous awakening of 1970. I'm not sure it disappeared without a trace from that moment on. For that to have happened, I would probably have had to detect it clearly in myself, whereas it seems to me I was mostly denouncing it in others. In fact, it was Chevalley who was one of the first, along with Denis Guedj, whom I also met through Survivre, to draw my attention to this ideology (they called it "**meritocracy**", or something like that), and its violence and contempt. It was because of this, Chevalley told me (it must have been at the time of our first meeting at his place, about Survivre), that he could no longer stand the atmosphere in Bourbaki and had stopped going there. Looking back, I'm sure he must have realized that I'd been part of that ideology, and maybe even that traces of it still remained in some corners. But I don't remember him ever suggesting it. Perhaps he preferred to leave it to me to dot the i's and cross the t's, and I waited until now to do so. Better late than never!

## 6.9. (13) strength and thickness

It's quite possible that the incident I've reported also marks the moment of an inner shift within me, towards a more or less unconditional identification with the brotherhood of merit, at the expense of people considered to be worthless, or simply "without genius" as we would have said a few generations before (this term was no longer in vogue even in my day): dull, mediocre people - at best "resonance boxes" (as Weil wrote somewhere) for the great ideas of those who really matter... . The mere fact that my memory, which so often acts as a gravedigger even for episodes that at the time mobilize considerable psychic energy, retained this episode, is not linked to any other directly related memory, and appears so innocuous, makes this feeling of a "tipping point" that would have taken place then plausible.

□ In a meditation less than five years ago, I came to the realization that this ideology of "we great and noble minds... .", in a particularly extreme and virulent form, had reigned supreme.

p. 30

in my mother since she was a child, and dominated her relationship with others, whom she liked to look down on from her lofty height with an often disdainful, even contemptuous commiseration. In fact, I admired my parents unreservedly. The first and only group with which I identified myself, before the famous "mathematical community", was the family group reduced to my mother, my father and myself, who had had the honor of being recognized by my mother as worthy of having them as parents. In other words, the seeds of contempt must have been sown in me from childhood. The time might be ripe to follow the vicissitudes, through my childhood and adult life, of these seeds, and the harvests of delusion, isolation and conflict into which some of them have risen. But that's not the place here, where I have a more limited purpose. I think I can say that this attitude of contempt has never in my life taken on a vehemence and destructive force comparable to those I saw in my mother's life, (when I bothered to look at my parents' lives, twenty-two years after my mother's death, and thirty-seven years after my father's). But now is as good a time as any to examine carefully, here, at least, what place this attitude has had in my life as a mathematician.

Before doing so, to put the incident reported in the preceding paragraph into its general context, I'd like to emphasize that it stands entirely alone among my memories of the fifties, and even later. Even today, when I note a sometimes disconcerting erosion of certain elementary forms of courtesy and respect for others in my own milieu<sup>8</sup> (10), the direct and undisguised expression of contempt from boss to pupil must be a rare enough occurrence. As far as the fifties are concerned, I have very few recollections of fear surrounding a figure of notoriety, or of a contemptuous or simply disdainful attitude. If I dig in this direction, I can say that the first time I was received at Dieudonné's home in Nancy, with the delicate friendliness he always showed me, I was a little taken aback by the way this refined and affable man talked about his students.

- they were all morons! It was a chore to give them lectures, which it was obvious they didn't understand. ... After 1970 I heard the echoes□ coming from the amphitheater side, and I knew that Dieudonné was well and truly feared by students. And yet, while he was renowned for having strong opinions and for delivering them with a sometimes thunderous frankness, I never saw him behave in a hurtful or humiliating way, even in the presence of colleagues whom he held in low esteem, or at times of his legendary temper tantrums, which subsided as quickly and easily as they had arisen.

I didn't associate myself with Dieudonné's feelings about his students, but neither did I distance myself from his attitude, which was presented as the most obvious thing in the world, as almost self-evident from someone with a passion for mathematics. Thanks to the benevolent authority of my elder brother, this attitude seemed to me to be at least one of the possible attitudes one could reasonably have towards students and teaching tasks.

It seems to me that for Dieudonné and myself, both imbued with the same ideology of merit, its isolating effect was largely neutralized when we found ourselves in front of a real person, whose very presence silently reminded us of realities more essential than those of so-called "merit", and re-established a forgotten link. The same must have been true for most of our colleagues and friends, no less imbued than Dieudonné or myself with the widespread superiority syndrome. This is no doubt still the case today for many of them.

<sup>8</sup>(10)

For example, I've lost count of the number of letters, on mathematical as well as practical and personal matters, sent to colleagues or ex-students whom I once considered friends, and who have never received a reply. This doesn't seem to be just preferential treatment reserved for me, but a sign of a change in mores, according to echoes in the same vein. (Admittedly, these concern cases where the person sending a mathematical letter was not known to the recipient, a prominent mathematician... .)

Weil also had a reputation for being feared by his students, and he's the only one in my microcosm, in the fifties, whom I had the impression was feared even among colleagues of more modest status (or simply temperament). At times, he would display an attitude of unrelenting haughtiness, which could disconcert even the most hardened self-confidence. My susceptibility helped, and once or twice this led to a passing quarrel. I didn't perceive in his manner a hint of contempt or a deliberate intention to hurt or crush; rather, he had the attitude of a spoiled child, taking pleasure (sometimes maliciously) in making people uncomfortable, as if to convince himself of the power he wielded. In fact, he had a truly astonishing ascendancy over the Bourbaki group, which he sometimes gave me the impression of bossing around, rather like a kindergarten teacher bossing around a group of well-behaved children.

□ I can recall only one other occasion in the fifties when I felt a brutal expression, undisguised contempt. It came from a foreign colleague and friend, about my age. He had an uncommon mathematical power. A few years earlier, when this power was already quite evident, I had been struck by his submission (which seemed to me almost obsequious) to the great professor whose modest assistant he still was. His exceptional abilities soon earned him an international reputation, and a key position at a particularly prestigious university. There, he ruled over a small army of student assistants, apparently just as absolutely as his boss had ruled over him and his fellow students. To my question (if I remember correctly) whether he had any students (by which I mean: who did a good job with him), he replied, with an air of false casualness (I'm translating into French): "douze pièces!" - where "pièces" was the name by which he referred to his pupils and assistants. It's certainly rare for a mathematician to have such a large number of students at the same time doing research under his direction - and surely my interlocutor took a secret pride in this, which he tried to hide under that careless air, as if to say: "oh, just twelve pieces, not even worth talking about!". It must have been around 1959, I already had a good shell so surely, I did get a gutful though! I had to tell him on the spot one way or another, and I don't think he resented it. Perhaps even his relationship with his students wasn't as sinister as his expression might suggest (I didn't get a testimonial from one of his students), and he'd simply been caught up in his childish desire to strut before me in all his glory. Looking back, I can see that this incident must have marked a turning point in our relationship, which had been one of friendship - I sensed in him a kind of fragility, a finesse too, which attracted my affectionate sympathy. These qualities had become blunted, corroded by his position as an important man, admired and feared. After this incident, I still felt uneasy about him - I definitely didn't feel part of the same world as him...

p. 32

Yet we were part of the same world - and without realizing it any more than he did, I was probably getting thicker too. In this respect, I still have a vivid memory of the International Congress of Edinburgh, in 1958, Since the previous year, with my work on the Riemann-□Roch theorem, I was promoted to superstar, and (although I didn't have to tell myself this in no uncertain terms at the time) I was also one of the stars of the Congress (where I gave a talk on the vigorous start made by scheme theory in that same year). Hirzebruch (another star of the day, with his very own Riemann-Roch theorem) was giving an opening speech, in honor of Hodge, who was retiring this year. At one point, Hirzebruch suggested that mathematics was made by the work of young people in particular, rather than that of mature mathematicians. This triggered a general outcry of approval in the Congress hall, where young people formed the majority. I was thrilled and very much in agreement, of course - I was thirty years old, which could still pass for young, and the world belonged to me! In my enthusiasm, I had to shout out loud and bang my head on the table. I happened to be sitting next to Lady Hodge, the wife of the

p. 33

eminent mathematician who was supposed to be honored on this occasion, as he was about to retire. She turned to me with wide eyes and said a few words, which I no longer remember - but I must have seen reflected in her astonished eyes the tactless thickness that had just been unleashed without restraint in front of this lady at the end of her life. I felt something then, of which the word "shame" perhaps gives a distorted image - rather, a humble truth about who I was then. I didn't have to bang on any more tables that day. ...

## 6.10. (14) Birth of fear

It was around this time, I suppose, when (without having sought it out) I began to be seen as a star in the mathematical world, that a certain fear must also have begun to surround my person, for many unknown or lesser-known colleagues. I suppose so, without being able to place it in a precise memory, in an image that would have struck me and become fixed in my memory, like that incident reported earlier (which undoubtedly marked my first encounter with contempt in my adopted environment). It must have happened insensitively, without attracting my attention, without manifesting itself in some particular, typical incident that memory would have retained, perhaps just as deliberately anodyne as that other incident. What my memory of these transitional years gives me "en bloc" is that it

p. 34 it was not uncommon for people who approached me, whether after my seminar, or during a gathering such as the Bourbaki seminar or some ☐ colloque or congress, to have to overcome a kind of stage fright, which remained more or less apparent during our discussion, if any. When the discussion lasted more than a few minutes, this discomfort usually disappeared gradually as we talked and the conversation became more animated. Occasionally, though rarely, the discomfort would persist to the point of becoming a real obstacle to communication, even at the impersonal level of a mathematical discussion, and I would then feel a confused sense of helpless suffering in front of me, exasperated with itself. I'm talking about all this without really "remembering", as if through a fog that nonetheless restores to me impressions that must have been recorded, and no doubt evacuated as I went along. I'm unable to place in time, other than by supposition, the appearance of this discomfort, an expression of fear.

I don't believe that this fear emanated from me personally, and that it was limited to an attitude, to behaviors that would have set me apart from my colleagues. If this had been the case, it seems to me that I would have started to hear echoes of it in the early seventies, when I stepped out of a role to which I had previously lent myself, the role of the star, the "big boss". I think it was this role, and not myself, that was surrounded by fear. And this role, it seems to me, with this halo of fear that has nothing in common with respect, did not exist, not yet, in the early fifties, at least not in the mathematical milieu that had welcomed me from the very moment I met it, in 1948.

Before this "awakening" in 1970, I wouldn't have thought of describing as "fear" the stage fright and embarrassment I was sometimes confronted with by colleagues who weren't part of my most familiar environment. I was embarrassed by it myself when it manifested itself, and did my utmost to dispel it. A remarkable thing, typical of the lack of attention paid to this sort of thing in my beloved microcosm: I can't recall a single time, in the twenty years I've been part of this milieu, when the question was broached between a colleague and myself, or by others in front of me!<sup>9</sup> (11) This "fog" that takes the place of my memory does not give me

---

<sup>9</sup>(11) Aldo Andreotti, Ionel Bucur

Of course, it's not impossible that I've forgotten - not to mention that my particularly "polar" disposition at the time would hardly encourage anyone to talk to me about such things, nor would it lead me to remember any such conversation that might well have taken place. What is certain is that it must have been very exceptional, to say the least, for the question to have been raised.

nor any impression of conscious or unconscious gratification that such situations might have aroused in me. I don't think there was any on a conscious level, but I wouldn't venture to say that I wasn't touched by it occasionally □ unconsciously, in the early years. If so, this must have been fleeting, and not reflected in behavior that would have acted as a fixative for discomfort. It's certainly not that my fatuity wasn't committed to the role I was playing! But if I invested in this role without counting the cost, then what motivated my ego was not the ambition to impress the "rank colleague", but to constantly surpass myself in order to force the ever-renewed esteem of my "peers" - and above all, perhaps, of the elders who had given me credit and accepted me as one of their own even before I had had a chance to show my worth. It seems to me that the inner attitude I had towards the fear I was the object of, which I tried my best to ignore while at the same time dispelling it as best I could wherever it manifested itself - that this attitude can be considered typical throughout the sixties in the milieu (the "microcosm") of which I was a part.

p. 35

The situation has deteriorated considerably in the ten or fifteen years since then, at least judging by the signs that reach me from time to time from this world, and the situations of which I have been a close witness, even sometimes a co-actor. More than once, among those of my former friends or pupils who had been dearest to me, I have been confronted with the familiar, unmistakable signs of contempt; with the (seemingly "gratuitous") desire to discourage, humiliate and crush. A wind of contempt blew through this world that had been dear to me. It blows, regardless of "merit" or "demerit", burning with its breath the humblest vocations as well as the most beautiful passions. Is there a single one of my old companions, each protected by solid walls with "his own", settled (as I once was) in the hushed fear that surrounds his person - is there a single one who feels this breath? I know one and only one, among my old friends, who felt it and told me about it, without calling it by name. And I know another who felt it one day, as if against his will, only to forget it the very next day<sup>10</sup> (12). For one of my old friends, feeling this breath and taking it on

---

of fear be addressed (without even calling it by that name. . .), and it needs to be addressed just as much today, especially in the "beau monde".

Of my many friends in this world, apart from Chevalley, who must have been aware of this atmosphere of fear at least during the sixties, the only other one I can think of who must have perceived it clearly was Aldo Andreotti. I had met him, his wife Barbara and their twin children (still very small) in 1955 (at a party at Weil's in Chicago, I believe). We remained close friends until the "great turning point" of 1970, when I left the milieu that had been ours and lost touch with them. Aldo had a very keen sensitivity, which hadn't been dulled by his dealings with mathematics and detective stories like mine. He had a gift for spontaneous sympathy for those he came into contact with. This set him apart from all the other friends I knew in the mathematical world, or even outside it. With him, friendship always took precedence over shared mathematical interests (of which there were plenty), and he was one of the few mathematicians with whom I talked a little about my life, and he about his. His father, like mine, was Jewish, and had suffered in Mussolini's Italy, as I had in Hitler's Germany. I saw him always available to encourage and support young researchers, in a climate where it was becoming difficult to be accepted by the establishment. His spontaneous interest was always in people, not in mathematical "potential" or fame. He was one of the most engaging people I've ever had the good fortune to meet.

This evocation of Aldo brings back memories of Ionel Bucur, who was also taken from us unexpectedly and before his time, and like Aldo, missed even more (I think) as a friend whom we like to meet again, than as a partner in mathematical discussions. We sensed in him a kindness, alongside an uncommon modesty, a propensity for constantly stepping aside. It's a mystery how a man so little inclined to think of himself as important, or to impress anyone, ended up as Dean of the Faculty of Sciences in Bucharest; no doubt because he didn't feel like challenging the responsibilities that he was far from coveting, but which his colleagues or the political authorities were placing on his shoulders, which were, it must be said, robust. He was the son of peasants (something that must have played a role in a country where "class" is an important criterion), and had the common sense and simplicity of one. Surely he must have been aware of the fear that surrounds the man of notoriety, but surely it must also have seemed to him a matter of course, the natural attribute of a position of power. I don't think, however, that he himself ever inspired fear in anyone, certainly not in his wife Florica or their daughter Alexandra, nor in his colleagues or students - and the echoes I've been able to gather point in this direction.

<sup>10</sup>(12)

as it is for me, means accepting to take a look at ourselves.

## 6.11. (15) Harvesting and sowing

I don't think, I wouldn't dream of being indignant about a wind that blows, when I've clearly seen that I'm not the only one.

p. 36 am no stranger to this wind, as a fatuity in me would have me believe. And even though I au□rais been a stranger to it, my indignation would have been a paltry offering to those who are humiliated. and those who humiliate, whom I have loved one and all.

I was no stranger to this wind, because of my connivance with the contempt and fear in the world I had chosen. It suited me to turn a blind eye to these and many other blunders, both in my professional life and in my family life. In both, I reaped what I sowed - and what others sowed before me or with me, from my parents (and my parents' parents. . . ) to my new friends of yesteryear. And others besides me are reaping today from the seeds that were sown: my children (and my children's children), as well as one of my pupils today, treated with contempt by another of my pupils of yesteryear.

And there is neither bitterness nor resignation in me, nor self-pity, when I speak of sowing and reaping. For I have learned that in even the bitter harvest there is substantial flesh which it is up to us to feed on. When this substance is eaten and becomes part of our flesh, the bitterness has disappeared, which was merely a sign of our resistance to a food destined for us.

And I also know that there are no harvests that are not also the sowing of other harvests, often more bitter than those that preceded them. There are still times when something in me tightens at the seemingly endless chain of carefree sowing and bitter reaping, handed down and repeated from generation to generation. But I'm no longer overwhelmed or revolted by it, as if it were a cruel and inescapable fate, and even less am I its complacent and blind prisoner, as I once was. For I know that there is a nourishing substance in everything that happens to me, whether the seeds are sown by me or by someone else.

- it's up to me to eat and see it turn into knowledge. And it's no different for my children and all those I've loved and those I love at this moment, when they reap what I sowed in times of fatuity and carelessness, or what I still happen to sow today.

---

The word "tomorrow" is to be taken literally, not as a metaphor.

## 7.1. (16) Marshes and first rows

But I haven't yet come to the end of this reflection, on my part in the appearance of contempt and its progression, in this world to which I blithely continued to refer by the name of "ma<sup>thematic</sup> community". It's this reflection, I feel now, who do I have better to offer to those I have loved in this world, as I prepare, not to return, but to express myself once again.

p. 37

Above all, I think I need to examine the kind of relationships I had with the people who were part of that world, when I was still part of it like them.

Thinking about it now, I'm struck by the fact that there was a whole part of this world that I used to come into contact with regularly, but which escaped my attention as if it hadn't existed. I must have perceived it at the time as a kind of "swamp" with no clearly defined function in my mind, not even that of a "sounding board" I suppose - as a kind of grey, anonymous mass of those who in seminars and colloquia invariably sat in the back rows, as if they'd been assigned there by birth, those who never opened their mouths during a talk to hazard a question, certain as they must have been in advance that their question could only be off the mark. If they asked a question of people like me, reputed to be "in the know", it was in the corridors, when it was obvious that "the skills" weren't pretending to want to talk amongst themselves - they then asked their question quickly and as if on tiptoe, ashamed of abusing the precious time of important people like us. Sometimes the question seemed to be off the mark, and I'd try (I guess) to say in a few words why; often it was relevant, and I'd answer it as best I could, I think. In both cases, it was rare for a question asked in such a mood (or, should I say, in such an atmosphere) to be followed up by a second question, which would have clarified or deepened it. Perhaps we, the people in the front rows, were indeed in too much of a hurry in such cases (even as we were applying ourselves to the task).

I felt, of course, as did my interlocutor, that there was something false and artificial about the situation we were in. Of course, I sensed, as did my interlocutor, what was false and artificial about the situation in which we were involved - without my ever having formulated it to myself, and without his ever having formulated it to himself either. We both functioned as

p. 38 strange automatons, and a strange connivance bound us together: that of pretending to ignore the anguish that embraced one of us, obscurely perceived by the other - that <sup>particle</sup>□d'angoisse dans l'air chargé d'angoisse that saturated the place, that everyone surely perceived as we did, and that everyone chose to ignore by mutual agreement<sup>1</sup> (13).

This confused perception of anguish didn't become conscious in me until after the first "awakening", in 1970, when this "swamp" came out of the half-light in which I'd been happy to keep it in my mind until then. Suddenly, most of my new friends were precisely those whom, a year earlier, I would have tacitly placed in that nameless, contours-less land. Suddenly, the so-called marsh was coming alive in the faces of friends linked to me by a shared adventure - another adventure!

## 7.2. (17) Terry Mirkil

To tell the truth, even before this crucial turning point, I'd been friends with comrades (who later became "colleagues") whom I'd probably have located in the "swamp", had the question been put to me (and had they not been my friends. . . ). It took this reflection, and a lot of digging into my memories, to bring me back to mind, and for scattered memories to come together. I met these three friends in the very early days, when I was learning the trade in Nancy like them - at a time when we were still in the same boat, when nothing designated me as an "eminence". It's probably no coincidence that there were no other such friendships in the twenty years that followed. The four of us were foreigners, which was certainly a significant bond - my relations with the young "normaliens", parachuted into Nancy like me, were far less personal, and we hardly saw each other except at university. One of my three friends emigrated to South America a year or two later. Like me, he was a research associate at the CNRS, and I had the impression that he didn't really know himself what he was "looking for". We continued to see or write to each other from time to time, and eventually lost touch. My relationship with the other two friends was longer-lasting, stronger and much less superficial. Our mathematical interests played little or no part.

---

<sup>1</sup>(13)

Clearly, the foregoing description has no pretension other than to try and render as best I can, in concrete words, what this "fog" of memory delivers to me, which has not been condensed into any kind of case that is even remotely precise, of which I could have given here a description that was even remotely "realistic" or "objective". It would be a misrepresentation to suggest that colleagues who are reluctant to sit in the front rows, or who lack star or eminence status, are necessarily tied up in anguish when talking to one of the latter. This was clearly **not the** case for most of the friends I knew in this milieu, even among those who sometimes haunted conferences and seminars. What is unreservedly true is that the status of "eminence" creates a barrier, a gulf vis-à-vis those without such status, and that this gulf rarely disappears, even if only for the space of a discussion. I would add that the subjective distinction (which nevertheless seems very real to me) between the "front ranks" and the "marshes" can in no way be reduced to sociological criteria (of social position, posts, titles, etc. . . ) or even of "status" or renown, but that it also reflects psychological particularities of temperament or dispositions that are more delicate to pin down. When I arrived in Paris at the age of twenty, I knew that I was a mathematician, that I had **done** maths, and despite the disorientation I've already mentioned, I basically felt "one of them", although I was the only one to know it, and I wasn't even sure that I would continue to do math. Today, I'd be more inclined to sit in the back rows (on the rare occasions when the question arises).

With Terry Mirkil and his wife Presocia, slim and fragile as he <sup>was</sup>□<sup>rable</sup>, with an air of gentleness in both of us, we often spent evenings, and sometimes nights, in Nancy, singing, playing the piano (Terry played then), talking about music, which was their passion, and about other important things

in our lives. Not the **most** important ones, it's true - not the ones that are always so carefully hushed up. ... This friendship has given me a lot, though. Terry had a finesse and discernment that I lacked, when most of my energy was already focused on mathematics. Much more than me, he had retained a sense of the simple, essential things - the sun, the rain, the earth, the wind, the song, friendship ... . After Terry found a position to his liking at Dartmouth College, not so far from Harvard, where I made frequent visits (from the late fifties onwards), we continued to meet and write to each other. In the meantime, I knew he was prone to depressions, which led to long stays in "madhouses", as he called them in the only laconic letter he ever wrote to me, following one of those "horrible stays". When we met, there was never any mention of them - except once or twice, very incidentally, to answer my astonishment that he and Presocia weren't adopting children. I don't think it ever occurred to me that he and I could talk about the substance of the problem, or even touch on it - certainly not even the idea that there might be problems to look at, in my friend or mine. ... There was an unspoken, impenetrable taboo about these things.

Gradually, the meetings and letters became less frequent. It's true that I was becoming more and more a prisoner of tasks and a role, and above all of this desire, which had become like a fixed idea, an escape perhaps from something else, to constantly surpass myself in the accumulation of works - while my family life was mysteriously, inexorably deteriorating. ...

When I learned one day, through a letter from one of Terry's colleagues at Dartmouth, that my friend had committed suicide (this was long after he was already dead and buried. . . ), this news came to me as if through a fog, like an echo from a very distant world that I would have left, God knows when. A world inside me, perhaps, that had died long before Terry ended his life, devastated by the violence of an anguish he hadn't known or wanted to resolve, and that I hadn't known or wanted to guess... .

### 7.3. (18) Vingt ans de fatuité, or: l'ami tireless

□My relationship with Terry was not distorted, at any time I believe, by the difference in our statuses in the mathematical world, or by any feeling of superiority I might have derived from it. This friendship, and one or two others that life gave me in those days (regardless of whether I "deserved" it!) was surely one of the few antidotes then against a secret fatuity, fuelled by social status and, even more so, by the awareness I'd gained of my mathematical power and the value I myself placed on it. The same could not be said of my relationship with my third friend. Over the years, he and his wife (whom he'd met around the time we met in Nancy) showed me a warm friendship, marked by delicacy and simplicity, whenever we met, in their home or mine. In this friendship there was clearly no ulterior motive, linked to status or cerebral abilities. And yet, for over twenty years, my relationship with them remained marked by that deep ambiguity within me, that division I spoke of, which marked my life as a mathematician. In their presence, each time anew, I couldn't help feeling their affectionate friendship and responding to it, almost unwillingly! At the same time, for more than twenty years, I managed the feat of looking at my friend with disdain, from the height of my greatness. This must have been the case from the very first years in Nancy, and for a long time, my prejudice extended to his wife, as well.

if it could only be understood in advance that his wife could only be as "insignificant" as he was. Between my mother and me, we were fond of referring to him only by a mocking nickname, which must have stayed with me long after my mother's death in 1957. It now appears to me that at least one of the forces behind my attitude was the ascendancy that my mother's strong personality exerted over me throughout her life, and for almost twenty years after her death, during which I continued to be imbued with the values that had dominated her own life. My friend's gentle, affable, non-combative nature was tacitly classified as "insignificant", and became the object of mocking disdain. It's only now, taking the trouble for the first time to examine what that relationship had been, that I'm discovering

the full extent of this forced isolation from the warm sympathy of others, which had marked her for so long.

p. 41

My friend Terry, no more combative or forceful than this other friend, had ☐ l'heure, lui, d'être agréé by my mother and was not the object of her mockery - and I suspect that this is why my relationship with Terry was able to blossom without inner resistance within me. His investment in mathematics was no more fervent, nor were his "gifts" any more promising, without my using this as an excuse to cut myself off from him and his wife by this shell of disdain and smugness!

What still remains incomprehensible to me in this other relationship is that my friend's affectionate friendship was never discouraged by the reticence he could not fail to sense in me, with each new encounter. And yet, today I know that I was **something other** than that shell and that disdain, something other than a cerebral muscle and a fatuity that drew vanity from it. As in them, there was the child in me - the child I ignored, the object of disdain. I had cut myself off from him, and yet he lived somewhere inside me, healthy and vigorous as the day I was born. The affection of my friends, less cut off from their roots than I was, surely went to the child. And it was surely he, too, who responded in secret, on the sly, when the Big Chief's back was turned.

## 7.4. (19) The world without love

As for this relationship with these truly enduring friends, it seems to me that I've put my finger on the most blatant, the most grotesque case in my life of the effects of a certain fatuity (among other things) in a personal relationship. Maybe I'm just fooling myself again, but I think it's also the only case where my relationship with a colleague or friend in the mathematical world (or indeed anywhere else) has been permanently invested by fatuity, instead of just appearing occasionally, discreetly and fleetingly. In fact, it seems to me that among the many friends I had in the mathematical world at the time, and whom I liked to keep company with, there was not one for whom I could imagine they had experienced a similar misguidance, in a relationship with a colleague, friend or not. Of all my friends, I was perhaps the least "cool", the most "polite", the least inclined to show a hint of humor (it only came to me later), the most inclined to take myself terribly seriously. In fact, I probably wouldn't have sought out the company of people like me (assuming there ever were any)!

p. 42

☐ The amazing thing was that my friends, "swamp" or not "swamp," put up with me and even took affection. It's a good and important thing to say here - even though we often saw each other only to discuss maths for hours and days on end : affection flowed, as it still does today, between the friends of the time (according to sometimes fortuitous affinities) and me, from that first moment when I was received with affection in Nancy, in 1949, in the home of Laurent and Hélène Schwartz (where I was somewhat part of the family), that of Dieudonné, that of Godement (which at one time I also haunted regularly

).

This affectionate warmth that surrounded my first steps in the mathematical world, and which I have tended to forget, has been important throughout my life as a mathematician. It must surely have given a similar warm tone to my relationship with the environment that my elders embodied for me. It gave all its strength to my identification with this environment, and all its meaning to the name "mathematical community".

Clearly, for many young mathematicians today, it's being cut off during their apprenticeship, and often well beyond, from any current of affection or warmth; seeing their work reflected in the eyes of a distant boss and his parsimonious comments, rather as if they were reading a circular from the Ministry of Research and Industry, that clips the wings of work and robs it of any deeper meaning than that of a dull, uncertain livelihood.

But I'm anticipating this disgrace, perhaps the most profound of all, in the mathematical world of the 70s and 80s - the mathematical world in which those who were my students, and the students of my friends of yesteryear, set the tone. A world where, often, the boss assigns his subject of work to the student, as one throws a bone to a dog - that or nothing! Like assigning a cell to a prisoner: this is where you will purge your solitude! Where such meticulous, solid work, the fruit of years of patient effort, is dismissed with the smiling contempt of the all-knowing, all-powerful: "this work doesn't amuse me!" and the matter is closed. Good for the garbage can, let's say no more about it. . .

Such disgraces, I know, did not exist in the milieu I knew, among the friends I haunted, in the fifties and sixties. It's true that, in 1970, I learned that it was rather the daily bread □ in the scientific world outside maths - and even in maths it wasn't so

p. 43

apparently rare, open contempt, blatant abuse of power (and no recourse), even among some renowned colleagues whom I had had the opportunity to meet. But in the circle of friends I had naively taken to be "the" mathematical world, or at least a faithful miniature expression of it, I knew nothing of the sort.

And yet, the seeds of contempt must already have been there, sown by my friends and me, and sprouted in our pupils. And not only in our pupils, but also in some of my former companions and friends. But my role is not to denounce or even to fight: you can't fight corruption. To see it in such and such of my students whom I once loved, or in such and such of the companions of yesteryear, something in me tightens - and rather than accept the knowledge that a pain brings me, I often refuse the pain and struggle and take refuge in refusal and a fighting attitude: such a thing has no place! And yet it is - and I even know deep down what it means. In more ways than one, I'm no stranger to it, if one of my former students or companions, whom I've loved, likes to discreetly crush another whom I love and in whom he recognizes me.

Once again I digress, doubly so I might say - as if the wind of contempt only blew around my home! Yet it's by blowing on me above all, and on those who are close and dear to me, that I am touched by it and know it. But the time is not ripe to talk about it, except to myself alone, in silence. Instead, it's time for me to resume the thread of my reflection-testimony, which could well be called "In pursuit of contempt" - contempt in myself and around me, in the mathematical milieu that was mine in the fifties and sixties.

## 7.5. (20) A world without conflict ?

I'd thought I'd mention the "marsh" in a few lines, just to say that it was there but that I didn't frequent it - and as is so often the case in meditation (and also in mathematical work), the "nothing" we look at turns out to be rich in life and mystery, and in hitherto neglected knowledge. Like that other "nothing", which also happened to be located in Nancy (decidedly the cradle of my new identity!), the "nothing" of that student who was surely a bit of a loser, who was being treated like... I thought about it again

p. 44

in a flash earlier, when I wrote (perhaps a little hastily?) that "these disgraces" didn't yet exist "back home". Let's just say that this is the only□and only incident of its kind that I can report, which resembles (we must to the "disgrace" to which I alluded, without dwelling too much on a detailed description. Those who have experienced it know what I mean, without having to draw a picture. And also those who, without having experienced it, are not so quick to close their eyes whenever they are confronted with it. As for the others, those who despise to their heart's content as well as those who are content to close their eyes (as I myself successfully did for twenty years), even an album of drawings would be a wasted effort... .

It remains for me to examine my personal and professional relationships with my colleagues and students over these two decades, and incidentally also what I may have known about the relationships of my closest colleagues with each other, and with their students. The thing that strikes me most today is how **conflict** seems to **have been absent from all these relationships**. I should add at once that this is something that in those days seemed quite natural to me - like the least of things. Conflict, between people of good will, mentally and spiritually mature and all that (the least of things, again!), had no place. Where there was conflict, I looked on it as a kind of unfortunate misunderstanding: with the right amount of goodwill and explanation, it could only be resolved as quickly as possible and without a trace! If I chose mathematics as my preferred activity from an early age, it's surely because I felt that this was the path where my vision of the world had the best chance of not coming up against disturbing denials at every step. Once you've **demonstrated** something, after all, everyone agrees, i.e. people of good will and all that.

As it happens, I was right. And the story of those two decades spent in the quiet, "conflict-free" (?) world of my beloved "mathematical community", is also the story of a long inner stagnation within me, eyes and ears plugged, learning nothing except maths or little else - while in my private life (first in the relationship between my mother and me, then in the family I founded immediately after her death) a silent destruction was rampant that at no time during those years did I dare

p. 45

look. But that's another story. ... The "awakening" of 1970, of which I have spoken often in these lines, was a turning point not only in my life as a mathematician□and a radical change of milieu, but a turning point (give or take a year) in my family life. It was also the year when, for the first time, in contact with my new friends, I risked an occasional glance, still quite furtive, at the conflict in my life. It was the moment when a doubt began to grow in me, which matured over the years that followed, that the conflict in my life, and the conflict I sometimes feared in the lives of others, was not just a misunderstanding, a "burr" that could be wiped away with a sponge.

This (at least relative) absence of conflict, in the environment I had chosen as my own, seems to me in retrospect a rather remarkable thing, when I've come to learn that conflict rages wherever humans live, in families as much as in workplaces, be they factories, laboratories or teachers' or assistants' offices. It's almost as if I'd stumbled, in September or October 1948, unsuspectingly landing in Paris on the only heavenly island in the Universe where people live without conflict with each other!

All of a sudden, after everything I've learned since 1970, it seems really extraordinary. Surely it deserves a closer look - is it myth, or reality? I can see the affection that flowed between so many of my friends and me, and later between students and me, I don't have to invent it - but it almost seems as if I'm obliged to invent conflict, in this heavenly world from which conflict seems banished!

It's true, in the course of this reflection I've had the opportunity to touch on two situations of conflict, each revealing an inner attitude within me: One is the "l'élève nul" incident in Nancy, the ins and outs of which I don't know between the direct protagonists. The other is a situation of conflict within myself, a division, in my relationship with the "indefatigable friend" - but this never expressed itself as a conflict between people, the only form of conflict generally recognized. Remarkably, in the conventional sense of the word, the relationship between these friends and myself was entirely free of conflict - at no time was there the slightest cloud. The division was in me, not in them.

I continue the census. One of the first thoughts: the Bourbaki group! During the years I was participate more or less regularly, so until the late fifties, this group embodied for me, the ideal of a collective work respecting both the minute appa  rence of detail in this work p. 46

The Bourbaki Group is a group of people who share the same values, not of themselves, but of the freedom of each and every one of its members. At no time did I sense among my friends in the Bourbaki group any hint of coercion, either on myself or on anyone else, veteran member or guest, who had come on a trial basis to see if things would "click" between him and the group. At no time was there any hint of a struggle for influence, be it over differences of opinion on this or that agenda item, or a rivalry for hegemony over the group. The group functioned without a leader, and apparently no one in their right mind, as far as I could see, aspired to that role. Of course, as in any group, one member exerted a greater influence on the group, or on other members, than another. Weil played a special role in this respect, which I've already mentioned. When he was present, he was a bit of a "playmaker"<sup>2</sup> (14). Twice, I think, my sensibilities were offended, and I left - these are the only signs of "conflict" of which I am aware. Gradually, Serre exerted an ascendancy over the group comparable to that of Weil. While I was a member of Bourbaki, this did not give rise to any rivalry between the two men, nor was I aware of any enmity developing between them later on. With the benefit of twenty-five years' hindsight, Bourbaki, as I knew him in the 1950s, still seems to me a remarkable example of success in terms of the quality of relationships within a group formed around a common project. This quality of the group strikes me as even rarer than the quality of the books that came out of it. It was one of the many privileges of my life, full of privileges, to have met Bourbaki, and to have been part of it for a few years. If I didn't stay, it wasn't because of conflicts or because the quality I mentioned had deteriorated, but because more personal tasks attracted me even more strongly, and I devoted all my energy to them. Nor did this departure cast a shadow over my relationship with the group or any of its members.

I'd have to review the conflict situations I've been involved in, which have pitted me against

---

<sup>2</sup>(14)

You'd think this would contradict the assertion that there was no leader, but it's not so. For Bourbaki alumni, it seems to me that Weil was perceived as the soul of the group, but never as a "leader". When he was there and when he liked it, he became the "ringleader" as I said, but he didn't lay down the law. When he was in a bad mood, he could block discussion on a subject he disliked, even if it meant taking up the subject again at another congress when Weil wasn't there, or even the next day when he was no longer obstructing. Decisions were taken unanimously by the members present, given that it was by no means out of the question (nor even rare) for one person to be in the right against the unanimity of all the others. This may seem an aberrant principle for group work. The extraordinary thing is that it actually worked!

p. 47 to one of my colleagues or students, between 1948 and 1970. The only thing that stands out at all are the two passing quarrels with Weil, which have already been mentioned. A few passing shadows, my relations with Serre, because of my susceptibility to a certain casualness, sometimes disconcerting way in which he would cut things short when a conversation had finished interesting him, or express his lack of interest in, or even aversion to, a particular piece of work I was involved in, or a particular view of things I insisted on, perhaps a little too much and too often! It never got to the point of a falling out. Temperamental differences aside, our mathematical affinities were particularly strong, and he must have felt as I did that we complemented each other.

The only other mathematician with whom I felt a comparable or even stronger affinity was Deligne. In this respect, I remember that the question of Deligne's appointment to the IHES in 1969 gave rise to tensions, which I didn't perceive as a "conflict" (which would have been expressed by a quarrel, or by a turning point in a relationship between colleagues).

It seems to me that I've come full circle - that in terms of conflict between people, visible through tangible manifestations, in relations between colleagues or between colleagues and students in the environment I haunted, that's all during those twenty-two years, incredible as it may seem. In other words, no conflict in the paradise I'd chosen - so, are we to believe, no contempt? Another contradiction in mathematics?

I'll definitely have to take a closer look!

## 7.6. (21) A well-kept secret

p. 48 I'm sure I forgot a few minor episodes yesterday, such as a temporary "chill" in my relationship with a colleague, due in particular to my susceptibility. I should also add three or four occasions when my self-esteem was disappointed, when colleagues and friends failed to remember, in one of their publications, that an idea or result I had shared with them must have played a role in their work (so it seemed to me). The fact that I still remember it shows that it was a sensitive point, and one that perhaps hasn't entirely disappeared with age! Except on one occasion, I refrained from mentioning it to those concerned, whose good faith was certainly above suspicion. The opposite situation must surely have occurred as well, without that I receive any echo of it. I am not aware of any case, in my "microcosm", where a question of priority is the occasion of a brouille or enmity, or even of bitter-sweet remarks between the interested parties. Even so, the only time I've ever had such a discussion (in what seemed to me an egregious case) there was a spat of sorts, which cleared the atmosphere without leaving a residue of resentment. It concerned a particularly brilliant colleague, whose abilities included the ability to assimilate everything he heard with impressive speed, and it seems to me that he often had an unfortunate tendency to take as his own the ideas of others that he had just learned from their mouths.

There's a difficulty here that all mathematicians (and not just mathematicians) have to deal with to a greater or lesser degree, and it's not just due to the egotistical drive that pushes most of us (and I'm no exception) to attribute "merits" to ourselves, whether real or supposed. The understanding of a situation (mathematical or otherwise), however we achieve it, with or without the assistance of others, is in itself something of a personal essence, a personal experience whose fruit is a vision, also necessarily personal. A vision can sometimes be communicated, but the vision communicated is different from the initial vision. This being the case, we need to be extremely vigilant when it comes to identifying the part played by others in shaping our vision. I'm sure I didn't always have this vigilance, which was the least of my worries, even though I expected it of others in relation to my own vision.

screw me! Mike Artin was the first and only person to suggest to me, with the joking air of someone revealing an open secret, that it was both impossible and perfectly pointless to bother trying to discern which part was "one's own" and which was "someone else's", when you manage to take a substance head-on and make sense of it. I was a little taken aback by this, even though it was not at all part of the deontology that had been taught to me by example by Cartan, Dieudonné, Schwartz and others. Yet I had a vague feeling that there was a truth in his words, and just as much in his laughing gaze, that had eluded me until then<sup>3</sup>. My relationship with mathematics (and above all, with mathematical production) was heavily invested by the ego, and this was not the case with Mike. He really gave the impression of doing math like a kid having fun, without forgetting to eat and drink.

## 7.7. (22) Bourbaki, or my great luck - and its downside

Even before plunging a little further below the visible surface, there is a realization that is self-evident. The **mathematical milieu I inhabited for two decades, in the 50s and 60s, was indeed a "world without conflict"**, so to speak! That's a pretty extraordinary thing in itself, and one that deserves a few words of reflection.

p. 49

I should make it clear right away that this was a very restricted milieu, the central part of my mathematical microcosm, limited to my immediate "environment" - the twenty or so colleagues and friends I met regularly, and to whom I was most closely linked. Reviewing them, I was struck by the fact that more than half of these colleagues were active Bourbaki members. Clearly, **the core and soul of this microcosm was Bourbaki**. It was, pretty much, Bourbaki and the mathematicians closest to Bourbaki. In the '60s, I was no longer part of the group myself, but my relationship with some of the members remained as close as ever, notably with Dieudonné, Serre, Tate, Lang and Cartier. I continued to be a regular at the Séminaire Bourbaki, or rather, I became one at that time, and it was there that I gave most of my talks (on schema theory).

It was undoubtedly in the sixties that the "tone" in the Bourbaki group shifted towards an increasingly pronounced elitism, of which I was certainly a part at the time, and which for that reason I was unlikely to notice. I still remember how astonished I was, in 1970, to discover how unpopular the very name of Bourbaki had become in large sections (of me hitherto unaware) of the mathematical world, as a synonym more or less for elitism, narrow dogmatism, the cult of "canonical" form at the expense of living understanding, hermeticism, castrating antispontaneity and so on! And it wasn't just in the "swamp" that Bourbaki got a bad press: in the sixties, and perhaps even earlier, I'd heard occasional echoes of it from mathematicians with a different turn of mind, allergic to the "Bourbaki style"<sup>4</sup> (15). As an unconditional adherent, I had been surprised

<sup>3</sup>(September 30) For another aspect of things, however, see the note of June 1 (three months after the present text), "Ambiguity" (n° 63"), examining the pitfalls of a certain complacency with oneself and others.

<sup>4</sup>(15)

I didn't get the impression that this "allergy" to the Bourbaki style gave rise to any communication difficulties between these mathematicians and myself or other Bourbaki members or sympathizers, as would have been the case if the spirit of the group had been that of a chapel, of an elite within the elite. Above and beyond styles and fashions, there was in all members of the group a keen sense of mathematical substance, wherever it came from. It was only in the sixties that I remember one of my friends referring to mathematicians whose work he wasn't interested in as "pain in the ass". When it came to things about which I otherwise knew virtually nothing, I tended to take such assessments at face value, impressed by such casual assurance - until one day I discovered that such a "pain in the ass" was an original and profound mind, which had not pleased my brilliant friend. It seems to me that among certain Bourbaki members, an attitude of modesty (or at least reserve) towards the work of others, when one ignores that work or understands it imperfectly, has eroded.

p. 50 and a little pained - I thought mathematics made minds agree! Yet I should have remembered that when I first started out, it wasn't always easy or inspiring to swallow a text□Bourbaki, even if it was expedient. The canonical text hardly gave an idea of the mood in which it was written, to say the least. It now seems to me that this is precisely the main flaw in the Bourbaki texts - that not even the occasional smile can give any hint that these texts were written by **people**, and people bound by anything other than some oath of unconditional loyalty to ruthless canons of rigor... .

But the question of the slide towards elitism, like that of Bourbaki's writing style, is a digression here. What strikes me here is that the "Bourbakian microcosm" I had chosen as my professional milieu **was a world without conflict**. This seems all the more remarkable given that the protagonists in this milieu each had a strong mathematical personality, and many are considered to be "great mathematicians", each of whom undoubtedly had the weight to form his own microcosm, of which he would have been the center and undisputed leader!<sup>5</sup> (16) It's the cordial and even affectionate conviviality, over two decades, of these strong personalities in the same microcosm and in the same working group, that strikes me as so remarkable, perhaps unique. This ties in with the impression of "exceptional success" that was already expressed yesterday about Bourbaki.

In the end, it would seem that I was exceptionally fortunate, when I first came into contact with the mathematical world, to stumble upon **the** privileged place, in time and space, where a mathematical milieu of exceptional quality, perhaps unique in its own right, had been forming for some years. This environment became mine, and has remained for me the embodiment of an ideal "mathematical community", which probably did not exist at that time (beyond the environment that for me embodied it) any more than at any other time in the history of mathematics, except perhaps in a few equally restricted groups (such as the one that had formed around Pythagoras in a quite different spirit).

p. 51 My identification with this milieu was very strong, and inseparable from my new identity as a mathematician, born in the late forties. It was the first group, beyond the family group, where I was welcomed with open arms. warmth, and accepted as one of their own. Another link, of a different kind: my own approach to mathematics was confirmed in that of the group, and in those of the members of my new environment. It wasn't identical to the "Bourbachic" approach, but it was clear that the two were brothers.

This environment, moreover, must have represented for me that ideal place (or very close to it!), that **conflict-free place** whose quest had undoubtedly led me to mathematics, the science above all others, where any hint of conflict seemed to me to be absent! And although I spoke earlier of my "exceptional good fortune", it was clear to me that this good fortune had its downside. While it enabled me to develop my skills, and to show my worth as a mathematician in the midst of my elders who became my peers, it was also the welcome means of escape from conflict in my own life, and of a long spiritual stagnation.

---

first of all, when there was still that "mathematical instinct" that makes you sense a rich substance or a solid work, without having to refer to a reputation or a renown. From the echoes that reach me here and there, it seems to me that both modesty and instinct have become rare things today in what used to be my mathematical milieu.

<sup>5</sup>(16)

In fact, many of the Bourbaki members surely had their own microcosm "of their own", more or less extensive, apart from or beyond the Bourbakian microcosm. But perhaps it's no coincidence that, in my own case, such a microcosm only formed around me after I had ceased to be part of Bourbaki, and all my energy had been invested in tasks that were personal to me.

## 7.8. (23) De Profundis

This "bourbachic" environment has certainly exerted a strong influence on me as a person, and on my vision of the world and my place in it. This is not the place to try and pinpoint this influence, and how it has expressed itself in my life. I'll just say that it doesn't seem to me that my inclinations towards fatuity, and their meritocratizing rationalizations, were in any way stimulated by my contact with Bourbaki and my insertion into the "Bourbach milieu" - at least not in the late forties and fifties. The seeds had long been sown within me, and would have found room to develop in any other milieu. The incident of the "null pupil" that I have reported is in no way typical, quite the contrary, of an atmosphere that would have prevailed in this environment, I repeat, but only of an ambiguous attitude in my own person. The atmosphere in Bourbaki was one of respect for the individual, an atmosphere of freedom - at least that's how I felt; and it was such as to discourage and attenuate any inclination towards attitudes of domination or fatuity, whether individual or collective.

This medium of exceptional quality is no more. He died, I don't know when, without anyone knowing, I suppose there must have been an insensible degradation in people. I suppose an insensitive degradation must have taken place in people - we've all had to "bottle up", grow stale. We've become important people, listened to, powerful, feared, sought after. ☐ The spark perhaps was still there, but the innocence

52

lost along the way. Some of us may find it again before we die, like a new birth - but the environment that welcomed me is no more, and it would be pointless for me to expect it to resurrect. Everything is back to normal.

And respect, too, may have been lost along the way. By the time we had pupils, it was perhaps too late for the best to be passed on - there was still a spark, but no longer the innocence, nor the respect, except for "his peers" and "his people".

The wind can pick up and blow and burn - we're sheltered behind thick walls, each of us with "our own".

Everything's back to normal. ...

## 7.9. (24) Mes adieux, or: les étrangers

This retrospective of my life as a mathematician takes a completely different path than I had anticipated. To tell the truth, I wasn't even thinking of a retrospective, but only of saying in a few lines, or even a page or two, what my relationship to the world I had left was today, and perhaps, conversely, what my former friends' relationship to me was, according to the echoes that reach me from far and wide. I had intended, on the other hand, to take a closer look at the sometimes strange vicissitudes of some of the ideas and notions I had introduced in those years of intense mathematical work - I should say, rather: the new types of objects and structures I had the privilege of glimpsing and drawing out of the night of the totally unknown into the penumbra, and sometimes even into the clearest light of day! This statement now seems to stand out in what has become a meditation on a past, in an effort to better understand and assume a certain, sometimes confusing, present. Decidedly, the planned reflection on a certain "school" of geometry, which was formed at my instigation, and which vanished without (almost) leaving a trace, will have to wait for a more propitious occasion<sup>6</sup>. For the time being, therefore, my concern will be to bring this retrospective on

<sup>6</sup>This "more propitious occasion" appeared sooner than expected, and the reflection in question is the subject of the second part, "The Burial", of Harvest and Sowing.

my life as a mathematician in the world of mathematicians, not to epilogize on a work and its fate.

During the past five days, occupied by tasks other than these reflective notes, one memory came back to me with a certain insistence. It will serve as an epilogue to the De Profundis on which I'm working.

p. 53

had stopped.

It happened towards the end of 1977. A few weeks earlier, I had been summoned to appear before the Montpellier Criminal Court for the offence of having "gratuitously housed and fed a foreigner in an irregular situation" (i.e. a foreigner whose residence papers in France were not in order). It was on the occasion of this quote that I learned of the existence of this incredible paragraph of the 1945 ordinance governing the status of foreigners in France, a paragraph which forbids any French person to provide assistance in any form whatsoever to a foreigner "in an irregular situation". This law, which had no analog even in Hitler's Germany with regard to Jews, had apparently never been applied in its literal sense. By a very strange "coincidence", I had the honor of being taken as the first guinea pig for the first enforcement of this unique paragraph.

For a few days I was stunned, paralyzed, deeply discouraged. Suddenly, I felt like I'd gone back thirty-five years, to a time when life didn't carry much weight, especially for foreigners... . Then I reacted, I shook myself. For a few months, I invested all my energy in trying to mobilize public opinion, first at my university and in Montpellier, and then at national level. It was during this period of intense activity, for a cause that later proved to be lost in advance, that the episode that I could now call **my farewell took place**.

With a view to taking action on a national level, I had written to five "personalities" from the scientific world, particularly well-known (including a mathematician), to inform them of this law, which even today still seems as incredible as the day I was quoted. In my letter, I proposed a joint action to demonstrate our opposition to this scurrilous law, which was tantamount to outlawing hundreds of thousands of foreigners living in France, and singling out millions of other foreigners for public suspicion, like lepers, who would then become suspects, likely to bring the worst trouble to any Frenchman who wasn't on his guard.

□ Astonishingly, completely unexpectedly for me, I received no response from any of these five "personalities. Decidedly, I had things to learn. ...

p. 54

It was then that I decided to go to Paris for the Séminaire Bourbaki, where I was sure to meet up with many old friends, in order first of all to mobilize opinion in the mathematical community, with which I was most familiar. This milieu, it seemed to me, would be particularly sensitive to the cause of foreigners, since all my fellow mathematicians, like myself, have to deal on a daily basis with foreign colleagues, pupils and students, most if not all of whom have had difficulties with their residency papers, and have had to face arbitrariness and often contempt in the corridors and offices of police prefectures. Laurent Schwartz, whom I had informed of my project, told me that I would be given the floor at the end of the presentations on the first day of the Seminar, to explain the situation to the colleagues present.

And so it was that I arrived that day with a bulky packet of leaflets in my suitcase for my colleagues. Alain Lascoux helped me distribute them in the corridor of the Institut Henri Poincaré, before the first session and during the "entr'acte" between the two lectures. If I remember correctly, he even made a little leaflet of his own - he was one of the two or three colleagues who heard about the affair,

were moved and contacted me before my trip to Paris, to offer their help<sup>7</sup> (17). Roger Godement was also one of them, and even produced a leaflet entitled "A Nobel Prize in Prison? It was chic of him, but we were definitely not on the same wavelength: as if the scandal was to attack a "Nobel Prize winner", rather than the first lampoonist who came along!

The first day of the Bourbaki Seminar was indeed crowded, with many people I had known more or less closely, including Bourbaki's old friends and companions; I think most of them were there. Many of my former students too. It must have been ten years since I'd seen all these people, and I was glad to have this opportunity to see them again, even if it meant seeing a lot of them at once! But we'd end up meeting up again in smaller numbers...

The reunion though "wasn't that", it was pretty clear from the début. Many outstretched hands p. 55 and tight-lipped, to be sure, and plenty of "Hey, you there, what wind brings you?" questions, yes - but there was an air of indefinable awkwardness behind the cheerful tones. Was it because they weren't interested in the cause that brought me, when they'd come for a certain tri-annual mathematical ceremony that demanded their full attention? Or, irrespective of what brought me here, was it my very person who inspired this discomfort, rather like the discomfort that a defrocked priest would inspire among a group of well-to-do seminarians? I couldn't say - perhaps it was both. For my part, I couldn't help noticing the transformation that had taken place in certain faces that had once been familiar, even friendly. They had frozen, as it were, or slumped. A mobility I had known there seemed gone, as if it had never been. I found myself standing before strangers, as if nothing had ever linked me to them. Obscurely, I sensed that we didn't live in the same world. I had thought I'd found brothers on this exceptional occasion, and here I was before strangers. Admittedly well-mannered, I don't recall any bitter-sweet comments, nor any leaflets lying around on the floor. In fact, all (or almost all) the leaflets handed out must have been read, curiosity permitting.

That's not to say that the scurrilous law has been jeopardized! I had my five minutes, maybe even ten, to talk about the situation of those who for me were brothers, called "foreigners". The amphitheatre was packed with colleagues, quieter than if I'd been giving a mathematical lecture. Perhaps the conviction to speak to them was already gone. There was no longer, as there once was, a current of sympathy and interest. There must have been some people in a hurry, so I thought I'd cut it short, proposing that we meet again immediately, with colleagues who felt concerned, to discuss in greater detail what could be done... .

When the session was declared adjourned, there was a general stampede for the exits - clearly, everyone was on their way out.

had a train or metro that was about to leave, and was not to be missed at any price! In the space of a minute or two, the Hermite amphitheatre was empty - it was like a miracle! Three of us in the large, deserted amphitheatre, under the cruise lights. Three of us, including Alain and me. I didn't know the p.

56

third, one of those unmentionable foreigners again I bet, in dubious company and illegal to boot! We didn't take the time to dwell on the quite eloquent scene that had just unfolded before us. Perhaps I was the only one who couldn't believe my eyes, and my two friends were kind enough to refrain from commenting on the matter. Clearly, I had just arrived...

The evening ended at Alain's and his ex-wife Jacqueline's home, where we took stock of the situation and went on to discuss

<sup>7</sup>(17)

Above all, it was outside the scientific community that I encountered warm echoes of the action to which I had committed myself, and active help. In addition to the friendly support of Alain Lascoux and Roger Godement, I must mention here above all that of Jean Dieudonné, who came to Montpellier for the Correctionnelle hearing, to add his warm testimony to others in favor of a lost cause.

## 2. A walk through a work or the Child and Mother

to review what could be done; to get to know each other a little better, too. Neither on that day, nor later, did I take the time to situate the episode I had just lived through in relation to a past. It was on that day, however, that I came to understand without words that a certain milieu, a certain world I had known and loved, was no more, that a living warmth I had thought I'd rediscovered had long since dissipated.

That hasn't stopped the echoes that still reach me, year after year, from that world whose warmth has fled, from disconcerting me and touching me painfully. I doubt that this reflection will change anything for the future - except, perhaps, that I'll rebel less at being touched in this way... .

## 8.1. (25) The student and the program

I haven't finished reviewing my relationships with other mathematicians, at a time when I felt part of the same world, the same "mathematical community". Above all, I'd like to examine my relationships with my students, as I experienced them, and with others for whom I was the elder statesman.

Generally speaking, I think I can say without reservation that my relationship with my students has been one of respect. In this respect at least, I believe that what I received from my elders when I was a pupil myself did not deteriorate over the years. As I had a reputation for doing "difficult" maths (admittedly a very subjective notion!), and moreover for being more demanding than other bosses (something already less subjective), the students who came to me were from the outset quite strongly motivated: "they wanted it"! There was just one student who at first was a bit "ollé ollé", it wasn't really clear whether he was going to start - and then yes, it went off without me having to push. ...

□As far as I can remember, I accepted every student who asked to work with me. For

For two of them, it became clear after a few weeks or months that my style of working didn't suit them. To tell the truth, it seems to me now that both of these situations were blockages, which I hastily interpreted as signs of an inability to work mathematically. Today, I'd be much more cautious about making such predictions. I had no hesitation in sharing my impressions with the two concerned, advising them not to continue in a career which, it seemed to me, was not suited to their dispositions. In fact, I knew that for one of these two students at least, I had made a mistake - this young researcher went on to make a name for himself in difficult subjects at the frontiers of algebraic geometry and number theory. I don't know whether the other student, a young woman, continued or not after her disappointment with me. It's not impossible that my impression of her abilities, expressed too peremptorily, discouraged her, even though she was perhaps just as capable of doing a good job as anyone else. It seems to me that I had given credit and confidence to these students as to others. On the other hand, I missed

p. 57

discernment to sort out what were surely signs of blockage, rather than ineptitude<sup>1</sup> (18).

From the early sixties onwards, over a period of ten years, eleven students worked with me on their doctoral dissertations<sup>2</sup> (19). Having chosen a subject to suit them, they each did their work with gusto, and (as I felt) they identified strongly with their chosen subject. There was one exception, however, in the case of a student who had chosen, perhaps without any real conviction, a subject that "had to be done", but which also had its ungrateful aspects, as it involved a technical fine-tuning, sometimes arduous, even arid, of ideas that had already been acquired, when there were hardly any surprises or suspense left

---

<sup>1</sup>(18)

I believe that this lack of discernment was not due to any negligence on my part on those two occasions, but rather to a lack of maturity, an ignorance. It was only some ten years later that I began to pay attention to blocking mechanisms, whether in my own person, in those close to me or in students, and to measure the immense role they play in everyone's life, and not just at school or university. Of course, I regret not having had the discernment of greater maturity on these two occasions, but not for having expressed my impressions clearly, whether well-founded or not. When, in one case, I saw work done without seriousness, naming these things for what they are seems to me to be a necessary and beneficial thing. If, in yet another case, the conclusion I drew was hasty and unfounded, I was not the only one whose responsibility was engaged. The student thus shaken had the choice of either learning from it (which is perhaps what happened the first time), or letting himself be discouraged, and perhaps then changing profession (which isn't necessarily a bad thing either!).

<sup>2</sup>(19) **Jesus and the twelve apostles**

From 1970 to the present day, another student, Yves Ladegaillerie, has prepared and passed a thesis with me. The students of the first period are P. Berthelot, M. Demazure, J. Giraud. Mme M. Hakim, Mme Hoang Xuan Sinh. L. Illusie, P. Jouanolou. M. Raynaud, Mme M. Raynaud, N. Saavedra, J.L. Verdier. (Six of them completed their thesis work after 1970, at a time when my mathematical availability was most limited). Among these students, Michel Raynaud takes a special place, having found for himself the essential questions and notions that are the subject of his thesis work, which he moreover developed entirely independently; my role as "thesis director" properly speaking was therefore limited to reading the finished thesis, constituting the jury and sitting on it.

When I proposed a subject, I was careful to limit myself to those to which I had a sufficiently strong relationship to feel in a position, if need be, to support the student's work. A notable exception was Mme Michèle Raynaud's work on local and global Lefschetz theorems for the fundamental group, formulated in terms of 1-fields on suitable scalar sites. This question seemed (and indeed proved) difficult to me, and I had no idea of how to prove the conjectures I was proposing (which, incidentally, could hardly be doubted). This work continued in the early '70s, and Mme Raynaud (as had previously been the case with her husband) developed a delicate and original method without any assistance from me or anyone else. This excellent work also opens up the question of extending Ms. Raynaud's results to the case of *n*-fields, which seems to me to represent the natural outcome, in the context of schemes, of theorems of the "weak Lefschetz theorem" type. The formulation of the relevant conjecture here (which can hardly be doubted either) does, however, make essential use of the notion of *n*-fields, the pursuit of which is supposed to be the main object of the present work [*This is actually volume 3 of Réflexions Mathématiques, not the present volume 1 Récoltes et Semailles - see Introduction, p.(v).*], as its name "A la Poursuite des Champs" indicates. We'll come back to this in due course,

Another rather special case is that of Mme Sinh, whom I had first met in Hanoi in December 1967, during a month-long lecture-seminar I gave at the evacuated Hanoi University. The following year, I offered her the subject of her thesis. She worked under the particularly difficult conditions of wartime, her contact with me being limited to episodic correspondence. She was able to come to France in 1974/75 (on the occasion of the International Congress of Mathematicians in Vancouver), and complete her thesis in Paris (before a jury chaired by Cartan, and including Schwartz, Deny, Zisman and myself).

I should also mention Pierre Deligne and Carlos Contou-Carrère, both of whom were somewhat of a pupil, the former around 1965-68, the latter around 1974-76. Both obviously had (and still have) uncommon means, which they used in very different ways and with very different fortunes too. Before coming to Bures, Deligne had been a pupil of Tits (in Belgium) - I doubt he was a pupil of anyone in mathematics, in the usual sense of the word. Contou-Carrère had been a pupil of Santalo (in Argentina), and for a while of Thom (more or less). Both had the stature of mathematicians by the time contact was established, except that Contou-Carrère lacked method and craft.

My mathematical role with Deligne was limited to informing him, on the spur of the moment, of the little I knew about algebraic geometry, which he learned as if he'd always known it, and, along the way, to raising questions that were usually answered on the spot or in the days that followed. These are the

in perspective<sup>3</sup> (20). Carried away by the necessities of a vast program for which I needed arms, I must have lacked psychological discernment in proposing this subject, which was surely not suited to this student's particular personality. He, for his part, probably didn't realize what he was getting into! In any case, neither he nor I could see in time that things had got off on the wrong foot, and that it was better to start afresh.

□ Visibly he worked without real conviction, and without parting with an air that was always a little sad, maus- p. 58  
sade. I think I'd already reached the point where I didn't pay too much attention to these things, which (I should have remembered) are the night and day of all research work, and not just research! My role then was limited to being annoyed when the work seemed to be dragging on, and breathing a sigh of relief when it picked up again, and when the planned program was finally "completed".

It was only years after my awakening in 1970, having corresponded with this former pupil (now a teacher, like everyone else in these clement times!), that the idea came to me that something had definitely gone wrong in this case, that perhaps it wasn't a total success. Today, it feels like a failure, despite the "completed program" (by no means botched!), the diploma and the job. And I bear a large part of the responsibility, for having put the needs of a program before those of a person - a person who had entrusted herself to me with confidence. The "respect" that I claimed to have shown my students ("without any reservations") remained superficial here, divorced from what is the true soul of respect: loving attention to the person's needs, at least insofar as their satisfaction depended on me. The need, here, for joy in work, without which it loses its meaning and becomes a constraint.

In the course of this reflection, I've had occasion to speak of a "world without love", and I've been looking for the seeds of that world in myself, which I reject. Here is a major one - and I can't say today how it has arisen in others. This superficial respect, devoid of attention and true love, is also the "respect" I gave my children. With them, I've had the privilege of seeing this seed grow and proliferate. And I've come to understand that there's no point in begrudging the harvest... ...

## 8.2. (26) Rigor and rigor

With the exception of this one pupil, who was certainly no less "gifted" than the others, I can say that relations between my pupils and myself were cordial, often even affectionate. By necessity, all

---

Deligne's earliest works that I know of. Those after 1970 (for him as well as for my "official pupils") are known to me only through very scattered and distant echoes [This is in *fact* volume 3 of *Réflexions Mathématiques*, and not the present volume 1 *Récoltes et Semailles* - see *Introduction*, p.(v)].

My role with Contou-Carrère, as he himself says at the beginning of his thesis, was limited to introducing him to the language of schematics. In any case, I've only been remotely involved in the work he's been preparing as a doctoral thesis in recent years, on a highly topical subject that falls outside my remit. Following a number of misadventures in the wide world, Contou-Carrère was recently led, in extremis and (it now seems to me) unwillingly, to call on my services to act as thesis director and jury. (This exposed him to the risk of becoming one of Grothendieck's "post-1970" students, in a conjecture where this can have serious drawbacks... .). I carried out this task to the best of my ability, and this will probably be the last time I do so (at the level of a state doctorate thesis). I am all the happier, in this rather special circumstance, for the friendly assistance of Jean Giraud, who also took a month or two out of his time to do a thorough reading of the voluminous manuscript, of which he made a detailed and warm report.

<sup>3</sup>(20)

It reminds me of the subject Monique Hakim had taken up, which wasn't much more engaging to tell the truth - I wonder how she managed to keep her spirits up! If she was struggling at times, it was certainly not to the point of making her sad or sullen, and the work between us was done in a cordial and relaxed atmosphere.

p. 59

learned to be patient with my two main faults as a "boss": my impossible handwriting (although I think everyone eventually learned to decipher it) and, more seriously (and which I didn't realize until much later), my fundamental difficulty in following someone else's thinking, without first translating it into my own images, and rethinking it in my own style. I was much more inclined to communicate to my pupils a certain vision of things that I had imbibed strongly, rather than encouraging them to develop a personal vision, perhaps quite different from my own. This difficulty in relating to my pupils hasn't disappeared yet, but it seems to me that its effects have been attenuated, because I'm aware of this propensity within myself. Perhaps my temperament, innate or acquired, predisposes me more to solitary work, which was mine for the first fifteen years of my mathematical activity (from 1945 to around 1960), than to the role of "master" in contact with pupils whose mathematical vocation and personality are not fully formed<sup>4</sup> (21). It's also true, however, that I've loved teaching ever since I was a child, and that from the 1960s to the present day, the students I've had have played an important role in my life. In other words, my teaching activity, my role as a teacher, has played and continues to play a major role in my life<sup>5</sup> (22).

During this first period of my teaching activity, there was no apparent conflict between any of my students and myself, which would have been expressed even by a temporary "coldness" in our relations. Only once did I find myself obliged to tell a pupil that he wasn't serious about his work and that I wasn't interested in continuing with him if it went on like that. Of course, he knew just as well as I did what he was talking about, he pulled himself together and the incident was closed without a cloud being cast. On another occasion, back in the early seventies, when most of my energy was devoted to the activities of the "Survivre et Vivre" group, a student to whom I had shown (as is my custom) the thesis report I had just written on his work, became angry, judging that certain considerations in the report called into question the quality of his work (which was in no way my intention). This time I rectified the situation without any difficulty. It didn't seem to me, then, that this brief incident could cast a shadow over our relationship,

but I may have been wrong. The relationship between this student and me had been more impersonal than with the other students (apart from the "sad student" I mentioned), a good working relationship without more, without a

p. 60

that would have passed between us. I don't think, however, that it was an unconscious lack of benevolence on my part that would have made me include in my report the considerations he judged to be disadvantageous to him, adding "that he wasn't going to let the thing pass" as a fellow student of his had done, who had already done his thesis with me. With this other student, of a sensitive and affectionate nature, I was bound by a relationship

---

<sup>4</sup>(21)

Perhaps it would be more accurate to say that, for my temperament, I still lack the necessary **maturity** to fully assume a teaching role. My acquired temperament has long been marked by an excessive predominance of "masculine" (or "yang") traits, and one of the aspects of maturity is precisely a "yin-yang" balance with a "feminine" (or "yin") predominance.

(Added later.) Even more than maturity, I see that it's a certain **generosity** that I've lacked in my teaching life to date - a generosity that expresses itself in a more delicate way than availability of time and energy, and which is more essential. This lack didn't manifest itself visibly (through an accumulation of failed situations, let's say) in my first period of teaching, no doubt mainly because it was compensated for by a strong motivation in the students who chose to come and work with me. In the second period, on the other hand, from 1970 to the present day, it seems to me that this lack of motivation is at least one of the reasons, and in any case the one that involves me most directly, for the overall failure that I observe in my teaching at research level (from the DEA level upwards). On this subject, see "Esquisse d'un programme", par.8, and par.9 "Bilan d'une activité enseignante", where the sense of frustration that this activity has left me with over the last seven or eight years is apparent [*Compare also note (23iv), added later*].

<sup>5</sup>(22)

Not for much longer, perhaps, as I have decided to apply for admission to the Centre National de la Recherche Scientifique, thus putting an end to a teaching career in academia that has become increasingly problematic in recent years.

particularly friendly; if I had included in my report on his thesis the same kind of consideration that had so displeased his fellow student, it was surely not for lack of benevolence! On the other hand, for both of them, as for all my students, I wouldn't have given the go-ahead for a defense if I hadn't been fully satisfied with the work they presented. In fact, none of my students from that period had any difficulty in finding a suitable job quickly after their thesis.

Until 1970: I had virtually unlimited availability to my students<sup>6</sup> (22'). When the time was ripe, and whenever it would be useful, I would spend whole days with one or other of them, if need be, working on questions that hadn't been finalized, or reviewing together the successive stages of their work. As I experienced these work sessions, it doesn't seem to me that I ever played the role of "director" making decisions, but that each time it was a joint research project, where discussions took place on an equal footing, until both were completely satisfied. The student's energy was considerable, though of course not on a par with that of myself, who had more experience and sometimes a more acute sense of smell.

The thing, however, that seems to me to be most essential to the quality of all research, whether intellectual or otherwise, is not at all a question of experience. It's **the requirement of oneself**. It's not a matter of scrupulous conformity to any standards, rigorous or otherwise. It consists of extreme **attention to something**

delicate thing inside ourselves, which escapes all norms and measures. This delicate thing is the absence or presence of an understanding of the thing examined. More precisely, the attention with which I ☐veuxp . 61  
To speak is to pay attention to the **quality of understanding** present at every moment, from the cacophony of a heterogeneous pile of notions and statements (hypothetical or known), to the total satisfaction, the completed harmony of a perfect understanding. The depth of a search, whether its outcome is fragmentary or total understanding, lies in the quality of this attention. Such attention does not appear as the result of a precept to be followed, of a deliberate intention to "goof off", to be attentive - it arises spontaneously, it seems to me, from the passion to know, it is one of the signs that distinguish the drive to know from its egotistical counterfeits. This attentiveness is also sometimes called "**rigor**". It is an inner rigor, independent of the canons of rigor that may prevail at a given moment in a (let's say) given discipline. If in this book I allow myself to take liberties with canons of rigor (which I have taught and which have their *raison d'être* and their usefulness), I don't believe that this more essential rigor is any less in it than in my past publications, in canonical style. And if, despite everything, I've been able to pass on to my students something of greater value than language and know-how, it's undoubtedly this demand, this attention, this rigor - if not in the relationship with others and with oneself (although at this level it was as lacking in me as in anyone else), at least in the ~~mathematical~~ work - that I've been able to pass on to them.<sup>7</sup>

---

<sup>6</sup>(22')

Even after 1970, when my interest in maths became sporadic and marginal in my life, I don't think there was an occasion when I recused myself when a student called on me to work with him. I can even say that, apart from two or three cases, the interest of my post-1970 students in the work they were doing was far below my own interest in their subject, even in the periods when I was only interested in maths on the days when I went to university. So the kind of availability I had for my pre-1970 students, and the extreme demand for work that was a principal sign of it, would have made no sense to most of my later students, who did maths without conviction, as if by a continual effort they'd had to make on themselves. ...

<sup>7</sup>(23) **The Child and the Master**

The term "transmit" here doesn't really correspond to the reality of things, which reminds me of a more modest attitude. This rigor is not something that can be transmitted, but at the very most awakened or encouraged, while it is ignored or discouraged from an early age, by the family environment as well as by school and university. As far back as I can remember, this rigor has been present in my quests, those of an intellectual nature at least, and I don't think it was passed on to me by my parents, and even less by masters, at school or among my mathematician elders. It just

(23). It's a modest achievement, but perhaps better than nothing.

### 8.3. (27) la bavure - or twenty years later

Except perhaps in the case of the two students I've mentioned, with whom a working relationship was finally not established, I don't recall any of the other students who came to me asking to work with me, coming with "stage fright" or fear. No doubt they already knew something or other about me, having attended my seminar at the IHES for at least some time. If there was any awkwardness at the start of our relationship, it eventually dissipated, leaving no trace, in the course of the work. I should, however, make two exceptions. One concerns a student who never really got to grips with his work, and who remained monosyllabic even during our work together. Perhaps

so he came at a time when I was becoming less available, and there were no afternoon and day-long sessions of work on parts with him. No, indeed I don't remember

p. 62

I don't think we ever had such sessions; I think we used to meet up for an hour or two to see how he was getting on. He must have had the worst time with me!

The other student, on the other hand, worked with me back when I still had complete disponibility for my students. Our relationship was cordial from the start. He's even one of the few students with whom I've established a friendly relationship, the ones I'd sometimes see at their place just as they'd come to mine, a sort of family-to-family relationship. It's true that even in these cases, the relationship always remained on a relatively superficial level, at least as far as I was concerned. On a conscious level, while I was already unaware of much of what was going on at home, under my own roof, I knew almost nothing about the lives of my mathematician friends, students or not, apart from the names of the wife and children (and even then, I sometimes forgot them, without ever being blamed!). Perhaps I represented an extreme case of "polard", but I believe that in the mathematical environment I knew, most if not all relationships, even friendly and affectionate ones, remained at that superficial level where we know very little about each other, except what is perceived at the informal level. This is surely one of the reasons why conflict between people was so rare in this environment, whereas it's clear to me that division existed within most of my colleagues and friends, and within their families, just as much as it did in my own home and everywhere else.

I don't believe that my relationship with this student differed from my relationship with others, nor did I feel at the time that, conversely, his relationship with me differed in any noticeable way from that of other students, particularly those with whom friendly ties were forged. It's only recently that I've come to realize that this must have been a stronger relationship than for most of my other students. The visible manifestations of an unspoken conflict came as an unexpected revelation, almost twenty years after he had been my pupil. Only then did I make the connection with a long-forgotten "little" fact. For a long time, perhaps even for the entire period (from a few

---

seems to be one of the attributes of **innocence**, and therefore one of the things we are born with. Very early on, this innocence "sees a lot of green and a lot of black", which means that it is obliged to plunge more or less deeply, and that often there is hardly a trace of it left in the rest of life. In my case, for reasons I haven't yet thought of investigating, a certain innocence has survived at the relatively innocuous level of intellectual curiosity, whereas everywhere else it has plunged deep, unseen and unheard of, just like everyone else. Perhaps the secret, or rather the mystery, of "teaching" in the full sense of the word, lies in reconnecting with this seemingly vanished innocence. But there's no question of rediscovering this contact in the pupil, if it isn't already present or rediscovered in the person of the teacher himself. And what is "transmitted" by the teacher to the pupil is by no means this rigor or innocence (innate in both of them), but a respect, a tacit revaluation of this thing commonly rejected.

years) when we worked together on a more or less regular basis', □ this student had retained a certain "stage fright". This would manifest itself at each meeting, in unmistakable signs. These signs disappeared fairly quickly afterwards, as we worked together. I was, of course, embarrassed by these signs of discomfort, and I sensed that he was more so. We both pretended to ignore the matter, as if it was nothing. Surely the idea of talking about it wouldn't have occurred to either of us, nor would it have occurred to either of us to pay any undue attention to a strange, obviously interesting situation! For him, as for me, this "stage fright" must have felt like a simple "burr", which had no reason to exist. The "burr" reminded us regularly, but each time, it had the good taste of disappearing, leaving us free to get on with the serious business of maths - and at the same time to forget "what didn't belong". I don't remember stopping once to wonder about the meaning of the blunder, and I'm sure the same was true of my pupil and friend. No doubt nothing in what we had both known around us since our early childhood could suggest in him or in me the idea of any other attitude towards a troublesome thing than that of **removing it as far as possible, so** that it ceased to be troublesome. In this case, it was perfectly possible and even easy, and we were perfectly in agreement that we'd seen nothing, felt nothing and heard nothing.

Through the many echoes and cross-references that have come back to me over the last two or three years, I've come to realize that what was dismissed as irrelevant has not ceased to be, and to manifest itself. What sometimes came back to me doesn't "belong" either - and yet "it is", and now can't be dismissed out of hand.

...

## 8.4. (28) The unfinished harvest

Until the first "awakening" in 1970, my relationship with my students, like my relationship with my own work, was a source of satisfaction and joy, one of the tangible, irrefutable foundations of a sense of harmony in my life, which continued to give it meaning, even as elusive destruction raged in my family life. At that time, I saw no apparent element of conflict in my family life.

these relationships, none of which, at any time, even fleetingly, was the cause of frustration or pain.

It is a thing that may seem paradoxical, that the conflict in the relationship □ to such and such of my students has only become

p. 64

apparent that after this famous awakening, after a turning point that gave my life an openness it hadn't known before, and my person a little beginning of flexibility perhaps - qualities that, one might think, should be of a nature to resolve or avoid conflict, and not to provoke or exacerbate it.

On closer inspection, however, I can see that the paradox is only apparent, and that it disappears, whichever way you look at it. First of all, for a conflict to have a chance of being resolved, it must first have manifested itself. The stage of manifested conflict represents a maturing compared to that of hidden or ignored conflict, whose manifestations do exist, and are all the more "effective" for the fact that the conflict expressed by them remains ignored. So: for a conflict to manifest itself in a recognizable way, a **distance** must first have been reduced or disappeared. The changes that have taken place in my life over the last fifteen years, notably in the course of successive "awakenings", have all been changes, it seems to me, of a nature to reduce a distance, to erase an isolation. A conflict that has difficulty expressing itself to a prestigious, admired boss, feels more at ease with someone who has been stripped of a position of power (voluntarily, in this case), who has been exiled from a certain milieu holding authority and prestige, who is perceived less and less as an incarnation or privileged representative of some entity (such as mathematics), and more and more as an individual.

like any other: a person who is not only susceptible to harm, but who is also less and less inclined to hide wounds or sorrows. And thirdly and most importantly: my evolution since the first awakening, especially at that time and in the years that followed, was such as to raise (or perhaps awaken) questions, concern and "questioning" in the well-ordered world of my former pupils. I had ample opportunity to realize that this was the case not only for them, but also among my friends and companions in the mathematical world of yesteryear, and sometimes even among scientific colleagues who knew me only by hearsay.

p. 65

It has to be said, too, that resolving a conflict of any depth is one of the rarest things in the world. The most often, notwithstanding all the surface truces and reconciliations, the growing procession of our conflicts follows us without  $\square$  guère leaving us for a whole lifetime, only to finally let go between the sullen hands of undertakers. Occasionally, I have seen a conflict unravel somewhat, and sometimes even resolved with knowledge - but so far, no such thing has happened in the course of my relationship with one of my students, or with one of my old friends in the mathematical world. And I also know that it's by no means certain that such a thing will ever happen, even if I were to live another hundred years.

It's remarkable that the very moment of my break with a certain past, by which I mean the episode of my departure from the IHES (from the institution that represented something like the "matrix" of the mathematical microcosm that had formed around me) - that this decisive episode was at the same time the first occasion on which one of my students expressed deep antagonism towards me. It was surely this circumstance that made this episode particularly distressing, particularly painful, like a birth or childbirth that had taken place under particularly difficult conditions. Of course, I couldn't then see this episode, the meaning of which escaped me, in the light in which I have since learned to see it. This painful surprise remained with me for a long time to come. And yet, in the summer of that same year, that bitter departure felt like a liberation - like a door that had suddenly opened wide (all I had to do was push it!) onto an unsuspected world, beckoning me to discover it. And each new awakening since then has also been a new liberation: the discovery of a subjection, an inner fetter, and the rediscovery of the presence of an immense unknown, hidden behind the familiar appearance of what was supposed to be "known". But throughout these fifteen years, and right up to the present day, this stubborn, discreet and unwavering antagonism has followed me, as the one great and lasting source of frustration I have known in my life as a mathematician<sup>8</sup> (23'). Perhaps I could say that it was the price I paid for that first liberation, and for those that followed. But I'm well aware that liberation and inner maturation have nothing to do with a "price to pay", that they're not a question of "profits" and "losses". Or to put it another way: when the harvest is completed, when it's finished, there's no "profit" to be made.

has no loss - the very thing that seemed "loss" has become "profit". And it is becoming clear that I have not yet been able to bring this harvest to its term  $\square$  me, which remains, even as I write these lines, unfinished.

p. 66

---

<sup>8</sup>(23')

For the past seven or eight years, however, there has been another chronic "source of frustration" in my life as a mathematician, but one that has expressed itself much more discreetly over the years. It eventually became apparent as a result of the repetition and obstinate accumulation of the same type of "frustrating" situation in my teaching activity, and finally exploded into a sort of "fed-up", causing me to practically put an end to all so-called "research direction" activities. I touch on this question once or twice in the course of my reflection, and finally examine it at least a little at the end. At the very least, I describe this frustration, and examine the role it played in my "return to maths" (cf. par. 50. "Weight of a past").

## 8.5. (29) The Enemy Father (1)

The kind of students who started working with me after the turn of 1970, in the completely different environment of a provincial university, was also very different from the students before. Only two of them went on to work with me on a state doctorate thesis. The rest worked on DEA or post-graduate doctoral theses. I should also include a good number of students who have taken to certain introductory research "courses", which have given them the opportunity to ask themselves often unexpected mathematical questions, and sometimes to come up with original ways of solving them. I found the most active participation in certain "option courses" for first-year students. For students who have already spent a few years in the university environment, however, a certain freshness, a capacity for interest and personal vision are already more or less extinguished. Many of the students in the elective courses clearly had the makings of an excellent mathematician. Given the current economic climate, I was reluctant to encourage any of them to go down this path, which could have attracted them and where they could have excelled.

With the students who took one of my "courses" to prepare for a master's degree, the relationship didn't usually last beyond the end of the year. On each occasion, I had the impression that they quickly became cordial and relaxed, on the whole. Except in the case of one student afflicted with invasive "stage fright".<sup>9</sup>

---

### <sup>9</sup>(23") Fear of playing

This student had worked with me on a DEA "work placement" for a whole year, and remained "contracted" in his working relationship with me right up to the end. It was a frankly friendly relationship, shot through with a mutual sympathy that could not be doubted. Yet there was this "stage fright"; this fear, the real cause of which was surely not fear of me, even though it looked like it. I might not even have noticed it, had this student not told me about it himself, no doubt to "explain" more or less the reason for an almost complete block in his work during the year.

As was the case with other students who, like him, were initially hooked on a certain geometrical substance, the blockage manifested itself as soon as it was a question of doing "work on parts", i.e. putting statements in black and white, or just grasping the meaning and significance of those I was providing and proposing to admit as the foundations of a language, as "rules of the game". School reflexes almost always push the student, faced with a situation where he's supposed to be "doing research", to adopt the implicit "rules of the game", transmitted by the teacher, as a "given" that's both vague and imperative, and which it's certainly not a question of trying to make explicit, let alone understand. The concrete form these implicit rules take are "recipes" for semantics or arithmetic, along the lines of, say, a mole book (or any other common textbook). What's more, the pupil expects the teacher to perform a task of the form "demonstrate that...". (Incidentally, I don't believe that the attitudes of most professional mathematicians, and of other scientists too, are essentially different - except that the "master" is replaced by the "consensus", which fixes the rules of the game of the moment and regards it as an immutable given. This consensus also fixes the "problems" to be solved, between which everyone feels free to choose as they see fit, even allowing themselves to modify them in the course of their work, or even invent new ones. . . ). I've noticed that my entirely different attitude to the mathematical substance I'm trying to fathom, and therefore also to the student, almost certainly triggers disarray, one of the signs of which is anxiety. Like all anxiety, this will tend to take on a face, to project itself onto an external "reason", plausible or not. One of the most common faces of anguish is fear.

Such difficulties hardly arose in the first period of my teaching activity, except perhaps in the two cases where a "teacher-student" relationship didn't continue beyond a few weeks, and perhaps (I can't say) in the case of the "sad pupil", who perhaps felt "riveted" to a subject that didn't inspire him at all, even though he had every opportunity to change it. In the case of the student (whom I also mentioned) who remained afflicted by stage fright for a long time, it's clear that the reason lay elsewhere. He was by no means blocked in his work, but on the contrary perfectly at ease with the theme he had chosen, on which he did a great deal of groundwork. In fact, most of my students during this period were former students of the Ecole Normale, and their contact with Henri Cartan had already shown them the example of another "approach to mathematics". At the opposite end of the spectrum (so to speak), in my second period as a teacher, at the University of Montpellier, it was among first-year students that the anguish I've mentioned least interfered with reflective work. For many of these students, astonishment at a different approach didn't provoke anguish or closure, but rather openness and a willingness to do interesting things for once! From my observations, the effect of a few years in college on a student's creative disposition is radical and devastating. It's a strange thing that, in this respect, the effect of the long years of high school seems relatively innocuous. Perhaps this is because

(23"), it was the same with students who were officially expected to prepare a research paper under my guidance, at one level or another. One difference (among many!) with my previous students was that our relationship wasn't so much confined to joint mathematical work. Often the exchange between the student and me involved our persons in less superficial ways<sup>10</sup> (23v). It's not surprising, then, that in this second period of my teaching activity, the conflicting elements in the relationship with certain students appeared more clearly and directly, even vehemently. Among my former

p. 67

first period, there are two in whom attitudes of systematic and unequivocal antagonism subsequently appeared (which I have had occasion to mention in passing), yet remained at the level of the informal, and perhaps even the unconscious. In the second, longer period, there were three students in whom I was confronted with antagonism. In two of them, it manifested itself acutely.

In the case of one of these pupils, antagonism arose overnight in what had been a most friendly relationship, long years after this friend had ceased to be my pupil. I suspect that the cause of the conflict was not so much my unspeakable conduct and personality, as a long-suppressed dissatisfaction at not having found the reception for his work (which had been excellent) that he would have been entitled to expect. This was the downside of the dubious privilege of having had me as his boss "after 1970", and he must have resented it, without really recognizing it even in his own heart.

With the other student, an acute antagonism had already emerged after a year and a half's work, in an atmosphere that had seemed very cordial. This was the first and only time that a relational difficulty between a pupil and myself had arisen at a time when he was still a pupil. It made it impossible for us to continue working together, despite the auspicious start and the auspicious enthusiasm for a magnificent theme. I had the feeling that there was an insidious lack of confidence in this young researcher's ability to do a good job (an ability which, for me, was beyond doubt), and that the manifestation of antagonism was a sort of "headlong rush" to get ahead of a dreaded failure, and blame it on an odious boss<sup>11</sup> (23").

---

the university years are at an age when the creativity innate in us **must**, at the end of the day, be expressed through personal work, otherwise we'll be shipwrecked forever, at least in terms of creative work of an intellectual nature. It must have been a healthy instinct that during my student years (also at the University of Montpellier) I practically never set foot in class, devoting almost all my energy to personal mathematical reflection.

<sup>10</sup>(23v)

A particularly striking sign of this difference was the "stranger episode", which I've already mentioned (section 24). While I received expressions of sympathy from many people who were complete strangers to me, I don't recall any of my pre-1970 students thinking of expressing such sympathy, let alone offering to help me in the action I had embarked upon. On the other hand, I can't think of a single one of my students or former students from the second period who didn't express their sympathy and solidarity with me, and several actively joined the campaign I was running at local level. Beyond this restricted circle, the 1945 ordinance affair also created a certain amount of emotion among many students at the Faculty who knew me by name at most, and a good number of them came to the Palais de Justice on the day of my summons, to show their solidarity. This last circumstance suggests, moreover, that the difference I observed between the attitudes of my students "before" and "after" 1970 may express less the difference in **relations** between them and me, than a difference in **mentalities**. Clearly, my "before" pupils had become important people, and it takes a lot for important people to consent to be moved... . But the episode of my departure from the IHES in 1970 and my involvement in militant action seems to show that there's more to it than that. It was a time when none of them was yet such an important figure, and yet I don't remember any of them showing the slightest interest in the activity I was getting involved in. Rather, I think it must have made them uncomfortable, all of them without exception. This again points to a difference in mentality, but one that can't be blamed solely on differences in social status.

<sup>11</sup>(23") **The two brothers**

This student's antagonism took the form, from the outset, of a "class antagonism": I was the "boss" who had "power of life and death" over his mathematical future, which I could decide at my whim... . Of course, events only served to confirm this vision, since it wasn't long before I had to put an end to my responsibilities (which had become painful) to

One aspect common to all these appearances of conflict between students and myself, in the nearly twenty-five years I've been teaching mathematics, is a strong **ambivalence**. In all these cases, without exception, the antagonism manifests itself after the fact, often insidiously, in a relationship of sympathy that can be left in no doubt. I can even say that in all these cases, as in many others where a frankly antagonistic component has not manifested itself, my person has exerted and still exerts a strong attraction. It is surely the very strength of this attraction that also feeds the strength of the antagonism.

and ensures its continuity. It is still so, surely, in cases where antagonism takes the form of a violent antipathy, an outraged rejection; as also in such another case, at the opposite extreme, where under the pavilion of friendly respect is expressed (when the occasion is right) with an affectation of casual, delicately measured disdain... ..

Such situations of ambivalence, to tell the truth, are not peculiar to my relationship with some of my students or ex-students. In fact, they have abounded throughout my adult life, since at least the age of thirty (i.e., since my mother died). This has been true both in my love life and in my relationships with men, and more specifically, with men who are much younger than I am. I've come to understand that something in me, whether innate or acquired, seems to predispose me to act as a father figure. I seem to have the ideal build and the right vibe to make the perfect adoptive father! It has to be said that the role of Father fits me like a glove - as if it had been

---

this student. This put him in a tricky situation, in these times when it's not so easy to find a "boss", especially when the subject has already been chosen. For the other student, frustrated in his legitimate expectations, the antagonism took a similar form. I felt like the tyrannical "mandarin", who could not tolerate contradiction from those (students or lower-ranking colleagues) he considered his subordinates.

Such a "class attitude" never manifested itself, if at all, during the relationship with my students of the first period. The obvious reason was that, in the pre-1970 context, there was no doubt that the student, once he had passed his thesis, would have a position as a lecturer, and would therefore enjoy a social status identical to mine, that of "university professor". Loquacious figures: the eleven students who began working with me before 1970 were given lectureships as soon as their work was completed, whereas none of the twenty or so students who worked more or less under my direction had access to such a position. It's true that only two of them were motivated enough to do a state doctorate thesis (an excellent one for both of them, by the way).

It's hardly surprising, then, that in this second period, certain ambivalences (whose deeper origins remained hidden) took the form of class antagonism, of ~~mistrust~~ (presented and felt as "visceral") towards the "boss". For one of those who had more or less been a pupil, friendly relations continued for around ten years without any apparent antagonistic episode, and yet marked by this same ambiguity, expressed in an attitude of ~~mistrust~~, held "in reserve" behind overt sympathy. To tell the truth, I was never fooled by this commanding "distrust", which appeared to me above all as a reason that this friend saw fit to give himself for not venturing outside the well-defined domain he had chosen as his own, in his professional life as in his life in general - something he was free to do, however, without anyone (except, at most, himself!) calling him to account. ...

In fact, these three cases are the only ones in all my teaching experience where a certain ambivalence in the relationship between a student (or someone who is more or less a student) and myself has been expressed by a "class attitude". Such an attitude appears particularly ambiguous when it manifests itself between colleagues within an academic "corps" where they both enjoy exorbitant privileges compared to the situation of ordinary mortals, privileges which make differences in rank (and salary) appear relatively insignificant. In fact, I've noticed that these attitudes disappear as if by magic (and with good reason!), as soon as the person concerned sees himself promoted to the position of which only the day before he was complaining to others.

Indeed, I detect a similar ambiguity in most, if not all, of the conflict situations I've witnessed within the mathematical world (and often outside it too). Those who are "cast", whether or not their rank corresponds to their expectations (justified or not), enjoy quite unheard-of privileges, which no other profession or career can offer. Those who don't fit in aspire to the same security and privileges (which doesn't necessarily prevent them from taking an interest in maths itself, and sometimes from doing great things). These days, when the competition for a place is fierce, and the unhoused are often treated like stragglers, I've more than once felt the connivance between the one who enjoys humiliating and the one who is humiliated - and who swallows and crushes. The real object of his bitterness and animosity is **not** the one who has made use of power, but is none other than **himself**, who has crushed himself and invested the other with this power which he uses at pleasure. The one who takes pleasure in humiliating is also the one who takes his revenge and compensates (without ever erasing it. . . ) for a long-lasting humiliation that has long since been buried and forgotten. And he who acquiesces in his own humiliation is his brother and emulator, who secretly envies it and in bitterness buries both the humiliation, and the humble message about himself that it brings him.

mine by birth. I won't try to count the number of times I've taken on such a role vis-à-vis another person, in perfect tacit agreement on both sides. More often than not, this distribution of father-son or father-daughter roles remained unspoken, even unconscious, but it also happened to be formulated more or less clearly. In some cases, too, I acted as a father without even entering into the game, I think, in ignorance of what was going on, both consciously and unconsciously.

I first became aware of my role as adoptive father in 1972, at the time of "Survivre et Vivre", when I was suddenly confronted with an attitude of violent rejection on the part of a young friend. (Interestingly, he was a maths student on the verge of dropping out!) Something in my behaviour towards third parties had disappointed him. I think I'd have had no difficulty in recognizing that his disappointment was well-founded, that I'd been ungenerous in this instance - but the violence of the reaction literally blew me away. It was like a sudden outburst of vehement hatred, which subsided almost immediately, when it became clear that he hadn't really managed to throw me off. (It was close, but I kept that to myself... ). I don't know how I got the intuition when he was projecting onto my

person, duly idealized, of unresolved conflicts with his father. This sudden intuition, now forgotten, didn't prevent me from penning the role of father for years to come, always with the

p. 69

same conviction, without the slightest suspicion. Of course, I was always as painfully astonished, not believing my eyes or the rest of it, when I was later confronted with signs of conflict, insidious or violent.

It was only after six or seven months of intense, solitary work on my parents' lives, which enabled me to see them in an unsuspected light, that I understood the illusory nature of this role of adoptive parent, which would replace (for the better, that's a given!) a real parent who does exist, and who would be declared (if only by tacit agreement) "failing". It's helping someone else to avoid the conflict where it exists, in his relationship with his father, let's say, and projecting it onto a third person (myself, in this case) who is entirely foreign to it. Since this meditation, which took place from August 1979 to March 1980, I've been vigilant about myself, so as not to allow myself to indulge in my unfortunate paternal vocation with my eyes closed. This hasn't prevented the false situation from recurring (as in my relationship with that student with whom I had to stop working) - but now, I believe, without any connivance on my part.

If I set aside the case of the pupil frustrated in these legitimate expectations, there's no doubt in my mind that in all the other cases where I've been confronted with antagonism in a pupil or ex-pupil, it's been the reproduction of the same archetypal conflict with the father: the Father both admired and feared, loved and hated - the Man to be confronted, defeated, supplanted, perhaps humiliated . . . but also the One we secretly wish we were, stripping Him of a strength to make it our own - another Self, feared, hated and shunned. . .

## 8.6. (30) The Enemy Father (2)

It wasn't the great turning point of 1970 that created antagonisms between some ex-students and me, against the backdrop of an idyllic, cloudless past. It only made visible antagonisms that could hardly be expressed within the more conventional framework of a typical boss-student (or ex-boss-ex-student) relationship. I suspect that such conflicts are not uncommon in the scientific world, but that they are often expressed in a more roundabout and less recognizable way than in relationships in

□that I've been involved in.

In retrospect, I don't feel that in my relationships with my students, I've been so inclined to take on a paternal role - in fact, I can't think of a single memory that goes beyond that.

p. 70

in this sense more or less. As far as **I'm** concerned, it seems to me that almost all the energy I invested in a relationship with a student was the same energy I also invested in mathematics, and in the realization of a vast program. In the first period, I can think of only one case where I had an interest in a student, in the nature of an affinity or sympathy, which had a strength comparable (if not equal) to that of mathematical interest. But even then, I don't feel that I've taken on a paternal role towards him. As for any ascendancy I may have exercised over him or other students, at one level or another, that's the sort of thing I paid no attention to in my relationship with my pupils. (Even today, I tend not to pay attention to it, either with the students who have worked with me in recent years, or even with other people.) Of course, in all these cases, the relationship between the pupil and myself was by no means "symmetrical", in the sense that for at least the duration of the teacher-pupil relationship (and probably even beyond, more often than not), the importance a pupil had in my life was not comparable to that which I had to take on in his, nor the psychic forces that the relationship brought into play in my person and in his. Except in the five or six cases where these forces manifested themselves in clearly recognized signs of antagonism, I realize that the nature of the relationships to me of my various pupils and then ex-pupils, over more than twenty years of teaching activity, remain a total mystery to me! In fact, it's not really my job to probe these mysteries, but rather that of each of them in his or her own right. But as long as you're interested in your own person, there may be hotter things to look at than the ins and outs of your relationship with your ex-boss... . In any case, even though I showed no inclination towards my pupils to take on a paternal role, it can't have been uncommon for me to have acted as a sort of adopted father for them, given my particular psychic "profile", which I mentioned earlier, and given the dynamics inherent in a situation where I could not fail to act as an elder, to say the least.

□ In any case, in several of the cases I've mentioned, this particular coloring of the relationship between a  
 There's no doubt in my mind that I'm a student. Outside my professional life, there have been many other cases where, with or without my connivance, I have acted as an adopted father to younger men and women, attracted by me and linked to me by mutual sympathy, but by no means by kinship. As for my own children, the paternal fibre in me towards them has been strong, and from an early age they have had an important place in my life. In a strange irony, however, none of my five children accepted the fact that I was their father. In the lives of the four of them that I've come to know closely, especially in recent years, this division in their relationship to me reflects a deep division within themselves; a refusal in particular of everything in them that makes them like me, their father... . But this is not the place to explore the roots of this division, which go back to a childhood torn apart, to my own childhood and that of my parents, as well as to my mother's childhood and that of her parents. Nor is this the place to measure its effects, in their own lives, or in those of their children... .

p. 71

## 8.7. (31) The power to discourage

To conclude this summary tour of my relationships in the mathematical world between 1948 and 1970, it remains for me to talk about my relationships with younger mathematicians, more or less beginners and therefore without the status of "colleague" in the strict sense of the word, without my playing the role of "boss" vis-à-vis them. These are young researchers whom I met for a year or two in my seminar at IHES, or on the occasion of such courses or seminars at Harvard or elsewhere, or also sometimes, on the occasion of a "seminar" at the University of Paris.

correspondence, for example when I'd received a piece of work from a young author for which he or she was looking for feedback, and surely also encouragement.

Dealing with novice researchers is part of a role that is less apparent than that of "boss" of such students, but just as important, as I have since come to realize. At the time, I didn't realize, as I have for the last six or seven years, that this role, for a mathematician in the limelight, represents a major challenge.

p. 72 considerable **power**. It is first of all the power **to encourage**, to stimulate, which exists as much in the case of visibly brilliant <sup>tra</sup>□vail (but perhaps served by clumsiness of presentation or a It exists even in the case of work that represents only a very modest contribution, or even negligible or nil by the standards of a senior in full possession of powerful means, proven experience of the subject, and extensive information. The power to encourage is there, as long as the work submitted to us has been written with seriousness - something generally discernible from the very first pages.

And the power to **discourage** exists just as much, and can be exercised at discretion whatever the work. This is the power that Cauchy used against Galois, and Gauss against Jacobi - it's not just that it exists and that eminent and feared men use it! If history has recorded these two cases, it's because the men who had to pay the price had sufficient faith and self-confidence to go their own way, despite the unsympathetic authority of those who were then calling the shots in the mathematical world. Jacobi found a journal to publish his ideas, and Galois the sheets of his last letter, acting as a "diary".

Today, it's certainly more difficult for an unknown or little-known mathematician to make a name for himself than it was in the last century. And the power of the prominent mathematician is not only psychological, but practical too. He has the power to accept or reject a work, i.e. to give or refuse his support for a publication. Rightly or wrongly, it seems to me that "in my day", in the fifties and sixties, refusal was not without appeal - if the work presented "worthy" results, it had a chance of finding the support of another eminence. Today, this is certainly no longer the case, as it has become difficult to find even a single influential mathematician who will agree to review (with whatever willingness he or she may have) a work in his or her field, unless the author has already acquired a reputation, or is recommended to him or her by a well-known colleague.

Over the past few years, I've seen some brilliant and influential mathematicians make use of the of their power to discourage and refuse, both with regard to such solid work that obviously had to be done'□ and with regard to such large-scale works clearly denoting the power and originality of their authors. On several occasions, the person who used his discretionary power in this way happened to be one of my p. 73 former students. This was probably the most bitter experience of my life as a mathematician.

But I'm straying from my point, which was to examine the way in which, in the days when I lent myself with conviction to the role of "mathematician in the limelight", I wielded the power to encourage and discourage that I spoke of. I should add that, at the more modest level where my scientific activity continued after 1970, as a teacher among others at a provincial university, this power did not cease to exist, either vis-à-vis my students or pupils, or (rarely, it's true) vis-à-vis oc- casional correspondents. But for my present purposes, it's the first period of my life as a mathematician that's important.

As far as my relationship with my students is concerned, from the first one I had to this very day, I think I can say without restriction that I've done everything in my power to encourage them.

in the work they had chosen<sup>12</sup> (23iv). It must be rare, even today, for it to be otherwise in the relationship between "boss" and pupil, and especially so in the case of a boss who has the means to train brilliant pupils, and with their help clear vast tracts of land ready for ploughing. Hardly believable, yet true, is the extreme case of the prestigious boss taking pleasure in extinguishing in brilliantly gifted pupils the mathematical passion that had animated him at a younger age.

But I'm digressing again! It's my relationship with the young researchers who weren't my students that needs to be examined. In such relationships, the egotistical forces in the person of the man in the spotlight would be less likely to push him in the direction of encouragement, while the successes of the young stranger approaching him would add little or nothing to his own glory. On the contrary, I believe that the play of egotistical forces alone, in the absence of genuine benevolence, would almost invariably tend to make the young stranger's successes less attractive to his own glory.

to push in the opposite direction, to use the power to discourage, to refuse. This, it seems to me, is neither more nor less than that general law, which can be constructed in all sectors of society: that egotistical desire <sup>dep. 74</sup>

to prove one's own importance, and the secret pleasure that comes with satisfying it are generally stronger and more appreciated, when the power at one's disposal finds occasion to cause one's fellow man discomfort, or even humiliation, rather than the other way round. This law is particularly brutal in certain exceptional contexts, such as war, concentration camps, prisons or psychiatric asylums, or even in the all-purpose hospitals of a country like ours... . But even in the most everyday contexts, each of us has had occasion to be confronted with attitudes and behavior that attest to this law. The correctives to these attitudes are, firstly, **cultural** correctives, stemming from a consensus, in a given environment, on what is considered "normal" or "acceptable" behavior; secondly, they are forces of a non-egotistical nature, such as sympathy towards a particular person, or sometimes, a spontaneous attitude of benevolence independent even of the person to whom it is addressed. Such benevolence is undoubtedly rare in any environment. As for the cultural corrective in mathematics, it seems to me that it has eroded considerably over the past two decades. This is certainly the case, in any case, in the circles I've visited.

---

<sup>12</sup>(23iv) Teaching failure (1)

Since these lines were written, I've had the opportunity to speak with two of my ex-students from after 1970, in an attempt to probe with them the reason for the failure of my teaching at research level, at the University of Montpellier. They told me that my tendency to underestimate the difficulty of assimilating techniques familiar to me, but not to them, had had a discouraging effect on them, as they constantly felt that I had fallen short of my expectations of them. What's more (and this seems even more far-reaching to me), they sometimes felt frustrated when I "sold the worm" by giving them a shaped statement I had up my sleeves, instead of letting them discover it for themselves, at a time when they were already very close to it. After that, all they had to do was the "exercise" (which they weren't otherwise keen on) of demonstrating the statement in question. Herein lies the "lack of generosity" in me that I had noted in an earlier note (note 21), without elaborating further. It is disappointments such as these, above all, that represent my personal contribution to the disappearance of interest in research in both of us, after what was nonetheless an excellent start.

I realize that I was no more generous before 1970 than after. If I didn't have the same difficulties then, it's probably because the kind of students who came to me in those days were motivated enough to find even a "long exercise" appealing, as an opportunity to learn the trade and a host of other things along the way; and also, for a starter statement I was "selling the fuse" on, to come up with a host of others of their own that went far beyond the first. When I moved to a new teaching location, I made the necessary adjustment in the choice of topics for reflection that I proposed to my new students, by choosing mathematical objects that could be grasped by immediate intuition, independently of any technical baggage. But this essential adjustment was in itself insufficient, due to differences in **disposition** (in my new pupils compared to those of yesteryear), even more important, than a single difference in **baggage**. This ties in with the observation made earlier (beginning of par.25) about a certain **inadequacy** in me for the role of "master", which came out much more strongly in my second period as a teacher than in the first.

known.

Decidedly, I persist in straying from my point, which was not a discourse on the century, but a meditation on myself and my relationship with the more or less novice researchers who were not my students. I don't believe that the "law" I alluded to found expression in these relationships. For reasons that needn't be examined here, it would seem that egotistic forces, just as strong in me as in anyone else, have not taken this path in my life to manifest themselves at the expense of others (apart from a few cases dating back to my childhood). I think I can even say, having had the opportunity to examine the matter, that the basic tone of my disposition towards others is one of benevolence, a desire to help when I can help, to relieve when I can relieve, to encourage when I am in a position to encourage. Even in a relationship as deeply divided as that with this "indefatigable friend" of mine

p. 75 I've had to talk about, never has the fatuity in me led me astray to the point where I would have thought (even if by unconscious intent) of harming him. (I would have had the possibility of <sup>fai</sup>re, and "with the best conscience in the world" alright. of course). And I believe that, in most cases, this general benevolence (even if only a little on the surface) also marked my relations in the mathematical world, including with beginner mathematicians who, although not among my students, might have needed my support or encouragement.

I believe this was the case without exception, at least during the fifties and into the early sixties. It seems to me that, in those days at least, this benevolence was not limited to visibly brilliant youngsters like Heisuke Hironaka or Mike Artin (even though they were not yet renowned for their abilities). But it may well have faded to a greater or lesser extent during the sixties, under the influence of egotistical forces. I would be particularly grateful for any testimony on this subject.

My memory only recalls a specific case, which I'm going to talk about, and beyond this case, this famous "fog" that doesn't condense into any other specific case or fact, but rather gives me a certain inner attitude. I used to feel a certain irritation when it happened that another mathematician "stepped on my toes" without pretending to ask me anything, as if he was at home the young white boy! It must have been mostly cases of young people, not too up to speed, who thought they'd come across something I'd known for years, and even longer, in some very special cases. I don't think it happened very often, but maybe two, three or four times, I can't say. As I've just said, I can only recall one case in point, perhaps because the situation occurred with the same young mathematician on several occasions, in one form or another. I can say that in every respect this young researcher, whose home university was abroad, was perfectly correct in sending the work he had just done to me, who was supposed to be the person most in the loop. Each time, I reacted very coolly, for the reason I said. I can't even tell for sure if I was telling him straight out that what he was doing had been known to me for ages, and that for that reason it bothered me that he was publishing it without at least giving me a little bow in the introduction. Of course, if he had

p. 76 was my pupil, this authorial fatuity would not have come into play so much, on the one hand because of a sympathetic relationship that had already been established with the pupil, but also because it went <sup>de</sup> soi anyway that the pupil's work also contained the boss's ideas, unless otherwise stated! I think the situation must have happened twice, maybe even three times, with this same researcher, and each time I had an equally cool, equally discouraging attitude. I never agreed, if I remember correctly, to recommend a work by this researcher for publication in such-and-such a journal, nor to sit on a thesis jury (I seem to recall the question having arisen). It's almost as if I'd decided to choose him as my pet. The most beautiful,

is that his work in each case was perfectly valid - I believe it was carefully written, and I have no reason to suppose that he didn't come up with the ideas he was developing himself, which at the time were not yet widely known, and were (more or less) "well known" only to a handful of people in the know, such as Serre, Cartier, myself and one or two others. What's incomprehensible to me is that this young colleague (he ended up, of course, with a well-deserved thesis and job) never tired of addressing me, who "beat him cold" with every blow, and that he apparently never resented me for it. Still, I remember the surprise he once expressed at my reticence - he obviously didn't understand what was going on. He'd have had a hard time if he'd waited for me to explain! He had a beautiful head, a bit like a classic Greek, very youthful - rather soft, peaceful features, evoking an inner calm... . Now that I'm trying for the first time to put my finger on the impression of his person and physiognomy, I suddenly realize that he really did look a lot like that "indefatigable friend" I'd spoken about; they could have been brothers, this friend of my age in smiling tones, and this researcher, twenty years younger, in rather serious, but by no means sad, tones. It's not impossible that this resemblance came into play, that I projected onto one a disdain that had found no occasion to express itself with the other, disarmed as he was by the signs of such a faithful friendship! And indeed, I had to have developed a really thick shell, not to be disarmed by the obvious good faith and desire to do the right thing in this young man, who was certainly endearing, and who never tired of coming back to me without my deigning to give him so much as a smile!

## 8.8. (32) The ethics of the mathematician

The case I reported yesterday, now that I've finally <sup>taken</sup> <sup>the</sup> trouble to write it down in black and white, <sup>p. 77</sup> seems to me of considerable significance, greater in some respects than the other three cases (no doubt typical too) reported earlier, where forces of fatuity deeply disturbed in me a natural attitude of benevolence and respect. This time, using a position of real power (then that I, like everyone else, pretended to ignore this power), I used it to discourage a willing researcher, and refuse a work that deserved to be published. That's what we call **abuse of power**. It's no less blatant for not falling under an article of the penal code. Fortunately, the situation at the time was less difficult than it is today, so that this researcher was able, without too much difficulty I believe, to get his work published with the support of some colleagues more benevolent than myself, and his career as a mathematician was not seriously disrupted, let alone broken, by my abusive behavior. I'm happy about this in retrospect, but I don't want to make it an "extenuating circumstance". It's possible that in tougher times, I would have been more careful - but that's just a guess, and has little to do here. All the same, I think I can say that there was no secret malice in me, no desire to do harm caused by the irritation I mentioned. I reacted to this irritation in a "visceral" way, without the slightest inclination to criticize myself, and even less without the slightest inclination to look at what was going on inside me, or even the impact my reaction could have on the other person's life. I didn't realize how much power I had, and the thought of any responsibility that went with that power (even if only the power to encourage or discourage) never occurred to me during this relationship. It was a typical case of **irresponsible behavior**, the kind you find on every street corner, in the scientific world as elsewhere.

It's possible that the only case of his kind that I can remember is an extreme one, among a few others like it. What triggers an attitude without benevolence is the irritation of a vanity, impatient of

to see "the first comer" arrogating to himself the right to walk through guarded hunting grounds and take some small game that belongs only to the masters of these places... . This irritation has its own rationalizations, which

p. 78 have a nobler allure, one suspects. It's not my modest self that's at stake but no, but the love of art and mathematics, this young man who doesn't even have the excuse to be great the clumsy kind rather. he's going to ruin everything, woe betide us, if only he could do things better than I can, but the beautiful prescriptions I'd planned all went out the window, you've got to be a little shameless, frankly... . ! The meritocratic leitmotiv is always present: only the very best (like me) have the right to work for me, or those who put themselves under the protection of one of those! (As for the less common case where it's actually another great chef who steps on my toes, that's a different kettle of fish - one day at a time!) In the case in point, there was (I'm in no doubt about this) another force moving in the same direction, entirely unconscious, which had already played a major role in my relationship with the indefatigable friend of my early days: an automatism of rejection towards a certain type of person, not corresponding to the canons of "virility" I'd taken over from my mother. But this circumstance, which has its own significance and interest for an understanding of myself, is relatively irrelevant for my present purpose: that of finding in myself, in attitudes and behaviours that were mine when I was still part of a certain milieu, the typical signs of a profound degradation that I see there today.

If this case, which I have just examined, seems to me of greater significance than the others in which I failed to show kindness and respect, it is because it is the one in which a certain **elementary ethic** is violated in the mathematician's profession<sup>13</sup> (24). In the milieu where I was welcomed in my early days, the Bourbaki milieu and those close to Bourbaki, this ethic I'm talking about was generally implicit, but it was nevertheless present, alive, the object (it seems to me) of an intangible consensus. The only person who expressed it to me in no uncertain terms, as far as I can remember, was Dieudonné, probably one of the first times I was his guest in Nancy. He may have returned on other occasions. He obviously felt it was important, and I must have sensed the importance he attached to it, to have remembered it even today, thirty-five years later. Simply because of the moral authority of the group of my elders, and Dieudonné, who obviously expressed a group consensus at the time, I had to tacitly adopt this ethic as my own, without ever having given it a moment's thought, or understood what was behind it.

p. 79 was important. To tell you the truth, it didn't even occur to me that it might be useful for me to give it some thought.

□une reflection, convinced as I had been for a long time that my parents and myself represented, a perfect embodiment (or very nearly so) of an ethical, responsible and foolproof attitude<sup>14</sup> (25).

---

<sup>13</sup>(24)

The ethics I'm talking about apply just as much to any other milieu formed around a research activity, and where the possibility of making one's results known, and taking credit for them, is a matter of "life or death" for the social status of any member, or even of "survival" as a member of this milieu, with all the consequences this implies for him and his family.

<sup>14</sup>(25) **Ethical consensus - and control of information**

Apart from the conversation with Dieudonné, I can't recall a single conversation in my life as a mathematician in which the ethics of the profession or the "rules of the game" were discussed. (I exclude here the discussions about the collaboration of scientists with the military, which took place in the early 70s around the "Survivre et Vivre" movement. They didn't really concern the relationships between mathematicians. Many of my friends in Survivre et Vivre, including Chevalley and Guedj, felt that the emphasis I placed at that time, especially in the early days, on this issue to which I was particularly sensitive, distracted me from more essential everyday realities, of precisely the kind I am examining in the present reflection). These things were never discussed between a student and myself. The tacit consensus, I believe, was limited to this one rule, not to present as one's own any ideas of others of which one might have been aware. This consensus, it seems to me, has existed since antiquity, and has never been contested in any scientific milieu. But in the absence of this other complementary rule, which guarantees every researcher the possibility of making his ideas and results known, the

Dieudonné didn't give me a long speech - it wasn't his style any more than it was that of any of his friends in Bourbaki. He must have mentioned it in passing, and as something that was taken for granted. He was simply insisting on a simple rule, seemingly unimportant, which is this: **anyone who finds a result worthy of interest must have the right and the opportunity to publish it, on the sole condition that this result is not already the subject of a publication.** So even if this result was known to one or more people, as long as they didn't take the trouble to put it down in black and white and publish it, so as to make it available to (hm!) the "mathematical community", any other person (innuendo: including the famous "first-timer"! ) who finds the result by his or her own means (innuendo: whatever his or her means, points of view and insights, and whether or not they seem "narrow" to people supposedly more in the know than he or she is... . ) must have the possibility of publishing it, according to his own means and insights. I seem to remember Dieudonné adding that if this rule was not respected, it opened the door to the worst abuses - it's possible that it was on this occasion and through his mouth that I learned of the historic case of Gauss refusing Jacobi's work, on the pretext that Jacobi's ideas had been known to him for a long time.

This simple rule was the essential corrective to the "meritocratic" attitude that existed in Dieudonné (and other Bourbaki members) as well as in myself. Respect for this rule was a guarantee of **probity**. I'm happy to be able to say, from everything that has come down to me to date, that this essential probity has remained intact in every member of the original Bourbaki group<sup>15</sup> (26). I note that this was not the case for other mathematicians who were part of the Bourbaki group or milieu. It has not remained intact in my own person.

The ethics Dieudonné spoke to me about in down-to-earth terms are dead as ethics. of a certain milieu. Or rather, this milieu  $\square$  I lui-même died at the same time as that probity which made it the soul. This probity has been preserved in certain isolated individuals, and it has reappeared or will reappear in others where it had deteriorated. Its appearance or disappearance in each of us is part of the crucial episodes of our spiritual adventure. But the stage on which this adventure takes place is profoundly transformed. A milieu that had welcomed me, that I had made my own, of which I was secretly proud, is no more. What made it worthwhile died within me, or at least was invaded and supplanted by forces of a different nature, long before the tacit ethics that governed it were openly disavowed in customs and professions of faith. If I've ever been surprised or offended, it's been out of wilful ignorance. What came back to me from this milieu that was once mine had a message to bring me about myself, which I've been happy to avoid until now.

p. 80

---

first rule remains a dead letter. In today's scientific world, men in positions of prestige and power have discretionary control over scientific information. In the milieu I knew, this control is no longer tempered by a consensus like the one Dieudonné spoke of, which perhaps never existed outside the restricted group whose spokesman he was. The scientific que in a position of power receives practically all the information it deems useful to receive (and often even more), and has the power, for much of this information, to prevent its publication while retaining the benefit of the information and rejecting it as "uninteresting", "more or less well known", "trivial", etc. ... I return to this situation in note (27).

<sup>15</sup>(26)

Bourbaki's "founding members" are Henri Cartan, Claude Chevalley, Jean Delsarte, Jean Dieudonné. André Weil. They are all still alive, with the exception of Delsarte, who died before his time in the 1950s, at a time when the ethics of the profession were still generally respected.

On re-reading the text, I was tempted to delete this passage, in which I may give the impression of issuing certificates of "probity" (or non-probity) that the interested parties have no use for, and that it is not my responsibility to issue. The reservations this passage may arouse are surely justified. I've kept it, however, out of concern for the authenticity of the testimony, and because it does convey my feelings, however misplaced they may be.

### 9.1. (33) The note - or the new ethics

Of course, a rule of deontology only takes on its meaning through an inner attitude, which is its soul. It cannot create the attitude of respect and fairness it seeks to express; at most, it can contribute to the permanence of such an attitude, in an environment where the rule enjoys general consensus. In the absence of an inner attitude, even if the rule is professed by the lips, it loses all meaning and value. No amount of exegesis, no matter how scrupulous or meticulous, can change that.

One of my friends and companions of yesteryear kindly explained to me recently that these days, alas, with the inordinate influx of mathematical production, "we" are absolutely obliged, whether we like it or not, to make a severe selection from the papers that are written and submitted for publication, to publish just a small part of them. He said this with an air of sincere regret, as if he himself were a bit of a victim of this inescapable fatality - a bit like the air he also had to say that he himself was one of the "six or seven people in France" who decide which articles will be published, and which not. Having become less loquacious with age, I confined myself to listening in silence. There was a lot to say on the subject, but I knew it would be wasted effort. One or two months later

I have learned, moreover, that this colleague refused a few years ago to recommend the publication of a certain note to the CRs' <sup>whose</sup> author as well as the theme (which I had suggested to him seven or eightp . 81 years) are close to my heart. The author had spent two years of his life developing this theme, which is admittedly not fashionable (although it still seems so topical to me). I think he did an excellent job (presented as a post-graduate thesis). I wasn't the "boss" of this young researcher, who happens to be brilliantly gifted (I don't know whether he'll continue to apply his gifts in mathematics, given the reception. . . ), and he did his job. ), and he did his work without any contact with me. But it's also true that there could be no doubt as to the origin of the theme developed; the poor guy was in a bad way, and he certainly didn't suspect a thing! This colleague put his foot down, at least, and I wouldn't have expected anything less from him: "I'm really sorry, but you understand... .". Two

years of work by a highly motivated novice researcher, against a three-page CR note - how much would it have cost the public purse? The absurdity of this enormous disproportion between one and the other is obvious. Surely this absurdity disappears, if we take the trouble to examine the underlying motivations. Only this colleague and former friend is in a position to fathom his own motivations, just as I am in a position to fathom mine. But without having to go too far, I'm well aware that it's not the inordinate influx of mathematical production you know, nor the public purse (or the patience of an imaginary "unknown reader" of the CRs) that it would have been a question of sparing...

This same draft note to the CRs had already had the honor of being submitted to another of the "six or seven people in France... .", who sent it back to the author's "boss", because this mathematics "didn't amuse him" (textual!). (The boss, disgusted but cautious, himself in a rather precarious position, preferred both times to crush rather than displease... .) Having had the opportunity to discuss the matter with this colleague and ex-student, I learned that he had taken the trouble to read the submitted note carefully and reflect on it (it must have brought back many memories for him. . . ), and that he had found that some of the statements could have been presented in a more user-friendly way. Yet he didn't deign to waste his precious time submitting his comments to the person concerned: fifteen minutes from the illustrious man, against two years' work from an unknown young researcher! He was "amused" enough by the maths to seize the opportunity to reconnect with the world.

p. 82 situation studied in the note (which could not fail to arouse in him, as in myself, a rich web of diverse geometric associations), to assimilate the description given, then, without difficulty given his baggage and his means, to detect clumsiness or shortcomings. He hasn't wasted his time: his knowledge of a certain mathematical situation has been clarified and enriched, thanks to two years of conscientious work by a researcher taking his first steps; work that the Master would certainly have been able to do (in broad outline and without demonstrations) in a few days. Having acquired this knowledge, we remember who we are - the case is judged, two years of work by Monsieur Personne is fit for the dustbin... .

Some people don't feel a thing when that wind blows - but even today, it still takes my breath away. This was surely one of the desired effects in this case (given the exquisite form of the refusal), but certainly not the only one. In the same interview, this friend of yesteryear confided in me, with an air of modest pride, that he only agreed to submit a note to the CRs when "the results stated astonished him, or he didn't know how to demonstrate them"<sup>1</sup> (27). This is undoubtedly one of the reasons why he rarely publishes. If he applied to himself

<sup>1</sup>(27) "Youth snobbery", or the defenders of purity

Ronnie Brown shared with me a reflection by J.H.C. Whitehead (of whom he was a pupil), speaking of the "snobbery of the young, who believe: that a theorem is trivial because its proof is trivial". Many of my old friends would do well to ponder these words. Today, this "snobbery" is by no means limited to young people, and I know more than one prestigious mathematician who routinely practices it. I'm particularly sensitive to it, because the best work I've done in mathematics (and elsewhere too. . . ), the notions and structures I've introduced that seem to me to be the most fruitful, and the essential properties I've been able to extract from them through patient and persistent work, all fall under the label of "trivial". (None of these things would have stood much chance of being accepted for a CR grade these days, were the author not already a celebrity!) My lifelong ambition as a mathematician, or rather my passion and joy, has been constantly to **find the obvious things**, and this is my sole ambition also in the present work (including this introductory chapter. . . ). The decisive thing is often already to see the **question** that had not been seen (whatever the answer may be, and whether it has already been found or not) or to come up with a statement (even if it is conjectural) that sums up and contains a situation that had not been seen or understood; if it is demonstrated, it doesn't matter whether the demonstration is trivial or not, which is entirely incidental, or even whether a hasty and provisional demonstration proves to be false. The snobbery of which Whitehead speaks is that of the jaded wine-lover who deigns to appreciate a wine only after he has ascertained that it has cost a great deal of money. More than once in recent years, taken back by my old passion, I've offered the best I had, only to see it rejected by that sufficiency. I've felt a pain that's still alive, a joy that's been disappointed - but that doesn't mean I'm homeless, and fortunately for me, I wasn't trying to fit in an article of my own.

The snobbery of which Whitehead speaks is an abuse of power and a dishonesty, not only an insensitivity or closure to the beauty of things, when it is exercised by a man of power against a researcher at his mercy, whose ideas he has free rein to assimilate and use, while blocking their publication on the pretext that they are "obvious" or

He knows everything, and it must be as difficult to surprise him as it is to find something demonstrable that he can't demonstrate. (This has only happened to me two or three times in the space of twenty years, and not even in the last ten or fifteen!) He's clearly proud of his "quality" criteria, which make him the champion of the highest standards in mathematics. I've seen his unfailing self-indulgence, and more than once his unbridled contempt for others, behind the appearances of smiling, good-natured modesty. I've also seen that he finds great satisfaction in it.

This colleague's case is the most extreme I've come across among representatives of the "new ethics". It is no less typical. Here again, both in the incident I have reported and in the profession of faith that rationalizes it, there is an ubiquitous absurdity, in terms of simple common sense - of such enormous dimensions that this former friend with such an exceptional brain, and surely also many of his colleagues of less prestigious status (who will be content not to approach him to present a note to the CRs) no longer see it.

To see, you have to look, at the very least. When one takes the trouble to look at the motivations (and one's own first and foremost),<sup>□</sup> then the absurdities appear in full light, and they cease on p. 83 at the same time as being absurd, by delivering their humble and obvious meaning.

If in recent years I have often found it so distressing to be confronted with certain attitudes and, above all, certain behaviours, it's surely because I could discern in them, obscurely, a caricature taken to the extreme, to the point of grotesqueness or odiousness, of attitudes and behaviours that had once been mine and that were brought back to me by some of my former students or friends. More than once, I've been triggered by the old reflex to denounce, to fight "evil" that has been clearly pointed out - but if I've given in to it, here and there, it's been with divided conviction. Deep down, I know that to fight is to continue skating on the surface of things, to evade the issue. My role is not to denounce, or even to "improve" the world in which I find myself, or to "improve" myself. My vocation is to learn, to know this world through myself, and to know myself through this world. If my life can bring any benefit to myself or to others, it's only insofar as I know how to be faithful to this vocation, how to be in tune with myself. It's time to remind myself of this, to cut short those old mechanisms in me, which here would like to push me to plead a cause (of a certain dead ethic, let's say), or to convince (of the supposedly "absurd" character of this ethic which has replaced it, perhaps), rather than to **probe** to discover and know, or to **describe** as a means to probe. In writing the preceding two or three pages, with no more precise aim than to say a few words about the current attitudes that have replaced those of yesterday, I have felt continually on my guard towards myself, in the mood of one who would be prepared at any moment to cross out with a broad stroke everything he has just written and throw it in the garbage can! However, I'm going to keep what I've written, which isn't false but nevertheless creates a false situation, because I'm involving others more than I'm involving myself. I felt deep down that I wasn't learning anything by writing, and that's surely what created this unease in me. Decidedly, it's time to return to a more substantial form of reflection, one that instructs me rather than pretending to instruct or convince others<sup>2</sup> (28).

---

"trivial", and therefore "uninteresting". I'm not even thinking here of the extreme situation of plagiarism in the common sense of the term, which must still be very rare in mathematical circles. Yet from a practical point of view, the situation is the same for the researcher who pays the price, and the inner attitude that makes it possible doesn't seem much different to me either. It's simply more comfortable, since it's accompanied by the feeling of an infinite superiority over others, and the good conscience and intimate satisfaction of the person who poses as the intransigent defender of the intangible purity of mathematics.

<sup>2</sup>(28)

In writing the preceding pages, I was initially divided between a desire to "get it off my chest", and a concern to keep to myself.

## 9.2. (34) Silt and source

p. 84

It seems to me that, for the most part, I've come full circle in my relationships with other mathematicians of all ages and ranks, back when □ I was part of their world, the world of mathematicians; and in At the same time, and above all, because of the part I have played, through my own attitudes and behavior, in a certain spirit that I see there today, and which is certainly not new. In the course of this reflection - or journey, to put it more accurately - I came across four situations that struck me as typical of certain attitudes and ambiguities in myself, where spontaneous dispositions of benevolence and respect towards others were disrupted, if not totally swept away, by egotistical forces, and above all (in three of these cases at least) by **fatuity**. This fatuity was based above all on the supposed superiority conferred on me by a certain cerebral power, and the inordinate investment I made in my mathematical activity. It found confirmation and support in a general consensus that valued, almost without reservation, this cerebral power and this disproportionate investment.

It's the last of the situations examined, that of the "young misfit who stepped on my toes", which seems to me the most important of the four for my present purpose. The first three are typical of me, or of certain aspects of me, at a certain time (in a certain context too, it's true) - but, as I've had occasion to say over and over again, I don't consider them in any way typical of the milieu to which I belonged. Nor do I think they are typical of the current mathematical milieu in France, let's say - it's likely that the kind of chronic bewilderment that characterized my relationship with "l'ami infatigable", for example, is as uncommon nowadays as it must have been then. My attitude and behavior in the case of the "young misfit", on the other hand, is typical of what happens every day in the mathematical world, wherever you look. It's the attitude of benevolence and respect shown by the influential mathematician towards the young stranger that becomes the rare exception, when the said stranger is not his pupil (and yet. . . ), or the pupil of a colleague of comparable status and recommended by him. This is undoubtedly what was coming back to me in the aftermath of my "awakening" in 1970, which had loosened mute tongues - but the first-hand accounts I heard at the time remained remote for me,

because they didn't directly concern me or my dearest friends. I was affected more than superficially from the moment (around 1976) when the echoes □ which I

p. 85

In some cases, the lack of benevolence, or even an ostentatious attitude of contempt, was reinforced, at the very least, if not aroused, by the mere fact that a young researcher was a friend of mine, or even an ex-student who had become important, and even more so when those who were the target of malice were people I knew well, students on more than one occasion (post-1970 students, needless to say!), whose fate therefore touched me. In some cases, moreover, there was no doubt that the lack of benevolence, or even an attitude of ostentatious contempt, was reinforced at the very least, if not aroused, by the mere fact that such a young researcher was my pupil, or that he was taking the risk (without necessarily being my pupil) of doing what my friends of yesteryear and other colleagues also readily called "Grothendieckeries". . .

The "young misfit" wrote to me again in the early '70s, asking me very courteously (although he was under no obligation to ask me anything at all!) if I didn't mind him publishing a demonstration he'd found for a theorem he'd been told I'd authored, and which had never been published. I remember that I replied in the same bad-tempered mood as before, without saying yes or no I think, and implying, without knowing his demonstration (that he was

---

discretion. So I'd been keeping to the point, which was surely the main reason for my discomfort, my feeling that "I wasn't learning anything". Since the lines noting this malaise were written, I've twice rewritten those pages that had left me feeling so discontented inside, getting more clearly involved and getting to the bottom of things. Along the way, I have indeed "learned something", and I also believe that I have managed to put my finger on something important that goes beyond the case in point and beyond myself.

I was of course ready to communicate it to myself, but I didn't care about it, busy as I was with my militant duties!), that it certainly wouldn't add anything to mine (although it would have helped, at the very least, if it had been written down in black and white and made available to the mathematical public, along with the statement itself!) This just goes to show the extent to which this famous "awakening" was still superficial, without any impact on certain behaviours rooted in fatuity and "meritocratic" attitudes, which I was surely denouncing at the same time in heartfelt articles in *Survivre et Vivre*, in public debates, etc. ... .

This is a very concrete answer to a question I had left open earlier. I might as well admit this humble truth, that such attitudes of fatuity are by no means overcome "once and for all" in my person, and I doubt they ever will be if not at my death. If there has been a transformation, it is not through the disappearance of vanity, but through the appearance (or reappearance) of curiosity about myself and the true nature of certain attitudes, behaviours etc. ... in myself. It's a

through this curiosity that I have become somewhat sensitive to the manifestations of vanity within myself. This profoundly modifies a certain inner dynamic, and thereby modifies the effects of "vanity"; that is of this force that often pushes me to conceal or counterfeit my healthy and fine perception of reality, in order to aggrandize myself and put myself above others while pretending the opposite. . 86

Perhaps such a reader will feel baffled, as I once did, by the apparent contradiction between the insidious and tenacious presence of **vanity** in my life as a mathematician (which he may also have glimpsed at times in his own), and what I call my **love**, or **passion**, for mathematics (which perhaps also echoes in his own experience of mathematics, or of some other person or thing). If he is baffled indeed, he has within him everything he needs to get back in touch (as I once did) with the reality of things themselves, which he can know first-hand, rather than spinning around like a squirrel trapped in an endless cage of words and concepts.

Will he who sees muddy water say that water and mud are one and the same thing? To know which water is not mud, all you have to do is go up to the spring, look and drink. To know the mud that isn't water, all you have to do is go up to the bank, dried by the sun and the wind, and detach a ball of grainy clay in your hand. Ambition and vanity can more or less regulate the proportion of one's life devoted to a particular passion, like mathematical passion, and can make it all-consuming, if the returns satisfy them. But the most devouring ambition is powerless on its own to discover or know the least of things - quite the contrary! In the moment of work, when little by little an understanding begins, takes shape, deepens; when in a confusion little by little an order appears, or when what seemed familiar suddenly takes on unusual, then disturbing aspects, until finally a contradiction bursts forth and upsets a vision of things that seemed unchanging - in such work, there is no trace of ambition, or vanity. What then leads the dance is something that comes from much further away than the "I" and its hunger for constant expansion (be it of "knowledge" and "knowing") - from much further away, surely, than our person or even our species.

This is the source, which is within each one of us.

### 9.3. (35) Mes passions

□ Three great passions have dominated my adult life, alongside other forces of a different nature. I ended up p. 87 recognize in these passions three expressions of the same deep-seated drive; three paths taken by the drive for knowledge in me, among the infinite number of paths open to it in our infinite world.

The first to manifest itself in my life was my passion for mathematics. At the age of seventeen, just out of high school, I let go of a simple inclination and turned it into a passion, which directed the course of my life for the next twenty-five years. I "knew" mathematics long before I knew the first woman (apart from the one I knew from birth), and today in my middle age, I see that it is still not consumed. She doesn't rule my life any more than I pretend to. Sometimes it slumbers, sometimes to the point where I think it's extinguished, only to reappear unannounced, as fiery as ever. It no longer devours my life as it once did, when I gave it my life to devour. She continues to leave a deep imprint on my life, like the imprint in a lover of the woman he loves.

The second passion in my life was the quest for a woman. This passion often presented itself to me in the guise of the quest for a companion. I wasn't able to distinguish one from the other until the latter came to an end, when I knew that what I was pursuing was nowhere to be found, or that I was carrying it within myself. My passion for women didn't really unfold until after my mother's death (five years after my first love affair, from which a son was born). It was then, at the age of twenty-nine, that I started a family, from which three more children were born. My attachment to my children was originally an indissoluble part of my attachment to my mother, a part of the power emanating from the woman who drew me to her. It's one of the fruits of this passion for love.

I didn't experience the presence of these two passions within me as a conflict, either in the early days or later on. I must have obscurely sensed the profound identity of the two, which became clear to me much later, after the appearance in my life of the third. Yet the effects of both passions on my life were not the same.

p. 88 could only be very different. The love of mathematics drew me into a certain world, that of mathematical objects, which surely has its own "reality" of its own, but which is not the world in which life unfolds of men. The intimate knowledge of mathematical things taught me nothing about myself, let alone about others - the impulse of discovery towards mathematics could only distance me from myself and from others. There may sometimes be communion between two or more in this same impulse, but this is communion on a superficial level, which in fact distances each of us from ourselves and from others. This is why my passion for mathematics has not been a maturing force in my life, and I doubt that such a passion can foster maturation in anyone<sup>3</sup> (29). If I gave this passion such a disproportionate place in my life for a long time, it was surely also precisely because it enabled me to escape the knowledge of conflict and the knowledge of myself.

The sex drive, on the other hand, whether we like it or not, launches us straight into the encounter with the other, and straight into the knot of conflict in ourselves as well as in the other! The quest for "companionship" in my life was the quest for conflict-free bliss - not the drive for knowledge, the drive for sex, as I liked to believe, but an endless flight from the knowledge of conflict in the other and in myself. (This was one of the two things I had to learn, so that this illusory quest would come to an end, and the anxiety that accompanies it like its inseparable shadow... .) Fortunately, no matter how much we run away from conflict, sex quickly brings us back to it!

One day I gave up trying to deny the teaching that conflict had stubbornly brought me, through the women I loved or had loved, and through the children born of these loves. When I finally began to

---

<sup>3</sup>(29) **Fear of playing & The two brothers**

I'm talking here about an intense, long-term investment in mathematics, or in some other wholly intellectual activity. On the other hand, the unfolding of such a passion - which can be a way of reacquainting ourselves with a forgotten force within us, and an opportunity to measure ourselves against a reluctant substance and, in the process, renew and enrich our sense of identity with something truly personal to us - such an unfolding may well be an important stage in an inner journey, in a maturing.

listening and learning, and for years afterwards, it turned out that everything I learned, I learned from the women I had loved or loved<sup>4</sup> (30). Until 1976, at the age of forty-eight, it was the quest for women that was the only great maturing force in my life. If this maturation only took place in the years that followed, i.e. over the last seven years, it's because I protected myself from it (as I had learned to do from my parents and the people around me) by every possible means.

available to me. The most effective of these means was my investment in my mathematical passion.

The day the third great passion appeared in my life - a certain night in October 1976 p. 89

- the great fear of learning has vanished. It's also the fear of simple reality, of humble truths about myself first and foremost, or about people I care about. Strangely enough, I had never perceived this fear in myself before that night, at the age of forty-eight. I discovered it the very night this new passion, this new manifestation of the passion to know, appeared. It took the place, so to speak, of fear, finally recognized. For years, I had seen this fear clearly in others, but by some strange blindness, I couldn't see it in myself. The fear of seeing prevented me from seeing this very fear of seeing! I was strongly attached, like everyone else, to a certain image of myself, which for the most part hadn't changed since my childhood. The night I'm talking about is also the one when, for the first time, that old image collapsed. Other images like it followed, holding on for a few days or months, or even a year or two, thanks to stubborn forces of inertia, only to collapse in their turn under a scrutinizing gaze. The laziness of looking often delayed such a new awakening - but the **fear of** looking never reappeared. Where there's curiosity, there's no room for fear. When I'm curious about myself, there's no more fear of what I'm going to find than when I want to know the final word of a mathematical situation: there's a joyful expectation, impatient at times and yet obstinate, ready to welcome whatever comes its way, foreseen or unforeseen - a passionate attention on the lookout for the unequivocal signs that make it possible to recognize the true in the initial confusion of the false, the half-true and the maybe.

In curiosity about oneself, there's love, untroubled by any fear that what we're looking at might not be what we'd like to see. And to tell the truth, love for myself had silently blossomed in the months leading up to this night, which is also the night when this love took on an active, enterprising form, ruthlessly shaking up costumes and sets! As I said, other costumes and sets soon reappeared as if by magic, to be jostled in their turn, without invective or gnashing of teeth... .

The way this new passion has manifested itself in my life over the last seven years has led me to appear  
seem like the moving up-and-down of waves following one another, like the breaths of a vase<sup>te</sup> and peaceful  
piration. res

is is not the place to try to trace its sinuous, shifting line, or perhaps  
that, in counterpoint, of the manifestations of mathematical passion. I've given up trying to regulate the  
course of one or the other - it's rather this double movement of one and the other that today regulates the  
course of my life - or better said, **is** its course. Th . 90

In the months that had already preceded the appearance of the new passion - months of gestation and plenitude  
- the woman's quest began to change its face. It began to separate itself from the anxiety with which it had  
been imbued, like a "breath" that had freed itself from the oppression that had weighed it down, and regained  
its amplitude and rhythm. Or like a fire that had been smouldering, half-stifled for lack of an escape, and  
which, under a breath of fresh air, would suddenly spread out in crackling, agile flames.

---

<sup>4</sup>(30)

In recent years, my children have taken over the task of teaching a sometimes reluctant pupil about the mysteries of human existence. ...

and lively!

The fire burned to satiation. A hunger that seemed unquenchable was satisfied. For the past two or three years, it seems that this quest has been consumed without a trace of ashes, leaving the field open to the song and counter-song of two passions. One, the passion of my youth, served for thirty years to separate me from a disowned childhood. The other, the passion of my middle age, led me to rediscover both the child and my childhood.

#### 9.4. (36) Desire and meditation

The night I mentioned, when a new passion took the place of an old fear that had vanished forever, was also the night I discovered meditation. It was the night of my first "meditation", which came about under the pressure of a pressing, urgent need, after I had been overwhelmed by waves of anguish in the preceding days. Like all anguish, perhaps, this was a "take-off anguish", insistently signalling the take-off between a humble and obvious reality about myself, and an image of myself that was forty years old and never questioned by me. Surely there must have been a great thirst for knowledge, alongside considerable escapist forces, and a desire to escape anguish, to be at peace as before. So there was intense work, which continued for a few hours until it came to an end, without me yet knowing the meaning of what was happening, let alone where I was going. In the course of this work, the red herrings have been recognized one after the other; or to put it better, it's this work that has made

p. 91

□ appear one by one these red herrings, each under the guise of an intimate conviction that I was finally taking the

I took the trouble to write it down in black and white, as if to get a better grasp of it, whereas until then it had remained in a blur. I was quite happy to write it down, without the slightest suspicion, it must surely have seduced me - in the mood of someone who doubts nothing, and for whom the mere fact of having written down an informal conviction in black and white was the irrefutable sign of its authenticity, the proof that it was well-founded. If it hadn't been for my indiscreet, not to say indecent, desire to know, I would have stopped every time at this "happy ending", and it was with this happy ending that the stage ended. And then, woe is me! I'd get the whim, God knows how and why, to take a closer look at what I'd just written to my complete satisfaction: it was there in black and white, all I had to do was reread it! And as I reread it carefully, naively, I sensed that something was a little off, that it wasn't quite so clear! Then, taking the trouble to look a little more closely, it became clear that it wasn't that at all, that it was all bogus, in other words, that I'd just been led astray! Each time, this partial discovery came as a famous surprise: "Wow, that's a good one", a joyful surprise that rekindled my thinking with a surge of new energy. We're going to get to the bottom of this, and I'm sure it's going to come out no later than now, so let's keep the momentum going! We'll take stock, take stock... and here we go again, with all the trappings of "the end of the story", we just have to believe it must be it this time, we'll write it down anyway, out of good conscience, and it's a pleasure even to write down such judicious and well-felt things, you'd really have to be wrong-headed not to agree, such obvious good faith, you can't do better than that, it's perfect as it is!

This was the new end of the stage, the new happy ending, on which I would have paused contentedly, if it hadn't been for the naughty little boy who once again got into mischief and, incorrigible as ever, decided to stick his nose into this last "fin mot" and happy ending. There was no stopping him, and here we go again!

And so, for four hours, the stages followed one □to another, like an onion whose I would have peeled off layer after layer (that's the image that came to me at the end of that night), to get to the **heart of the matter** - to the simple, obvious truth, a truth that was staring me in the face, and yet which I had managed for days and weeks (and my whole life, in fact) to conceal under this accumulation of "onion layers" hiding one behind the other.

The appearance at last of the humble truth was an immense relief, an unexpected and complete deliverance. I knew in that instant that I had touched the crux of anguish. The anguish of the last five days was well and truly resolved, dissolved, transformed into the knowledge that had just formed within me. The anguish had not only disappeared from my sight, as it had throughout the meditation, and several times during the previous five days too; and the knowledge into which it had been transformed was in no way in the nature of an idea, of a concession that I would have made, let's say, to be even and quiet (as had happened to me here and there during the same night); it was not an external thing that I would then have adopted or acquired to add to my person. It was **knowledge** in the full sense of the word, first-hand, humble and obvious, which was now part of me, just as my flesh and blood are part of me. It was, moreover, formulated in clear and unequivocal terms - not in a long speech, but in a silly little sentence of three or four words. This formulation had been the final step in the work that had just been carried out, which remained ephemeral, reversible as long as this final step had not been taken. Throughout this work, the careful, even meticulous formulation of the thoughts that formed, the ideas that presented themselves, had been an essential part of this work, each new departure of which was a reflection on the stage I had just gone through, which was known to me through the written testimony I had just given (with no possibility of retracting it in the mists of a failing memory!).

In the minutes that followed the moment of discovery and deliverance, I also knew the full significance of what had just happened. I had just discovered something even more precious than the humble truth of the last few days. This thing was the power in me, for as little as I□s interested, to know.

the final word on what's going on inside me, on any situation of division or conflict - and thus the ability to resolve entirely, by my own means, any conflict inside me of which I may have become aware. The resolution is not the result of some **grace**, as I had tended to believe in previous years, but of intense, obstinate and meticulous **work**, making use of my ordinary faculties. If there is such a thing as "grace", it is not in the sudden and definitive disappearance of a conflict within us, or in the appearance of an understanding of the conflict that would come to us ready-made (like the chickens in the land of Cocagne!) - but it is in the presence or appearance of this desire to know<sup>5</sup> (31). It was this desire that had guided me to the heart of the conflict in the space of a few hours - just as the desire to love leads us unfailingly to find the path that leads to the innermost depths of the woman we love.

Whether we're talking about self-discovery or mathematics, in the absence of desire, all so-called "work" is nothing but a mockery, leading nowhere. At its best, it keeps the person who indulges in it "beating around the bush" endlessly - the contents of the bush are reserved for those who are hungry enough to eat! As with all

---

<sup>5</sup>(31)

I'm thinking here of the "yang" form of the desire to know - that which probes, discovers, names what appears... . It is having been **named** that makes the knowledge that appears irreversible, ineffaceable (even if it is subsequently buried, forgotten, ceases to be active. . . ). The "yin", "feminine" form of the desire for knowledge is in an openness, a receptivity, in a silent welcoming of knowledge appearing in deeper layers of our being, where thought has no access. The appearance of such openness, and of a sudden knowledge that for a time erases all traces of conflict, comes as a grace once again, touching deeply even though its visible effect may be ephemeral. I suspect, however, that this wordless knowledge that comes to us in this way, at certain rare moments in our lives, is just as ineffaceable, and its action continues even beyond the memory we may have of it.

When it comes to the desire to know myself, my knowledge of myself and the situations I'm involved in remains inert. When it comes to the desire for self-knowledge, then my knowledge of myself and the situations in which I'm involved remains inert, and I act not with full knowledge of the facts, but at the whim of simple inveterate mechanisms, with all the consequences that implies - a bit like a car being driven by a computer, not by a person. But whether it's meditation or mathematics, I wouldn't dream of pretending to "work" when there's no desire, when there's no hunger. That's why I've never meditated for even a few hours, or done maths for even a few hours<sup>6</sup> (32), without learning something; and more often than not (not to say always) something **unforeseen** and unpredictable. This has nothing to do with faculties that I have that others don't, but only comes from the fact that I don't pretend to work without really wanting to. (It's the strength of this "desire" that alone also creates the **requirement** I've talked about elsewhere, which means that in work we're not satisfied with a little more, but with a lot more.

p. 94 is satisfied only after having gone to the end of an understanding, however humble). Where discovery is concerned, work without desire is nonsense **and simagre**, just as much as making love without desire. To say true, I haven't experienced the temptation to waste my energy pretending to do something I have no desire to do, when there are so many exciting things to do, if only to sleep (and dream. . . ) when it's time to sleep.

It was on this very night, I believe, that I understood that the **desire** to know and the **power** to know and discover are one and the same thing. If we trust it and follow it, it is desire that leads us to the heart of the things we wish to know. And it's desire that makes us find, without even having to look for it, the most efficient method of knowing these things, and the one that suits us best. In the case of mathematics, it would seem that writing has always been an indispensable means, regardless of who is "doing math": doing math is above all **writing**<sup>7</sup> (33). The same is undoubtedly true of any work of discovery in which the intellect plays a major role. But surely this is not necessarily the case with "meditation", by which I mean the work of self-discovery. In my case, however, and up to now, writing has been an effective and indispensable means of meditation. As in mathematical work, it is the material support that fixes the

<sup>6</sup>(32) **A hundred irons in the fire, or: nothing is worth drying!**

When I was still doing Functional Analysis, i.e. up until 1954, I would sometimes persist endlessly on a question that I couldn't solve, even though I had no more ideas and was content to go round in circles with old ideas that obviously didn't "bite" any more. This was the case, in any case, for a whole year, notably for the "approximation problem" in topological vector spaces, which would only be solved some twenty years later by methods of a totally different order, which could only have escaped me at this point. I was driven then, not by desire, but by stubbornness, and by an ignorance of what was going on inside me. It was a painful year - the only time in my life when doing math had become painful for me! It took that experience to make me realize that there's no point in "skipping" - that once a piece of work has reached a standstill, and as soon as you've realized it, you have to move on to something else - even if it means coming back to the question at hand at a more propitious moment. This moment almost always comes quickly - the question matures, without me even pretending to touch it, simply by virtue of having worked enthusiastically on questions that may seem to have nothing to do with this one. I'm convinced that if I persisted, I wouldn't get anywhere even in ten years! It was from 1954 onwards that I got into the habit in maths of always having many irons in the fire at the same time. I only work on one of them at a time, but by a kind of miracle that constantly renews itself, the work I do on one also benefits all the others, which are waiting for their time. The same has been true, without any deliberate intention on my part, from my first contact with meditation - the number of burning questions to be examined has increased day by day, as reflection has continued. ...

<sup>7</sup>(33) **"Youth snobbery", or the defenders of purity**

This does not mean that moments when paper (or the blackboard, which is a variant of it!) is absent are not important in mathematical work. This is especially true in the "sensitive moments" when a new intuition has just appeared, when it's a question of "getting to know" it in a more global, more intuitive way than by "working on parts", which this informal stage of reflection prepares. In my case, this kind of reflection takes place mostly in bed or out for a walk, and it seems to me that it accounts for a relatively modest proportion of total work time. The same observations apply to meditation work as I've practised it up to now.

It gives us a tangible record of the work we've just done, to which we can refer at any time. Writing also gives us a tangible trace of the work we've just done, to which we can refer at any time. In long-term meditation, it's often useful to be able to refer back to written traces that bear witness to a particular moment of meditation in the days before, or even years before.

Thought, and its meticulous formulation, therefore play an important role in meditation as I've practiced it up to now. It is not, however, limited to the work of thought alone. Thought alone is powerless to grasp life. It is effective above all in detecting contradictions, often enormous to the point of grotesqueness, in our vision of ourselves and our relationships with others; but it is often not enough to grasp the meaning of these contradictions. For those driven by the desire to know, thought is an often useful and effective, even indispensable, tool, as long as we remain aware of its limitations, which are quite obvious in meditation (and more hidden in mathematical work). It is important that p. 95 thought knows how to fade away and disappear on tiptoe at sensitive moments when something else appears - perhaps in the form of a sudden, profound emotion, while the hand perhaps continues to run over the paper to give it a clumsy, stammering expression at the same time. ...

## 9.5. (37) Wonder

This retrospective on the discovery of meditation came here entirely unexpectedly, almost out of the blue - it wasn't at all what I set out to examine when I began. I wanted to talk about **wonder**. This night, so rich in so many things, was also rich in wonder at these things. Already in the course of the work, there was a kind of incredulous wonder at each new red herring uncovered, like a crude costume sewn from coarse white thread that I had been willing - it was scarcely believable! to take for real the most seriously in the world! Many times since then, in the years that followed, I've rediscovered the same sense of wonder as on that first night of meditation, at the enormity of the facts I was discovering, and the crudeness of the subterfuges that had made me ignore them until then. It was through its burlesque sides that I began to discover the unsuspected world I carry within me, a world that over the days, months and years has revealed itself to be prodigiously rich. On that first night, however, I had more to marvel at than vaudeville episodes. It was the night when, for the first time, I reconnected with a forgotten power that lay dormant within me, the nature of which still escaped me, except that it is a power, and which is at my disposal at any moment.

And the preceding months had already been rich in a mute wonder of something I'd been carrying inside me, probably for as long as I could remember, with which I'd only just made contact again. I felt this thing not as a power, but rather as a secret sweetness, as a beauty that was both peaceful and unsettling. Later, in the exultation of discovering my long-ignored power, I forgot those months of silent gestation, to which only a few scattered poems bore witness - love poems, that is to say, poems of love. perhaps would have detonated most often in the midst of my meditation notes. ...

It was only years later that I remembered those times d'émervaillement en la beauté p. 96 of the world and the one I felt resting inside me. I knew then that this gentleness and beauty I had felt within me, and this power I discovered shortly afterwards that profoundly changed my life, were two inseparable aspects of one and the same thing.

And now I can also see that the gentle, collected, silent aspect of this multiple thing that is creati-

vity in us, spontaneously expresses itself in wonder. And it's also in the wonder of an indi- target beauty revealed by the beloved, that man knows the beloved woman and she knows him. When wonder in the thing explored or in the being loved is absent, our embrace with the world is mutilated of the best that is in it - it is mutilated of what makes it a blessing for oneself and for the world. The embrace that is not wonder is a powerless embrace, a mere reproduction of a gesture of possession. It is powerless to engender anything other than yet more reproductions, bigger or fatter or thicker perhaps, who cares, never a renewal<sup>8</sup> (34). It's when we're children and ready to marvel at the beauty of things in the world and in ourselves, that we're also ready to renew ourselves, and ready as supple, docile instruments in the hands of the Worker, so that by His hands and through us, beings and things may perhaps be renewed.

I well remember that, in the informal group of friends who, for me, represented the mathematical milieu in the late forties and beyond - a milieu that was sometimes noisy and self-assured, and where a somewhat peremptory tone was not uncommon (but without any hint of smugness) - there was always room for wonder. The one in whom wonder was most visible was God-given. Whether he was giving a talk, or simply listening, when the crucial moment came and a sudden breakaway opened up, Dieudonné would be seen beaming and ecstatic. It was pure, infectious, irresistible wonder - where all traces of "me" had disappeared. As I recall him now, I realize that this wonder itself was a power, that it exerted an immediate action all around him, like a radiance of which he was the source. If I've ever seen a mathematician use a powerful and elementary "power of encouragement", it's him! I've never thought about it before, but I remember now that it was also in this way that he had already welcomed

---

<sup>8</sup>(34) **The powerless embrace**

The word "embrace" is by no means a mere metaphor for me, and the common language here reflects a profound identity. It could be said, not without reason, that it's not true then that embrace without wonder is powerless - that the earth would be depopulated if not deserted, if it were so in the literal sense. The extreme case is that of rape, from which wonder is certainly absent, while it happens that a being is procreated in the raped woman. Of course, the child born of such an embrace cannot fail to bear the mark of this embrace, which will be part of the "package" he or she receives and must assume; but this does not prevent a new being from being conceived and born. that there has been **creation**, a sign of **power**. And it's also true that it happens that a mathematician I've seen, filled with sufficiency, finds and proves beautiful theorems, signs of an embrace that has not lacked force! But it's also true that if a mathematician's life is suffocated by his sufficiency (as was to some extent the case in my own life, at one time), the fruits of his embraces with mathematics are a blessing to him and to no-one else. And the same can be said of the father and mother of a child born of rape. When I speak of an "embrace without force", I mean above all the powerlessness to engender **renewal** in the person who believes he is creating, when in fact he is only creating a **product**, something external to him, with no deep resonance within himself; a product which, far from liberating him, creating harmony within him, binds him more closely to the fatuity within him of which he is a prisoner, which ceaselessly pushes him to produce and reproduce. This is a form of impotence at a deep level, behind the appearance of "creativity" which is basically just unbridled **productivity**.

I've also had ample opportunity to realize that **complacency**, the inability to marvel, is in the nature of a true blindness, a blockage of natural sensitivity and flair; a blockage that, if not total and permanent, is at least manifest in certain situations. It's a state in which a prestigious mathematician sometimes reveals himself, in the very things in which he excels, to be as stupid as the most stubborn of schoolchildren! On other occasions, he will perform prodigious feats of technical virtuosity. I doubt, however, that he is yet in a position to discover the simple and obvious things that have the power to renew a discipline or a science. They are far too far below him for him to deign to see them! To see what no one deigns to see, he needs an innocence that he has lost, or banished. . . It's no coincidence, surely, with the prodigious increase in mathematical production over the last twenty years, and the bewildering profusion of new results that overwhelm the mathematician who simply wants to "keep up to date", that (as far as I can judge from the echoes that reach me here and there) there has hardly been any real **renewal**, any far-reaching transformation (and not just by accumulation) of any of the major themes of thought with which I have been even remotely familiar. Renewal is not a quantitative thing, it is foreign to a quantity of investment, measurable in a number of mathematician-days devoted to a given subject by such and such mathematicians of such and such a "level". A million mathematician-days is powerless to give birth to something as childlike as the zero, which has renewed our perception of number. Only innocence has this power, a visible sign of which is wonder. ...

my very first results in Nancy'—resolving questions he had posed with Schwartz (on spaces  $(F)$  and  $(LF)$ ). The results were modest, nothing great or extraordinary, and nothing to marvel at. Since then, I've seen things of a completely different scale dismissed by the unapologetic disdain of colleagues who think they're great mathematicians. Dieudonné was in no way encumbered by such pretensions, justified or not. There was nothing of the sort that prevented him from being delighted even by the little things.

p. 97

There is a **generosity** in this capacity for delight, which is a benefit for those who are willing to let it blossom within themselves, as well as for those around them. This benefit is exercised without the intention of pleasing anyone. It's as simple as the fragrance of a flower, or the warmth of the sun.

Of all the mathematicians I've known, it was in Dieudonné that this "gift" appeared to me in the most dazzling, communicative and perhaps even active way, I can't say<sup>9</sup> (35). But in none of the mathematician friends I've enjoyed making friends with was this gift absent. It found occasion to manifest itself, perhaps in a more restrained way, at any time. It manifested itself every time I came to one of them to share something I'd just found and which had enchanted me.

If I've experienced frustration and sorrow in my life as a mathematician, it's above all in not finding, in some of those I've loved, that generosity I'd known in them, that sensitivity to the beauty of things, "small" or "great"; as if what had made the life of their being quiver had died out without a trace, smothered by the smugness of someone for whom the world is no longer beautiful enough for him to deign to rejoice in it.

Of course, there has also been that other pain, of seeing one of my friends of yesteryear treat another of my friends of today with condescension or contempt. But this pain is inflicted by the same closure, deep down. He who is open to the beauty of a thing, however humble, when he has felt that beauty, cannot help but also feel a respect for the one who conceived or made it. In the beauty of a thing made by the hand of man, we feel the reflection of a beauty in the one who made it, of the love he put into making it. When we feel this beauty, this love, there can be no condescension or disdain in us, any more than there can be condescension or disdain in us.

cannot be condescension or disdain— for a woman, in a moment when we feel her beauty, and the power within her, the sign of which is this beauty.

p. 98

## 9.6. (38) Return impulse and renewal

The rapture that radiated from time to time in Dieudonné's person must have touched something deep and strong within me, so that the memory comes back to me now with such intensity, such freshness, as if I'd just witnessed it again just now. (Although it's been almost fifteen years since I've had the opportunity to meet Dieudonné, except once or twice on the spur of the moment). Of course, I didn't pay any particular attention to it on a conscious level - it was just a slightly touching, at times almost comical, peculiarity of my colleague's expansive personality. What was important to me, however, was to have found in him the perfect collaborator, a dream collaborator I might say, to lay down in black and white, with meticulous care, loving care, what was to serve as the foundation for the vast perspectives I saw opening up before me. It is only at this moment when I evoke both of them that

<sup>9</sup>(35)

This "gift" is nobody's privilege; we're all born with it. When it seems absent in me, it's because I've driven it out myself, and it's up to me to welcome it back. In me or in such-and-such a person, this "gift" expresses itself in a different way than in another, less communicative, less irresistible perhaps, but it's no less present, and I couldn't say if it's less active.

the link suddenly appears to me: what made Dieudonné the ideal servant for a great task, whether within Bourbaki or in our collaboration on another great foundation project, was his **generosity**, the absence of any trace of vanity, in his work and in the choice of his major investments. I have constantly seen him take a back seat to the tasks he has made himself the servant of, lavishing his inexhaustible energy on them without seeking any return. There's no doubt that, without looking for anything in return, he found in his work and in the very generosity he put into it a fulfillment and blossoming that all those who knew him must have felt.

The rapture of discovery that I have so often felt radiating from her person, is immediately associated in me with a similar rapture, which I happened to witness in a very young child. Two memories rush through my mind - both of which take me back to my very young daughter. In the first picture, she must be a few months old, just starting to crawl. She must have dragged herself from the patch of grass where she'd been sitting to a gravel path. She discovered the little gravels in silent ecstasy - and in action, grabbing them with her hands and putting them in her mouth!

p. 99 In the other picture she must have been a year or two old, someone had just thrown pellets into a goldfish bowl. □ The fish swam towards them, mouths wide and mouths wide. open, to swallow the tiny yellow crumbs suspended in the air as they slowly sank into the water. The little girl had never realized before that fish eat the way we do. It was like a sudden dazzle, expressed in a cry of pure delight: "Look, Mommy, **they're eating!** There was indeed much to marvel at - she had just discovered, in a sudden flash, a great mystery: that of our kinship with all other living beings. ...

There's a communicative force in the delight of a little child that eludes words, a force that radiates from him and acts on us, even though we do our best, more often than not, to evade it. In moments of inner silence, we feel this force present in the child at all times. Only at certain moments is its action stronger than at others. It's in newborn babies, in the first days and months of life, that this kind of "force field" around the child is most powerful. More often than not, it remains sensitive throughout childhood, unravelling over the years until adolescence, when there often seems to be no trace left. Yet it can be found radiating around people of all ages, at privileged moments for some, or for others as a kind of breath or halo that surrounds them at all hours. I had the great good fortune to know such a person in my childhood, a man who has now passed away...

I'm also thinking of that other force, or power, that we sometimes feel radiating from a woman, especially at times when she's fulfilled in her body, in communion with it. The word that often comes to mind is "beauty", which evokes one aspect of it. It's a beauty that has nothing to do with canons of beauty or so-called "perfection"; it's not the privilege of youth or maturity. Rather, it's the sign of a profound accord within the person. And yet, it manifests itself in this radiance, a sign of power. It's a force that draws us back to the center from which it emanates - or rather, it calls forth within us a profound impulse to **return** to the body of Mother Woman from which we emerged, at the dawn of our lives. Its action is sometimes irresistibly powerful, overwhelming when it emanates from the woman aimée. But for those who don't deliberately close themselves off to it, elle is perceptible in every woman who allows her inner self to blossom. that beauty, that deep harmony.

p. 100 The force that radiates from the child is closely related to the force that emanates from the woman who loves herself within her body. The one is constantly born of the other, just as the child is constantly born of the Mother. But the nature of the force of childhood is not one of attraction, nor is it one of repulsion. Humble action

that this force exerts on those who do not shrink from it, is an action of **renewal**.

## 9.7. (39) Belle de nuit, belle de jour (or: the stables of Augias)

The memory of wonder in one of my children dates back to the very late fifties and early sixties. If I don't have a similar recollection for other children who were born later, it may be that my own capacity for wonder had dulled, that I had become too distant to commune in the delight of one of my children, or to witness it at all.

I've never yet thought of tracking the vicissitudes of this ability in my life, from childhood to the present day. Surely there would be a common thread here, a "detector" of great sensitivity. If I've never thought of following this thread, it's surely because this ability is of such a humble nature, almost insignificant in appearance, that it would hardly have occurred to me to pay any particular attention to it, absorbed as I was in discovering and probing what I used to call "the great forces" in my life (which continue to manifest themselves even today). And yet, this ability to look so humble provides a sign, of all signs, of the presence or absence of the rarest and most precious "force" within us... .

Throughout my adult life, I was never entirely cut off from this force. However arid my life may have become, I found in love the wonder of the child, the rapture of discovery. Through many deserts, the passion of love remained the living, vigorous link with something I'd left behind, an umbilical cord that silently continued to nourish me with warm, generous blood. And for a long time, too, wonder in the woman I loved was inseparable from wonder in the new beings she gave birth to - those brand-new, infinitely delicate, intensely alive beings who and inherited its power.

□ But my purpose here is above all to follow the vicissitudes of this "force of innocence" through my life as a mathematician, when I was part of the "world of mathematicians", from 1948 to 1970. Surely, wonder has never permeated my mathematical passion to the extent that it does the passion of love. Strangely enough, if I try to recall a particular moment of rapture or wonder in my mathematical work, I can't find any! My approach to mathematics, ever since the age of seventeen when I first became deeply involved in it, has been to set myself big **tasks**. Right from the start, they were always tasks of "tidying up", of cleaning up. I saw an apparent chaos, a confusion of heterogeneous things and sometimes imponderable mists, which obviously had to have a common essence and conceal an order, a hidden harmony that had to be brought out through patient, meticulous and often lengthy work. It was often mop and broom work, for the big jobs that already absorbed a considerable amount of energy, before coming to the finishing touches with a feather duster, which I was less passionate about, but which also had their charm and, in any case, an obvious usefulness. There was an intense satisfaction in the day-to-day work, in seeing little by little the order we had guessed at emerge, which always turned out to be more delicate, with a richer texture than what had been glimpsed and guessed at. The work was constantly rich in unforeseen episodes, most often arising from the examination of what might have seemed an infinitesimal detail that had been neglected until then. Often, the fine-tuning of such a "detail" threw unexpected light on work done years before. Sometimes, too, it led to new intuitions, the deepening of which became the object of another "big task".

So, in my mathematical work (apart from the "difficult year" around 1954 that I've already mentioned), there was constant suspense, and my attention was constantly held in suspense. Fidelity to my "tasks", moreover, prevented me from escaping too far, and I gnawed at my brakes in an impatience to get on with my work.

p. 101

I'd come to the end of them all, and set off into the unknown, the real unknown - even though the scale of these tasks had already become such that even with the help of the good people who'd eventually come to the rescue, the rest of my days wouldn't have been enough to see them through!

p. 102 My main guide in my work was the constant search for a perfect coherence, a complete harmony that I guessed behind the □ turbulent surface of things, and that I patiently strove to draw out. never tired of it. It was surely an old-fashioned sense of "beauty" that was my flair and my only compass. My greatest joy was not so much to contemplate it when it appeared in full light, as to see it gradually emerge from the cloak of shadow and mist in which it was constantly hiding. Of course, I didn't stop until I'd succeeded in bringing it into the clearest light of day. Sometimes, then, I experienced the fullness of contemplation, when all audible sounds contribute to a single, vast harmony. But even more often, what was brought into the light of day immediately became the motivation and the means for a new plunge into the mists, in pursuit of a new incarnation of the One who remained forever mysterious, unknown - constantly calling out to me, to know Her again... .

Dieudonné's pleasure and delight, it seems to me, was above all in seeing the beauty of things manifested in full light, and my joy was above all in pursuing it in the obscure recesses of mists and night. This is perhaps the profound difference between Dieudonné's and my approach to mathematics. The sense of the beauty of things, for a long time at least, must have been no less strong in me than in Dieudonné, although it may have dulled during the sixties, under the action of a fatuity. But it would seem that my perception of beauty, which manifested itself in Dieudonné's sense of wonder, took on different forms in me: less contemplative, more enterprising, less manifest in the emotion I felt and expressed. If this is the case, then my aim is to follow the vicissitudes of my openness to the beauty of mathematical things, rather than the mysterious "gift of wonder".

## 9.8. (40) Mathematics sport

It's quite clear that openness to the beauty of mathematical things never entirely disappeared in me, even in the sixties until 1970, when fatuity gradually took a growing place in my relationship to mathematics and to other mathematicians. Without a modicum of openness to the beauty of things, I would have been incapable of "functioning" as a mathematician, even at my best.

p. 103 modest - and I doubt that anyone can do any useful work in mathematics, if this sense of beauty doesn't remain alive in them, even a little. It is not so much, it seems to me, a pretended "brain power" which makes the difference between one mathematician and another, or between one work and another by the same mathematician; but rather the quality of finesse, of greater or lesser delicacy of this openness or sensitivity, from one researcher to another or from one moment to another in the same researcher. The most profound, the most fruitful work is also that which attests to the most delicate sensitivity for apprehending the hidden beauty of things<sup>10</sup> (36).

If that's the case, then I must believe that this sensitivity must have stayed with me right to the end, at times all the way through to the end.

---

<sup>10</sup>(36)

Such a delicate sensitivity to beauty seems to me intimately linked to something I've had occasion to refer to as "exigency" (with regard to oneself) or "rigor" (in the full sense of the word), which I described as "attention to something delicate in ourselves", attention to a quality of understanding of the thing probed. This quality of **understanding** of a mathematical thing cannot be separated from a more or less intimate, more or less perfect perception of the "beauty" particular to that thing.

at least, since it was at the end of the sixties<sup>11</sup> that I began to catch a glimpse of the most hidden and mysterious mathematical thing I had ever discovered - the thing I called "motif". It is also the thing that has held the greatest fascination for me in my life as a mathematician (apart from certain reflections in recent years, which are intimately linked to the reality of patterns). There's no doubt that if my life hadn't suddenly taken an entirely unexpected course, taking me far away from the serene world of mathematical things, I'd have ended up following the call of this powerful fascination, leaving behind the "tasks" that had until then held me captive!

Perhaps I can say that, in the solitude of my work room, my sense of beauty remained unchanged until my first "awakening" in 1970, unaffected by the fatuity that so often marked my relations with my fellow creatures? A certain "flair" must even have been refined over the years, through daily, intimate contact with mathematical things. The intimate knowledge we can have of things, which sometimes enables us to apprehend beyond what we know in the moment and penetrate further into knowledge - this knowledge or maturity, and this "flair" which is its most visible sign, is closely related to openness to the beauty and truth of things. It fosters and stimulates such openness, and is the sum and fruit of all the moments of openness, all the "moments of truth" that have gone before.

What remains for me to examine, then, is the extent to which a spontaneous sensitivity to beauty has been disturbed to a greater or lesser degree, at times when it had had the opportunity to manifest itself in my relationship with this or that colleague.

□ That which memory delivers to me on this subject is not condensed into a tangible, precise fact, which I could here

p. 104

The memory here again is limited to a kind of fog. Here again, memory is limited to a kind of fog, which nevertheless gives me an overall impression that I must try to pin down. It's the impression left on me by a certain **inner attitude**, which must have become like second nature, and which manifested itself every time I received mathematical information about something that was more or less "up my alley". To tell the truth, in some relatively innocuous way, this attitude must have always been mine, it's part of a certain temperament, and I've had occasion to touch on it in passing. It's about this reflex, of first agreeing to take cognizance only of a **statement**, never of its demonstration, to try first of all to situate it in what is known to me, and to see if in terms of what is known the statement becomes transparent, obvious. This often leads me to reformulate the statement in a more or less profound way, in the sense of greater generality or greater precision, often both at the same time. It's only when I can't "fit" the statement in terms of **my** experience and images, that I'm ready (almost unwillingly at times!) to listen to (or read. . . ) the ins and outs that sometimes give "the" reason for the thing, or at least a demonstration, understood or not.

This is a peculiarity of my approach to mathematics, which, it seems to me, set me apart from all the other Bourbaki members when I was part of the group, and made it virtually impossible for me to fit into a group effort like them. This peculiarity must also have been a handicap in my teaching activity, a handicap that must have been felt by all my students until today, when (with the help of age) it has softened somewhat.

This trait in me is surely already indicative of a lack of openness. It implies only a partial openness, ready to welcome only what "comes to the point", or at least very reticent in welcoming everything else. In the choice of my mathematical investments, and the time I'm willing to devote to

---

<sup>11</sup>(August 8) Once I've checked, it's clear that I started thinking about motifs at the beginning, not at the end, of the sixties.

this or that unexpected information, this deliberate intention of "partial closure" is today stronger than ever. It is even a necessity, if I am to be able to follow the call of what fascinates me ☐le most, without yet giving "my life to devour" to lady mathematics!

However, the "fog" gives me more than just this particularity, which I came to realize a few years ago (better late than never!). At a certain point, this reflex became like a **point of honor**; it would be the devil if I didn't manage to "get" this statement (assuming it wasn't already quite familiar to me) in less time than it takes to say it! If it were an illustrious stranger who was the author of the statement, there'd be the added nuance that **I** (who'm supposed to be in the know, after all!) wouldn't already have all that up my sleeves! And very often I did have it, and more - my attitude then would have tended to go along the lines of: "Well, you can go and get dressed - you'll come back when you've done a bit better!"

That was precisely my attitude in the case of the "young white boy who was stepping on my toes". I couldn't even swear that in what he was doing, there weren't interesting details that weren't covered by what I'd done in my "secret notes" - which is incidental<sup>12</sup> by the way. Finally, this episode also sheds light on the question I'm examining here: that of a profound disturbance in this openness to the beauty of mathematical things. It was as if, from the moment I had "done" such and such a thing, its beauty had disappeared for me, and all that remained was a vanity that claimed credit and profit. (Though I didn't deign to take the time to publish it - admittedly, there would have been too much of that.) It was a typical attitude of possession, analogous to that of a man who, having known a woman, no longer feels her beauty and runs after a hundred others without suffering for all that that another knows her. It was an attitude I disapproved of in love life, believing myself to be far above such vanity, while being careful not to notice the obvious fact that this was indeed my attitude towards mathematics!

I have a feeling that these crude competitive dispositions, "sporting" dispositions if you like, which I've just put my finger on in my person, must have started to become common in "my" mathematical milieu, around the time they were common in me. I'd be hard pressed to situate in time the moment of their appearance, or the one when they became like an intimate part of the air we breathed in this <sup>mi</sup>☐lieu, or the one my students breathed in contact with my person. The only thing I can say is that it must have taken place in the sixties, perhaps as early as the early sixties, or the late fifties. (If so, all my students were entitled to it - take it or leave it!) To place it, I'd need other specific cases, which at the moment escape my memory entirely.

This humble reality was, of course, in complete contrast to the noble image I had of my relationship with mathematics, and with young researchers in general. The crude subterfuge I used to fool myself was meritocratic in inspiration: for this image, all I retained was the relationship with my students (who contributed to my prestige, of which they were the noblest jewels!), and to particularly brilliant young mathematicians, whose merits I had recognized and whom I treated on an equal footing, just like my students, without waiting for their heads to be crowned with laurels (which of course didn't take long - you either have "flair" or you don't!). As for the youngsters who didn't happen to be among my pupils, or among those of a friend of mine, nor to be young geniuses, I didn't care what my relationship with them was. **They didn't matter.**

I think that this reality was more often than not softened, tempered, when I found myself in a relationship with a person.

---

<sup>12</sup>(August 8) It has since dawned on me that this thing is not so "incidental" as all that, that it constitutes the dividing line between "sporting attitude" and the beginnings of dishonesty, a line which I may have crossed... ..

I had a personal relationship with the young researcher, either because I met him at my seminar, or because he wrote to me. It may be that the case of the "young white boy" is, from this point of view, something of an exception. It seems to me that, in the case of the researchers I've just mentioned, I must have considered them as having put themselves "under my protection", and this must have awakened in me a more benevolent attitude. In this case too, my desire to put myself forward could find an outlet, by giving my comments to the person concerned and making suggestions for taking up his work in a broader perspective perhaps, or by getting to the bottom of things. In such a case, there's a good chance that the young researcher, who for a limited time took on the role of pupil, would also find something to enjoy, and that he would have fond memories of his relationship with me. (Any feedback on this subject would be most welcome).

I was thinking here mainly of the case of younger researchers, when the "sporting" attitude was by no means p. 107 limited to my relationship with them, needless to say. But it's certainly in my relationship with young researchers that the impact, both psychological and practical, of a mathematician in the limelight tends to be strongest, with the most far-reaching consequences for their future professional lives.

## 9.9. (41) Krishnamurti, or liberation as hindrance

I stopped last night with a feeling of relief, of great satisfaction, the contentment of someone who hasn't wasted his time! I suddenly felt light and joyful - a slightly mischievous joy at times, bursting into mischievous laughter - the laughter of a joking brat. And yet I hadn't actually done anything, I'd just watched an episode I'd already "known", that of the famous "white boy who . . ." from a slightly different angle. An angle showing **my relationship to mathematics itself**, in certain circumstances, not just my relationship to mathematicians. That's all it took for a cherished myth to go up in smoke.

To tell the truth, this isn't the first time I've looked at my relationship with mathematics. Two and a half years ago, I had already devoted a few weeks or months to it. At that time, I had realized (among other things) the importance of egotistical, self-aggrandizing forces in my past investment in maths. But last night I had just put my finger on an aspect that had escaped me at the time. Now that I'm coming back to it, I realize that this aspect, the aspect of **the jealous attitude** in my relationship to maths, is in line with the "simple" discovery that came at the end of the first night when I "meditated" (meditating without knowing it, like Monsieur Jourdain writing prose. . .). It's quite possible that this had something to do with the joyful exultation that followed. Even if it wasn't consciously perceived, it was a bit like the reconfirmation, in a new light, of something I'd discovered earlier - and the pleasure then is the same as in mathematics, when without having looked for it you come across, by an entirely different means, something you know, that you've found perhaps years before. Each time, it's accompanied by a feeling of intimate satisfaction, as the harmony of things is revealed once again, and our knowledge of them is more or less renewed.

De plus, I think I've really "done the trick" this time! I'd had a feeling for days that he p. 108 there was still something to bring to light, though I couldn't say exactly what. I didn't try to force it, I felt I just had to let it happen, letting the thread I was following unfold freely, through landscapes that were both familiar and unexpected. Unexpected, because until now I'd never bothered to look at them. At a walking pace, I approached the remaining "hot spot". And I think it's the last one, in the journey I've just made, which is coming to an end.

And as soon as I reached this point, I had the impression of someone arriving at a belvedere, from where he can see the whole world unfold.

landscape he has just traversed, of which at any given moment he could still only perceive a portion. And now there's this perception of expanse and space, which is a liberation.

If I try to put into words what the landscape in front of me delivers to me, it comes to this: everything that has come to me, and often unwelcome and unwelcome, in my life as a mathematician in recent years, is the harvest and message of what I sowed, back when I was part of the world of mathematicians.

Of course, I've said this to myself over and over again over the years, and even in the notes I've just written. I've said it to myself, somewhat by analogy with other harvests that have come to me insistently, that I've long rejected and that I've ended up welcoming and making my own. From the very first one I accepted, even before I knew anything about meditation, I understood that every harvest had to have a meaning, and that to balk at it was only to evade a meaning and put off the deadline for a denouement. This knowledge has been precious to me, for it has often kept me from self-pity, and from the righteous indignation that is often a disguised form of it. This knowledge is in me like a half-maturity, which by no means yet puts an end to the inveterate reflex of refusing harvests when they seem bitter. When I say to myself "there's no point in begrudging", the harvest is not welcomed for all that. I don't pity myself or perhaps feel indignant, and yet I "balk"! Until the dish is eaten, it is not welcomed - and not to eat is to begrudge.

p. 109

To host and eat is a **job**: a certain energy  $\square$  "works", a job is done in broad daylight or in the shade, something is transformed... . Whereas reluctance is a waste of energy that is dispersed - to "begrudge"! And you can't do without the work of eating, digesting and assimilating. The mere fact of going through events, of "doing" or "acquiring" an experience, has nothing in common with work. It's simply possible **material** for a job that you're free to do, or not to do. In the thirty-six years since I first encountered the world of mathematicians, I've made use of the freedom I have by **avoiding** work, while the material, the substance to be eaten and digested, has increased year by year. The feeling of joyful liberation I've been experiencing since yesterday is surely a sign that the work I've been putting off in favor of other work or tasks has finally been done. It's about time indeed!

It's still too early to be sure that this is indeed the case, that there isn't some stubbornly obscure corner that has escaped my attention, to which I'll have to return. But it's also true that this feeling of liberation doesn't deceive - every time I've felt it in my life, I've been able to see afterwards that it was indeed a sign of **liberation**; of something lasting, acquired, the fruit of an understanding, a knowledge that has become a part of myself. I am free, if I please, to ignore this knowledge, to bury it where and how I please. But it is not in my power or anyone else's to destroy it, any more than you can destroy the ripeness of a fruit, make it return to a state of greenness that is no longer its own.

It's a great relief to have it confirmed, once again, that I'm not "better" than the others. Of course, this too is something I repeat to myself quite often - but **repeating** and **seeing** are definitely not the same thing! Lacking the innocence and mobility of a child who sees as he breathes, it often takes work to see the obvious - and now I've finally **seen** it: I'm not "better" than certain colleagues or ex-students who, just a few days ago, were "taking my breath away"! Judge the weight I've been relieved of! Perhaps it's gratifying in a way to think oneself better than others.

But it's also very tiring. It's an extraordinary waste of energy even - as it is every time you have to maintain a fiction. It  $\square$  rarely occurs to us, but it already takes energy, just

p. 110

to maintain the fiction against all odds, while the evidence at every step proclaims in my carefully plugged ears that it's all fake, so look stupid! Maybe it's a job sometimes to see,

but when it's done, it's done. It saves me, once and for all, having to walk around plugging my eyes and ears all the time - that's got to be done too! and having to suffer an intolerable outrage every time something falls on me that I've inadvertently put there.

Fed up with the ride! Once you've seen the merry-go-round, you're already off it. You've paid, okay, I've got the right to go for life on it, and even the duty to do so, as everyone will tell me: right, duty - it's up to the customer. It's very tiring too, all these rights that are duties and all these duties that are rights, which stick to me when I think I'm better than the others. It's normal after all, when you're better, you cash in discreetly (that's "rights") and you "pay", you do your duty for the honor of the human spirit and mathematics - it's very beautiful, it's true, honor, spirit, mathematics, who could say it better, bravo! bis! It's all very beautiful, but it's also very tiring, and ends up giving you a stiff neck. I've had my torticollis and now that's enough - I leave room for others to stand stiffly.

It's also normal (since I was talking about students) for the student to surpass the teacher. I was offended by it, I had energy to waste! No more of that!

What a relief!

### 10.1. (42) The child

In fact, there must be corners where the broom hasn't been. Never mind, they'll come to my attention, and I'll always have time to take care of them. But as for my famous "mathematician past", the big clean-up is done, no doubt about it.

Now that I've seen once again that I'm no better than the others, I shouldn't I don't want to fall back into the same old trap of thinking I'm **better than I am**! To think I'm better **now**, off the merry-go-round and all, than I was fifteen years ago, or fifteen years ago, or fifteen years ago. days. I learned something□chose during those fifteen years, that's for sure, and during the fortnight too and even p. 111 since yesterday. When I learn something I mature, I'm not quite the same. I'm not "better" when I've learned something, than when the thing to be learned was still in front of me. A riper fruit is not "better" than a less ripe or green one. A season is not "better" than the one before it. The taste of the ripest fruit may be more pleasant, or less pleasant, depending on taste. I feel better about myself from one year to the next, so I guess the changes in me are "to my liking" - but they're not to the liking of all my friends and family. Every time I go back to doing maths, I get compliments from all sides, like: "What an idea he had to do something else! Everything's back in order, it's about time! It's worrying to see someone change... .

I learn, I mature, I change - so much so that sometimes I find it hard to recognize myself in the person I was and am rediscovering, through a memory or the unexpected testimony of others. I change, and there's also something that remains "the same". It's always been there, probably since birth, and maybe even before. I seem to have come to recognize it quite well in recent years. I call it "the child". By this thing, I'm no better at this moment than at any other time in my life; he was there, even if it would often have been difficult to guess his presence. By this thing too, I'm no better than anyone else, and no one else is better than me. In certain moments or in certain people, the child is more present. And that's a very good thing. It doesn't mean that someone is "better" than someone else, or than themselves at another moment.

Often, when I'm doing math, or making love, or meditating, it's the child who's playing. He's not always the only one "playing". But when he's not there, there's no math, no love, no meditation. You don't have to pretend - and I've rarely pretended.

p. 112

It's not just the child, that's for sure. There's the "me", the "boss" or the "big boss", call him what you will. Surely the boss is indispensable to the running of the company. If there's a boss, it must be have something to do with it. He looks after the housekeeping, and like all bosses, he has an annoying tendency to become intrusive. He takes himself terribly seriously and wants at all costs to be better than the boss on the other side. face. Invasive or not, he's just the boss, not the worker. He organizes, he orders, and he cashes in, that's for sure! - He takes profits as his due, and suffers losses as an outrage. But he creates nothing. Only the worker has the power to create, and the worker is none other than the child.

It's rare to find a company where boss and worker get along. More often than not, the worker is nowhere to be seen, locked away in God-knows-where. It's the boss who has pretended to take his place in the workshop, with the results we can only guess at. And often, when the worker is actually there, the boss wages war on him, either violently or through skirmishes - not much comes out of the workshop! Sometimes, too, there's a wary tolerance in the boss towards the worker, and he lets him get on with it, grumbling, without taking his eyes off him. It's like a constantly renewed truce in a war that has never ceased. And the worker is able to get some work done, thanks to the truce.

It's not at all certain that, by virtue of the meditation I've just made, my possessive attitude towards mathematics has magically disappeared! At the very least, I'd have to take a much closer look at the manifestations of possessiveness, one of which I've just touched on by name. This is not the place for this "introduction", which has become an "introductory chapter", which in turn is already getting long! One thing did click last night, however, and I'd like to come back to it now, something I'd noted with some surprise two or three years ago.

I was working on a mathematical question, I don't know what it was, and at some point (through some circumstance) it occurred to me that the question I was looking at had perhaps already been looked at, that it might well be dealt with in black and white in some book that it was up to me to consult in the library. The mere mention of this possibility had an astonishing effect: from one moment to the next, the desire had disappeared. Suddenly, the question I'd perhaps spent weeks thinking about, and was prepared to spend weeks more, had lost all interest for me! It wasn't spite, it was a sudden and total lack of interest. If I'd had the book in my hands, I wouldn't have bothered to open it.

p. 113

In fact, the eventuality was not confirmed, and so the desire ☐reappeared and I continued on my way. as if nothing had happened. Still, I was taken aback. Of course, if I'd really **needed** what I was doing to do **something else**, there wouldn't have been such a dramatic drop in interest. I've often redone familiar things, knowing or suspecting that they were familiar, without giving them the slightest thought. At the time, I was on a path where it was more economical, and much more interesting, to do things my way, as they presented themselves to me, than to go digging through books or articles. I would do it "in the stride" towards something else, towards which the desire would carry me. And of course, I was "in the know" enough to know that what was at the end was not to be found in any book or article.

This reminds me that mathematical work, even if done in solitude for years on end, is **not** a purely personal, individual endeavor, as meditation is - at least not for me. The "unknown" that I pursue in mathematics, for it to attract me with such force, must not only be unknown to me, but unknown to everyone. What is written in mathematical books is not unknown, even if I myself have never heard of it. Reading a book or an article has never attracted me; I've avoided it whenever I could. What it can tell me is never the unknown, and I've never heard of it myself.

the interest I take in her doesn't have the quality of desire. It's an "interest" of circumstance, an interest in a **information** that can be useful to me, as an instrument of a desire of which it is in no way the object.

On reflection, it doesn't seem to me that the event I reported was the sign of a jealous, possessive disposition, the sign of a vanity that had been disappointed. There was no spite or disappointment in me, simply the sudden disappearance of a desire that, just the moment before, had been intense. This was at a time when I had absolutely no thought of publishing anything, nor of ever wanting to publish again. This desire was not an expression of vanity, of the craving to accumulate knowledge, titles and credits - it was a real desire, the desire of a child passionate about play. And suddenly - nothing! Understand who can, I don't. ... Sorry!

## 10.2. (43) The troublemaker boss - or the pressure cooker

□ I feel I have finally completed this retrospective of my life as a mathematician. Of course, I haven't not exhausted my subject - volumes would be needed, assuming such a subject could be "exhausted". That wasn't my point. My point was to get to the bottom of whether or not I'd been part and parcel of the appearance of a certain "air" that I now feel in puffs, and if so, in what way. Now I know for sure, and it feels good. It could be fascinating to go further, to go deeper into what has only been glimpsed or touched upon. There are so many exciting things to look at, to do, to discover! As far as my past as a mathematician is concerned, it seems to me that what I **needed** to look at, to take on that past, has been seen.

p. 114

Undoubtedly, as I went deeper into this meditation, I would learn many interesting things about my present. One thing that this work has made me feel almost every step of the way is the extent to which I have remained attached to this past, the importance it has had to this day in my self-image, and also in my relationship with others; especially in my relationship with those I have, in a certain sense, left behind. My relationship with this past has undoubtedly been transformed in the course of this work, in the sense of a detachment, or a greater lightness. Time will tell. But it's likely that an attachment will remain, as long as my mathematical passion is not burnt out and quenched - as long as I "do maths". And I don't care to guess or predict whether it will die out before I do... .

For more than ten years, I had believed this passion to be extinct. It would be truer to say that I had **decreed** it extinct. That was the day I stopped doing maths for a while, and rediscovered the world! For three or four years, I was absorbed in an activity so intense that my old passion couldn't have found the slightest gap to slip through to manifest itself. These were years of intense learning, at a certain level that remained rather superficial. In the years that followed, mathematical passion manifested itself in sudden, totally unexpected bursts. These would last a few weeks or months, and I would stubbornly ignore their clear meaning. I'd decided once and for all that my craving for maths, which was decidedly good for nothing, was now a thing of the past, period! But the "good-for-nothing" didn't hear it that way - and I remained deaf.

□ Which may seem paradoxical, it was after the discovery of meditation (in 1976), with the entry of a new passion in my life, that the reappearances of the old one were particularly strong, almost violent - as if each time a lid popped off under too much pressure. It was only five years later, under the pressure of events, to put it mildly, that I took the trouble to examine what was going on. It was the longest meditation I've ever done on a seemingly well-defined issue: it took me six months of intense, stubborn work to get around a kind of iceberg,

p. 115

the visible summit of which had finally become embarrassing enough to force me, almost unwillingly, to go and have a look. I was faced with a situation of **conflict**, which appeared to be the conflict of two forces or desires: the desire to meditate, and the desire to do maths.

In the course of this long meditation, I learned step by step that the desire to do math, which I treated with disdain, was, just like the desire to meditate, which I valued to the hilt, a child's desire. The child has nothing to do with the disdain or modest pride of the big boss! The child's desires follow one another, as the hours and days go by, like the movements of a dance arising from one another. Such is their nature. They are no more opposed than the stanzas of a song, or the successive movements of a cantata or fugue. It's the bad conductor who declares one movement "good" and another "bad", creating conflict where there is harmony.

After this meditation, the boss has calmed down and is less inclined to stick his nose where it doesn't belong. The work this time was long, whereas I thought it would be done in a few days. Once the work is done, the "result" seems obvious, and can be summed up in a few words<sup>1</sup> (37). But if someone had said these words to me before or during the work, it probably wouldn't have done me any good. If the work took so long, it's because the resistance was strong and deep-rooted. The boss got a kick out of it, and he never batted an eyelid, because it was all done in an atmosphere where there was no way he'd get angry. One thing's for sure, it was a busy six months, and I couldn't have done without it; any more than a woman can do without the nine months of pregnancy to finally give birth to something as "obvious" as a toddler.

### 10.3. (44) The steam is reversed.

p. 116

□ It's been a year and a half since I meditated, apart from a few hours in December, to clear up an urgent question. And it's been a year since I invested most of my energy doing maths. This "wave" came like the others, math waves or meditation waves: they come without announcing their arrival. Or if they do, I never hear them! The boss has a slight preference for meditation, it seems: each time the meditation-wave is already followed by a maths-wave, whereas I thought it would last forever; and the maths-wave, which (it seemed to me) was a matter of a few days or weeks at most, lingers on and extends over months and maybe even, who knows, years. But the boss has come to understand that it's not he who makes these rhythms, and that he has nothing to gain by trying to regulate them.

But perhaps there has finally been a shift in the boss's "little preference", since it's been almost a year since it was agreed and decided, that I'd be away for at least a few years "doing maths again", officially so to speak: I've even applied for a position at the CNRS! More importantly, and entirely unexpected a year ago, I'm back to publishing. Even after the 1981 meditation I mentioned earlier, when the urge to do maths ceased to be treated as a poor relation, the idea would never have occurred to me that I might start publishing maths again. At a pinch, a book about meditation, or dreams and the Dreamer - and even then, I was far too busy with what I was doing to publish anything about math.

---

<sup>1</sup>(37)

I hardly need to add, I think, that this long-term work has brought out, day by day, much more than the "result" I've just delivered in lapidary form. It's no different for a work of meditation than it is for a mathematical work motivated by a particular question that we set out to examine. Very often, the twists and turns along the way (which may or may not lead to a more or less complete clarification of the initial question) are more interesting than the initial question or the "final result".

feel like writing a book about it! And for what?!

It was a rather important decision, one that would affect the course of my life for years to come, and one that was taken somewhat on the spur of the moment, I'm not even sure when and how. One day, when there began to be a good deal of typed notes (I'll say! until then

I had confined myself to handwriting my mathematical cogitations...<sup>2</sup> (38), on homotopic fields and models, etc. ... it turned out to be a done deal: we're publishing this! And while we're at it, we might as well pull out all the stops and start a little series of mathematical reflections, the name of which was a no-brainer - all we had to do was capitalize it: "Réflexions Mathématiques" (Mathematical Reflections)! That's more or less what I'm getting back in this :

the famous "fog" that so often takes the place of a memory. I'm sure it's a very abbreviated memory

□I occurrence. The remarkable thing, in any case, is that this thing was done without even a pause to **look at** where I was going, what was pushing me, what was carrying me... . That's what I'd like to do again, on the momentum of this unexpected meditation, so that I can feel it's really finished.

p. 117

The question that immediately springs to mind: is this "remarkable thing" I've just noticed a sign of the (so-called?) "discretion" of the boss, who wouldn't dream of interfering (even with an indiscreet glance . . . ) in such a beautiful spontaneous movement that has no need of him etc. . . ; or is it a sign, on the contrary, that he's taken sides outright, and that the so-called "little preference" is pushing him all the way in the maths direction?

It was enough to put the question in black and white for the answer to appear! It's not the kid, who's in for a longer game than most, perhaps, who's decided that he's going to continue for X number of years without a hitch, and wisely fill in as many pages as it takes to make a reasonable number of volumes in a beautiful series with capital letters! The boss has planned and organized everything, and all the kid has to do is get on with it. Maybe the kid won't ask for anything better - there's no way of knowing in advance - but that's an incidental question. The kid's desires depend, to a certain extent at least, on the **circumstances**, which depend above all on the boss.

The boss has clearly made up his mind. In fact, he's just shown a certain flexibility, since a meditation has been going on under his benevolent eye for over a month now. It's also true that his benevolence is by no means disinterested, since the tangible product of the meditation, the notes I'm currently writing, will be the most beautiful cornerstone of the tower he already sees himself building, with the stones gracefully cut by the apparently willing child-worker. Decidedly, it's a little early to be complimenting him on his "suppleness"! A few hours of meditation three months ago, and all in all a year from now! and a half, that's pretty thin!

Yet I don't have the impression that there was, during all this time □ a desire for meditation that would have been p. 118 repressed, frustrated. In the few hours in December, I took stock and saw what I had to see; that was enough to transform a situation, which hadn't been clear. I resumed the thread of the interrupted mathematical work, without having to cut short anything else. It doesn't seem to me that a conflict has reappeared, I mean, the one that had been resolved over two years ago and which would have reappeared this time in reverse form. It's in the boss's nature to have preferences, and that's his right - it would be silly for him to pretend not to (although sillier things happen than that. . . ). It's not a sign of conflict, even though it's often the cause of it. As things stand, there really doesn't seem to be any need to

<sup>2</sup>(38)

These notes were in fact a continuation of the long letter to... which became the first chapter. They were t y p e d so as to be legible for this old friend, and for two or three others (Ronnie Brown in particular) whom I thought might be interested. This letter, by the way, was never answered, nor was it read by the addressee, who almost a year later (when I asked him if he'd received it) expressed sincere astonishment that I'd even thought for a moment that he could read it, given the kind of mathematics that was to be expected of me. ...

blame for lack of flexibility!

With that out of the way, it remains for me to try and pinpoint the boss's "motivations" for this turnaround, which took place as discreetly as possible but which, on closer inspection, is quite spectacular.

## 10.4. (45) Le Guru-pas-Guru - or the three-legged horse

This brings me back to a meditation I'd been doing from July to December 1981, after a four-month period of mathematical frenzy. This somewhat insane period (very fruitful, by the way, from a mathematical point of view<sup>3</sup> (39)) had ended, overnight, following a dream. It was a dream that described, in a parable of irresistible wildness, what was happening in my life - a parable of this frenzy. The message was dazzlingly clear, yet it took me two days of intense work to accept its obvious meaning<sup>4</sup> (40). Once that was done, I knew what I had to do. I didn't return to this dream in my work for the next six months, but I was doing nothing more than penetrating its meaning and fully assimilating its message. The day after the dream, the message was understood on a level that remained superficial and crude. What I needed to deepen, above all, was "my" relationship; that of the boss, I mean, to both of the two desires involved, which appeared to me to be antagonistic.

So much has happened in my life since that meditation, that it seems to me to be in the very distant past. If I try to formul<sup>er</sup> what I took away from what it taught me about motiva-

p. 119

In the twelve years since the "first awakening" (in 1970), the boss had bet on what was obviously "the wrong horse": **between mathematics and meditation** (which he liked to pit one against the other), **he had opted for meditation.**

That's one way of putting it, since the thing and the name "meditation" had only entered my life in October 1976, five years earlier. But in the beloved image of myself that had been given a fresh coat of paint in 1970, meditation had come at just the right moment, six years later, to enhance a certain attitude or pose, long spotted but never examined until that 1981 meditation. I called it my "master's syndrome", and some have (rightly) called it my "Guru pose". If I adopted the former designation rather than the latter, it was undoubtedly because it fostered a confusion about the nature of the thing, in which I liked to maintain myself. From my earliest childhood, I'd always had a spontaneous pleasure in teaching, which was in no way opposed to the spontaneous pleasure in learning, and which had nothing to do with my own personal interests.

---

<sup>3</sup>(39)

This was the period, among others, of the "Long Walk through Galois theory", discussed in "Esquisse d'un Programme" (par. 3: "Corps de nombres associés à un dessin d'enfant").

<sup>4</sup>(40) **The visit**

The work on this dream is the subject of a long letter in English, to a friend and colleague who had dropped in on me the day before. Some of the materials used by the Dreamer, to bring this strikingly realistic dream out of apparent nothingness, were obviously borrowed from that short episode of the visit of a dear friend I hadn't seen for nearly ten years. So, on the first day of work and against my previous experience, I thought I could conclude that the dream that had come to me concerned my friend more than it concerned me - that it was **he** who should have had the dream, not me! It was a way of evading the message of the dream, which (I should have known from my past experience) concerned no one but me. I finally realized this in the night following this first, superficial phase of the work, which I resumed the next day in the same letter. Since that memorable letter, I have received no further sign of life from this friend, one of the closest I have ever had.

This work was the only meditation that took the form of a letter (and in English to boot), so I no longer have a written record of it. I was particularly struck by this episode, one of many that show how any sign of work that goes beyond a certain façade, and brings to light simple facts that we generally make a point of ignoring - how any such work inspires unease and fear in others. I'll come back to this later (see par. 47, "The solitary adventure").

nothing of a pose. It was this strength above all that was at play in my relationship with my students; this relationship was superficial, but it was strong and good-natured, by which I mean: without pose. It was after what I called my "awakening" in 1970, when a world that had been familiar to me was receding to the point of almost disappearing, and with it the students and the opportunities I had "to teach", to share things I knew and which for me had meaning and value - that "the boss" took his revenge as best he could: instead of teaching maths, which was just a good way to earn a living, but otherwise unworthy of my new greatness, I saw myself teaching a certain "wisdom" by life and example. I was careful, of course, not to say anything of the sort to myself or others, and when I received echoes in this direction, I surely had to recuse myself, pained by so much incomprehension on the part of such friends or relatives. No matter how many times I explained it to them, they still didn't get it - sorry pupils if ever there was one!

I had read a book or two by Krishnamurti that had made a strong impression on me, and my head had assimilated in a jiffy a certain message and certain values<sup>5</sup> (41). That was all it took to believe that everything was

p. 120

#### <sup>5</sup>(41) Krishnamurti, or liberation turned hindrance

It would be inaccurate to say that the only thing I took away from this reading was a certain vocabulary, and a propensity to make it my own and finally substitute it, as it should be, for reality. The reason I was so struck by Krishnamurti's first book (even though I'd only had the chance to read a few chapters) was that what he was saying totally overturned a number of things I'd always taken for granted, and which I immediately realized were **commonplaces** that had always been part of the air I'd breathed. At the same time, this reading drew my attention, for the first time, to far-reaching facts, especially that of flight from reality, as one of the most powerful and universal conditioning of the mind. This gave me an essential key to understanding situations that until then had been incomprehensible and therefore (without my realizing it until I discovered meditation five or six years later) generating anguish. I could immediately see the reality of this escape all around me. This eased some of my anxieties, without changing anything essential, because I could only see this reality in others, while taking it for granted that it didn't exist in myself, that I was the exception that confirmed the rule (and without asking myself any further questions about this truly remarkable exception). In fact, I was in no way curious about myself or others. This "key" can only **open in the hands** of the person motivated by the desire to penetrate. In my hands, it had become an exorcism and a pose.

It was at the beginning of 1974 that, for the first time, I realized that the destruction in my life, which was following me step by step, couldn't have come from others **alone**, that there was something **within me** that was attracting it, feeding it, perpetuating it. It was a moment of humility and openness, conducive to renewal. But the renewal remained peripheral and ephemeral, for lack of in-depth **work**. This "something inside me" was still vague. I could see that it was a lack of love, but the very idea of working to identify more closely where and how there had been a lack of love in me, how it had manifested itself, what its concrete effects had been, etc. . - (On the contrary, K. likes to insist on the vanity of all work, which he automatically equates with the ego's "craving to become"). So, with borrowed "wisdom" as my compass, I saw nothing to do but wait patiently for "love" to descend upon me like a grace from the Holy Spirit.

And yet, the humble truth I had just learned at the end of a wave had triggered the rise of a powerful wave of new energy, comparable to the one that was to carry me through my first foray into meditation two and a half years later. This energy did not remain entirely unused. A few months later, when I was immobilized by a providential accident, it led to a (written) reflection in which, for the first time in my life, I examined the worldview that had been the unspoken basis of my relationship with others, and which came to me from my parents and especially my mother. I realized very clearly that this vision had gone bankrupt, that it was incapable of accounting for the reality of relationships between people, and of fostering personal fulfillment and relationships with others. This reflection remains marked by the "Krishnamurti style", and also by the Krishnamurtian taboo on any real **work** towards understanding. It did, however, make tangible and irreversible a knowledge born a few months earlier, which at first remained vague and elusive. No book or other person in the world could have given me this knowledge.

To have the quality of a meditation, what this reflection lacked above all was a look at myself and my **vision of myself**, and not just my vision of the world, a system of axioms where I wasn't really "in the flesh". It also lacked a look at myself in **the moment**, at the very moment of reflection (which fell short of a real work); a look that would have led me to detect not only a borrowed style, but also a certain complacency in the literary aspect of these notes, a lack of spontaneity and authenticity. Insufficient though it was, and relatively limited in its immediate effects on my relationships with others, this reflection nonetheless seemed to me to be a step - probably a necessary one, given the starting point - towards the more profound renewal that was to take place two years later. It was then that I discovered meditation - and discovered that first unsuspected fact: **that there were things to discover about myself** - things that almost completely determined the course of my life and the nature of my relationships with others. . .

(while pretending otherwise, of course). I didn't need to read any more, I was able to improvise the purest Krishnamurti in speech and writing, in a speech of flawless coherence. But no matter how beautiful and flawless the discourse, at no point did it seem to be of any use to me or anyone else. It went on for years without me even pretending to take any notice. With the discovery of meditation, the jargon fell away from me overnight, without a trace. I knew then the difference between talk and knowledge.

The big boss immediately rectified the situation: Krishnamurti out, meditation in! Discreetly, needless to say, he now had to play the game with a completely different touch. Times had changed, with this kid now running between his legs, and a bit sharp-eyed at times. I guess the kid was busy elsewhere. In any case, it was only five years later, when a certain pot had exploded and the kid had run to see what was going on, that the great chef's scheme was revealed.

It wasn't so long ago after all, just over two years ago, that the Guru-without-an-air was finally stale - one more disguise down the drain! The poor boss was about to be stripped naked. Or to put it another way: the "Meditation" horse, which had taken the place of the horse with no name (which was definitely not to be called "Krishnamurtian"! ) was making really derisory returns, especially when compared with the coquettish returns of the "Mathematics" horse in the days when the boss was still betting on him. If he maintained the wrong bet for so long, it was out of sheer inertia - he'd already changed his bet once, which isn't all that common, and it took the full impact of an impacting event<sup>6</sup> (42). Bosses don't really like to change bets - and in this case, it was a sort of going back to the previous bet.

It was in 1973, when I retired to the countryside, that the returns from the new horse began to be really meagre compared to the old one. The unexpected appearance of meditation three years later gave them a bit of a boost. There was even the episode of a vertiginous peak from March to July.

---

### <sup>6</sup>(42) The salutary snatch

"The "percussive" event in question was the discovery, at the end of 1969, that the institution I felt part of was partially financed by funds from the Ministry of the Armed Forces, something which was incompatible with my basic axioms (and still is today). This event was the first in a whole chain of others (each more revealing than the last!) which had the effect of: my departure from the IHES (Institut des Hautes Etudes Scientifiques), and one thing leading to another, a radical change of environment and investments.

During the heroic years of the IHES, Dieudonné and I were the only members, and the only ones to give it credibility and an audience in the scientific world: Dieudonné through the publication of "Publications Mathématiques" (the first volume of which appeared in 1959, the year after Léon Motchane founded the IHES), and I through the "Séminaires de Géométrie Algébrique". In those early years, the IHES' existence was very precarious, with an uncertain financing (thanks to the generosity of a few companies acting as patrons) and with its only premises a room lent (with visible bad humor) by the Fondation Thiers in Paris for the days of my seminar [*A recent brochure published by the IHES on the occasion of the twenty-fifth anniversary of its foundation (of which Nico Kuiper was kind enough to send me a copy) says nothing about these difficult beginnings, perhaps unworthy of the solemnity of the occasion, celebrated with great pomp last year.*]. I felt a bit like a "scientific" co-founder, with Dieudonné, of my home institution, and I intended to live out my days there! I had ended up identifying strongly with IHES, and my departure (as a consequence of my colleagues' indifference) was experienced as a kind of uprooting from another "home", before proving to be a liberation.

Looking back, I realize that there must already have been a need for renewal within me, I just can't say how long ago. It's surely no mere coincidence that the year before I left IHES, there was a sudden shift in my investment of energy, leaving behind the tasks that had been burning in my hands the day before, and the questions that fascinated me most, to throw myself (under the influence of a biologist friend, Mircea Dumitrescu) into biology. I was embarking on this with a view to making a long-term investment in the IHES (which was in keeping with the multidisciplinary vocation of this institution). Surely this was no more than an outlet for the need for a much more profound renewal, which could not have been achieved in the "scientific incubator" atmosphere of the IHES, and which took place during that "cascade of awakenings" to which I have already alluded. There have been seven, the last of which took place in 1982. The "military funds" episode was providential in triggering the first of these "awakenings". The Ministry of the Armed Forces and my ex-colleagues at IHES were finally grateful to me!

1979, which I won't go into here, where once again I pre-<sup>121</sup>sent the figure of an apostle, this time an apostle of a sa-

gesse immémoriale et nouvelle à la fois, chantée dans un ouvrage poétique de ma composition et que je me abstenu finalement de confier aux mains d'un éditeur<sup>7</sup> (43). But two years later, with the Guru definitively out of action, it was as if the Meditation horse had broken a leg (as far as returns to the boss were concerned) - there was no way, fingering or no fingering, to play the Gurus!

After that, it wasn't long - the three-legged horse down the hatch, along with the Apostle-Poet, The Guru-not-Guru and Krishnamurti-who-dare-not-say-his-name. And long live Mathematics!

We look forward to what happens next. ...

---

<sup>7</sup>"The poetic work of my composition" contains much that I know first-hand, and which today appears to me to be just as important in my life, and "in life" in general, as when it was written, with the intention of publishing it. If I refrained from doing so, it was mainly because I later realized that the form was afflicted by a deliberate intention to "make poetic", so that its overly constructed overall conception, and many passages, lack spontaneity, to the point at times of painful stiffness or swelling. This form, ampoule at times, was a reflection of my dispositions, where it was decidedly often the "boss" who led the dance - heavily, it goes without saying... .

### 11.1. (46) The forbidden fruit

I had to stop writing for two days. After careful rereading, it seems to me that the above scenario is indeed, roughly speaking, a description of reality, a description that I'd now have to delve into a little more. In particular, I'd have to take a closer look at the respective merits of the two "horses" meditation and mathematics; and also try to understand which events or conjunctures ended up triggering the "swing" in the boss's wager, against the forces of inertia that would rather push him to keep a losing wager indefinitely.

Perhaps we should also sound out the kid's preferences. It's an established fact that he wants to change games from time to time, and the boss apparently has a modicum of flexibility so as not to force him to always play this and never that. Over the last few years, he's learned to take the kid into account, to work with him, without waiting for pots to explode. It's not complete harmony, but it's no longer war, more a kind of entente cordiale, which occasional tensions tend to soften, not harden.

When he's not too hard up against it, the kid is by nature quite flexible in his preferences. (Unlike the boss, who eventually learned a modicum of flexibility only unwillingly and in his old age... .) But just because the kid's flexible doesn't mean he doesn't have a preference of his own, which he'll be happy to accept.

is attracted more strongly to one thing than to another.

It's often hard to see clearly, to distinguish between the kid's desires and preferences or even what the boss has decided once and for all. When I used to say to myself: meditation is better, more important, more serious and all that than mathematics, for such and such reasons (the most pertinent, no doubt), it was the boss who gave himself good reasons afterwards to convince himself that the bet he was making was indeed "the right one". The kid doesn't say that one thing is "better" or "more important" than another. He's not one for speeches. When he feels like doing something, he just goes ahead and does it if no one is in his way, without questioning whether it's "important" or "better". His desires vary from one thing to another and from one moment to the next. To detect his preferences, it's no use listening to the boss's explanatory speeches, when he claims to speak for the kid when he can only speak for himself. It's only by observing the kid at play that we can identify his preferences.

p. 122

can perhaps detect his predilections. And even then, it's not so obvious: when he plays this with gusto, it doesn't always mean that he wouldn't play something else with delight, if the boss didn't give him a helping hand.

Clearly, what attracts him above all else is **the unknown** - to pursue into the nebulous recesses of the night and bring into the open that which is unknown to him and to everyone else. And I have the impression that when I added "and everyone else", I was referring to the child's desire, not the boss's vanity, who wants to impress the gallery and himself. It's also a well-known fact that what the kid brings back every time from the shadows of inexhaustible attics and cellars are "obvious", childlike things. The more obvious they seem, the happier he is. If they're not, it's because he hasn't done his job to the end, that he's stopped halfway between darkness and daylight.

In maths, "obvious" things are also things that sooner or later someone **has to** stumble upon. They're not "inventions" that you can do or not do. They're things that have always been there, that everyone comes into contact with without paying any attention to them, even if it means taking a long detour around them, or going over them.

p. 123 stumbling every time. After a year or a thousand, infallibly, someone ends up paying attention to the thing, digging around it, digging it up, looking at it from all sides, cleaning it up, and finally giving it a name. This

kind of work, my work of choice, another could do it every time, and what's more, another could do it every time.

**was bound to do so** at some point<sup>1</sup> (44).

It's a completely different story when it comes to self-discovery, in the non-collective game of "meditation". What I discover, no other person in the world, today or at any other time, can discover for me. It's up to me alone to discover it, which also means: to **assume it**. This unknown is not destined to be known, almost by force of circumstance, whether or not I take the trouble to be interested in it. If it waits in silence for the moment when it will be known, and if sometimes, when the time is ripe, I hear it calling, it is only I, the child in me, who is called to know it. He's not a stranger on borrowed time. Of course, I'm free to follow his call, or to evade it, to say "tomorrow" or "someday". But the call is addressed to me and to no one else, and no one but me can hear it, no one else can follow it.

Every time I've followed this call, **something has changed in the "company"**, more or less. The effect has been immediate, and immediately felt as a blessing - sometimes, as a sudden release, an immense relief, from a weight I was carrying without even realizing it, and whose reality is manifested by this relief, this liberation. On a smaller scale, such experiences are common in any work of discovery, and I've had occasion to talk about them. What distinguishes the work of self-discovery (whether it takes place in the open or remains underground) from any other work of discovery, however, is precisely that it really changes something in the "business" itself. It's not a quantitative change, an increase in output, or a difference in the size or even quality of the products leaving the workshop. It's a change in the **relationship between boss and worker-child**. Perhaps there's even a change in the boss himself, if that means anything other than his relationship with the worker-child. For example, he may look less at production - but this is also an aspect of his relationship with the worker, through the emergence of a concern or respect that had previously been foreign to him. In every case in which I meditated, the change was in the

p. 124 □ The new regulations are intended to **clarify** and **calm** relations between management and labor. Except in certain cases

where meditation remained superficial, "circumstantial" meditations under the sole pressure of an immediate and limited need, clarification has lasted until today, and so has appeasement.

<sup>1</sup>Needless to say, I'm disregarding the hypothesis - by no means improbable, to say the least - of the unexpected eruption of an atomic war or some other such joyous event, likely to put an abrupt end, once and for all, to the collective game called "Mathematics", and to much else besides... .

This gives the work of self-discovery a different **meaning** from any other work of discovery, even though many essential aspects are the same. There is a dimension to self-knowledge, and to the work of self-discovery, that sets it apart from all other knowledge and work. Perhaps this is the "**forbidden fruit**" of the Tree of Knowledge. Perhaps the fascination that meditation has exerted on me, or rather that of the mysteries it has revealed to me, is the fascination of the forbidden fruit. I've crossed a threshold where fear has disappeared. The only obstacle to knowledge is inertia, sometimes considerable, but finite and by no means insurmountable. I felt this inertia at almost every step, insidious and omnipresent. It exasperated me at times, but never discouraged me. (No more so than in mathematical work, where it is also the main obstacle, but of incomparably lesser weight). This inertia becomes one of the essential ingredients of the game; one of the protagonists, to put it better, in this delicate and by no means symmetrical game which has two - or three, to put it better: on the one hand, the child who dashes forward, and the boss (made of inertia) who puts the brakes on everything he can (while pretending not to be there), and on the other, the glimpsed form of the beautiful unknown, rich in mystery, at once near and far, who both evades and calls... .

## 11.2. (47) L'aventure solitaire

This fascination with "meditation" has been of considerable power for me - as powerful as the attraction of "woman", whose place it seems to have taken. The fact that I've just written "has been" doesn't mean that this fascination has been extinguished. In the year that I've been involved in mathematics, it has faded into the background. Experience tells me that this situation can be reversed overnight, just as this situation is itself the effect of an entirely unforeseen reversal. In fact, during each of the four long periods of meditation I went through (one of which was

extended over almost a year and a half), it was a matter of course for me that I was going to keep going until I **drew**

my last breath, to probe as far as I could into the mysteries of life and those of human existence. When the notes piled up in impressive stacks to the point of threatening to overwhelm my workroom, I even ended up having a piece of furniture made to measure to accommodate them, with plenty of room (thanks to a quick calculation of arithmetic progression) to accommodate those that would soon be added over the years; I had allowed for a margin of around fifteen years if I remember correctly (which was already starting to happen!). In this case, the boss had done things right, and for stewardship it was a fine piece of stewardship! That, and a large-scale tidying-up of all personal papers closely or remotely linked to meditation work, was in fact his last task undertaken and (almost) successfully completed, just before the switch of preferences and bets. It makes you wonder whether he didn't have an ulterior motive, and whether he didn't already see tomes of "Mathematical Reflections" filling the empty shelves supposedly intended for the "Notes" to come.

It's true that the passion for meditation and self-discovery is vast enough to fill my life for the rest of my days. It's also true that the mathematical passion is not consumed, but perhaps that hunger will be sated in the years to come. Something in me wishes it would, and feels mathematics to be a hindrance to a solitary adventure that only I can pursue. And it seems to me that this "something" inside me is **not** the boss, nor one of the boss's desires (which, by nature, is divided). It seems to me that mathematical passion still bears the mark of the boss, and in any case, that following it makes my life move in a closed circle; in the circle of an **ease**, and in a movement that is that of **inertia**, certainly not of renewal.

. 125

I've been wondering about the meaning of this stubborn persistence of mathematical passion in my life. When I follow it, it doesn't really fill my life. It gives me joy, and it gives me satisfaction, but it doesn't in itself give me true fulfillment. Like any purely intellectual activity, intense, long-term mathematical activity has a rather **mind-numbing** effect. I see this in others, and especially in myself, every time I do it again.

This activity is so fragmentary, it involves only such a tiny part of our faculties of intuition, of sensitivity, that these become dulled to the force of not being used. For a long time, I didn't realize this.

p. 126

It's only since I've been meditating, it seems to me, that I've become aware of this thing. It's only since I've been meditating, it seems, that I've become aware of this thing. If you pay attention, it's obvious - **maths in large doses thickens**. Even after the meditation of two and a half years ago, where mathematical passion was recognized as a passion indeed, as an important thing in my life - when I give myself to this passion now, there's still a reserve, a reluctance, it's not a total gift. I know that a so-called "total gift" would in fact be a kind of abdication, it would be following an inertia, it would be a flight, not a gift.

There is no such reserve in me for meditation. When I give myself to it, I give myself totally, there is no trace of division in this giving. I know that in giving myself, I am in complete accord with myself and with the world - I am true to my nature, "I am the Tao". This gift is beneficial to myself and to all. It opens me up to myself and to others, by lovingly untying what remains knotted within me.

Meditation opens me up to others; it has the power to untie my relationship with them, even though the other remains tied up. But it's very rare that I have the opportunity to communicate with others in any way whatsoever about the work of meditation, about this or that thing that this work has made me aware of. This is not because it's "too personal". To take an imperfect image, I can only communicate about maths that interests me at a given moment, with a mathematician who has the essential background, and who at the same time is willing to take an interest in it too. It happens that for years I'm fascinated by such and such mathematics, without meeting (or even trying to meet) another mathematician with whom to communicate about it. But I know that if I looked for them, I'd find them, and that even if I didn't, it would simply be a matter of luck or circumstance; that the things I'm interested in can't fail to interest someone, or even a few people, whether ten years or a hundred, it doesn't really matter. This is what gives meaning to my work, even if it's done in solitude. If it

were there no other mathematicians in the world, and that there should be no more, I don't think doing maths would still make sense to me - and I suspect it's no different for any other mathematician,

or any other "researcher" whatsoever. This ties in with my earlier observation that, for me, the "mathematical unknown" is what nobody knows yet - it's something that doesn't depend on me alone, but on a collective reality. **Mathematics is a collective adventure**, going on for millennia.

p. 127

In the case of meditation, in order to communicate about it, the question of "baggage" doesn't arise; not at the point I'm at, at least, and I doubt it ever will. The only question is that of an interest in the other, which responds to the interest in me. So it's a question of curiosity about what's really going on in oneself and in others, beyond the de rigueur facades, which don't hide much as long as you're really interested in seeing what they cover. But I've learned that the moments when such interest appears in a person, the "moments of truth", are rare and fleeting. It's not uncommon, of course, to meet people who are "interested in psychology", as they say, who have read Freud and Jung and many others, and who would like nothing better than to have "interesting discussions". They have this

The baggage they carry with them, more or less heavy or light, what we call a "culture". It's part of the image they have of themselves, and reinforces that image, which they are careful never to examine, just like someone else who's interested in maths, flying saucers or angling. It's not this kind of "baggage", nor this kind of "interest", that I meant earlier - although the same words here refer to things of a different nature.

To put it another way: **meditation is a solitary adventure**. Its nature is to be solitary. Not only is the **work** of meditation solitary - I think this is true of any work of discovery, even when it is part of a collective effort. But the **knowledge** that arises from the work of meditation is "solitary" knowledge, knowledge that cannot be **shared**, let alone "communicated"; or if it can be shared, it's only in rare moments. It's a work, a knowledge that goes against the grain of the most inveterate consensus, and worries each and every one of us. This knowledge

is expressed simply, in simple, clear words. When I express it to myself, I learn by expressing it, because expression *même* is part of a job, driven by intense interest. But those same simple words and are powerless to communicate meaning to others, when they come up against the closed doors of indifference or fear. Even the language of dreams, with its infinite resources and strength, constantly renewed by a tireless and benevolent Dreamer, cannot penetrate these doors. ...

p. 128

There is no meditation that is not solitary. If there is a shadow of concern for anyone's approval, confirmation or encouragement, there is no work of meditation and no self-discovery. The same is true, it may be said, of any genuine work of discovery, at the very moment of the work itself. Of course. But outside of the work itself, the approval of others - be it someone close to you, or a colleague, or a whole milieu to which you belong - is important for the meaning of this work in the life of the person who gives it his or her all. This approval and encouragement are among the most powerful incentives that make the "boss" (to use this image) give an unconditional green light for the kid to give it his all. Above all, they determine the boss's investment. It was no different in my own investment in mathematics, encouraged by the kindness, warmth and confidence of people like Cartan, Schwartz, Dieudonné, Godement, and others after them. For meditation work, on the other hand, there's no such incentive. It's a passion of the young worker that the boss is basically kind enough to tolerate, because **it doesn't "earn" anything**. It bears fruit, of course, but it's not the kind of fruit a boss aspires to. When he's not fooling himself about it, it's clear that he's not going to invest in meditation - the boss is gregarious by nature!

Only children, by nature, are solitary.

### 11.3. (48) Donation and welcome

Speaking yesterday of the solitary essence of meditation, I was touched by the thought that the notes I've been writing for nearly six weeks, which have ended up becoming a kind of meditation, are nonetheless intended for publication. Inevitably, this has influenced the form of the meditation in many ways, notably in terms of brevity and discretion. One of the essential aspects of meditation, namely

constant attention to what was going on inside me at the very moment of the work, manifested itself only very occasionally, and superficially. Surely all this must have *inflated* on the course of the work and on

quality. I feel, however, that it has the quality of meditation, above all by the nature of its fruits, by the appearance of a knowledge of myself (in this case, that of a certain **past**) that I had evaded until now. Another aspect is spontaneity, which has meant that for none of the nearly fifty "sections" or

129

sap.

"I couldn't have said at the outset what the substance would be; each time it was revealed only along the way, and each time the work brought new facts to light, or shed new light on hitherto neglected facts.

The most immediate sense of this work was that of a dialogue with myself, a meditation. However, the fact that this meditation is destined to be published, and moreover, to serve as an "overture" to the "Mathematical Reflections" that are to follow, is by no means an incidental circumstance, which would have been a dead letter in the course of the work. For me, it is an essential part of the meaning of this work. If I hinted yesterday that the boss is surely getting something out of it (he's a master at "getting something out of everything", or very nearly so!), that in no way means that its meaning can be reduced to this - to a belated, almost posthumous "return" of the famous three-legged horse! More than once, too, I've felt that the deeper meaning of an act sometimes goes beyond the motivations (apparent or hidden) that inspire it. And in this "return to mathematics", I've guessed a meaning other than that of being the result-sum of certain psychic forces that were present in my person at such and such a time and for such and such a reason.

This "meditation" that I'm pursuing in order to offer it to those I've known and loved in the mathematical world - if I feel it's an important part of this glimpsed meaning, it's not in the expectation that the gift will be welcomed. Whether or not it is accepted does not depend on me, but only on the person to whom it is addressed. I'm certainly not indifferent to whether it's accepted or not. But that's not **my** responsibility. My only responsibility is to be true to the gift I give, that is to say, to be myself.

What I learn from meditation are the humble and obvious things, things that don't pay for themselves. mine. They're also the ones I won't find in any book or treatise, however learned, profound, brilliant - the ones no one else can find for me. I have questioned a "fog", I have ☐ taken the trouble to listen to it, I have learned

p. 130

a humble truth about a "sporting attitude" and its obvious meaning, in my relationship to mathematics as in my relationship to others. I would have read "in the text" the Holy Scriptures, the Koran, the Upanishads, Plato, Nietzsche, Freud and Jung on top of it all - I would have been a prodigy of vast and profound erudition - but all that would have done was to **distance me** from this truth, a childish, self-evident truth. And I would have repeated Christ's words a hundred times, "Happy are those who are like little children, for theirs is the Kingdom of Heaven", and commented on them in fine detail, and it would only have served to keep me away from the child in me, and from the humble truths that bother me and that only the child can see. **These things** are the best I have to offer.

And I'm well aware that when such things are said and offered, in simple, clear words, they're not always welcomed. To welcome is not simply to receive information, with embarrassment or even interest: "Gee, who'd have guessed... . .", or "It's not so surprising after all... . .". Welcoming often means recognizing oneself in the giver. It means getting to know yourself through the person of another.

## 11.4. (49) Acknowledgement of a division

This short reflection on the meaning of the present work, and on giving and receiving, comes as a digression in the thread of reflection; or rather, as an illustration of certain aspects that distinguish "meditation" from any other work of discovery, and in particular from mathematical work. Yesterday, I realized that these aspects have a double effect, namely two effects **in opposite directions**: a unique fascination with "the kid", and a total lack of interest in "the boss". It seems that this double effect is in the nature of things, and cannot be mitigated by any compromise or arrangement. Whatever we do, when the kid

is his real predilection, the boss doesn't like it, not at all!

There's no doubt that this is the meaning of the shift that's taken place, which could well wipe the slate clean of meditation in my life in the years to come (with the exception of "occasional meditations", like three months ago). I don't think these have to be entirely barren years for that, any more than the year past has been fruitless. But it is also true that what I learned there (apart from maths) is minimal, if I p . 131  
The strange thing is that each of the four long periods of meditation I experienced were times of great fulfillment. The strange thing is that each of the four long periods of meditation I experienced were times of great fulfillment, with nothing to suggest that something inside me remained frustrated. Yet, if pots exploded, it was because somewhere there was pressure, and that pressure must not have been there that day; it must have been there, somewhere out of my sight, for weeks or months, while I was intensely and totally absorbed in meditation.

But now I'm getting carried away by the momentum of the pen (or rather, the typewriter). The reality is that (except in the last period of meditation, which was cut off midstream by a combination of events and circumstances), the intensity of meditation gradually diminished from one moment onwards, like a wave about to be followed by another about to take its place... . The feeling of fullness, in fact, followed this same movement, with the difference that it was only present at the time of the meditation-waves, not the "mathematical" waves.

The situation I'm trying to define is no longer, it seems to me, a situation of conflict, but it's becoming apparent that it still contains the germ, the potentiality of conflict. For me, it is now perhaps the most visible sign, through its impact on the course of my life, of a **division** within me. This division is none other than the boss-child division.

I can't put an end to it. All I can do, now that it's well and truly detected in this manifestation, is pay attention to it, and follow its signs and evolution over the months and years ahead. Perhaps this passion for maths, a little misguided it must be said, will burn itself out (as another passion in me has already burned itself out. . . ), to make way for the sole passion of discovering myself and my destiny.

This passion is vast enough, as I said, to fill my life - and surely my whole life won't be enough to exhaust it.

## 11.5. (50) The weight of a past

It's been a few days since I finished putting the finishing touches to "Récoltes et Semailles" - after having believed, for over a month, that I was surviving to finish in the next few days. Even this time- p . 132  
here, after I'd put the finishing touches to it, I wasn't entirely sure whether I'd actually finished it or not.  
- there was one question I'd left unanswered. It was to "understand what events or circumstances finally triggered the "tipping" in favor of mathematics instead of meditation, against considerable forces of inertia. Without any deliberate intention, my thoughts returned with some insistence to this question, in these last few days when I had already begun to branch off into other matters of a completely different order, including mathematical questions (of conformal geometry). I might as well make the most of this meditative "fin de lancée", to dig a little deeper and clear the decks.

Several associations come to mind, when I try to answer "on the spur of the moment" why "I'm getting back into maths" (in the sense of a major investment intended to be long-term, of the order of at least

a few years ago). Perhaps the strongest of all relates to the feeling of chronic frustration I've come to feel in my teaching activity over the last six or seven years. There's this increasingly strong feeling of being "**underemployed**", and even, quite often, of investing myself and giving the best of myself for morose students who don't care what I have to give.

I see wonderful things to do everywhere, just waiting to be done. Often, all that's needed to tackle them is a derisory baggage, and it's these things themselves that tell us what language to develop to understand them, and what tools to acquire to dig into them. I can't help seeing them, simply because of regular contact with maths (at however modest a level) as a result of teaching, even in those periods of my life when my interest in maths is most marginal. Behind everything we look at, no matter how little we look, there are other beautiful things, covering and revealing others in their turn... . Whether in maths or anywhere else, wherever you look with genuine interest, you'll see a richness revealed, a depth opened up that you'd guess is inexhaustible. The frustration I'm talking about is that of not being able to communicate this feeling of richness - of depth - to my students, even if it's only a spark of desire to explore at least what's right at their fingertips, to have fun with it.

p. 133

during the few months or years that they are in any case determined to invest in a so-called "research" activity, for the purposes of preparing this or that degree. Except for two or three of the students I've had since

At ten years of age, it seems that the very idea of "giving it their all" frightens them, and that for months and years they'd rather sit back and do nothing, or laboriously do some mole's work for which they know neither the ins and outs, as long as there's a diploma at the end. There's a lot to be said for this kind of paralysis of creativity, which has nothing to do with the existence or non-existence of "gifts" or "faculties" - and this goes back to the very beginning of my reflection, when I touched in passing on the root cause of such blockages. But that's not my point here, which is rather to note the state of chronic frustration that these situations, constantly repeated throughout the last seven years of my teaching career, have come to create in me.

The obvious way to "resolve" such frustration, at least insofar as it's that of the "mathematician" in me and not that of the teacher, is to do for myself at least some of those things that I despaired of seeing any of my students grasp at the end of the day. And that's what I've done here and there, whether it be occasional reflection lasting a few hours, or even a few days, on the bangs of my teaching activity, or during periods of mathematical frenzy (which sometimes occurred like veritable explosions. . . ), sometimes lasting weeks or months. Such occasional and intermittent work could usually only give rise to a very first rough sketch of a question, and to a most fragmentary vision - rather, a clearer vision of the work in perspective, whereas this work itself always remains to be done and, to be better seen, only appears all the more burning. Two months ago, I gave an overall sketch of the main themes I've begun to take the measure of. This is the "Esquisse d'un Programme", to which I have already alluded, and which will finally be attached to the present reflection, to constitute together volume 1 of "Réflexions Mathématiques".

It is quite clear that this ("private", so to speak) prospecting work alone was not enough to solve the problem. my frustration. This feeling of "being underemployed" surely reflected a **desire** (of egotic origin, I believe, i.e. "the boss's" desire) **to exert an action**. Here, it's not so much a question of acting on others (on my students

p. 134

let's say, set them in motion, "communicate something" to them, or help them get that degree that could enable them to apply for such and such positions, etc. . . ) than "mathematician" action: contributing to the discovery of such and such unsuspected facts, to the emergence of such and such a theory, etc. ... . This is immediately associated with

I've already made the observation that mathematics is a "collective adventure". If I reflect on my attitude when I was doing maths over the last ten years, at a time in my life when it would never have occurred to me that I might one day go back to publishing, and when it was also more or less clear that none of my present or future students would have anything to do with my prospecting work - it immediately occurred to me that these were by no means the dispositions of someone doing something for personal pleasure alone, or driven by an inner need that concerned only himself, with no relationship to others. When I do maths, I believe that somewhere within me it is clearly understood that this maths is meant to be communicated to others, to be part of a larger thing to which I am contributing, a thing that is by no means individual in nature. I could call this "thing" "mathematics", or better still, "our knowledge of mathematical things". The term "our" here undoubtedly refers, first and foremost, in concrete terms, to the group of mathematicians whom I know and with whom I have interests in common; but it is also beyond doubt that it goes beyond this restricted group just as much as it goes beyond myself. This "our" refers to **our species**, insofar as it, through some of its members down the ages, has been and is interested in the realities of the world of mathematical objects. I have never, before this very moment of writing, considered the existence of this "thing" in my life, let alone wondered about its nature and its role in my life as a mathematician and teacher.

The desire to take action to which I have alluded seems to take the following form in my life as a mathematician: to bring out of the shadows that which is **unknown to all**, not only to me (as I saw earlier), and this, moreover, for the purpose of being made **available to all**, thus enriching a common "patrimony". In other words, it's the desire to contribute to the enlargement and enrichment of this "thing", or "heritage", which goes beyond my person.

In this desire, certainly, the desire to enlarge my person through my works is not absent. By this aspect, I find again the craving for "growth" <sup>□d'</sup>agrandissement, which is one of the characteristics of the ego, of the "boss" ; p.

135

This is its invasive and ultimately destructive aspect (cf. note 44' § 13.1.1 p. 260). However, I also realize that the desire to increase the number of things that (for a short or long time) will more or less bear my name, is far from exhausting, from covering up this desire or this more vast force, which drives me to want to contribute to enlarging a common heritage. It seems to me that such a desire could find satisfaction (if not "in my company", where the boss remains rather invasive, at least in a mathematician of greater maturity) while the role of one's own person would remain anonymous. Perhaps this is a "sublimated" form of the ego's tendency to enlarge, through identification with something beyond itself. Unless this kind of force is not egotistical in nature, but more delicate and profound, expressing a deep need, independent of any conditioning, that attests to the profound link between the life of a person and that of the whole species, a link that is part of the meaning of our individual existence. I don't know, and it's not my purpose here to probe such far-reaching questions.

Instead, I'd like to examine (from a more modest angle) a concrete situation concerning myself: a situation of frustration, with a partial and provisional outlet in the form of sporadic mathematical activity. The logic of the situation, therefore, was bound to lead me sooner or later to **communicate** what I found. Since, until last year, I was by no means prepared to make the large-scale, long-term investment in my mathematical passion that would have been necessary to "exploit" the mines I was uncovering for publication purposes, by means of detailed "piecework", I was left with the alternative of communicating to certain mathematician friends who were sufficiently "in the know" at least those things that were closest to my heart.

I think that if I had found a mathematician friend in the last ten years who plays opposite

of me as an **interlocutor** and source of information (as had been the case with Serre to a very large extent, for many years in the 50s and 60s), as well as a **relay** for any "information" I could pass on to him (a role Serre had not had to play in the past, as I

p. 136

myself!), my desire "to exercise action in maths" would have found sufficient satisfaction to resolve my frustration, while contenting me with an episodic and moderate *investissement d'énergie* in mathematics, leaving the lion's share to my new passion. The first time I approached a mathematician friend with such an expectation (at least implicit in me) was in 1975, and the last time in 1982, a year and a half ago. Funny coincidence, both times it was to try to "place" (for the purpose of being echoed and, who knows, developed at the end of the ends!) the same "program" of homo-logical and homotopic algebra, the first seeds of which date back to the fifties, and which was perfectly "mature" (according to the intimate conviction I had of it) even before the end of the sixties; a program of which a preliminary and broad outline development is the very theme of this *Poursuite des Champs* whose Introduction I'm supposed to be writing at the moment! The fact remains that, for reasons that undoubtedly differ from one case to another, my attempts to rediscover a "privileged interlocutor" relationship, such as I had (before 1970) with Serre, and then with Deligne, came to nothing. A common circumstance, however, was the relatively limited availability I was willing to give to maths. On the two occasions I've already mentioned (in 1975 and 1982), this surely contributed to the lack of communication. In fact, I was mainly looking to "place" something, without worrying too much about making the necessary effort to "(re)bring myself up to speed" to be on my side a satisfactory interlocutor for my correspondent, who was much more "in the know" than I was (to say the least!) when it came to current techniques in homotopy.

I could consider the "Letter to . . ." which serves as the first chapter of the *Poursuite des Champs* (letter from February last year, just over a year ago) as my last attempt to find an echo, from one of my friends of yesteryear, for some of my ideas and concerns of now. The continuation of the reflection begun (or rather, taken up) in that letter was to become (without my even suspecting it for weeks) the first mathematical text since 1970 promised to be published. It was only almost a year later that I received an indirect reaction to this substantial letter (compare note<sup>2</sup> (38)). It was more eloquent than any other letter received to date from a fellow mathematician, in making me feel certain attitudes towards my modest self that have become commonplace among my mathematician friends since I left the milieu of which I was a part with them. There is in this letter, from someone at

p. 137

to whom I had addressed myself as a friend, in a mood of warm sympathy, a deliberate intention to *dérision*, which reminded me in a particularly violent way of something I had come to realize

more and more clearly in recent years. Previously, I had had occasion to notice a distancing from myself in the mathematical "big world", and above all among those who had been my close friends (45). Here, it's no longer a question of distancing myself as a person, but rather of a consensus, in the nature of a fashion and as it presents itself as something to be taken for granted, between people who are "in the know" to some extent: that the thousand-page maths genre, and the notions I've been harping on about for a decade or two (46,47), aren't very serious at all; that there's a lot of bombast there for not much worthwhile, and that apart from the "general nonsense" toast around the notion of pattern and

<sup>2</sup>These notes were in fact a continuation of the long letter to... which became the first chapter. They were typed so as to be legible for this old friend, and for two or three others (Ronnie Brown in particular) whom I thought might be interested. This letter, by the way, was never answered, nor was it read by the addressee, who almost a year later (when I asked him if he'd received it) expressed sincere astonishment that I'd even thought for a moment that he could read it, given the kind of mathematics that was to be expected of me. ...

cohomologie étale (which sometimes have their uses; alas, we're willing to admit it), it's more charitable to at least forget the rest; that those who would nevertheless pretend to still be singing this kind of Grothendieckian trumpet, despite good taste and the obvious canons of seriousness, are to be lumped in with their Master, avowed or not, and have only themselves to blame if they are treated as they deserve... ..

Surely, the many echoes in this direction (which I've just transcribed "in plain English") that have reached me since 1976 (50), and especially over the last two or three years, have finally awakened in me a fighting spirit that had become somewhat dormant over the last ten years. Like a reflex, they've made me want to throw myself into the fray, to shut the mouths of these whitewashers who haven't understood a thing - a completely idiotic reflex, in fact, like that of the bull to whom all you have to do is show a piece of red cloth and wave it in front of his nose, and he'll immediately get into a frenzy and start moving, forgetting the path he was quietly following and which was his own! Still, I think this reflex is pretty epidermal, and wouldn't have been enough on its own to shake me off. Fortunately, doing maths is much more appealing than running into a piece of cloth and getting larded from all sides. But doing maths, while pursuing my own style of work} and approach to things, is also a bit like "throwing myself into the fray"; it means asserting myself in the face of signs of disdain and rejection - which I'm sure will come my way,

in response to the disdain my former friends have felt or thought they felt in me, if not towards them, at least towards a milieu with which they continue to identify unreservedly. It is therefore also, to some extent, following

instead of following **my** path.

This idea has occurred to me on several occasions over the past few weeks, and it's perhaps this aspect in particular that has prompted today's reflection. Along the way, another aspect has come to light, one in which the forces of the ego surely play a large part too, but which is not a simple combative reflex. Rather, it's a desire within me, the nature of which I can't yet clearly discern, to give meaning to the mathematical work I've been doing for the last ten or twelve years, or to see it take on its full meaning; a meaning which (I'm firmly convinced) cannot be reduced to that of private pleasure or personal adventure. But even if the nature of this desire remains misunderstood, since I haven't taken the time to examine it more closely, this reflection is enough to show me that it is indeed here, in this desire, that the force that weighs on me and forces my hand, so to speak, in favor of a mathematical investment - the "tipping" force - really lies. It would be just as effective. red fabric or not. If it's a sign of attachment to a past, it's the past of the last ten years, the "post-1970" past, and not the past of things already written in black and white, things done, things before 1970.

Basically, I'm not worried about these things, about what "posterity" will do to them in the future (although it's doubtful there will even be a posterity. . . ). What interests me in this past is by no means what I did (and the fortune that is or will be its), but rather what was not done, in the vast program that I had before my eyes at the time, and of which only a very small part was realized by my efforts and those of the friends and students who sometimes kindly joined me. Without having planned or sought it, this program itself was renewed, along with my vision and approach to mathematics. Over the years, the emphasis has shifted both in terms of themes and my own approach.

my first aim now is to probe the **mysteries** that have fascinated me most, such as "motifs", or "patterns".

that of the "geometric" description of the Galois group of  $\mathbb{Q}$  over  $\mathbb{Q}$ . Along the way, of course'  $\square$  <sup>1</sup> won't be able to p.

at least prevent me from sketching out the foundations here and there, as I've begun to do (among other things)

in "La longue Marche à travers la théorie de Galois", or as I'm doing now in "La Poursuite des Champs". But the subject has changed, and so has the style that expresses it.

To put it another way: in the last ten years, I've glimpsed mysterious and beautiful things in the world of mathematics. These things are not personal to me, they are meant to be communicated - the very meaning of having glimpsed them, as I see it, is to communicate them, to be taken up, understood, assimilated... . But communicating them, if only to oneself, also means deepening them, developing them a little - that's a **job**. I'm well aware, of course, that there's no way I could complete this work, even if I had a hundred years left to devote to it. But I don't have to worry about that today, about how many years or months I'm going to devote to this work out of the time I have left to live and discover the world, when there's **another** job waiting for me that only I can do. It is not in my power, nor is it my role, to regulate the seasons of my life.

# 12. NOTES for the first part of "RECOLTES ET SEMAILLES" (harvests and weeks)

## 12.1. Ø

**Note 1** □ (Added March 1984) It is probably an overstatement to say that my "style" and "method" of workingp  
. 141 have not changed, whereas my style of expressing myself in mathematics has been profoundly  
transformed. Most of the time devoted over the last year to "La Poursuite des Champs" has been spent on my  
machine at  
typing reflections that are intended to be published virtually as they are (with the addition of relatively short  
notes added later to facilitate reading by cross-referencing, error correction, etc. . ). No scissors or glue to  
laboriously prepare a "definitive" manuscript (which, above all, must reveal nothing of the process that led  
to it) - that's a lot of changes in "style" and "method"! Unless you dissociate the mathematical work itself  
from the writing and presentation of results, which is artificial, because it doesn't correspond to the reality of  
things, since mathematical work is indissolubly linked to writing.

## 12.2. $\emptyset$

**Note 2** ( Added in March 1984) On rereading these last two paragraphs, I had a certain feeling of unease, due to the fact that in writing them, I implicate others and not myself. Obviously, the thought that my own person might be involved hadn't occurred to me while writing. I surely didn't learn anything when I confined myself to putting down in black and white (no doubt with a certain satisfaction) things that for years I have perceived in others, and seen confirmed in many ways. As I continue my reflection, I'm led to remember that there has been no shortage of contemptuous attitudes towards others in my life. It would be strange if the link I've grasped between contempt for others and contempt for oneself were absent in the case of myself; sound reason (and also the experience of similar situations of blindness towards myself, which I've come to realize) tells me that this must surely not be the case! For the time being, however, this is no more than a simple deduction, the only possible use of which would be to encourage me to see with my own eyes what's going on, and to see and examine (if it does indeed exist, or has existed) this as yet hypothetical contempt for myself, so deeply rooted in my own life.

p. 142 buried that it has completely escaped my gaze until now. It's true that there's been no shortage of things to look at! <sup>one</sup> This suddenly seems to me to be one of the most crucial, precisely because it's at such a crucial point in my life. hidden...<sup>1</sup>.

## 12.3. $\emptyset$

**Note 3** I'm thinking in particular of the famous conjectures by Mordell, Tate and Chafarevitch, all three of which were demonstrated last year in a forty-page manuscript by Faltings, at a time when the well-established consensus of those "in the know" was that these conjectures were "out of reach"! As it happens, "the" fundamental conjecture that serves as the keystone of the "Anabelian algebraic geometry" program I'm so fond of, is close to Mordell's conjecture. (It would even seem that the latter is a consequence of the former, which just goes to show that this program is not a story for serious people. ...). )

## 12.4. $\emptyset$

**Note 4** Even today, we come across "demonstrations" of uncertain status. So it was for years with Grauert's demonstration of the finiteness theorem that bears his name, which nobody (and there was no shortage of good-willers!) could read. This perplexity was resolved by other, more transparent demonstrations, some of which went even further, taking over from the initial one. A similar, more extreme situation is the "solution" to the so-called "four-color problem", the computational part of which was solved with a computer (and a few million dollars). This is a "demonstration" that is no longer based on the intimate conviction that comes from understanding a mathematical situation, but on credit given to a machine devoid of the faculty of understanding, and whose structure and operation the mathematician user is unaware of. Even supposing that the calculation is confirmed by other computers, following other calculation programs, I don't consider the four-color problem to be closed. It will just have changed its face, in the sense that it's no longer a question of looking for a counter-example, but only a demonstration (readable, of course!).

---

<sup>1</sup>(August 1984) On this subject, however, see the last two paragraphs of the note "The massacre", n° 87.

## 12.5. Ø

**Note 5** This fact is all the more remarkable given that, until around 1957, I was regarded with a certain reserve by more than one member of the Bourbaki group, who ended up co-opting me, I believe, with some reluctance. There was a good-natured quip that I was a "dangerous specialist" (in Analyse Fonctionnelle). I sometimes sensed in Cartan a more serious unexpressed reserve - for some years, p. 143

I must have given him the impression of someone inclined towards gratuitous and superficial generalization. I saw him quite surprised to find in the first (and only) rather long essay I wrote for Bourbaki (on differential formalism on varieties) a reflection of any substance - he hadn't been too keen when I'd offered to take it on. (This reflection came in handy again years later, when I developed the residue formalism from the point of view of coherent duality). I was more often than not left behind during the Bourbaki congresses, especially during the joint readings of the essays, being unable to keep up with the readings and discussions at the rate they were going. Maybe I'm just not cut out for group work. In any case, this difficulty I had in fitting into the common work, or the reservations I may have aroused for other reasons in Cartan and others, never drew sarcasm or rebuff, or even a shadow of condescension, except once or twice from Weil (definitely a case apart!). At no time did Cartan deviate from an equal kindness towards me, imbued with cordiality and also with that distinctive touch of humor that for me remains inseparable from his person.

## 12.6. My friends from Survivre et Vivre

**Note 6** Among these friends, I should probably also count Pierre Samuel, whom I had previously known mainly through Bourbaki, as had Chevalley, and who (like Chevalley) played an important role in the Survivre et Vivre group. It doesn't seem to me that Samuel was much given to this illusion of the superiority of the scientist. Above all, I feel he contributed a great deal through the common sense and smiling good humor he brought to joint work, discussions and relations with others, as well as gracefully taking on the role of "ugly reformer" in a group inclined towards radical analyses and options. He remained with Survivre et Vivre for some time after I withdrew, acting as editor of the newsletter of the same name, and left with good grace (to join Friends of the Earth) when he felt that his presence in that group had ceased to be useful.

Samuel belonged to the same restricted milieu as me, but that didn't stop him from being one of my friends.

those bubbling years from which I think I learned something (however bad a student I was. . . ). These ways of being, like Chevalley's even though they hardly resemble each other, were a better antidote p. 144 for my "meritocratic" leanings, only the most incisive analysis!

It now seems to me that for all the friends I learned something from during this period, it was more through their way of being and their sensibility, which differed from mine, and from which "something" ended up being communicated, than through explanations, discussions, etc. ... . In addition to Chevalley and Samuel, I especially remember Denis Guedj (who had a great influence on the Survivre et Vivre group), Daniel Sibony (who kept his distance from this group, while pursuing his evolution with a half-disdainful, half-narcotic eye), Gordon Edwards (who was a co-actor in the birth of the "movement" in June 1970 in Montreal, and who for years did prodigious feats of energy to maintain an "American edition" of the Survivre et Vivre newsletter, in English), Jean Delord (a physicist about my age, who was also a member of the "Survivre et Vivre" group), and the other members of the group.

age, a fine, warm-hearted man who had taken a liking to me and the Survrien microcosm), Fred Snell (another US-based physicist from Buffalo, whose country house I stayed in for a few months in 1972).

Of all these friends, five are mathematicians, two are physicists, and all are scientists - which seems to show that the environment closest to me in those years remained an environment of scientists, and especially mathematicians.

## 12.7. Ø

**Note 7** The preceding paragraph is the first of the entire introduction to be heavily crossed out on my initial manuscript, and provided with numerous over-writings. The description of the incident and the choice of words initially went against the grain, against the current - a force was clearly pushing to get over the incident quickly, as if by conscience, to "get down to business". These are the familiar signs of **resistance**, here against the elucidation of this episode, and its significance as a revelation of an inner attitude. The situation is very similar to that described at the beginning of this introduction (par. 2), that of the "crucial" moment of the discovery of a contradiction and its meaning, in a mathematical work: it is then **the inertia** of the es-

p. 145

prit, its reluctance to part with an erroneous or inadequate vision (but one in which our person is in no way involved), which plays the role of the "resistance". This resistance is of an active nature, inventive if necessary to ~~die~~

drown a fish even without water, whereas the inertia I've been talking about is simply a passive force. In this case, even more than in the case of mathematical work, the discovery that has just appeared in all its simplicity, in all its obviousness, is followed in the instant by a feeling of relief from a weight, a feeling of **liberation**. It's not just a feeling - it's rather an acute, grateful perception of what has just happened, which **is** a liberation.

## 12.8. Ø

**Note 8** As will become clear later, this ambiguity did not "dissipate in the aftermath of the 1970 awakening". This is a typical strategic retreat of the "I", who writes off the period "before the awakening", which immediately becomes the demarcation line for an irreproachable "after"!

## 12.9. Ø

**Note 9** This is not entirely accurate; there is at least one exception among my closest colleagues, as will become apparent later. There was a typical "laziness" of memory, which often tends to "pass over" facts that don't "fit" with a familiar, long-established view of things.

## 12.10. Ø

**Note 10** For example, I've lost count of the number of letters, on mathematical as well as practical or personal matters, sent to colleagues or ex-students whom I considered friends, and who have never received a reply. It doesn't just seem to be a case of special treatment for

but a sign of a change in morals, according to echoes in the same vein. (Admittedly, these concern cases where the person sending a mathematical letter was not known to the recipient, a prominent mathematician... . )

## 12.11. Aldo Andreotti, Ionel Bucur

**Note 11** Of course, it's not impossible that I've forgotten - not to mention that my particularly "polar" disposition at the time would hardly encourage anyone to talk to me about this sort of thing, nor would it lead me to remember any conversation along these lines that might well have taken place. What is certain is that it must have been very exceptional, to say the least, for the question of fear to be broached (without even

to call it by that name... ), and it must be just as true today, especially in the "beau monde".

□ Among my many friends in that world, apart from Chevalley, who must have become aware of this am-  
The only other person I can think of who must have perceived it clearly was Aldo Andreotti. I had met him, his wife Barbara and their twin children (still very small) in 1955 (at a party at Weil's in Chicago, I believe). We remained close friends until the "great turning point" of 1970, when I left the milieu that had been ours and lost sight of them. Aldo had a very keen sensitivity, which hadn't been dulled by his dealings with mathematics and detective stories like mine. He had a gift for spontaneous sympathy for those he came into contact with. This set him apart from all the other friends I knew in the mathematical world, or even outside it. With him, friendship always took precedence over shared mathematical interests (of which there were plenty), and he was one of the few mathematicians with whom I spoke at all about my life, and he about his. His father, like mine, was Jewish, and had suffered in Mussolini's Italy, as I had in Hitler's Germany. I saw him always available to encourage and support young researchers, in a climate where it was becoming difficult to be accepted by the establishment. His spontaneous interest was always in people, not in mathematical "potential" or fame. He was one of the most engaging people I've ever had the good fortune to meet.

p. 146

This evocation of Aldo brings back memories of Ionel Bucur, who was also taken from us unexpectedly and before his time, and like Aldo, missed even more (I think) as a friend whom we like to meet again, than as a partner in mathematical discussions. We sensed in him a kindness, alongside an uncommon modesty, a propensity for constantly stepping aside. It's a mystery how a man so little inclined to take himself for granted or to impress anyone ended up as Dean of the Faculty of Sciences in Bucharest; no doubt because he didn't feel like refusing to accept the responsibilities that he was far from coveting, but which his colleagues or the political authorities were placing on his shoulders, which were, it must be said, robust. He was the son of peasants (something that must have played a role in a country where "class" is an important criterion), and had the common sense and simplicity of one. Surely he must have been aware of the fear that surrounds the man of notoriety, but certainly

so it must have seemed self-evident to him, a natural attribute of a position of power. I

don't think, however, that he himself □ had ever inspired fear in anyone, certainly not his wife Florica or to their daughter Alexandra, nor to their colleagues or students - and the feedback I've had is very much along these lines.

p. 147

## 12.12. Ø

**Note 12** The word "tomorrow" is to be taken literally, not as a metaphor.

## 12.13. Ø

**Note 13** Clearly, the foregoing description has no pretension other than to try and render as best I can, in concrete words, what this "fog" of memory delivers to me, which has not been condensed into any kind of case that is even remotely precise, of which I could have given a description here that was even remotely "realistic" or "objective". It would be a misrepresentation to suggest that colleagues who are reluctant to sit in the front rows, or who lack star or eminence status, are necessarily tied up in anguish when talking to one of the latter. This was clearly **not the** case for most of the friends I knew in this milieu, even among those who sometimes haunted conferences and seminars. What is unreservedly true is that the status of "eminence" creates a barrier, a gulf vis-à-vis those without such status, and that this gulf rarely disappears, even if only for the space of a discussion. I would add that the subjective distinction (which nevertheless seems very real to me) between the "front ranks" and the "marshes" cannot be reduced to sociological criteria (of social position, posts, titles, etc. . . ) or even of "status" or renown, but that it also reflects psychological particularities of temperament or dispositions that are more delicate to pin down. When I arrived in Paris at the age of twenty, I knew that I was a mathematician, that I had **done** maths, and despite the disorientation I've already mentioned, I basically felt "one of them", even though I was the only one to know it, and I wasn't even sure that I would continue to do math. Today, I'd be more inclined to sit in the back rows (on the rare occasions when the question arises).

## 12.14. Ø

**Note 14** One might think that this contradicts the assertion that there is no leader, but this is not the case.

p. 148

For Bourbaki alumni, it seems to me that Weil was perceived as the soul of the group, but never as a "leader". When he was there and when he liked it, he became a "ringleader" as I said, but he didn't do anything.

not the law. When he was in a bad mood, he could block discussion on a subject he disliked, even if it meant taking up the subject again at another congress when Weil wasn't there, or even the next day when he was no longer obstructing. Decisions were taken unanimously by the members present, given that it was by no means out of the question (nor even rare) for one person to be in the right against the unanimity of all the others. This may seem an aberrant principle for group work. The extraordinary thing is that it actually worked!

## 12.15. Ø

**Note 15** I didn't get the impression that this "allergy" to the Bourbaki style gave rise to any communication difficulties between these mathematicians and myself or other Bourbaki members or sympathizers, as would have been the case if the spirit of the group had been that of a chapel, of an elite within the elite. Beyond styles and fashions, there was in all members of the group a lively sense of mathematical substance, wherever it came from. It was only in the sixties that I remember one of my friends referring to mathematicians whose work he wasn't interested in as "pain in the ass". When it came to things I knew virtually nothing about, I tended to take such assessments at face value, impressed by such casual assurance - until one day I discovered that such a "pain in the ass" was an original and profound mind, which had not pleased my brilliant friend. It seems to me that with some

Bourbaki members, an attitude of modesty (or at least reserve) towards the work of others, when one is unaware of that work or understands it imperfectly, eroded at first, while that "mathematical instinct" which makes one feel a rich substance or a solid work, without having to refer to a reputation or a renown, still subsisted. From the echoes that reach me here and there, it seems to me that both modesty and instinct have become rare things today in what used to be my mathematical milieu.

## 12.16. ∅

**Note 16** To tell the truth, many of the Bourbaki members surely had their own microcosm "of their own", more or less extensive, apart from or beyond the Bourbakian microcosm. But perhaps it's no coincidence that in my own case, such a microcosm only formed around me after I had ceased to be part of Bourbaki, and all my energy was invested in tasks that were personal to me.

## 12.17. ∅

**Note 17** ☐ It was mainly outside the scientific community that I encountered warm echoes of the action . 149 to which I had committed myself, and active help. Apart from the friendly support of Alain Lascoux and Roger Godement, I must mention here above all that of Jean Dieudonné, who came to Montpellier for the Correctionnelle hearing, to add his warm testimony to others in favor of of a lost cause.

## 12.18. ∅

**Note 18** I believe that this lack of discernment was not due to any negligence on my part on those two occasions, but rather to a lack of maturity, an ignorance. It was only some ten years later that I began to pay attention to blocking mechanisms, whether in my own person, in those close to me or in students, and to measure the immense role they play in everyone's life, and not just at school or university. Of course, I regret not having had the discernment of greater maturity on these two occasions, but not for having expressed my impressions clearly, whether well-founded or not. When, in one case, I saw work done without seriousness, naming these things for what they are seems to me to be a necessary and beneficial thing. If, in yet another case, the conclusion I drew was hasty and unfounded, I was not the only one whose responsibility was engaged. The student thus shaken had the choice of either learning from it (which is perhaps what happened the first time), or letting himself be discouraged, and perhaps then changing profession (which isn't necessarily a bad thing either!).

## 12.19. Jesus and the twelve apostles

**Note 19** From 1970 to the present day, another student, Yves Ladegaillerie, has prepared and passed a thesis with me. The students of the first period are P. Berthelot, M. Demazure, J. Giraud. Mme M. Hakim, Mme Hoang Xuan Sinh. L. Illusie, P. Jouanolou. M. Raynaud, Mme M. Raynaud, N. Saavedra, J.L. Verdier. (Six of them actually completed their thesis work after 1970, at a time when my availability was still limited.

mathematics). Among these students, Michel Raynaud takes a special place, having found for himself the essential questions and notions that are the subject of his thesis work, which he moreover developed entirely independently; my role as "thesis director" proper was therefore limited to reading the finished thesis, constituting the jury and serving on it.

p. 150

□ When it was me who suggested a subject, I was careful to limit myself to those for which I had an interest. relationship strong enough for me to feel in a position, if need be, to support the student's work. A notable exception was Ms. Michèle Raynaud's work on local and global Lefschetz theorems for the fundamental group, formulated in terms of 1-fields on suitable scalar sites. The question seemed (and indeed proved) difficult, and I had no idea of how to prove the conjectures I was proposing (which, incidentally, could hardly be doubted). This work continued into the early '70s, and Mme Raynaud (as had previously been the case with her husband) developed a delicate and original method without any assistance from me or anyone else. This excellent work also opens up the question of extending Ms. Raynaud's results to the case of  $n$ -fields, which seems to me to represent the natural outcome, in the context of schemes, of theorems of the "weak Lefschetz theorem" type. However, the formulation of the relevant conjecture here (which can hardly be doubted either) makes essential use of the notion of  $n$ -field, the pursuit of which is supposed to be the main object of the present work<sup>2</sup>, as its name "A la Poursuite des Champs" indicates. We'll come back to this in due course,

Another rather special case is that of Mme Sinh, whom I had first met in Hanoi in December 1967, during a month-long lecture-seminar I gave at the evacuated Hanoi University. The following year, I offered her the subject of her thesis. She worked under particularly difficult wartime conditions, her contact with me being limited to occasional correspondence. She was able to come to France in 1974/75 (on the occasion of the International Congress of Mathematicians in Vancouver), and complete her thesis in Paris (before a jury chaired by Cartan, and including Schwartz, Deny, Zisman and myself).

Finally, I must mention Pierre Deligne and Carlos Contou-Carrère, both of whom were somewhat of a pupil, the former around 1965-68, the latter around 1974-76. Both obviously had (and still have) uncommon means, which they used in very different ways and with very different fortunes too. Before coming to Bures, Deligne had been a pupil of Tits (in

Belgium) - I doubt he was a student of anyone in mathematics, in the common sense of the term. Contou-Carrère had been a pupil of Santalo (in Argentina), and for a while of Thom! little □ou prou). One of them and the other already had the stature of a mathematician when the contact was established, except that

p. 151

Contou-Carrère lacked method and craft.

My mathematical role with Deligne was limited to informing him, on a weekly basis, of the little I knew about algebraic geometry, which he learned as if he'd always known it, and to raising questions along the way, which he usually answered on the spot or in the days that followed. These were the first works of Deligne's that I knew. His work after 1970 (for him as well as for my "official students") is known to me only through very scattered and distant echoes<sup>3</sup>.

My role with Contou-Carrère, as he himself says at the beginning of his thesis, was limited to introducing him to the language of schematics. In any case, I've only been remotely involved in the work he's been preparing as a doctoral thesis in recent years, on a highly topical subject that falls outside my remit.

<sup>2</sup>This is actually volume 3 of *Réflexions Mathématiques*, not the present volume 1 *Récoltes et Semailles* - see Introduction, p.(v).

<sup>3</sup>In particular, I had the opportunity to browse through some Berthelot and Deligne separate prints, which they were kind enough to send me.

Following a few misadventures in the wide world, Contou-Carrère was recently led, in extremis and (it now seems to me) unwillingly, to call on my services to act as thesis director and jury. (This exposed him to the risk of appearing as Grothendieck's pupil "after 1970", in a conjecture where this can present serious disadvantages... .). I carried out this task to the best of my ability, and this will probably be the last time I do so (at the level of a state doctorate thesis). I am all the happier, in this rather special circumstance, for the friendly assistance of Jean Giraud, who also took a month or two out of his time to do a thorough reading of the voluminous manuscript, of which he made a detailed and warm report.

## 12.20. ∅

**Note 20** This reminds me of the subject Monique Hakim had taken up, which wasn't much more engaging to tell the truth - I wonder how she managed to keep her spirits up! If she did suffer at times, it was certainly not to the point of making her sad or sullen, and the work between us was done in a cordial and relaxed atmosphere.

## 12.21. ∅

**Note 21** □ It would perhaps be more accurate to say that for the temperament that is mine, it is **maturity** which I still lack to fully assume a teaching role. My acquired temperament has long been marked by an excessive predominance of "masculine" (or "yang") traits, and one of the aspects of maturity is precisely a "yin-yang" balance with a "feminine" (or "yin") predominance.

p. 152

(Added later.) Even more than maturity, I see that it's a certain **generosity** that I've lacked in my teaching life to date - a generosity that expresses itself in a more delicate way than availability of time and energy, and which is more essential. This lack didn't manifest itself visibly (through an accumulation of failed situations, let's say) in my first period of teaching, no doubt mainly because it was compensated for by a strong motivation in the students who chose to come and work with me. In the second period, on the other hand, from 1970 to the present day, it seems to me that this lack of motivation is at least one of the reasons, and in any case the one that involves me most directly, for the overall failure that I observe in my teaching at research level (from the DEA level upwards). On this subject, see "Esquisse d'un programme", par.8, and par.9 "Bilan d'une activité enseignante", where the sense of frustration that this activity has left me with for the last seven or eight years is apparent<sup>4</sup>.

## 12.22. ∅

**Note 22** Not for much longer, perhaps, since I have decided to apply for admission to the Centre National de la Recherche Scientifique, thus putting an end to a teaching activity in a university environment, which in recent years has become increasingly problematic.

---

<sup>4</sup>Compare also note (23iv), added later.

## 12.23. Ø

**Note 22** Even after 1970, when my interest in maths became sporadic and marginal in my life, I don't think there was an occasion when I recused myself when a student called on me to work with him. I can even say that, apart from two or three cases, my post-1970 students' interest in the work they were doing was far below my own interest in their subject, even in periods when I had to work with them.

p. 153

where I didn't worry much about maths except on the days I set foot in college. Also the kind of availability I had to mes pre-1970 students, and the extreme demand for work that was a sign of it

In the main, they would have made no sense to most of my later students, who did maths without conviction, as if by a continual effort they had to make on themselves... ..

## 12.24. The Child and the Master

**Note 23** The term "transmit" here doesn't really correspond to the reality of things, which reminds me of a more modest attitude. This rigor is not something that can be transmitted, but at most awakened or encouraged, while it is ignored or discouraged from a very young age, by the family environment as well as by school and university. As far back as I can remember, this rigor has been present in my quests, those of an intellectual nature at least, and I don't think it was passed on to me by my parents, and even less by masters, at school or among my mathematician elders. It seems to me to be one of the attributes of **innocence**, and therefore one of the things that everyone is born with. Very early on, this innocence "sees a lot of green and a lot of black", which means that it is obliged to plunge more or less deeply, and that often there is hardly a trace of it left in the rest of one's life. In my case, for reasons I haven't yet thought of investigating, a certain innocence has survived at the relatively innocuous level of intellectual curiosity, whereas everywhere else it has plunged deep, unseen and unheard of, just like everyone else. Perhaps the secret, or rather the mystery, of "teaching" in the full sense of the word, lies in reconnecting with this seemingly vanished innocence. But there's no question of rediscovering this contact in the pupil, if it isn't already present or rediscovered in the person of the teacher himself. And what is "transmitted" by the teacher to the pupil is by no means this rigor or innocence (innate in both of them), but a respect, a tacit revaluation of this commonly rejected thing.

## 12.25. Ø

**Note 23** For the past seven or eight years, however, there has been another chronic "source of frustration" in my life as a mathematician, but one that has expressed itself much more discreetly over the years. It eventually became apparent through an effect of repetition, of obstinate accumulation of the same type of "frustrating" situation.

p. 154

in my teaching activity, and by finally bursting into a sort of "fed up!", causing me to practically put an end to all so-called de " research direction" activity. I touch on this issue once or twice at the

In the course of my reflection, I finally examine it at least a little at the very end. At the very least, I describe this frustration, and examine the role it played in my "return to maths" (cf. par.50. "Weight of a past").

## 12.26. Fear of playing

**Note 23** This student had worked with me on a DEA "work placement" for a whole year, and remained "contracted" in his working relationship with me right up to the end. It was a frankly friendly relationship, shot through with a mutual sympathy that could not be doubted. Yet there was this "stage fright"; this fear, the real cause of which was surely not fear of me, even though it looked like it. I might not even have noticed it, had this student not told me about it himself, no doubt to "explain" more or less the reason for an almost complete block in his work during the year.

As was the case with other students who, like him, were initially hooked on a certain geometrical substance, the blockage manifested itself from the moment it was a question of doing "work on parts", i.e. putting statements in black and white, or just grasping the meaning and significance of those I was providing and proposing to admit as the foundations of a language, as the "rules of the game". School reflexes almost always push the student, faced with a situation where he's supposed to be "doing research", to adopt as a "given", both vague and imperative, the implicit "rules of the game" handed down by the teacher, and which it's certainly not a question of trying to make explicit, let alone understand. The concrete form these implicit rules take are "recipes" for semantics or arithmetic, along the lines of, say, a mole book (or any other common textbook). What's more, the pupil expects the teacher to perform a task of the form "demonstrate that...". (Incidentally, I don't believe that the attitudes of most professional mathematicians, and other scientists too, are essentially different - except that the "master" is replaced by the "consensus", which sets the rules of the game at the time and regards it as an immutable given. This consensus also defines the "problems" to be solved, between which everyone feels free to choose as they wish, even allowing themselves to modify them as they go along. of its work, or even to invent new ones. ... ). I noticed that the entirely different attitude that

p. 155

is mine vis-à-vis a mathematical substance that needs to be probed, and therefore also vis-à-vis the student, almost certainly triggers disarray, one of the signs of which is anguish. Like all anxiety, this will tend to take on a face, projecting itself onto an external "reason", plausible or not. One of the most common faces of anguish is fear.

Such difficulties hardly arose in the first period of my teaching activity, except perhaps in the two cases where a "teacher-student" relationship didn't continue beyond a few weeks, and perhaps (I couldn't say) in the case of the "sad student", who perhaps felt "riveted" to a subject that didn't inspire him at all, even though he had every opportunity to change it. In the case of the student (whom I also mentioned) who remained afflicted by stage fright for a long time, it's clear that the reason lay elsewhere. He was by no means blocked in his work, but on the contrary perfectly at ease with the theme he had chosen, on which he did a great deal of groundwork. In fact, most of my students during this period were former students of the Ecole Normale, and their contact with Henri Cartan had already shown them the example of a "different" approach to mathematics. At the opposite end of the spectrum (so to speak), in my second period as a teacher at the University of Montpellier, it was among first-year students that the anguish I've mentioned least interfered with reflective work. For many of these students, astonishment at a different approach didn't provoke anguish or closure, but rather openness and a willingness to do interesting things for once! From my observations, the effect of a few years in college on a student's creative disposition is radical and devastating. It's a strange thing that in this respect the effect of the long years of high school seems relatively

trivial. Perhaps the reason is that the college years come at an age when the creativity innate in us **must** ultimately be expressed through personal work, otherwise we'll be shipwrecked forever, at least in terms of creative work of an intellectual nature. It must have been a healthy instinct that during my years as a student (also at the Fac de Montpellier) I practically refrained from setting foot in class, devoting almost all my energy to <sup>personnel</sup> mathematical reflection.

## 12.27. The two brothers

**Note 23** This student's antagonism took the form, from the outset, of a "class antagonism": I was the "boss" who had "power of life and death" over his mathematical future, which I could decide at my own pleasure. ... Of course, events only confirmed this vision, as I soon put an end to my (now painful) responsibilities towards this student. This put him in a tricky situation, in these times when it's not so easy to find a "boss", especially when the subject has already been chosen. For the other student, frustrated in his legitimate expectations, the antagonism took a similar form. I felt like the tyrannical "mandarin", who could not tolerate contradiction from those (students or lower-ranking colleagues) he considered his subordinates.

Such a "class attitude" never manifested itself, if at all, during the relationship with my students of the first period. The obvious reason was that, in the pre-1970 context, there was no doubt that the student, once he had passed his thesis, would have a position as a lecturer, and would therefore enjoy a social status identical to mine, that of "university professor". Loquacious figures: the eleven students who began working with me before 1970 were given lectureships as soon as their work was completed, whereas none of the twenty or so students who worked more or less under my direction had access to such a position. It's true that only two of them were motivated enough to do a state doctorate thesis (an excellent one in both cases).

It's hardly surprising, then, that in this second period, certain ambivalences (whose deeper origins remained hidden) took the form of class antagonism, of distrust (presented and felt as "visceral") towards the "boss". For one of those who had been more or less a pupil, friendly relations continued for ten years without any apparent antagonistic episode, and yet marked by this same ambiguity, expressed by an attitude of mistrust, held "in reserve" behind manifest sympathy. To tell the truth, I've never been fooled by this "mistrust" of command, which

appeared to me above all as a reason that this friend sees fit to give himself for not venturing outside the well-defined domain he has chosen as his own, in his professional life as in his life all short - something he is free to do, however, without anyone (except, at most, himself!) calling him to account. ...

In fact, these three cases are the only ones in all my teaching experience where a certain ambivalence in the relationship between a student (or someone who is more or less a student) and myself has been expressed in a "class attitude". Such an attitude appears particularly ambiguous when it manifests itself between colleagues within a university "body" where they both enjoy exorbitant privileges compared to the situation of ordinary mortals, privileges which make differences in rank (and salary) appear relatively insignificant. In fact, I've noticed that these attitudes disappear as if by magic (and with good reason!), as soon as the person concerned sees himself promoted to the position of which only the day before he was complaining to others.

In fact, I detect a similar ambiguity in most, if not all, of the conflict situations I've encountered.

within the mathematical world (and often outside it too). Those who have been "castrated", whether or not their rank corresponds to their expectations (justified or not), enjoy quite unheard-of privileges, which no other profession or career can offer. Those who don't fit in aspire to the same security and privileges (which doesn't necessarily prevent them from taking an interest in maths itself, and sometimes from doing great things). These days, when the competition for a place is fierce, and the unhoused are often treated like stragglers, I've more than once felt the connivance between the one who enjoys humiliating and the one who is humiliated - and who swallows and crushes. The real object of his bitterness and animosity is **not** the one who has made use of power, but is none other than **himself**, who has crushed himself and invested the other with this power which he uses at pleasure. The one who takes pleasure in humiliating is also the one who takes his revenge and compensates (without ever erasing it. . . ) for a long-lasting humiliation that has long since been buried and forgotten. And he who acquiesces in his own humiliation is his brother and emulator, who secretly envies it and in bitterness buries both the humiliation, and the humble message about himself that it brings him.

## 12.28. Teaching failure (1)

### Note 23ivSince

these lines were written, I have had the opportunity to speak ☐with two of my ex-studentsp . 158  
 from after 1970, to try to probe with them the reason for the failure of my teaching at the level of re- research, at the University of Montpellier. They told me that the propensity I had to underestimate the difficulty that the assimilation of such techniques, familiar to me but not to them, could represent for them, had a discouraging effect on them, as they constantly felt they were falling short of the expectations I had of them. What's more (and this seems even more far-reaching to me), they sometimes felt frustrated when I "sold the worm" by giving them a shaped statement I had up my sleeves, instead of letting them discover it for themselves, at a time when they were already very close to it. After that, all they had to do was the "exercise" (which they weren't otherwise keen on) of proving the statement in question. Herein lies the "lack of generosity" in me that I had noted in an earlier note (note 21), without elaborating further. It is disappointments such as these, above all, that represent my personal contribution to the disappearance of interest in research in both of us, after what was nonetheless an excellent start.

I realize that I was no more generous before 1970 than after. If I didn't have the same difficulties then, it's undoubtedly because the kind of students who came to me in those days were motivated enough to find even a "long exercise" appealing, which was an opportunity to learn the trade and a host of other things along the way; and also, for a starter statement I was "selling the fuse" on, to come up with a host of others on their own that went far beyond the first. When I changed teaching location, I made the necessary adjustment in the choice of topics for reflection that I proposed to my new students, by choosing mathematical objects that could be grasped by immediate intuition, independently of any technical baggage. But this essential adjustment was in itself insufficient, due to differences in **disposition** (in my new students compared to those of yesteryear), even more important, than a single difference in **baggage**. This ties in with the observation made earlier (beginning of par.25) about a certain inadequacy in me for the role of "master", which came out much more strongly in my second period as a teacher than in the first.

## 12.29. Ø

**Note 23v** □ A particularly striking sign of this difference was seen in the "episode

strangers", which I have already mentioned (section 24). While I did receive expressions of sympathy from many people who were complete strangers to me, I don't recall any of my pre-1970 students thinking of expressing this, let alone offering me any help in the action I had embarked upon. On the other hand, I can't think of a single one of my students or former students from the second period who didn't express their sympathy and solidarity with me, and several actively joined the campaign I was running at local level. Beyond this restricted circle, the 1945 ordinance affair also created a certain emotion among many students at the Faculty who knew me by name at most, and a good number of them came to the Palais de Justice on the day of my summons, to show their solidarity. This last circumstance suggests, moreover, that the difference I observed between the attitudes of my students "before" and "after" 1970 may express less the difference in **relations** between them and me, than a difference in **mentalities**. Clearly, my "before" pupils had become important people, and it takes a lot for important people to consent to be moved... . But the episode of my departure from the IHES in 1970 and my involvement in militant action seems to show that there's more to it than that. It was a time when none of them was yet such an important figure, and yet I don't remember any of them showing the slightest interest in the activity I was getting involved in. Rather, I think it must have made them uncomfortable, all of them without exception. This again points to a difference in mentality, but one that can't be blamed solely on differences in social status.

## 12.30. ∅

**Note 24** The ethics I'm talking about apply just as much to any other milieu formed around a research activity, and where the possibility of making one's results known, and taking credit for them, is a matter of "life or death" for the social status of any member, or even of "survival" as a member of this milieu, with all the consequences this implies for him and his family.

## 12.31. Deontological consensus - and information control

**Note 25** Apart from the conversation with Dieudonné, I can't recall a conversation I've participated in or witnessed, during my life as a **mathématicien**, where the ethics of the profession were discussed, rules of the game" in relations between members of the profession. (I exclude here the discussions about the collaboration of scientists with the military, which took place in the early 70s around the "Survivre et Vivre" movement. They didn't really concern the relationships between mathematicians. Many of my friends in Survivre et Vivre, including Chevalley and Guedj, felt that the emphasis I placed at that time, especially in the early days, on this question to which I was particularly sensitive, distracted me from more essential everyday realities, of precisely the type I am examining in the present reflection). These things were never discussed between a student and myself. The tacit consensus was limited, I believe, to this one rule: not to present as one's own any ideas of others of which one may have been aware. This consensus, it seems to me, has existed since antiquity and has not been challenged in any scientific milieu to this day. But in the absence of this other complementary rule, which guarantees every researcher the possibility of making his ideas and results known, the first rule remains a dead letter. In today's scientific world, men in positions of prestige and power hold the key to success.

discretionary control of scientific information. This control is no longer tempered, in the milieu I had known, by a consensus such as Dieudonné spoke of, which perhaps never existed outside the restricted group whose spokesman he was. The scientist in a position of power practically receives all the information he deems useful to receive (and often even more), and has the power, for much of this information, to prevent its publication while keeping the benefit of the information and rejecting it as "uninteresting", "more or less well known", "trivial", etc. ... I return to this situation in note (27).

## 12.32. ∅

**Note 26** The "founding members" of Bourbaki are Henri Cartan, Claude Chevalley, Jean Delsarte, Jean Dieudonné. André Weil. They are all still alive, with the exception of Delsarte, who died before his time in the 1950s, at a time when the ethics of the profession were still generally respected.

Rereading the text, I was tempted to delete this passage, in which I can give the impression of to award certificates of "probity" (or non-probity) which the interested parties have no use for, and which it is not my responsibility ☐ de faire. The reservation this passage may arouse is surely justified. Nevertheless, I retain it, p. 161  
for the sake of authenticity, and because this passage does convey my feelings, however misplaced they may be.

## 12.33. Youth snobbery", or the defenders of purity

**Note 27** Ronnie Brown shared with me a reflection by J.H.C. Whitehead (of whom he was a pupil), speaking of the "snobbery of the young, who believe: that a theorem is trivial because its proof is trivial". Many of my old friends would do well to ponder these words. Today, this "snobbery" is by no means limited to young people, and I know more than one prestigious mathematician who routinely practices it. I'm particularly sensitive to it, because the best I've done in mathematics (and elsewhere too. . . ), the notions and structures I've introduced that seem to me to be the most fruitful, and the essential properties I've been able to extract from them through patient and persistent work, all fall under the label of "trivial". (None of these things would have stood much chance of being accepted for a CR grade these days, were the author not already a celebrity!) My lifelong ambition as a mathematician, or rather my passion and joy, has been constantly to **find the obvious things**, and this is my sole ambition also in the present work (including the present introductory chapter. . . ). The decisive thing is often already to see the **question** that had not been seen (whatever the answer may be, and whether it has already been found or not) or to come up with a statement (even if it is conjectural) that sums up and contains a situation that had not been seen or understood; if it is demonstrated, it doesn't matter whether the demonstration is trivial or not, which is entirely incidental, or even whether a hasty and provisional demonstration proves to be false. The snobbery of which Whitehead speaks is that of the jaded wine-lover who deigns to appreciate a wine only after he has ascertained that it has cost a great deal of money. More than once in recent years, caught up in my old passion, I've offered the best I had, only to see it rejected by that kind of smugness. I've felt a pain that's still alive, a joy that's been disappointed - but that doesn't mean I'm homeless, and fortunately for me, I wasn't trying to fit in an article of my own.

p. 162 The snobbery of which Whitehead speaks is an abuse of power and a dishonesty, not only an insensibility or a closure to the beauty of things, when exercised by a man of power against  
of a researcher to his <sup>merci</sup>, whose ideas he has free rein to assimilate and use, while blocking their publication on the grounds that they are "obvious" or "trivial", and therefore "uninteresting". I'm not even thinking here of the extreme situation of plagiarism in the common sense of the term, which must still be very rare in the mathematical world. However, from a practical point of view, the situation is the same for the researcher who pays the price, and the inner attitude that makes it possible doesn't seem much different to me either. It's simply more comfortable, since it's accompanied by a feeling of infinite superiority over others, and the good conscience and intimate satisfaction of the intransigent defender of the intangible purity of mathematics.

## 12.34. Ø

**Note 28** In writing the preceding pages, I was initially divided between a desire to "get it off my chest", and a concern for reserve or discretion. As a result, I had remained in a state of "à-peu-près", which was surely the main reason for my unease, my feeling that "I wasn't learning anything". Since the lines noting this malaise were written, I've twice rewritten those pages that had left me feeling internally discontented, getting more clearly involved and getting to the bottom of things. Along the way, I did indeed "learn something", and I also believe that I managed to put my finger on something important that goes beyond the case in point and beyond myself.

## 12.35. Ø

**Note 29** I'm referring here to an intense, long-term investment in mathematics, or in some other entirely intellectual activity. On the other hand, the unfolding of such a passion - which can be a way of reacquainting ourselves with a forgotten force within us, and an opportunity to measure ourselves against a reluctant substance and, in the process, renew and enrich our sense of identity with something truly personal to us - such an unfolding may well be an important stage in an inner journey, in a maturing.

## 12.36. Ø

**Note 30** In recent years, my children have taken over the task of teaching a sometimes reluctant pupil about the mysteries of human existence. ...

## 12.37. Ø

p. 163 **Note 31** I'm thinking here of the "yang" form of the desire to know - the one who probes, <sup>discovers</sup>, names what appears. ... It is having been **named** that makes the knowledge that has appeared irreversible, ineffaceable (even though it would later come to be buried, forgotten, cease to be active. ... ). The "yin", "feminine" form of the desire for knowledge is in an openness, a receptivity, in a silent welcoming of a

knowledge appearing in deeper layers of our being, where thought has no access. The appearance of such openness, and of a sudden knowledge that for a time erases all traces of conflict, comes as a grace once again, touching deeply even though its visible effect may be ephemeral. I suspect, however, that this wordless knowledge that comes to us in this way, at certain rare moments in our lives, is just as ineffaceable, and its action continues even beyond the memory we may have of it.

## 12.38. A hundred irons in the fire, or: there's no point in drying out!

**Note 32** **W h e n** I was still doing Functional Analysis, that is, until 1954, I would sometimes persist endlessly on a question I couldn't solve, even though I had no more ideas and was content to go round in circles with old ideas that obviously didn't "bite" any more. This was the case, in any case, for a whole year, notably for the "approximation problem" in topological vector spaces, which would only be solved some twenty years later by methods of a totally different order, which could only have escaped me at this point. I was driven then, not by desire, but by stubbornness, and by an ignorance of what was going on inside me. It was a painful year - the only time in my life when doing math had become painful for me! It took that experience for me to realize that there's no point in "skipping" - that once a piece of work has reached a standstill, and as soon as you've realized it has, you have to move on to something else - even if it means coming back to the question at hand at a more propitious moment. This moment almost always comes quickly - the question matures, without me even pretending to touch it, simply by virtue of working with gusto on questions that may seem to have nothing to do with this one. I'm convinced that if I persisted, I wouldn't get anywhere even in ten years! It was from 1954 onwards that I got into the habit in maths to always have many irons in the fire at the same time. I only work on one at a time, but by a kind of miracle that constantly renews itself, the work I do on one  $\square$  profits the other as well. all the others, biding their time. It was the same, without any deliberate intention on my part, from my first contact with meditation - the number of burning questions to be examined increased day by day, as the reflection continued. ...

p. 164

## 12.39. $\emptyset$

**Note 33** This does not mean that moments when paper (or the blackboard, which is a substitute!) is absent are not important in mathematical work. This is especially true in the "sensitive moments" when a new intuition has just appeared, when it's a question of "getting to know" it in a more global, more intuitive way than by "working on parts", which this informal stage of reflection prepares. In my case, this kind of reflection takes place mostly in bed or out for a walk, and it seems to me that it accounts for a relatively modest proportion of total work time. The same observations apply to meditation work as I've practised it up to now.

## 12.40. The powerless embrace

**Note 34** The word "embrace" is by no means a mere metaphor for me, and the common language here reflects a profound identity. It could be said, not without reason, that it is not true that "embrace" is a metaphor.

without wonder is powerless - that the earth would be depopulated, if not deserted, if it were so in the literal sense. The extreme case is that of rape, in which wonder is certainly absent, even though it happens that a being is procreated in the raped woman. Of course, the child born of such an embrace cannot fail to bear the mark of this embrace, which will be part of the "package" he or she receives and must assume; but this does not prevent a new being from being conceived and born. that there has been **creation**, a sign of **power**. And it's also true that some mathematicians I've seen, full of self-importance, find and prove beautiful theorems, signs of an embrace that didn't lack force! But it's also true that if the life of such a mathematician is suffocated by his smugness (as was to some extent the case in my own life, at one time), the fruits of these embraces with mathematics are a blessing to him and to no-one else. And the same can be said of the father and mother of a child born of rape. When I speak of a "powerless embrace", I mean above all the powerlessness to engender **renewal** in those who believe:

p. 165 create, whereas all he creates is a **product**, something external to him, with no deep resonance within himself; a □product which, far from freeing him, creating harmony within him, binds him more closely to the fatuity within him of which he is

a prisoner of the constant pressure to produce and reproduce. This is a form of powerlessness at a deep level, behind the appearance of "creativity" which is basically just unbridled **productivity**.

I've also had ample opportunity to realize that complacency, the inability to marvel, is in the nature of true blindness, a blockage of natural sensitivity and flair; if not total and permanent, at least manifest in certain situations. It's a state of affairs in which a prodigious mathematician sometimes reveals himself, in the very things in which he excels, to be as stupid as the most stubborn of schoolchildren! On other occasions, he will perform prodigious feats of technical virtuosity. I doubt, however, that he is yet in a position to discover the simple and obvious things that have the power to renew a discipline or a science. They are far too far below him for him to deign to see them! To see what no one deigns to see, he needs an innocence that he has lost, or banished. . . It's no coincidence, surely, with the prodigious increase in mathematical production over the last twenty years, and the unrolling profusion of new results with which the mathematician who simply wants to "keep up to date" is inundated, that (as far as I can judge from the echoes that reach me here and there) there has hardly been any real **renewal**, any far-reaching transformation (and not just by accumulation) of any of the major themes of thought with which I have been even remotely familiar. Renewal is not a quantitative thing, it is foreign to a quantity of investment, measurable in a number of mathematician-days devoted to a given subject by such and such a "level" of mathematicians. A million mathematician-days is powerless to give birth to something as childlike as the zero, which has renewed our perception of number. Only innocence has this power, a visible sign of which is wonder. ...

## 12.41. ∅

**Note 35** This "gift" is nobody's privilege; we're all born with it. When it seems absent in me, it's because I've chased it away myself, and it's up to me to welcome it back. In me or in such-and-such a person, this "gift" expresses itself in a different way than in another, less communicative, less irresistible perhaps, but it's no less present, and I couldn't say if it's less active.

## 12.42. ∅

p. 166 □ **Note 36** Such a delicate sensitivity to beauty seems to me intimately linked to something I've had

I've had occasion to refer to it as "exigency" (with regard to oneself) or "rigor" (in the full sense of the word), which I described as "attention to something delicate in ourselves", attention to a quality of understanding of the thing being probed. This quality of **understanding** of a mathematical thing cannot be separated from a more or less intimate, more or less perfect perception of the "beauty" particular to that thing.

## 12.43. ∅

**Note 37** I think I hardly need to add that this long-term work has brought out, day by day, much more than the "result" I have just delivered in lapidary form. It's no different for a work of meditation than it is for a mathematical work motivated by a particular question that we set out to examine. Quite often, the twists and turns of the road followed (which may or may not lead to a more or less complete clarification of the initial question) are more interesting than the initial question or the "final result".

## 12.44. ∅

**Note 38** These notes were in fact a continuation of the long letter to. . . which became the first chapter. They were typed so as to be legible for this old friend, and for two or three others (Ronnie Brown in particular) whom I thought might be interested. This letter, by the way, was never answered, nor was it read by the addressee, who almost a year later (when I asked him if he'd received it) expressed sincere astonishment that I'd even thought for a moment that he could read it, given the kind of mathematics that was to be expected of me. ...

## 12.45. ∅

**Note 39** This is the period, among others, of the "Long Walk through Galois theory", discussed in "Esquisse d'un Programme" (par.3: "Corps de nombres associés à un dessin d'enfant").

## 12.46. The visit

**Note 40** The work on this dream is the subject of a long letter in English, to a friend and colleague who had dropped in on me the day before. Some of the materials used by the Dreamer to bring this strikingly realistic dream out of apparent nothingness were obviously borrowed from this short episode of the visit.

of a dear friend I hadn't seen in nearly ten years. <sup>Ausi</sup>si, on the first day of work and against from my past experience, I thought I could conclude that the dream that had come to me concerned my friend more than it concerned me - that it was **he** who should have had the dream, not me! It was a way of evading the message of the dream, which (I should have known from my past experience) concerned no one but me. I finally realized this in the night that followed this first, superficial phase of the work, which I resumed the next day in the same letter. Since that memorable letter, I have received no further sign of life from this friend, one of the closest I have ever had.

p. 167

This work was the only meditation that took the form of a letter (and in English to boot), so I no longer have a written record of it. I was particularly struck by this episode, one of many that show how any sign of work that goes beyond a certain façade, and brings to light simple facts that we generally make a point of ignoring - how any such work inspires unease and fear in others. I'll come back to this later (see par. 47, "The solitary adventure").

## 12.47. Krishnamurti, or liberation turned hindrance

**Note 41** It would be inaccurate to say that the only thing I took away from this reading was a certain vocabulary, and a propensity to make it my own and ultimately substitute it, appropriately enough, for reality. The reason I was so struck by Krishnamurti's first book (even though I'd only had the chance to read a few chapters) was that what he was saying totally overturned a number of things I'd always taken for granted, and which I immediately realized were **commonplaces** that had always been part of the air I'd breathed. At the same time, this reading drew my attention, for the first time, to far-reaching facts, especially that of flight from reality, as one of the most powerful and universal conditioning of the mind. This gave me an essential key to understanding situations that until then had been incomprehensible and therefore (without my realizing it until I discovered meditation five or six years later) generating anguish. I've noticed

p. 168 immediately the reality of this escape all around me. This unraveled certain anxieties, without however changing anything essential, because I only saw this reality in others, while <sup>□</sup>me figuring (as going from I was, in fact, the exception that confirmed the rule (and without asking myself any further questions about this truly remarkable exception). In fact, I was in no way curious about myself or others. This "key" can only **open in the** hands of the person motivated by the desire to penetrate. In my hands, it had become an exorcism and a pose.

It was at the beginning of 1974 that, for the first time, I realized that the destruction in my life, which had been following me step by step, could not have come from others **alone**, that there was something **within me** that attracted it, fed it, perpetuated it. It was a moment of humility and openness, conducive to renewal. But the renewal remained peripheral and ephemeral, for lack of in-depth **work**. This "something inside me" was still vague. I could see that it was a lack of love, but the very idea of working to identify more closely where and how there had been a lack of love in me, how it had manifested itself, what its concrete effects had been, etc. . - (On the contrary, K. likes to insist on the vanity of all work, which he automatically equates with the ego's "craving to become"). So, with borrowed "wisdom" as my compass, I saw nothing to do but wait patiently for "love" to descend upon me like a grace from the Holy Spirit.

Yet the humble truth I'd just learned in the depths of a wave had triggered a powerful surge of new energy, comparable to that which would carry me through my first foray into meditation two and a half years later. This energy did not remain entirely unused. A few months later, when I was immobilized by a providential accident, it led to a (written) reflection in which, for the first time in my life, I examined the worldview that had been the unspoken basis of my relationship with others, and which had come to me from my parents and especially my mother. I then realized very clearly that this vision had failed, that it was incapable of accounting for the reality of relationships between people, and of fostering personal fulfillment and relationships with others. This reflection remains

by the "Krishnamurti style", and also by the Krishnamurtian taboo on any real **work** towards understanding. However, she made tangible and irreversible a knowledge born a few months before, restéep at first vague and elusive. No book and no other person in the world could have given me this knowledge. . 169

To have the quality of a meditation, what this reflection lacked above all was a look at myself and my **vision of myself**, and not just my vision of the world, a system of axioms in which I wasn't really "in the flesh". It also lacked a look at myself in **the moment**, at the very moment of reflection (which fell short of a real work); a look that would have allowed me to detect not only a borrowed style, but also a certain complacency in the literary aspect of these notes, a lack of spontaneity and authenticity. Inadequate though it was, and relatively limited in its immediate effects on my relationships with others, this reflection nonetheless seemed to me to be a step, probably necessary given the starting point, towards the more profound renewal that was to take place two years later. It was then, at last, that I discovered meditation - and discovered that first unsuspected fact: **that there were things to discover about myself** - things that almost completely determined the course of my life and the nature of my relationships with others. . .

## 12.48. The salutary wrench

**Note 42** "The "percussive" event in question was the discovery, at the end of 1969, that the institution to which I felt I belonged was partly financed by funds from the Ministry of the Armed Forces, something which was incompatible with my basic axioms (and still is, in fact). This event was the first in a whole chain of others (each more revealing than the last!) which resulted in: my departure from the IHES (Institut des Hautes Etudes Scientifiques), and one thing leading to another, a radical change of environment and investments.

During the heroic years of the IHES, Dieudonné and I were the only members, and also the only ones to give it credibility and an audience in the scientific world, Dieudonné through the publication of "Publications Mathématiques": the first volume of which appeared as early as 1959, the year after the IHES was founded.

IHES by Léon Motchane), and I by the "Séminaires de Géométrie Algébrique". In those early years, the IHES' existence remained <sup>most</sup>precarious, with uncertain funding (through the generosity of a fewp companies acting as patrons) and with the only premises a room lent (with visible bad humor) by the Fondation Thiers in Paris for the days of my seminar<sup>5</sup>. I felt a bit like a "scientific" co-founder, with Dieudonné, of my home institution, and I intended to end my days there! I had come to identify strongly with the IHES, and my departure (as a consequence of my colleagues' indifference) was experienced as a kind of uprooting from another "home", before proving to be a liberation. . 170

Looking back, I realize that there must already have been a need for renewal within me, although I can't say how long ago it was. It's surely no mere coincidence that the year before I left IHES, there was a sudden shift in my investment of energy, leaving the tasks that had been burning in my hands the day before, and the questions that fascinated me most, to throw myself (under the influence of a biologist friend, Mircea Dumitrescu) into biology. I went into it with the attitude of a

<sup>5</sup>A recent brochure published by the IHES to mark the twenty-fifth anniversary of its foundation (of which Nico Kniper was kind enough to send me a copy) says nothing about these difficult beginnings, perhaps unworthy of the solemnity of the occasion, which was celebrated with great pomp last year.

long-term investment in IHES (in keeping with the institution's multi-disciplinary vocation). Surely this was no more than an outlet for the need for a much more profound renewal, which could not have been achieved in the "scientific incubator" atmosphere of the IHES, and which took place during that "cascade of awakenings" to which I have already alluded. There have been seven, the last of which took place in 1982. The "military funds" episode was providential in triggering the first of these "awakenings". The Ministry of the Armed Forces, like my ex-colleagues at IHES, have finally earned my gratitude!

## 12.49. Ø

**Note 43** "The poetic work of my composition" contains many things that I know first-hand, and which today appear to me to be just as important in my life, and "in life" in general, as when it was written, with the intention of publishing it. If I have refrained from doing so, it is above all because I

I later realized that the form was afflicted by a deliberate intention to "make poetic", so that its overly-constructed ensemble conception, and many passages, lack spontaneity, au

p. 171

The form was at times painfully stiff and swollen. This form, bulky at times, was a reflection of my disposition, where it was decidedly often the "boss" who called the shots - heavily, it goes without saying... .

## 12.50. Ø

**Note 44** Needless to say, I'm disregarding the hypothesis - by no means improbable, to say the least - of the unexpected eruption of an atomic war or some other such joyous event, likely to put an abrupt end, once and for all, to the collective game called "Mathematics", and to much else besides... .

**Part two.**

**BURIAL (I)**

## 13.1. I The student posthumous

### 13.1.1. Teaching failure (2) - or creation and fatuity

**Note 44'** [This note is called by section 50 of Chapter **VIII The Lonely Adventure** of Part (I) **Fatuity and Renewal** p. 227]

p. 173

This passage struck a chord with the friend I asked to read this last section, "The weight of a past" <sup>1</sup>(\*). He wrote to me: "For many of your former students, the aspect, as you say, of the invasive and almost destructive 'boss' has remained strong. Hence the impression you have." (Knowing, I presume, "the impression" that is expressed in certain passages of this section and notes n°s 46,47,50 that complete it.) Earlier he writes: "First of all, I think you did well to leave mathematics for a moment [!], because there was a kind of incomprehension between you and your students (apart from Deligne, of course). They were left a little dumbfounded...".

It's the first time I've heard such high praise for my role as "boss" before 1970, going beyond the usual compliments! Further up in the same letter: ". . I understand that your former students [read: those "before 1970"] don't really know what it's like to **create** mathematics, and that you may have had something to do with it. . . It's true that in their time, the problems were all posed...". <sup>2</sup>(\*\*).

p. 174

My correspondent probably means that it was **I** who was posing the "problems", and with them the notions of that I had to develop, rather than leaving it up to my students to find them; and that it was in this way that I may have obscured in them the knowledge of what is the essential part of the work of mathematical creation. This also ties in with a □ impression that emerged from the conversation with two of my post-1970 ex-students, mentioned in a previous note (note (23iv)). It's true that, in the students who came to me, I was above all looking for **collaborators** to develop intuitions and ideas that had already formed within me, to "push at the wheels", in short, of a carriage that was already there, which they therefore didn't have to pull out of a kind of nothingness (as my correspondent had to do). And yet, this is what has always been the most fascinating aspect of mathematical work for me, and the part of the work in which I felt that a "creation" was taking place, the "birth" of something more delicate and more essential than a simple "result".

If I sometimes see some of my students treating this prized thing with disdain, and thus displaying the "snobbery" of which J.H.C. Whitehead spoke (which consists in despising what one "would know how to dis- show") <sup>3</sup>(\*), I'm no doubt no stranger to it, in one way or another. The failure of my teaching, glaringly obvious in the period after 1970, is now also apparent to me, in a different and more hidden form, in my teaching in the first period, even though in the conventional sense it appears to have been a complete success! It's something I've already glimpsed from time to time over the last few years, and which I've mentioned in letters to several of my ex-students, without so far having received any real response from any of them.

I don't think it would be accurate, however, to say that the work I proposed to my students, and what they did with me, was purely technical work, of pure routine, unsuited to bringing their personalities into play.

---

<sup>1</sup>(\*) (May 10) The friend in question is none other than Zoghman Mebkhout, who has kindly authorized me to lift the anonymity I felt I had to maintain regarding the origin of the letter (April 2, 1984) I quote in this note.

<sup>2</sup>(\*\*) (May 10) The above quotation is heavily truncated, out of respect for my correspondent's anonymity. See the following note for a full quotation of the passage from which this quotation is taken, and for comments on its true meaning, which had initially escaped me for lack of more detailed information.

<sup>3</sup>(\*) See note "Youth snobbery - or the defenders of purity", n° 27 p. 247.

creative faculties. I put at their disposal tangible and sure starting points, between which they were free to choose, and from which they could launch out, as I myself had done before them. I don't think I've ever proposed a subject to a pupil that I wouldn't have enjoyed tackling myself; nor do I think there has been such an arid path in the journey that any of them have taken with me. that I haven't myself gone through others just as arid in the course of my mathematical life, without getting discouraged or rushing through them.

when it was clear that the job had to be done and there was no other way.

□ Also it seems to me that the failure I see today has more subtle causes than the type of themes I proposed, and to what extent these remained nebulous or were, on the contrary, clear-cut. My share in this failure seems to me to be due rather to attitudes of fatuity in my relationship to mathematics; attitudes which I have had occasion to examine in this reflection. If not in the actual work with a particular student, then at least in the atmosphere that surrounded me. Fatuity, even when it is expressed in the most "discreet" way in the world, always goes in the direction of a closure, an insensitivity to the delicate essence of things and their beauty - whether these are "mathematical things", or living people whom we have the power to welcome, encourage, or also to look upon from the height of our grandeur, insensitive to the breath that accompanies us and to its destructive effects on others as on ourselves.

p. 175

### 13.1.2. A feeling of injustice and powerlessness

**Note 44** [The appearance of this note does not respect the chronological order of writing]

(May 10) Taking advantage of my friend's permission to quote freely from his letters as I see fit, I give here a more complete quotation<sup>4</sup> (\*), which places the truncated quote in its true context:

"It's true that I was very isolated between 75-80, apart from a few rare questions to Verdier. But I don't blame your former students for that period, because nobody really understood the importance of this link [read: between discrete coefficients and continuous coefficients]. That all changed in October 1980, when we discovered the first very important application of this link for semisimple groups, namely the proof of the Kazhdan-Lusztig multiplicity formula, where we made essential use of the category equivalence in question. This equivalence took the name of "Riemann-Hilbert correspondence" without further comment - after all, it's so natural! That's when I realized that your former students don't really know what a mathematical **creation** is, and that perhaps you were partly to blame. I still feel a sense of injustice and powerlessness. It's true that by their time, the problems had all been solved. The number of applications of this theorem is impressive, both in the context of the transcendental framework, but always under the name of correspondence.

of Riemann-Hilbert! I feel my name is unworthy of this result for □ many people and in particular for your former students. But as you can clearly see from the introductions to my work, it's your "duality" formalism that naturally leads to this result. But like you, I'm not worried about the future of this link between "constructible discrete coefficients" and crystalline coefficients (or holonomic D-Modules). It's clear that it applies in many fields both in the cohomology of spaces and in analysis."

p. 176

It was this passage from my friend's letter that inspired (in addition to the present note) the later "L'inconnu" (The unknown).

<sup>4</sup>(\*) See second b. de p. of the previous note. "The failure of teaching (2) - or creation and fatuity", n° 44'.

and the good Lord's theorem". From the terms of this letter, I had no idea (as I explain in its place) that this "feeling of injustice and powerlessness" in my friend was the reaction, not simply to an attitude of blind disdain systematically **minimizing** his contributions (an attitude which has become quite familiar to me, among some of my former students), but to a veritable operation of swindling, consisting in purely and simply **swindling** the paternity of a theorem - key. This situation became clear to me only eight days ago - see the note "L' Iniquité - ou le sens d'un retour" and the following notes (n° s 75 to 80), grouped together under the title "Le Colloque - ou faisceaux de Mebkhout et Perversité".

**Note 45** My change of environment and lifestyle has meant that opportunities to meet or make further contact with my old friends have become rare. This has not prevented signs of "distancing" from manifesting themselves in many ways, to a greater or lesser degree from one to another. With others, however, such as Dieudonné, Cartan or Schwartz, and indeed with all the "elders" who had given me such a warm welcome in my early days, I felt nothing of the kind. Apart from these, however, I have the impression that there are very few of my former friends or students in the mathematical world whose relationship with me (whether or not it finds occasion to express itself) has not become divided, "ambivalent", after I withdrew from what was once a common milieu, a common world.

## 13.2. II orphans

### 13.2.1. My orphans

**Note 46** [This note is called by section 50 of Chapter **VIII The Lonely Adventure** of Part **(I) Fatuity and Renewal** p. ]

p. 177

□ I'd like to take this opportunity to say a few words here about mathematical notions and ideas, of all those I've uncovered, which seem to me (by far) to have the greatest impact  $(46)_1^5$  (\*). First and foremost, there are five closely related key concepts, which I'll briefly review, in order of increasing specificity and richness (and depth).

The first is the idea of a **derived category** in homological algebra (see note 48 on p. 274), and its use in a "catch-all" formalism known as **the "six operations formalism"** (i.e. the operations of the "six operations").

$\otimes^L, Lf^* Rf_!, RHom, Rf^*, Lf^!$  )  $(46_2)$  for the cohomology of the most important types of "spaces" which have so far been introduced in geometry: "algebraic" spaces (such as schemas, schema- tic multiplicities, etc. . . ), analytic spaces (both complex analytic, and rigid-analytic and similar), topological spaces (pending, of course, the context of "moderated spaces" of all kinds, and surely many more besides, such as that of the category (Cat) of small categories, serving as homotopic models. . . ). This formalism covers both discrete and continuous coefficients.

The gradual discovery of this duality formalism and its ubiquity came about through a solitary, obstinate and demanding process of reflection, which continued between 1956 and 1963. It was in the course of this reflection that the notion of derived category gradually emerged, along with an understanding of its proper role in homological algebra.

<sup>5</sup>(\*) Readers will find in notes n° 46<sub>1</sub> to 46<sub>9</sub> some more technical comments on the concepts reviewed in the present note. On the other hand, independently of the specific **notions** I have introduced, the reader will find some reflections

on what I consider to be "the main part" of my work (within the part of my work "fully completed"), in note no.° 88 "La dépouille".

What was still lacking in my vision of the cohomological formalism of "spaces" was an understanding of the link between discrete coefficients and continuous coefficients, beyond the familiar case of "spaces". local systems and their interpretation in terms of integrable connection modules, or modules. This deep connection, first formulated in the framework of complex analytic spaces, was discovered and established (nearly twenty years later) by Zoghman Mebkhout, in terms of derived categories formed on the one hand using "constructible" discrete coefficients, on the other using the notion of "*D-Module*" or "complex of differential operators" (cf. note 46<sub>3</sub> p. ).

p. 178

For almost ten years, Zoghman Mebkhout pursued his remarkable work in almost total isolation, in the absence of encouragement from those of my former students who were best placed to give it to him, and to back him up with their interest and the experience they had acquired through my contact. This did not prevent him from discovering and proving two key theorems<sup>6</sup> (\*) of a new crystalline theory that was being born in the midst of general indifference, both of which (and this was a decidedly bad sign!) expressed in terms of derived categories: one giving the category equivalence between "constructible discrete" coefficients and crystalline coefficients (satisfying certain conditions of "holonomy" and "regularity") (48'), the other being "**the**" crystalline global duality theorem, for the constant application of a smooth complex analytic space (not necessarily compact, which entails difficulties techniques) to a point. These are deep theorems<sup>7</sup> (\*\*), which throw

a nouveau day on the cohomology of both analytic and schematic spaces (in characteristic zero for the moment), and hold out the promise of a far-reaching renewal of the cohomological theory of these spaces. After two unsuccessful applications to the CNRS, they finally earned their author a position as a research fellow (equivalent to an assistant or senior assistant at the University).

p. 179

No one in these ten years has thought of telling Mebkhout, who is grappling with the considerable technical difficulties of the transcendent context, about the "six-variance formalism", well known to my students<sup>8</sup> (\*), but nowhere to be found "on the net". He finally learned of its existence from me last year (in the form of a form that, apparently, is known only to me. . . ), when he was kind enough and patient enough to explain to me what he had done; to me, who wasn't so much into cohomology any more . . . Nor did anyone think to suggest to him that it might be more "profitable" to start with the context of zero-characteristic schemes, where the difficulties inherent in the transcendental context disappear, and where, on the other hand, the conceptual questions fundamental to the theory appear all the more clearly. No one thought of pointing out to him (or even noticed what was known to me from the time I introduced crystals<sup>9</sup> (\*\*)) that the "*D-Modules*" on spaces (analytic or schematic)

<sup>6</sup>(\*) (June 7) Mebkhout points out that, in addition to these two theorems, a third must be added, also expressed in terms of derived categories, namely what he has called (somewhat improperly perhaps) the "**biduality theorem**" for *D-Modules*, and which is the most difficult of the three. For an overview of Mebkhout's ideas and results and their uses, see Le Dung Trang and Zoghman Mebkhout, Introduction to linear differential Systems, Proc. of Symposia in Pure Mathematics, vol.40 (1983) part.2, pp. 31-63.

<sup>7</sup>(\*\*) (May 30) The demonstration of the second theorem runs up against the technical difficulties usual to the transcendental context, requiring the use of "eavesque" techniques, so I guess it can be classed as a "difficult" demonstration. That of the first theorem is "obvious" - and profound, using the full force of Hironaka's resolution of singularities.

As I point out in the penultimate paragraph of the note "Solidarity" (n° 85), once the theorem has been worked out, "anyone" who is well-informed is capable of proving it. Compare also with J.H.C. Whitehead's observation quoted in the note "Youth snobbery - or the defenders of purity" (n° 27). When I wrote this last note, as if under the silent dictation of a secret prescience, I had no idea how far reality would go beyond my timid, groping suggestions!

<sup>8</sup>(\*) They learned this first-hand in the SGA 4 and SGA 5 seminars, and by text, in R. Hartshorne's "Residues and Duality".

<sup>9</sup>(\*\*) (May 30) But I had time to forget it - only to remember it again by virtue of the second encounter with Mebkhout, last year. (See note "Rencontre d'outre-tombe", n° 78.

smooth spaces are no more and no less than "**module crystals**" (when we disregard any question of "coherence" for either of them), and that the latter was a catch-all notion that worked just as well for "spaces" with any singularities as it did for smooth spaces (46 ).<sup>4</sup>

Given Mebkhout's means (and uncommon courage), it is quite clear to me that, placed in an atmosphere of sympathy, he would have had no difficulty but great pleasure in establishing the complete formalism of the "six variances" in the context of the crystalline cohomology of zero characteristic schemes, while all the ideas essential for such a large-scale program (including his own in addition to those of the others) would have been available to him.

p. 180 of the Sato school and my own) were already, it seemed to me, combined. For someone of his caliber, this was a matter of a few years' work, as was the development of an all-purpose formalism from cohomologie étale was a matter of a few years (1962-1965), as long as the common thread of the six operations was already known (in addition to the two key theorems of base change). It's true that these were years carried by a current of enthusiasm and sympathy from those who were co-actors or witnesses, and not a work against the haughty smugness of those who have everything in hand. ...

This brings me to the second pair of notions I wanted to talk about, that of **schema**, and the closely related one of **topos**. The latter is the more intrinsic version of the notion of **site**, which I first introduced to formalize the topological intuition of "localization". (The term "site" was later introduced by Jean Giraud, who also did much to give the notions of site and topos the necessary flexibility). It was the obvious needs of algebraic geometry that led me to introduce diagrams and topos one after the other. This pair of notions potentially contains a vast renewal of algebraic geometry, arithmetic and topology, through a **synthesis of** these "worlds", too long separated, in a common geometric intuition.

The renewal of algebraic geometry and arithmetic through the point of view of diagrams and the language of sites (or of "descent"), and through twelve years of work on the foundations (not counting the work of my students and other willing participants), has been accomplished over the last twenty years: the notion of diagram, and that of spread cohomology of diagrams (if not that of spread topos and that of spread multiplicity) have finally entered the mainstream, and the common heritage.

On the other hand, this vast synthesis, which would also encompass topology, while for the past twenty years ideas have been

p. 181 essential and the main technical tools required seem to me to be gathered and ready<sup>10</sup> (\*), is still biding its time. For five years (since my departure from the mathematical scene), the fertile unifying idea and the The notion of topos, a powerful tool for discovery, has been relegated by a certain fashion<sup>11</sup> (\*) to the sidelines of serious notions. Even today, few topologists have the slightest inkling of this considerable potential expansion of their science, and of the new resources it offers.

In this renewed vision, the topological spaces, differentiable spaces, etc. ... that the topologist handles daily are, along with schemas (which he has heard of) and topological multiplicities, differentiable spaces, etc. ... .

<sup>10</sup>(\*) (May 15) These "essential ideas and principal technical means" had been brought together in the vast fresco of the SGA 4 and SGA 5 seminars, between 1963 and 1965. The strange vicissitudes that befell the writing and publication of the SGA 5 part of this fresco, which appeared (in unrecognizable, devastated form) eleven years later (in 1977), give a striking picture of the fate of this vast vision in the hands of "a certain fashion" - or rather, in the hands of some of my students who were the first to introduce it (see note b. on next p.). These vicissitudes and their meaning are gradually revealed in the course of reflection over the last four weeks, continuing in the notes "Le compère", "La table rase", "L'être à part". "The signal", "The renversement", "Le silence", "La solidarité", "La mystification", "Le défunt", "Le massacre", "La dépouille", notes n° s 63", 67, 67', 68, 68' and 84-88.

<sup>11</sup>(May 13) Further reflection in the six weeks since these lines were written (end of March), has revealed that this "fashion" was first and foremost established by some of my students - the very ones who were best placed to make a certain vision, ideas and technical means their own, and who chose to appropriate working tools, while disowning both the vision that had given rise to them, and the person in whom this vision had originated.

or schematics (which nobody talks about) are all embodiments of the same type of remarkable geometric objects, the **ringed topos** (46<sub>5</sub>), which play the role of "spaces" in which intuitions from topology, algebraic geometry and arithmetic converge into a common geometric vision. The "modular" multiplicities of all kinds that we encounter at every step (provided we have eyes open to see) provide so many striking examples (46<sub>6</sub>). Their in-depth study is a first-rate guide to the essential properties of geometric objects (or other objects, if there are objects that are not geometric. . .), whose variation, degeneration and generalization are described by these modular multiplicities. Yet this richness remains ignored, since the notion that allows us to describe it in detail doesn't fit into commonly accepted categories.

Another unexpected aspect brought by this recused synthesis<sup>12</sup> (\*\*), is that  $\square$  the homotopic invariants familiar from some of the most common spaces (46<sub>7</sub>) (or more precisely, their profinite compactifications) are equipped with unsuspected arithmetic structures, including operations of certain profinite Galois groups.

p. 182

...

And yet, for almost fifteen years now, it has been part of the "high society" to look down one's nose at anyone who utters the word "topos", unless it's in jest, or they have the excuse of being a logician. ) Nor has the yoga of derived categories, to express the homology and cohomology of topological spaces, penetrated among topologists, for whom K nneth's formula (for a ring of coefficients that is not a body) still continues to be a system of two spectral sequences (or, at the very least, a kyrielle of short exact sequences), and not a unique canonical isomorphism in a suitable category ; and who still ignore the base change theorems (for a proper morphism or by a smooth morphism, for example), which (in the neighboring framework of stale cohomology) were the crucial turning point for the strong "start" of this cohomology (cf. note 46<sub>8</sub> p. 270). I shouldn't be surprised when the very people who helped develop this yoga have long since forgotten about it, and beat the crap out of anyone who even pretends to want to use it!<sup>13</sup> (\*).

The fifth notion that is closest to my heart, perhaps more than any other, is that of "**motif**". It differs from the previous four in that "**the**" right notion of pattern (even above a basic body, let alone a basic schema of any kind) has not so far been the subject of a

satisfactory definition, even admitting for this purpose all the "reasonable" conjectures one would need. Or rather, visibly,  $\square$  **the** "reasonable conjecture" to be made, as a first step, would be that of p. 183

the **existence of** a theory, satisfying such data and such properties, that it would not be at all difficult

<sup>12</sup>(\*\*) (May 13) This synthesis was "rejected" in the first place, both in its spirit and in the key notion that makes it possible, by none other than the very person who was the main user and beneficiary, throughout his work, of the technical means it had enabled me to develop (with the language of diagrams and the construction of a theory of staggered cohomology). It's Pierre Deligne. Because of his exceptional influence (due to his exceptional means), and because of the very special position he occupied in relation to my work, of which he was like an implicit legatee, the discreet and systematic barrage he put up against the main ideas I had introduced (with the exception of the notion of schema and staggered cohomology) was highly effective, surely playing a leading role in the establishment of the "fashion" that **buried** these ideas, reduced for nearly fifteen years to a vegetative life. His work has been deeply marked by this ambiguity, which I first glimpsed in the reflection that continues that of the present note. (See "Refus d'un h ritage - ou le prix d'une contradiction", note

n  47 p. 271) This initial perception, vivid but still confused, of this permanent hindrance in Deligne's work after my departure, became clearer and confirmed in a striking way during all the reflection on this Burial, in which my friend plays the role of principal official.

<sup>13</sup>(\*) (May 13) In the course of further reflection, it became clear that the situation began to change with the Colloque de Luminy in June 1981: those who had "forgotten" (or rather, buried. . .) these notions began to strut about with them, without however ceasing to

(See notes  s 75 and 81 on this memorable Colloquium).

(and quite fascinating!), for someone in the know<sup>14</sup> (\*), to fully explain. In fact, I came very close to doing so, shortly before I "quit maths".

In some respects, the situation resembles that of the "infinitely small" in the heroic days of differential and integral calculus, but with two differences. Firstly, we now have the experience in building sophisticated mathematical theories, and an effective conceptual baggage, that our predecessors lacked. And then, in spite of the resources at our disposal and in the more than twenty years since this visibly essential notion first appeared, no one has deigned (or dared, in spite of those who don't deign. . . ) to put their hand to the grindstone and outline a theory of patterns, as our predecessors did for infinitesimal calculus without beating about the bush. However, it's as clear now for patterns as it was for "infinitesimals", that these beasts exist, and that they manifest themselves at every step in algebraic geometry, as long as we're interested in the cohomology of algebraic varieties and families of such varieties, and more particularly in their "arithmetic" properties. Perhaps even more so than for the other four notions I've mentioned, that of motif, which is the

p. 184

and richest of all, is associated with a multitude of intuitions of all kinds, by no means vague but for  $\square$ mululable often with perfect precision (even sometimes, if need be, admitting a few motivic premises). For me, the most fascinating of these "motivic" intuitions was that of the "motivic Galois group", which, in a sense, makes it possible to "put a motivic structure" on the Galois groups profi- ned by bodies and schemes of finite type (in the absolute sense). (The technical work required to give precise meaning to this notion, in terms of the "premises" providing a provisional foundation for the notion of motive, was accomplished in Neantro Saavedra's thesis on "Tannakian categories").

The current consensus is a little more nuanced for the notion of pattern than for its three brothers (or sisters) in misfortune (derived categories, duality formalism known as the "six operations", topos), in the sense that it is not treated outright as "bombast"<sup>15</sup> (\*). In practice, however, it all boils down to the same thing: as long as there's no way of "defining" a motif and "proving" something, serious people can only refrain from talking about it (with the greatest regret, it's a matter of course, but you're either serious or you're not... .). Of course, we may never be able to construct a theory of motives and "prove" anything about them, as long as we declare that it's not serious even to talk about them!

But the few people in the know (and who make the fashion) know very well that in terms of the premises, which remain secret, many things can be proved. In other words, ever since the notion first appeared in the wake of Weil's conjectures (though proven by Deligne, which makes it

even a good point!), **pattern yoga does** exist. But it has the status of a **secret science**, with admittedly very few initiates<sup>16</sup> (\*\*). It may be "not serious", but it nevertheless allows  $\square$ those rare initiates to say

p. 185

in a host of cohomology situations, "what you'd expect". It thus gives rise to

---

<sup>14</sup>(\*) (May 13) I've come to understand that the only person (apart from myself) who to this day responds to the rather peculiar meaning of this "somewhat in the loop" is Pierre Deligne, who for four years has had the advantage of being the day-to-day confidant of my motivic reflections, at the same time as listening to "the little I knew about algebraic geometry". It's true that I've talked about these things to many other colleagues here and there, but none of them has apparently been "plugged in" enough to assimilate an overall vision that had been developing in me over several years, or to take my indications as a starting point for developing a vision and program on their own (as I myself had done from two or three "strong impressions" produced by some of Serre's ideas). Perhaps I'm mistaken, but it seems to me that people interested in the cohomology of algebraic varieties were not psychologically disposed to "take the motifs seriously" for as long as Deligne, who was an authority on cohomology and at the same time the only one supposed to know in depth what these motifs were all about, himself passed them over in silence.

(June 8) Checking this out, it appears that my first motivational reflections date back to the early sixties - so they've been going on for almost a decade.

<sup>15</sup>(\*) As I mentioned in a previous footnote, the derived categories were exhumed three years ago to great fanfare (without my name being mentioned). The topos and the six operations are still waiting for their time, and the motives

a multitude of intuitions and partial conjectures, which are sometimes accessible after the fact by the means at hand, in the light of the understanding provided by "yoga". Several of Deligne's works are inspired by this yoga<sup>17</sup> (\*), notably the one that (if I'm not mistaken) was his first published work, establishing the degeneracy of the Leray spectral sequence for a projective and smooth morphism of algebraic varieties (in null char., for the purposes of demonstration). This result was suggested by considerations of "weight", of an arithmetical nature. These are typically "motivic" considerations, by which I mean they can be formulated in terms of the "geometry" of motives. Deligne proved this statement with Lefschetz-Hodge theory and (if I remember correctly) said nothing about motivation (49), without which no one would have suspected anything so implausible!

In fact, the yoga of motifs was born, first and foremost, from this "yoga of weights" that I inherited from Serre<sup>18</sup> (\*\*). It was he who made me understand the charm of Weil's conjectures (now Deligne's theorem). He explained to me how (modulo a hypothesis of resolution of singularities in the envisaged characteristic) one could, thanks to the yoga of weights, associate "virtual Betti numbers" with every algebraic variety (not necessarily smooth or proper) over any body - something that struck me a lot at the time (46<sub>9</sub>). It was this idea, I believe, that was the starting point for my thinking on weights, which continued (in parallel with my tasks of writing foundations) throughout the years of

following years. (This is also the one I took up in the 70s, with the notion of "virtual pattern" on any base diagram, with a view to establishing a formalism of the "six operations" at least for p-adic patterns. virtual). Over the years, I've talked to Deligne (as a privileged interlocutor) about this yoga of motives, and to anyone who would listen<sup>19</sup> (\*). I certainly didn't want him and others to keep it a secret science, reserved for them alone. (⇒note 47 p. 271)

**Note** 46<sub>1</sub> At most, I would make an exception for the ideas and points of view introduced with the formulation I had given to the Riemann-Roch theorem (and with the two demonstrations I found of it), as well as for various variants of it. If I remember correctly, such variants appeared in the last lecture of the 1965/66 SGA 5 seminar, which was lost along with various other lectures from the same seminar. The most interesting seems to me to be a variant for constructible discrete coefficients,

---

also, except for the little piece unearthed two years ago, with an alternate authorship (see notes n°s 51, 52, 59). (May 13)  
<sup>16</sup>(\*\*) (May 13) I understand now that the "very few insiders" were reduced to the one and only Deligne until 1982.

It's true that he revealed this "secret science" through certain important results included in this yoga, revealed as and when he was able to prove them, in order to take credit for them while concealing his source of inspiration, which remained secret. And yet, for fifteen years, no one has come up with a far-reaching theory of patterns, because our times are decidedly far from the bold dynamism of the heroic age of infinitesimal calculus!

<sup>17</sup>(\*) (May 13) Having familiarized myself with the bibliography to some extent. I now see that Deligne's entire work is rooted in this yoga. And my bibliographical sampling (as well as other cross-checking) leads me to assume that in Deligne's entire work, the only reference to this source is found in a lapidary line (quoting me in a headline with Serre) in "Hodge Theory I" in 1970. (See notes n°s 78 and 78.)<sub>1 2</sub>

<sup>18</sup>(\*\*) What I've got from Serre (early 60s?) is an initial idea or intuition, making me realize that there was something important to understand! This acted as an initial impulse, triggering a process of reflection that continued over the following years, first on a "yoga" of weights and soon on a broader yoga of patterns.

<sup>19</sup>(\*) (April 10) It seems to me that Deligne was the only one to "hear" - and he was careful to reserve the exclusive privilege of what he heard. It's also true that in writing these final lines, I was "delaying" events: two years ago, there was a partial exhumation of the Yoga des motifs, without any hint of a role I'd played in it! See notes n°s 50, 51, 59, prompted by an unforeseen discovery that shed unexpected light (for me at least) on the meaning of the burial that had been going on for twelve years. Until then, I had been vaguely aware of a sort of burial, without taking the time to look more closely. ...

which I don't know whether it has since been made explicit in the literature<sup>20</sup> (\*\*). Note that this also admits a "motivic" variant, which essentially amounts to asserting that the "characteristic classes" (in the Chow ring of a regular scheme  $Y$ ) associated with constructible  $\chi$ -adic bundles for different prime numbers  $\chi$  (prime to residual characteristics), when these bundles come from the same "word" "pattern" (e.g. are  $Rf_! (\underline{Z}_\chi)$  for a given  $f : X \rightarrow Y$ ) are all equal.

p. 187 **Note 46<sub>2</sub>** This formalism can be seen as a kind of quintessential "**global duality**" formalism in cohomology; in its most "efficient" form, freed of all superfluous assumptions (of smoothness in particular for the "spaces" and applications considered, or of cleanliness for the morphisms' There is a need to to complement it with a **local duality** formalism, in which we distinguish among the "coefficients" admitted the objects or "complexes"  $\square$  said to be "**dualizing**" (a notion made stable by the operation  $Lf^!$ ), i.e. those giving rise to a "**biduality theorem**" (in terms of the  $RHom$  operation) for coefficients satisfying suitable finiteness conditions (on degrees, and consistency or "constructability" on local cohomology objects). When I speak of the "six-variance formalism"; I hereafter imply this complete duality formalism, both in its "local" and "global" aspects.

A first step towards a deeper understanding of duality in cohomology was the progressive discovery of the six-variance formalism in a first important case, that of Noetherian schemes and cohomology-coherent complexes of modules. A second was the discovery (in the context of spread cohomology of schemes) that this formalism also applied for discrete coefficients. These two extreme cases were sufficient to establish the conviction that this formalism was **ubiquitous** in all geometric situations giving rise to a Poincaré-type "duality" - a conviction that was confirmed by the work (among others) of Verdier, Ramis and Ruget. This conviction will undoubtedly be confirmed for other types of coefficients, once the fifteen-year **blockade** against the development and widespread use of this formalism has been broken down.

This ubiquity seems to me a **fact of** considerable significance. It made it imperative to feel a profound unity between Poincaré's duality and Serre's duality, which was finally established with the required generality by Mebkhout. This ubiquity makes the "six-variance formalism" one of the fundamental structures in homological algebra for an understanding of cohomological duality phenomena "tous azimuts"<sup>21</sup> (\*). The fact that this rather sophisticated structure has not been made explicit in the past (any more than the "right" notion of "triangulated category", of which the Verdier version is still a very provisional and inadequate form) doesn't change a thing; nor does the fact that topologists, and even algebraic geometers who pretend to be interested in cohomology, continue to ignore the very existence of the duality formalism, as well as the language of derived categories on which it is based.

p. 188 **Note 46<sub>3</sub>** The point of view of D-Modules and complexes of differential operators was introduced by Sato and developed first by him and his school, in a rather different optic (it seemed to me to understand) Mebkhout's approach, which is closer to my own.

The various notions of "**constructibility**" for "discrete" coefficients (in the analytic-complex, analytic-real, piecewise linear contexts) were first teased out by me, it seems, in the late 1950s (and I took them up again a few years later in the context of staggered cohomology). At the time, I raised the question of the stability of this notion of higher direct images for

<sup>20</sup>(\*\*) (June 6) I found it again (in a similar form, and under the flattering name of "Deligne-Grothendieck conjecture") in an article by Mac-Pherson published in 1974. For details, see note n° 87<sub>1</sub>.

<sup>21</sup>(\*) The interested reader will find an outline of this formalism in the Appendix to this volume.

a proper morphism of real or complex analytic spaces, and does not know whether this stability has been established in the complex analytic case<sup>22</sup> (\*). In the real analytic case, the notion I had envisaged was in fact the wrong one, for want of Hironaka's notion of a real subanalytic set, which possesses the essential liminal property of stability by direct images. As for operations of a local nature such as  $\underline{R}\mathrm{Hom}$ , it was clear that the argument establishing the stability of constructible coefficients in the framework of excellent schemes of zero characteristic (using the resolution of Hironaka singularities) worked as is in the complex analytic case, and likewise for the biduality theorem (see SGA 5 I). In the piecewise linear framework, natural stabilities and the biduality theorem are "easy exercises", which I had enjoyed doing as a check on the "ubiquity" of the duality formalism, when starting up staggered cohomology (one of whose main surprises had been precisely the discovery of this ubiquity).

Returning to the semi-analytical case, the "right" framework in this direction for stability theorems (coefficients constructible by the six operations) is obviously that of "moderated spaces" (see Esquisse d'un Programme, par. 5, 6).

**Note 46<sub>4</sub>** Of course, the D-Modules point of view, combined with the fact that  $D$  is a coherent ring bundle, brings to light a more hidden notion of "coherence" for moduli crystals than the one I used to work with, and which still makes sense on spaces (analytic or schematic) that are not necessarily smooth. It would only be fair to call it "**M-coherence**" (M as in Mebkhout). It should be

It is therefore obvious to anyone with a clue (and in full possession of their healthy mathematical instincts) that the "right category of coefficients" which generalizes the complexes  $\square$  "of differential operators" p. 189

in the smooth case, must be none other than the "M-coherent" derived category of that of moduli crystals (a crystal complex being called **M-coherent** if its cohomology objects are). This makes reasonable sense without smoothness assumptions, and should encompass both the theory of ordinary "continuous" (coherent) coefficients, and that of "constructible" discrete coefficients (introducing suitable holonomy and regularity assumptions for the latter). If my vision of things is correct, the two new conceptual ingredients of Sato-Mebkhout's theory, compared with the previously known crystalline context, are this notion of M-coherence for moduli crystals, and the holonomy and regularity conditions (of a deeper nature) concerning M-coherent complexes of crystals. With these notions acquired, a first essential task would be to develop the six-variance formalism in the crystalline context, so as to encompass the two special cases (ordinary coherent, discrete) I had developed over twenty years ago (and which some of my ex-cohomology students have long since forgotten in favor of arguably more important tasks... ).

Mebkhout had eventually learned of the existence of the notion of "crystal" by frequenting my writings, and he felt that his point of view should give a good approach to this notion (at least in zero characteristic) - but this suggestion fell on deaf ears. Psychologically, it was hardly conceivable that he would embark on the vast task of laying the foundations, placed as he was in a climate of haughty indifference on the part of the very people who were cohomological authorities, and best placed to encourage - or discourage. ...

**Note 46<sub>5</sub>** (May 13) The focus here is on topos ringed by a **local commutative** ring. The idea of describing a "variety" structure in terms of the datum of such a ring bundle on a topological space, a

---

<sup>22</sup>(\*) (May 25) Established by J.L. Verdier, see "Les bonnes références" note n° 82.

was first introduced by H. Cartan, and was taken up by Serre in his classic work FAC (Faisceaux algébriques cohérents). It was this work that provided the initial impetus for a reflection that led me to the notion of "schema". What was still missing in Cartan's approach, taken up by Serre, to encompass all the types of "spaces" or "varieties" that have arisen to date, was the notion of topos (i.e. precisely "something" on which the notion of "bundle of sets" makes sense, and possesses the familiar properties).

p. 190 **Note 46<sub>6</sub>** □ As other remarkable examples of topos that are not ordinary spaces, and for the-

As there doesn't seem to be a satisfactory substitute in terms of "accepted" notions either, I'd like to point out the following: quotient topos of a topological space by a local equivalence relation (e.g. manifolds of varieties, in which case the quotient topos is even a "multiplicity", i.e. is locally a variety); "classifying" topos for just about any kind of mathematical structure (at least those "ex- priming" in terms of finite projective limits). e. is locally a variety); "classifying" topos for just about any kind of mathematical structure (at least those "ex- priming in terms of finite projective limits and inductive limits of any kind"). When we take a "variety" structure (topological, differentiable, real or complex analytic, Nash, etc. . . or even smooth schematic on a given basis) we find in each case a particularly attractive topos, which deserves the name of "universal variety" (of the species under consideration). Its homotopic invariants (and in particular its cohomology, which deserves the name of "classifying cohomology" for the species of variety under consideration) should have been studied and known long ago, but for the moment it's taking no such course. ...

**Note 46<sub>7</sub>** These are spaces  $X$  whose homotopy type is "naturally" described as that of a complex algebraic variety. The latter can then be defined on a subbody  $K$  of the complex field, such that  $K$  is a finite-type extension of the prime field  $\mathbb{Q}$ . The profinite Galois group  $Gal(\bar{K}/K)$  operates then naturally on the homotopic invariants profinis of  $X$ . Often (e.g. when  $X$  is an odd-dimensional homotopic sphere) we can take the prime field  $\mathbb{Q}$  for  $K$ .

**Note 46<sub>8</sub>** (May 13) When I learned my first rudiments of algebraic geometry from Serre's FAC article (which was to "trigger" me in the direction of schemas), the very notion of base change was virtually unknown in algebraic geometry, except in the special case of base body change. With the introduction of the language of schemes, this operation has become probably the most commonly used in algebraic geometry, where it can be introduced at any time. The fact that this operation is still virtually unknown in topology, except in very special cases, strikes me as a typical sign (among many others) of topology's isolation from the ideas and techniques of algebraic geometry, and a tenacious legacy of the inadequate foundations of "geometric" topology.

p. 191 **Note 46<sub>9</sub>** □ (June 5) Serre's idea was that it should be possible to associate any scheme  $X$  of finite type on a body  $K$ , integers

$$h^i(X) \quad (i \in \mathbb{N})$$

which he calls his "virtual Betti numbers", so that we have :

**a)** for  $Y$  a closed subschema and  $U$  the complementary open

$$h^i(X) = h^i(Y) + h^i(U)$$

b) for smooth projective  $X$ , we have

$$h(X) = i.\text{th Betti number of } X$$

(defined, for example, via  $\chi$ -adic cohomology, for  $\chi$  prime to the characteristic of  $k$ ). If we admit singularity resolution for algebraic schemes over  $k$ , then it's immediate that the  $h^i(X)$  are uniquely determined by these properties. The **existence** of such a function  $X \rightarrow (h^i(X))_{i \in \mathbb{N}}$  for a fixed  $k$ , using the formalism of cohomology with proper support, can essentially be reduced to the case of

where the base field is finite. Working in the "Grothendieck group" of finite-dimensional vectors on  $Q_\chi$  on which  $\text{Gal}(\bar{k}/k)$  operates continuously, and taking the  $\chi$ -adic Euler-Poincaré characteristic (with proper support) of  $X$  in this group,  $h^i(X)$  then designates the virtual rank of the "weight component  $i$ " of  $\text{EP}(X, Q_\chi)$ , where the notion of weight is that deduced from Weil's conjectures, plus a weak form of singularity resolution. Even without resolution, Serre's idea is realized

thanks to the strong form of Weil's conjectures (established by Deligne in "Weil's Conjectures II").

I pursued heuristic reflections along these lines, leading me to a six-operation formalism for "virtual relative schemes", with the base body  $k$  replaced by a more or less arbitrary base scheme  $S$  - and to various notions of "characteristic classes" for such virtual schemes (of finite presentation) on  $S$ . Thus, I was led (to simplify matters by returning to the case of a basic body) to consider integer numerical invariants finer than those of Serre, denoted  $h^{p,q}(X)$ , satisfying properties analogous to a), b) above, and giving back the virtual Betti numbers of Serre by the usual formula

$$h^i(X) = \sum_{p+q=i} h^{p,q}(X)$$

### 13.2.2. Refusing an inheritance - or the price of a contradiction

**Note 47** [ This note is a direct continuation of note 46 p.13.2.1]

□ It should be noted that four of the five notions I have just reviewed (the ones that pass p. 192 for "not serious" things) concern cohomology, and above all, **the cohomology of algebraic schemes and varieties**. In any case, all four were suggested to me by the needs of a cohomological theory of algebraic varieties, first for continuous coefficients, then for discrete ones. In other words, the cohomology of algebraic varieties was my main motivation and a constant leitmotif in my work over the fifteen years from 1955 to 1970.

Remarkably, this is also the theme that Deligne still considers to be his main source of inspiration, if I am to believe what is said on the subject in last year's IHES brochure<sup>23</sup> (\*). I read this with some astonishment. Admittedly, I was still "on the scene" and all that, when Deligne (after his fine work on the Ramanuyam conjecture) developed his remarkable extension of Hodge's theory. Above all, for him as for me, it was a first step towards a formal construction of the notion of pattern on the field of complexes - for a start! In the early years after my "turning point" in 1970, I of course also heard of Deligne's proof of Weil's conjectures (which also proved Ramanuyam's conjecture), and in the wake of this, of the "Lefschetz cow theorem" in positive characteristic. I expected nothing less from him! I was even sure that he would

<sup>23</sup>(\*) (May 12) On the other hand, I've just noticed that nothing in the aforementioned brochure could lead the reader to suspect that my work has anything to do with the cohomology of algebraic varieties, or that of anything else! On this subject, see the note "L'Eloge Funèbre (1) - ou les compliments" (n° 98) written today. The brochure referred to is the one mentioned in the footnote to the note "L'arrachement salutaire", n° 42, and examined a little more closely in the note "L'Eloge Funèbre" mentioned above.

to have proved at the same time the "**standard conjectures**", which I had proposed towards the end of the sixties as a first step towards founding (at least) the notion of a "semisimple" pattern over a body, and translating some of the expected properties of such patterns in terms of  $\chi$ -adic cohomology properties and algebraic cycle groups. Deligne told me afterwards that his proof of Weil's conjectures would certainly not make it possible to prove the standard (stronger) conjectures, and that he had in fact no

how to approach them. That must be about ten years ago now. Since then, I'm not aware of any other really decisive progress that has taken place in understanding the aspects

p. 193

"motivic" (or "arithmetic") cohomology of algebraic varieties. Knowing Deligne's means, I had tacitly concluded that his main interest must have turned to other subjects - hence my astonishment to read that this was not the case.

What seems to me beyond doubt is that, for the last twenty years, it has scarcely been possible to make a major breakthrough in our understanding of the cohomology of algebraic varieties, without also appearing, more or less, as a "Grothendieck follower". Zoghman Mebkhout learned this the hard way, and (to a certain extent) so did Carlos Contou-Carrère, who soon realized that it was in his interest to change his subject (47<sub>1</sub>). One of the very first things that cannot be avoided is the development of the famous "six-variance formalism" in contexts of various coefficients, as close as possible to that of patterns (which, for the moment, play the role of a kind of ideal "horizon line"): crystalline coefficients in zero characteristic (in the tradition of the Sato school and Mebkhout, Grothendieck sauce) or  $p$  (studied above all by Berthelot, Katz, Messing and a whole group of visibly motivated younger researchers), "stratified promodules" à la Deligne, (which appear as a dualized variant, or "pro", of the "ind"-notion of coherent D-module, or D-coherent crystal), and finally "Hodge-Deligne" coefficients (which seem just as good as motifs, except that their definition is transcendental and restricted to basic schemes of finite type over the field of complexes). . . At the other end of the spectrum is the task of clearing the very notion of pattern from the mists that surround it (and for good reason. . . ), and also, if at all possible, tackling such precise questions as "standard conjectures". (For the latter, I had been thinking, among other things, of developing a theory of "intermediate Jacobians" for projective and smooth varieties over a body, as a means perhaps of obtaining the trace positivity formula, which was one of the essential ingredients of the standard conjectures. )

These were tasks and questions that burned in my hands right up to the moment when I "left maths" - burning, juicy things, none of which at any time appeared to me to form a "wall", a stopping point<sup>24</sup> (\*). They were an inexhaustible source of inspiration and substance.

p. 194

sables something where all you had to do was pull where it stuck out (and it "stuck out" everywhere!) and something would come along, the expected as well as the unexpected. With my limited means, but without being divided in my work, I know just how much can be achieved if you put your mind to it, in a single day, or in a year, or in ten. And I also know, having seen him at work at a time when he was not divided in his work, what Deligne's means are, and what he can do in a day, a week, or a month, when he puts his mind to it. But no one, not even Deligne, can, in the long run, do fruitful work, work of profound renewal, while looking down on the very objects that it is basically a question of probing, as well as the language and a whole arsenal of tools that have been developed for this purpose by such and such a predecessor (and with his assistance what's more, among many others who have put their hand to the dough. . . ). ) (59).

I'm also thinking of the "Deligne-Mumford" compactification of the modular multiplicity  $M_{g,v}$  (on Spec  $Z$ ),

<sup>24</sup>(May 25) Yet this is what was kindly suggested in that famous jubilee brochure, by an anonymous pen I think I recognize. On this subject, see the note "L'Eloge Funèbre (2)". which follows "L'Eloge Funèbre (1)" quoted in the previous b. de p. note.

for connected smooth algebraic curves of genus  $g$  with  $v$  marked points. They were introduced<sup>25</sup> (\*) on the occasion of the problem of proving the connectedness of modular spaces  $M_{g,v}$  in any characteristic, by a specialization argument from characteristic zero. These objects  $M_{g,v}$  seem to me (along with the group  $Sl(2)$ ) the most beautiful, the most fascinating I've encountered in mathematics (47<sub>2</sub>). Their very existence, with such perfect properties, seems to me a kind of miracle (perfectly well understood, moreover), of incomparably greater scope than the fact of connectedness that they were intended to demonstrate. For me, they contain the quintessence of what is most essential in algebraic geometry, namely the totality (more or less) of all algebraic curves (over all conceivable basic bodies), which are precisely the ultimate building blocks of all other varieties.

algebraic. But the kind of objects we're talking about, "smooth proper multiplicities on  $\text{Spec}(\mathbb{Z})$ ", eludes still to the "accepted" categories, i.e. those we are **willing** (for reasons we don't care to examine) to "admit". The average person speaks of them by allusion at most, and with an air of apology for appearing to be still making "general nonsense", while we are certainly careful to say "stack" or "field", so as not to utter the taboo word of "topos" or "multiplicity". This is the reason without no doubt why these unique gems have not been studied or used (as far as I know) since their introduction over ten years ago, except by myself in seminar notes  $\square$ rest unpublished. At

p. 195

Instead, we continue to work either with "coarse" varieties of modules, or with finite coverings of modular multiplicities that have the appearance of being real schemes - both of which, however, are only relatively fallible and lame shadows of those perfect gems from which they originate, and which remain practically banished. ...

Deligne's four works on the Ramanuyam conjecture, on mixed Hodge structures, on the compactification of modular multiplicities (in collaboration with Mumford), and on Weil's conjectures, each constitute a renewal of our knowledge of algebraic varieties, and thus a new starting point. These fundamental works follow each other within a space of a few years (1968-73). For nearly ten years, however, these major milestones have not been the springboards for a new launch into the glimpsed and the unknown, or the means for a more far-reaching renewal. Instead, they have resulted in a morose stagnation (47<sub>3</sub>). It's certainly not that the "means" that were there ten years ago, on the part of some and others, have magically disappeared; nor that the beauty of things at our fingertips has suddenly vanished. But it's not enough for the world to be beautiful - we must also deign to rejoice in it. ...

**Note** 47<sub>1</sub> I'm thinking here of Contou-Carrère's promising start, five or six years ago, on a theory of relative local Jacobians, their links with global Jacobians (known as "generalized Jacobians") for smooth curve schemes and not necessarily proper on any scheme, and with Cartier's theory of commutative formal groups and typical curves. Apart from an encouraging reaction from Cartier, the reception of Contou-Carrère's first note, by those best placed to appreciate it, was so cool that the author refrained from ever publishing the second, which he kept in reserve, and hastened to change subject (without, however, avoiding further mishaps)<sup>26</sup> (\*).

I had suggested to him the theme of local and global jacobienes, as a first step towards a program of local and global jacobienes.

which dates back to the late 1950s, and which is notably oriented towards a theory of a dualistic "adequate" complex.

lique" in any dimension, formed with local Jacobians (for local rings of dimension arbitrary), in analogy with the residual complex of a noetherian scheme (formed with the dualizing modules

p. 196

<sup>25</sup>(\*) In Pub. Math. 36, 1969, pp. 75-110. See comments in note n° 63<sub>1</sub>

<sup>26</sup>(\*) (June 8) See the sub-note (95<sub>1</sub>) to the note "Cercueil 3 - ou les jacobienes un peu trop relatives", n° 95.

of all its local rings). This part of my cohomological duality program found itself (along with others) somewhat relegated to oblivion, during the sixties, due to the influx of other tasks which then appeared more urgent.

**Note 47<sub>2</sub>** In truth, it is the "Teichmüller tower" into which the family of all these multiplicities fits, and the discrete or profinite paradigm of this tower in terms of fundamental groupoids, that constitutes the richest, most fascinating single object I have encountered in mathematics. The group  $S\chi(2, \mathbb{Z})$ , with the "arithmetic" structure of the profinite compactivity of  $S\chi(2, \mathbb{Z})$  (consisting in the operation of the Galois group  $\text{Gal}(\mathbb{Q})$  on it), can be considered as the main building stone for the "profinite version" of this tower. On this subject, see the indications in "Esquisse d'un Programme" (pending the volume(s) of *Réflexions Mathématiques* that will be devoted to this theme).

**Note 47<sub>3</sub>** This observation of "morose stagnation" is not the considered opinion of someone who is well acquainted with the main episodes in the last ten years concerning the cohomology of algebraic schemes and varieties. This is simply the overall **impression** of an "outsider", which I got from conversations and correspondence with Illusie, Verdier and Mebkhout, among others, in 1982 and 1983. This impression could surely be qualified in many ways. For example, Deligne's work "Conjectures de Weil II", published in 1980, represents substantial new progress, if not a surprise in terms of the main result. It seems that there has also been progress in crystalline cohomology of  $\text{car. } p > 0$ , not to mention the "rush" around intersection cohomology, which has ended up making some people (unwillingly) return to the language of derived categories, even making them remember long-repudiated paternities. ...

### 13.3. III La Mode - ou la Vie des Hommes illustres

#### 13.3.1. Instinct and fashion - or the law of the strongest

**Note 48** [ This note is called by note 46 p. 265]

p. 197

□ As is well known, the theory of derived categories is due to J.L. Verdier. Before he undertook the foundation work I had proposed, I had confined myself to working with derived categories in a heuristic way, with a provisional definition of these categories (which later turned out to be the right one), and with an equally provisional intuition of their essential internal structure (an intuition that turned out to be technically wrong in the intended context, as the "cone mapping" does **not** depend functorially on the arrow in a derived category that is supposed to define it, and which defines it only to non-unique isomorphism). The theory of the duality of coherent beams (i.e. the "six variances" formalism in the coherent framework), which I had developed towards the end of the fifties<sup>27</sup> (\*), only made sense as a module in the foundations of the notion of derived category, as Verdier subsequently did.

The text of Verdier's thesis (passed only in 1967), some twenty pages long, seems to me the best introduction to the language of derived categories written to date, placing this language in the context of its essential uses (many of which are due to Verdier himself). It was only the introduction to a work in progress, which ended up being written later. I can pride myself on being, if not the only one, at least one of the very few people who can testify to having held this work in their hands,

<sup>27</sup>(\*) It still lacked an  $Rf$  operation, (cohomology with proper support) for a non proper morphism, which was introduced six or seven years later by Deligne, thanks to his introduction of the context of coherent promodules, which seems to me to be an important new idea (successfully taken up in his theory of stratified promodules).

which is supposed to establish the validity of the title of Doctor of Science awarded to its author on the basis of the introduction alone! This work is (or was - I don't know if a copy still exists somewhere... ) the only text, to date, that presents systematic foundations of homological algebra from the point of view of derived categories.

□ Perhaps I'm the only one to regret that neither the introductory text nor the foundations themselves have been

198

published<sup>28</sup> (\*), so that the technical baggage essential for using the language of derived categories is scattered in three different places in the literature<sup>29</sup> (\*\*). This absence of a systematic reference text of comparable weight to the classic Cartan-Eilenberg book seems to me both a **cause** and a typical **sign** of the disaffection that struck the formalism of derived categories after my departure from the mathematical scene in 1970.

It's true that as early as 1968, it had become clear (in connection with the needs of a cohomological theory of traces, developed in SGA 5) that the notion of derived category in its primitive form, and the corresponding notion of triangulated category, were insufficient for certain needs, and that further groundwork remained to be done. A useful but still modest step in this direction was taken (mainly for the purposes of the trace cause) by Illusie, with the introduction in his thesis of "filtered derived categories". It would seem that my departure in 1970 was the signal for a sudden and definitive halt to any re-reflexion on the foundations of homological algebra, as well as on those, intimately linked, of a theory of patterns (48<sub>1</sub>). However, as far as the former were concerned, all the essential ideas for *en- vergure* foundations seemed to have been acquired in the years before my departure (48<sub>2</sub>). (Including the key idea of the "derivator", or "machine for making derived categories", which seems to be the common richer object underlying the triangulated categories we've encountered so far, an idea that would eventually be developed to some extent in a non-additive framework, almost twenty years later, in a chapter in volume 2 of *The Pursuit of Fields*). What's more, much of the groundwork to be done had already been laid by Verdier, Hartshorne, Deligne and Illusie, work that could be used as it stood for a synthesis taking up the ideas acquired in the broader perspective of derivation.

□ It's true that this disaffection in the past fifteen years<sup>30</sup> (\*) for the very notion of category

p. 199

This derivative approach, which for some is akin to a disavowal of the past, is in line with a certain fashion, which tends to look with disdain on any fundamental reflection, however urgent<sup>31</sup> (\*\*). On the other hand, it's quite clear to me that the development of staggered cohomology, which "everyone" uses today without looking twice (if only implicitly via Weil's conjectures. . . ), could not have taken place without the conceptual baggage represented by the derived categories, the six operations, and the language of sites and topos (first developed precisely for this purpose), not to mention SGA 1 and SGA 2. And it's just as clear that the stagnation we can see today in the cohomological theory of algebraic varieties could not have arisen, let alone taken root, if some of my students had known how to follow their healthy mathematical instincts during those years, rather than a fashion they were among the first to introduce, and which has long since become law with their support.

<sup>28</sup>(\*) (May 25) After these lines were written, I discovered that the first embryo of Verdier's thesis, dating from 1963 (four years before the defense), was published in 1967. See notes "Le compère" and "Thèse à crédit et assurance tous risques", n° 63"and 81.

<sup>29</sup>(\*\*) These places are: Hartshorne's well-known seminar on coherent duality, containing the only part published to date of the duality theory I had developed in the second half of the '50s; one or two Deligne papers in SGA 4; one or two chapters of Illusie's voluminous thesis.

<sup>30</sup>(\*) (May 24) these "fifteen years" should be qualified - see note no.° 47<sub>3</sub>, as well as the more detailed note "Thèse à crédit et assurance tous risques", no.° 81.

<sup>31</sup>(\*\*) (May 25) For a reflection on the forces at work in the emergence and persistence of this fashion, see the note "Le Fossoyeur - ou la Congrégation toute entière", n° 97.

**Note** 48<sub>1</sub> The same can be said (with certain reservations) of my entire program on the foundations of algebraic geometry, of which only a small part was completed: it came to a screeching halt with my departure. The stoppage hit me particularly hard in the duality program, which I considered particularly juicy. Zoghman Mebkhout's work, pursued against all odds, is nevertheless in line with this program (renewed by the contribution of unforeseen ideas). The same is true of Carlos Contou-Carrère's 1976 work (mentioned in note (47<sub>1</sub>) p. 273) - which he prudently suspended sine die. There was also work on duality in the fppf cohomology of surfaces (Milne). That's all I know about it.

It's true that I never thought of writing an outline of the long-term work program that I had set myself for me in the years between 1955 and 1970, as I did for the last twelve years, with *Esquisse d'un Programme*. The reason for this, I believe, is simply that there was never an opportunity to do so. sion (like now my application to join the CNRS) to motivate such exposure work.

p. 200

The letters to Larry Breen (from 1975), reproduced in the appendix to Chap I of the *History of Models* (Mathematical Reflections 2), give some indication of certain theories (notably duality) on my pre-1970 agenda, theories that are still waiting for arms to enter the common heritage.

**Note** 48<sub>2</sub> The same is true for the theory of motives, except that it is likely to remain conjectural for some time to come.

### 13.3.2. The service stranger and the good God theorem

**Note** 48 [ This note is called by note 46 p. ]

While it is customary to call the key theorems of a theory by the names of those who have done the work of identifying and establishing them, it would seem that Zoghman Mebkhout's name was deemed unworthy of this fundamental theorem, the culmination of four years of obstinate and solitary work (1975-79), against the fashion of the day and the disdain of his elders. The latter, on the day when the theorem's significance could no longer be ignored, took pleasure in calling it the "Riemann-Hilbert theorem", and I trust (although neither Riemann nor Hilbert would surely have asked for so much. . . ) that they had excellent reasons for doing so. After all (once the feeling of a need - that of an understanding of the precise relationships between general discrete coefficients and continuous coefficients, appeared against the general indifference, that it was refined and specified by delicate and patient work, that, after successive stages, the right statement was finally found, that it was written down in black and white and proved, and when finally this theorem, the fruit of solitude, proved itself where it was least expected - after all that) this theorem appears so obvious (not to say "trivial", for those who "would have known how to prove it" . . . ) that there's really no point in burdening our memory with the name of a vague stranger on duty!

Encouraged by this precedent, I propose to call any theorem "Adam and Eve's theorem". fundamental to a theory, or even to go back even further and give honor where honor is due, by simply calling it "**God's theorem**"<sup>32</sup> (\*).

p. 201

□ As far as I know, apart from myself, Deligne was the only one before Mebkhout to feel the interest he There was a need to understand the relationships between discrete coefficients and continuous coefficients in a framework broader than that of stratified modules, so as to be able to interpret any "constructible" coefficients in "continuous" terms. The first attempt in this direction was the subject of a seminar (still unpublished) by De-

---

<sup>32</sup>(\*) In my life as a mathematician, I've never had the pleasure of inspiring, or even encouraging, a student to write a thesis containing a "God's theorem" - at least not one of comparable depth and scope.

line at the IHES in 1968 or '69, where he introduces the "stratified promodule" point of view and gives a comparison theorem (over the field of complexes) for transcendental discrete cohomology and the associated De Rham-type cohomology, which still makes sense for schemes of finite type, over any base field of zero square. (Apparently, he was still unaware at that time of the remarkable result of his distant predecessors Riemann and Hilbert... ) Even more than Verdier<sup>33</sup> (\*) or Berthelot<sup>34</sup> (\*\*), Deligne was in a particularly good position to appreciate the interest of the direction in which Mebkhout's research was heading in 1975, and subsequently the interest of Mebkhout's results, in particular the "theorem of the good God", which gives a more delicate and deeper apprehension of discrete coefficients in terms of continuous coefficients, than the one he himself had worked out. However, this did not prevent Mebkhout from continuing his work in painful moral isolation, and the credit he deserves (all the more so, I would say) for his pioneering work remains unacknowledged even today, five years after<sup>35</sup> (\*\*\*)).

### 13.3.3. Canned weight and twelve years of secret

**Note 49** [ This note is called by note 46 p. ]

□ Verification done (in Publications Mathématiques 35, 1968), I note that towards the end of the article "Théorème de Lefschetz et critères de dégénérescence de suites spectrales", three lines allude to "weighty considerations" which had led me to conjecture (in a slightly less general form) the main result of the work. I doubt that this sybilline allusion could have been useful to anyone, nor understood at the time by anyone other than Serre or myself, who were already aware of it anyway<sup>36</sup> (\*).

In this connection, I'd like to point out that a very precise "yoga of weights", including the behavior of weights for operations such as  $R\Gamma_{\pm}^i$  and  $R\Gamma_{\dagger}^i$ , was well known to me (and therefore to Deligne) as early as the late sixties, in the wake of Weil's conjectures. Some of this yoga is finally established (in the context of *l-adic* coefficient bundles, until it is in the more natural setting of motives) in Deligne's work "Conjectures de Weil II" (Publications Mathématiques 1980). Unless I'm mistaken, in the twelve years or so between the two moments<sup>37</sup> (\*\*), there has been no trace in the literature of an exposé, however succinct and partial, of the yoga of weights (still entirely conjectural), which for all that time remained the exclusive privilege of a few (two or three?) initiates<sup>38</sup> (\*\*\*)). However, this yoga constitutes an essential first key to understanding the properties of weight.

<sup>33</sup>(\*) It would seem that Verdier, as official thesis supervisor for Zoghman Mebkhout's thesis (and who in this capacity even "granted him some discussions"), was the main person involved (apart from Mebkhout himself) in the concealment that took place around the authorship of this fundamental theorem, and of the credit due to his "pupil" in the renewal of the cohomological theory of algebraic varieties by the point of view of *D*-Modules developed by Mebkhout. However, I'm not aware that he was more moved by this than Deligne.

<sup>34</sup>(\*\*) (May 25) In writing these lines, I refrained (with some hesitation) from including the name of my friend Luc Illusie in this list of my students who would have been "best placed" to give Zoghman Mebkhout the encouragement that should have been self-evident. I didn't notice a certain uneasiness within me, which might have taught me that I was giving a helping hand to someone I care about, in order to relieve him of a responsibility that falls to him and to my other "cohomology students".

<sup>35</sup>(\*\*\*) (May 25) In fact, Deligne and Verdier themselves were the first to do this. On this subject, see the note "L'Iniquité - ou le sens d'un retour", n° 75.

<sup>36</sup>(\*) (April 29) For a closer look at this article, which is instructive in more ways than one, see the note "Eviction" (n° 63).

<sup>37</sup>(\*\*) (April 19) I note on a list of Deligne's publications that I have just received and read with interest, that it mentions of "weights" as early as 1974, in a paper presented by Deligne at the Vancouver Congress - that's six years of "secrecy around weights" instead of twelve. Yet this secret seems to me to be inseparable from the similar secret surrounding the motifs (during the twelve years 1970-1982). The meaning of this secrecy has just become clearer in the course of today's reflection, in the long

double-note that follows n° 51-52).

<sup>38</sup>(\*\*\*) (May 25) It would seem, from all the information that has come to light in the course of our discussions, that these "two or more three insiders" are limited to the one and only Deligne, who seems to have taken great care to reserve for himself the exclusive benefit of the

"In other words, it was a **way of** recognizing oneself in a given situation and of making predictions with a reliability that had never been seen before,

At the same time, it represented one of the most urgent and fascinating **tasks** facing the cohomological theory of algebraic varieties. The fact that this yoga remained virtually ignored until it was finally established (in certain important aspects at least), seems to me a particularly striking example of **the information-blocking** role often played by the very people whose privileged position and functions are supposed to ensure its wide dissemination<sup>39</sup> (\*).

### 13.3.4. You can't stop progress !

**Note 50** [This note is called by section 50 of chapter **VIII The solitary adventure** of part **(I) Fatuity and Renewal** p. ]

My first experiences in this direction were the unexpected fruits of my unsuccessful efforts to get Yves Ladegaillerie's thesis on isotropy theorems on surfaces published - a work as good as any of the eleven state doctorate works ("pre-1970", it's true!) for which I had been the "boss". As I recall, these efforts continued for a good year or more, and involved many of my former friends (not to mention one of my former students, as it happens)<sup>40</sup> (\*\*). The main episodes still seem like vaudeville to me today!

It was also my first encounter with a certain new spirit and mores (now commonplace in the circle of my old friends), which I've already alluded to here and there in the course of my reflection. It was during that year (1976) that I learned for the first time, but not for the last, that it is nowadays considered unserious (at least on the part of the first-timer. . . ) to actually demonstrate delicate things that everyone uses and that I'm sure you'll agree with me.

predecessors were always content to admit (in this case, the non-existence of wild phenomena in surface topology)<sup>41</sup> (\*\*\*). Or to demonstrate a result that encompasses □ as special cases

or corollaries of several well-known deep theorems (which obviously shows that the so-called

---

possession of this yoga, which he had inherited from me, until 1974 (see previous p. b. note)) when the time was ripe to be able to present it as his own ideas, without any reference to me or Serre (see notes n° s 78<sup>1</sup>, 78<sup>2</sup> .

(April 18, 1985) Since these lines were written, I have also had occasion to become acquainted with Deligne's paper "Théorie de Hodge I" at the Congrès Int. Math, Nice (1970) (Actes, t.1, p. 425-430). Contrary to what I had reason to believe from the fragmentary information in my possession, this article sets out a substantial part of weight yoga as early as 1970. As to the origin of these ideas, it confines itself to a sibylline and perfunctory mention of an article by Serre (a foreigner, by the way).

to the question), and "Grothendieck's conjectural theory of motives". (Compare notes n° s 78<sup>1</sup>, 78<sup>2</sup> .) The question<sub>1 2</sub>

of the behavior of the notion of weight by operations such as  $Rf_!$  and  $Rf^*$  is not even mentioned, nor is it important.

will not be until the quoted article "Weil's Conjecture II" from 1980, where my name is not mentioned in connection with the theorem.

of this work, any more than is Serre's or mine in the paper "Weights in the cohomology of algebraic varieties" mentioned in the previous b. de p. note (from a year ago to the day).

<sup>39</sup>(\*) On this subject, see also sections 32 and 33, "The mathematician's ethic" and "The note - or the new ethic (1)", as well as the two related notes, "Deontological consensus and information control" and "Youth snobbery, or the defenders of purity", n° s 25,27.

<sup>40</sup>(\*\*) On this subject, see the note "Coffin 2 - or cut to length", n° 94.

<sup>41</sup>(\*\*\*) See also the episode "The note - or the new ethic" (section 33). This famous "note" had precisely the wrong idea.

to make explicit notions and statements that had hitherto been left in the dark, yet which I have implicitly used to establish results that bear my name and that everyone has been shamelessly using for almost twenty-five years (something, incidentally, that the two illustrious colleagues knew perfectly well). (June 8) For further details, see note "Coffin 4

- or topos without flowers or wreaths" (n° 96). The "results that bear my name" are results on the generation and finished presentation of certain fundamental global and local profi nis, "demonstrated" in SGA 1, among others.

by descent techniques that remain heuristic in the absence of careful theoretical justification, accomplished in Olivier Leroy's (apparently "unpublishable") work on Van Kampen-type theorems for fundamental topos groups.

new can only be a special case or an easy consequence of known results). Or to take the trouble only, when stating a result or describing a situation in terms of another, to carefully formulate the natural hypotheses (a sign of regrettable bombast), rather than limiting oneself to some case in point to the liking of the high-flying person issuing the opinion. (Just last year, I saw Contou-Carrère reproached for not having confined himself in his thesis to a basic body instead of a general scheme - while conceding the mitigating circumstance that it was surely at the insistence of his boss of circumstance that he had had to do so. The person who expressed himself in this way was, however, sufficiently familiar with the subject to know that, even if we limit ourselves to the body of complexes, the necessities of demonstration force us to introduce general basic diagrams. ...). )

The excesses of a certain fashion today go so far as to disgrace not only careful demonstrations (or even demonstrations at all), but often even formal statements and definitions. Given the price of paper and the longevity of the gorged reader, it will soon be out of the question to bother with such costly luxuries! Extrapolating from current trends, we can predict the moment when a publication will no longer need to spell out definitions or statements, but will simply name them with code words, leaving it to the indefatigable and genial reader to fill in the blanks according to his or her own insights. The referee's task will be made all the easier, as all he'll have to do is look in the "Who is Who" directory to see if the author is known to be credible (in any case, no one could contradict the blanks and dotted lines that make up the brilliant article), or if he's an unavowable unknown who will be (as is already the case today and has been for a long time) automatically ejected. ...

## 14.1. IV Motives (burial of a birth)

### 14.1.1. Souvenir d'un rêve - or the birth of motifs. . .

**Note 51** [This note is called note 46 p. ]

p. 205

□(April 19) Since these lines (which end the note "My orphans", n° 46) were written, it is less than a month, I've noticed that they're a bit behind the times! I've just received "Hodge Cycles, Motives and Shimura Varieties" (LN 900), by Pierre Deligne, James S. Milne, Arthur Ogus and Kuang-Yen Shih, which

Deligne was kind enough to send me, along with a list of his publications. This collection of six texts, published in 1982, represents an interesting development since 1970, with the mention of motives in the title and a presence of this notion in the text, albeit still modest, especially via the notion of "motivic Galois group". Of course, we're still a long way from the overall picture of a theory of motives, which for the past fifteen or twenty years has been awaiting the bold mathematician who will be willing to "paint it, vast enough...".

to serve as inspiration, Ariadne's thread and horizon line for one or more generations of arithmetician geometers, who will have the privilege of establishing their validity (or at any rate of discovering the final word on the reality of the motifs. . . ) (53).

It's also since 1982<sup>1</sup> (\*), it would seem, that the tide of fashion has begun to turn, more or less, towards derived categories; Zoghman Mebkhout (in a perhaps somewhat euphoric flight of fancy) already sees them on the verge of "invading all areas of mathematics". If their usefulness, which simple mathematical instinct (for a well-informed person) made quite obvious in the early sixties, is only just beginning to be recognized now, it is (it seems to me) mainly thanks to the solitary efforts of Mebkhout, who for seven years stuck to the thankless task of wiping the slate clean, with the courage of one who trusts his instinct alone, against a tyrannical fashion... ..

□ It's remarkable to read this first publication, which dedicates (twelve years after my departure from the mathematical scene) a modest re-entry of the notion of motif into the areopagus of accepted mathematical notions, nothing could lead the uninformed reader to suspect that my modest person was in any way associated with the birth of this long-taboo notion, and with the unfolding of a rich and precise "yoga", which (in a very fragmentary form) appears there as if it had emerged from nothing, without allusion to any paternity (51 ).<sub>1</sub>

p. 206

When, just three weeks ago, I wrote in a page or two about the yoga of patterns - even one of my "orphans", and one that was closer to my heart than any other - I must have been way off the mark! No doubt I was dreaming, as I seemed to recall years of gestation of a vision, tenuous and elusive at first, and growing richer and more precise as the months and years went by, in an obstinate effort to try and grasp the common "motif", the common quintessence, of which the many cohomological theories then known (54) were so many different incarnations, each speaking to us in its own language about the nature of the "motif" of which it was one of the directly tangible manifestations. No doubt I'm still dreaming, remembering the strong impression made on me by such an intuition of Serre's, who had been led to see a Galois profinite group, an object that seemed to be essentially discrete in nature (or, at least, reducible to the Galois profinite group).

tautologically to simple systems of **finite** groups), as giving rise to an immense projective system of **analytic**  $l$ -adic groups, or even **algebraic** groups on  $\mathbb{Q}_l$  (by moving to suitable algebraic envelopes), which even had a tendency to be reductive - with the introduction of any

the arsenal of intuitions and methods (à la Lie) of analytic and algebraic groups. This construction made sense for any prime number  $l$ , and I felt (or I dream I felt. . . ) that there was a mystery to be probed, about the relationship of these algebraic groups for different primes; that they all had to originate from the same projective system of algebraic groups on the only natural common subbody of all its bodies

the  $\mathbb{Q}$  body, the "absolute" body of zero characteristic. And since I like to dream, I continue to dream that I remember entering this glimpsed mystery, through a work that was surely only a dream since I wasn't "demonstrating" anything; that I ended up understanding how the notion of motif provided the key to understanding this mystery - how, by the very fact of the presence of a category (here that of "smooth" patterns on a given basic scheme □ for example, patterns on a given basic body),

p. 207

having internal structures similar to those found on the category of linear representations of an algebraic pro-group over a  $k$ -field (the charm of the notion of algebraic pro-group having been revealed to me previously by Serre as well), we can indeed reconstitute such a pro-group (as soon as we have a suitable "fiber functor"), and interpret the "abstract" category as the category of its

<sup>1</sup>(\*) (May 25) I delay again, this time by a year - the turning point comes in June 1981 with the Colloque de Luminy, see the note "L'Iniquité - ou le sens d'un retour", n° 75.

linear representations.

This approach to a "motivic Galois theory" was inspired by the approach I had found, years before, to describe the fundamental group of a topological space or scheme (or even of any topos - but now I feel I'm going to offend delicate ears that "topos don't amuse". . . ), in terms of the category of spreadable coverings on the "space" under consideration, and the fiber functors on it. And the very language of "**motivic Galois groups**" (which I might just as well have called motivic "fundamental groups", the two kinds of intuition being for me the same thing, since the late fifties... . ), and that of "fiber functors" (which correspond exactly to the "manifest embodiments" referred to above, i.e. to the various "cohomological theories" that apply to a given category of patterns) - this language was designed to express the profound nature of these groups, and to suggest their immediate links with Galois groups and with ordinary fundamental groups.

I still remember the pleasure and wonder, in this game with fiber functors, and with the torsors under Galois groups that make it possible to pass from one to the other by "twisting", of finding in a particularly concrete and fascinating situation the whole arsenal of notions of noncommutative cohomology developed in Giraud's book, with the sheaf of fiber functors (here above the étale topos, or

better still,  $Q$ 's fpqc topos - non-trivial and interesting topos if ever there was one!), with the "link" (in groups or algebraic pro-groups) that link this sheaf, and the avatars of this link, realized by various algebraic groups or pro-groups, corresponding to the various "sections" of the sheaf, i.e. the various cohomological functors. The various complex points (for example) of a scheme of zero characteristic gave rise (via the corresponding Hodge functors) to as many sections of the sheaf, and to torsors of passage from one to the other, these torsors and the pro-groups operating on them being provided with struc-  
 remarkable algebraic-geometric patterns, expressing the specific structures of Hodge cohomology

- but here  $\square$  m anticipating another part of the motives dream. ... Those were the days when those who today make the

p. 208

mode hadn't yet declared that topos, sheaves and the like didn't amuse them and that it was therefore bullshit to talk about them (I wouldn't have minded recognizing topos and sheaves where they were. . . ). And now, twelve years on, the same people are pretending to discover and teach that sheaves (or even topos) do indeed have something to do with the cohomology of algebraic varieties, or even with the periods of abelian integrals... .

I could evoke here the dream of another memory (or the memory of another dream. . . ) around the dream of motifs, also born of a "strong impression" (I'm definitely in full subjectivity!) made on me by some of Serre's comments on a certain "philosophy" behind Weil's conjectures. Their translation into cohomological terms, for  $l$ -adic coefficients with variable  $l$ , made me suspect remarkable structures on the corresponding cohomologies - the "filtration by weights" structure<sup>2</sup> (\*). Surely the "motif" common to the various  $l$ -adic cohomologies was to be the ultimate support of this essential arithmetic structure, which then took on a geometric aspect, that of a remarkable structure on the geometric object "motif". To speak of "work" (when, of course, it was still a matter of guessing games, no more and no less) when it was a matter of "guessing" (with only the inner coherence of a vision being formed as a guide, using scattered elements known or conjectured here and there... . ), on the specific structure of the various cohomological "avatars" of a motif, how the filtration of weights was translated<sup>3</sup> (\*\*), starting with Hodge's avatar (at a time when the

<sup>2</sup>(\*) (January 24 1985) For a rectification of this distorted memory, see note no. ° 164 (I4), and sub-note no. ° 164<sub>1</sub>, giving details of the "yoga of the weights" filtration.

<sup>3</sup>(\*\*) (February 28, 1985) There's a slight confusion in my mind here. It is, in fact, the filtration closely linked by the

Hodge-Deligne theory had not yet seen the light of day, and for good reason...<sup>4</sup>(\*\*\*)). This allowed me (in my dream) to see Tate's conjecture on algebraic cycles (yet another "strong impression" that inspired the Dreamer in his dream of motives!) and Hodge's (55) competing in the same vast picture, and to come up with two or three conjectures of the same kind, which I've mentioned to some people who must have forgotten them, because I've never used them.

I never heard of them again, nor of  $\square$  "standard conjectures". Anyway, they were just p. 209

conjectures (and unpublished ones at that. . . ). One of these did not concern a particular cohomological theory, but gave a direct interpretation of the filtration of weights on the motivic cohomology of a nonsingular projective variety over a body, in terms of the geometric filtration of this variety itself by closed subsets of given codimension (the codimension playing the role of the "weight")<sup>5</sup> (\*).

And then there was the work (I should put quotation marks on "work", but I can't get used to it!) of "guessing" the behavior of the weights through the six operations (since lost. . . ). Here again, I never had the impression of inventing, but always of discovering - or rather of listening to what things were saying to me, when I took the trouble to listen to them with pen in hand. What they said had a peremptory precision that could not be mistaken.

Then there was a third "pattern-dream", which was like the marriage of the two previous dreams - when it came to interpreting, in terms of structures on motivic Galois groups and on the torsors under these groups that serve to "twist" a fiber functor to obtain (canonically) any other fiber functor<sup>6</sup> (\*\*), the various additional structures with which the category of patterns is equipped, one of the very first of which is precisely that of filtration by weights. I seem to remember that there was never any question of riddles, but rather of mathematical translations in due form. These were all brand-new "exercises" on linear representations of algebraic groups, which I enjoyed doing for days and weeks on end, feeling that I was getting closer and closer to a mystery that had fascinated me for years! Perhaps the most subtle notion I had to grasp and formulate in terms of representations was that of the "polarization" of a motif, taking my inspiration from Hodge's theory and trying to decant what still made sense in the motivic context. This was a reflection

which must have been around the time of my reflection on a formulation of the "standard conjectures", inspired one

$\square$  and the other by Serre's idea (still him!) of a "Kählerian" analogue of Weil's conjectures. In such a p. 210

situation, when things themselves tell us what their hidden nature is, and by what means we can most delicately and faithfully express it, and yet many essential facts seem beyond the immediate reach of demonstration, simple instinct tells us to simply write down in black and white what things insistently tell us, and all the more clearly as we take the trouble to write under their dictation! There's no need to worry about demonstrations or complete constructions - to bother with such requirements at this stage of the work would be tantamount to denying ourselves access to the most delicate, most essential stage of a vast work of discovery - that of the birth of a vision, taking shape and substance out of an apparent nothingness. The simple act of **writing, naming, describing**

- if only to describe elusive intuitions or simple "suspicions" reluctant to take shape

- has a **creative power**. This is the instrument of the passion to know, when it is invested in things that the intellect can apprehend. In the process of discovering these things, this work is the creative stage above all others, which always precedes the demonstration and gives us the means to do so - or, to put it another way, to discover them.

---

"levels".

<sup>4</sup>(\*\*\*) This was at a time when the young Deligne had probably never heard the word "schema" in a mathematical context, nor the word "cohomology". (He became acquainted with these notions through my contact, from 1965 onwards).

<sup>5</sup>(\*) (February 28, 1985) This is in fact filtration by "levels" (see previous footnote).

<sup>6</sup>(\*\*) Just as the fundamental groups  $\pi_1(s)$ ,  $\pi_1(y)$  of some "space"  $X$  at two "points"  $x$  and  $y$  reduce from each other by "twisting" by the torsor  $\pi_1(x, y)$  classes of paths from  $x$  to  $y$ . . .

to put it better, without which the question of "demonstrating" something doesn't even arise, before anything that touches on the essential has been formulated and seen. By the sheer virtue of an effort to formulate, what was shapeless takes shape, lends itself to examination, decanting that which is visibly false from that which is possible, and that above all which accords so perfectly with the totality of things known, or guessed at, that it in turn becomes a tangible and reliable element of the vision in the making. This vision becomes richer and more precise as the work of formulation progresses. Only ten suspected things, none of which (let's say Hodge's conjecture) leads to conviction, but which mutually clarify and complete each other and seem to contribute to the same still mysterious harmony, acquire in this harmony the force of vision. Even though all ten would eventually prove false, the work that has led to this provisional vision has not been done in vain, and the harmony it has given us a glimpse of and enabled us to penetrate is not an illusion, but a reality, calling us to know it. Through this work alone, we have been able to enter in intimate contact with this reality, this hidden and perfect harmony. When we know that things have reason to be what they are'  $\square$  <sup>that</sup> our vocation is to know them, not to dominate them, then the day when an error erupts is a day of exultation (56) - just as much as the day when a demonstration teaches us beyond any doubt that something we imagined was indeed the faithful and true expression of reality itself.

p. 211

In either case, such a discovery comes as a reward for work, and could not have happened without it. But whereas it would only come at the end of years of effort, or even if we never learned the final word, reserved for others after us, work is its own reward, rich in every moment of what this very moment reveals to us.

**Note** 51<sub>1</sub> (June 5) Zoghman Mebkhout has just drawn my attention, however, to a mention of "Grothendieck's motives" made on page 261 of the volume quoted, in an article by Deligne that "takes up and completes a letter to Langlands". It reads: "I will not be referring to Grothendieck's motives, as he defined them in terms of algebraic cycles, but to **absolute Hodge motives**, similarly defined in terms of absolute Hodge cycles". Grothendieck's motives" (not underlined) are named here, not as a source of inspiration, but to distance ourselves from them and insist that we're talking about **something else** (which we take care to underline). This distancing is all the more remarkable, given that the validity of Hodge's conjecture (a conjecture known to Deligne, I suppose, as it is to every reader of his article-letter, starting with his original addressee Langlands) would imply that the two notions are **identical** ! !

p. 212

Of course, as early as 1964, when I developed the notion of motivic Galois group, it was well known to me that a notion of "Hodge pattern" could be developed on the same model, with a corresponding notion of "motivic Galois-Hodge group", which was introduced independently by Tate (I can't say whether it was before or after) and then given the name of Hodge-Tate group (associated with a Hodge structure). The crude swindle (which doesn't seem to bother anyone, coming from such a prestigious figure) consists in purely and simply swallowing the paternity of a new and profound notion, that of motif, and of the whole rich fabric of intuitions I had developed around this notion, under the derisory pretext that the technical approach taken towards this notion (via absolute Hodge cycles, instead of of algebraic cycles) is (perhaps, if Hodge's conjecture is wrong) different from the one I had (very tentatively) adopted. This yoga, which I had been developing  $\square$  over a period of nearly ten years, has been the main source of inspiration in Deligne's work since its inception in 1968. Its fruitfulness and power as a tool for discovery were clear long before I left in 1970, and its identity is independent of any technical approach taken to establish the validity of this or that limited part of Deligne's work.

this yoga. Deligne had the merit of identifying two such approaches, independently of any conjecture. On the other hand, he was not honest enough to name his source of inspiration, endeavoring as early as 1968 to hide it from public view so as to reserve the exclusive benefit for himself, until he (tacitly) claimed credit for it in 1982.

### 14.1.2. Burial - or the New Father

**Note** 52 Returning to the dream of the motifs, I seem to remember that I dreamt it aloud. Admittedly, dreaming is by its very nature solitary work - but the twists and turns of this tenacious work, which went on for years on the sidelines of a vast task of writing foundations that absorbed most of my time - these twists and turns had a day-to-day witness, much closer than Serre, who confined himself to following things from afar. ... <sup>7</sup>(\*). I could have added that I even told him what I didn't "know" in the common sense of the term - those mathematical "dreams" (on the theme of patterns as on others) which always found in him an attentive ear and an alert mind, like mine, eager to understand.

It's true that when I wrote that Pierre Deligne may have been "a bit of a pupil", this is still a subjective impression (57), not corroborated (as far as I know) by any written or at least printed record, which could lead anyone to suspect that Deligne might have learned something from me - whereas it's a pleasure for me to remember that I never spoke mathematics with him without learning something. (And even when I stopped talking mathematics with him, I continued to learn more difficult and perhaps more important things from him, including on the very day I'm writing this. these lines... ).

□ Having been informed lately by a third party, who had guessed (one wonders how!) that I might be interested in the matter, of the existence of a text by Deligne and others in which motives or at least "Tanakian categories" were discussed, and having mentioned this to Deligne, he expressed his sincere surprise that I should be interested in such things. Looking through the copy he was kind enough to send me, however, I can see that his surprise was perfectly justified. Clearly, I'm a complete stranger to the subject at hand. At most, the introduction hints in passing that certain "standard conjectures" (which I had made at the time, one wonders why) would have a consequence for the structure of the category of patterns over a body. ... The reader curious to know more would be at a loss, for throughout this book he will find no details or references to these conjectures, which are no longer mentioned; nor any mention of the one and only published text in which I explain the construction of a category of patterns over a body in terms of the standard conjectures; nor of the only other published text from before 1970 in which patterns are discussed, by Demazure (in a Bourbaki Seminar, if I remember correctly), which followed my principle of ad hoc construction, in a slightly different perspective. ... <sup>8</sup>(\*).

p. 213

<sup>7</sup>(\*) (May 25) The beginnings of my thinking on motives, however, predate Deligne's appearance. My manuscript notes on Galois motivic theory date from 1964.

<sup>8</sup>(\*) After verification, I note that apart from a few pages on standard conjectures (Algebraic Geometry, Bombay, 1968, Oxford Univ. Press (1969) pp. 193-199), there is no published mathematical text by me in which motives are mentioned. In Demazure's talk (Séminaire Bourbaki n° 365, 1969/70), following Manin's talk in Russian, mention is made of talks on I had done at the IHES in 1967, and which (I suppose) constituted a first overall sketch of a vision of the motives. An account of the standard conjectures and their relation to the Weil conjectures, more detailed than the announcement at the Bombay congress, is given by Kleiman (Algebraic Cycles and the Weil conjectures, in Dix exposés sur la cohomologie des schémas, Masson-North Holland, 1968, pp. 359-386). I was not aware of any reflection on the standard conjectures, in particular towards a demonstration of them, outside my own before 1970. The deliberate intention to ignore these key conjectures (which I

p. 214

□ Even Neantro Saavedra, who had the good fortune to be one of my "pre-1970 students", was duly cited. He had done a thesis with me on what I called, I believe, "rigid tensorial categories", and which he called "Tannakian categories". One still wonders by what miraculous chance Saavedra had been able to foresee the needs of Deligne's theory of patterns, which was to blossom ten years later! In fact, in his thesis he does exactly **the** work that technically constitutes the key to a motivic Galois theory, just as J.L. Verdier's thesis was in principle **the** work that technically constitutes the key to a formalism of the six operations in cohomology. One difference (among others) in Saavedra's honor is that he took the trouble to publish his work; admittedly, he hadn't had the pen of Hartshorne, Deligne and Illusie combined to dispense with such a formality. Yet, ten years later, Saavedra's thesis is reproduced ab ovo and practically in toto in the remarkable collection, this time by Deligne and Milne. This may not have been essential, if it was merely a matter of correcting two particular points in Saavedra's work (58). But there is a reason for everything, and I think I can see why Deligne himself took the trouble<sup>9</sup> (\*), even though it runs counter to his own extremely exacting standards for publication, which he is known to apply with exemplary rigor when it comes to others...<sup>10</sup>(\*\*).

As for the authorship of the notions and motivic yoga themselves, for an uninformed reader (and informed readers are becoming rare and will eventually die their own death. . .) this authorship cannot be in the slightest doubt - without any need here to go bothering distant Hilbert and Riemann, let alone the good Lord. ) there can be no doubt whatsoever as to their authorship - and there's no need to go bothering distant Hilbert and Riemann, let alone the good Lord. If the prestigious author, whose beautiful result on absolute Hodge cycles

p. 215

on abelian varieties appears as the starting point, and birth to say the least, of the theory of motives, does not breathe a word of its paternity, it is there a modesty □ which honors him and in perfect agreement with the customs

and the ethics of the profession, which dictate that we leave it to others (if need be) to give honor where honor is obviously due: to the legitimate Father... .

**Note 53** Touched by the vicissitudes of this orphan, and doubting that another will do the work whose need and scope I am apparently the only one, even today, to feel, I presume that the "bold mathematician" in question will be none other than myself, once I have completed the Poursuite des Champs (which I anticipate will occupy me for another year or so).

**Note 54** Since then, two new cohomological theories have appeared for algebraic varieties (apart from the Hodge-Deligne theory, a natural extension, in the "motivic" spirit, of the Hodge cohomology): Deligne's theory of "stratified promodules" and, above all, that of crystals, a "*D-Modules*" version à la Sato-Mebkhout, with the new light provided by the theorem of the good God (aka Mebkhout) mentioned earlier. This approach to constructible discrete coefficients is likely to replace Deligne's earlier version, as it is probably better suited to expressing relations with De Rham's cohomology. Moreover, these new theories do not provide new functor-fibers on the category of smooth patterns on a given scheme, but rather (modulo a more thorough groundwork than has been done so far) a way of precisely apprehending the "Hodge" embodiment of a (not necessarily smooth) pattern on a finite-type scheme over the body

---

said, in my Bombay sketch, that I considered them, along with the resolution of singularities of excellent schemes, to be the most important open problem in algebraic geometry), seems to me to have a lot to do with the impression of stagnation that the cohomological theory of algebraic varieties gives me, from the echoes that have come back to me.

<sup>9</sup>(\*) On this subject, see the reflections in the note "La table rase", n° 67.

<sup>10</sup>(\*\*) (June 8) And even more so, when it comes to works that bear the mark of my influence - on this subject, see the episode entitled "The note - I'm not the only one! or the new ethics". Section 33.

of complexes, or the "De Rham" incarnation on a finite-type scheme over a body of zero characteristic. It is likely, moreover, that the (apparently still unwritten) theory of Hodge-Deligne coefficients on a finite-type scheme on  $\mathbb{C}$ , will eventually appear as contained in the (equally unwritten) theory of crystalline coefficients à la Sato-Mebkhout (with an additional filtration datum), or more precisely as a kind of intersection of the latter with the theory of constructible discrete coefficients

Q-vectorial ... . As for elucidating the relationship between Mebkhout's crystalline theory and that of the developed in positive characteristic by Berthelot and others, this is a task Mebkhout has been feeling since before 1978, in a climate of general indifference, and which seems to me to be one of the most fascinating that immediately arises for our understanding of "the" cohomology (unique and indivisible, motivic knowledge!) of algebraic varieties.

**Note 55** <sup>□</sup> I may have been dreaming, but my dream about the relationship between Hodge's patterns and structures made me put my finger, without even doing so on purpose, on an inconsistency in the "generalized" Hodge conjecture as originally formulated by Hodge, and to replace it with a rectified version which for the (I'd wager) must be no more or less false than the "usual" Hodge conjecture on algebraic cycles.

### 14.1.3. Prelude to a massacre

**Note 56** I'm thinking in particular, in the context of the cohomology of algebraic varieties, of Griffiths' discovery of the falsity of a seductive idea we'd long had about algebraic cycles, namely that a cycle homologically equivalent to zero had a multiple that was algebraically equivalent to zero. This discovery of a brand-new phenomenon struck me enough for me to spend a week trying to grasp Griffiths' example, transposing his construction into a new one.

(which was transcendental, on the  $\mathbb{C}$  body) into a construction "as general as possible", and valid in particular on bodies of any characteristic. The extension wasn't entirely obvious, with (if I remember correctly) Leray spectral sequences and Lefschetz's theorem.

(June 16) This reflection had been the occasion for me to develop, in the étale context, the cohomological theory of "Lefschetz brushes". My notes on this subject are developed in the SGA 7 II seminar (by P. Deligne and N. Katz) in lectures XVII, XVIII, XX by N. Katz (who takes care to refer to these notes, which he followed closely). In the introduction to the volume by P. Deligne, on the other hand, where it is stated that the key results of the volume are talks XV (Picard-Lefschetz formulas in étale cohomology) and XVIII (Lefschetz brush theory), the author is careful not to point out that I had anything to do with this "key theory" of Lefschetz brushes. Reading the introduction gives the impression that I have nothing to do with the themes developed in the volume.

The long SGA 7 seminar, which in 1967-69 followed on from the SGA 1 to SGA 6 seminars developed at my instigation between 1960 and 1967, was conducted jointly by Deligne and myself, who had kicked things off with a systematic theory of evanescent cycle groups. The presentations by volunteers, the two seminar volumes (SGA7 I and SGA 7 II) have not yet been published.

were not published until 1973, in the care of Deligne. While it had been understood at the time of the seminar that

217

After I left, Deligne informed me of his desire (which seemed strange to me) for the seminar to be **split in two**, with Part I presented as directed by me, and Part II by him and Katz. I now perceive in it an "operation" that prefigures the "SGA 4 operation<sup>1</sup>" aimed (among other things) at bringing to light the whole series of foundations SGA 1 to SGA 7, which in his mind

and its conception was inseparable from my person, as was the EGA series of *Eléments de Géométrie Algébrique*, as a collection of all-purpose texts in which my person would play only an episodic, even superfluous role. This tendency is very clear, even brutal, in the SGA 4 volume<sup>1</sup> and above all in the massacre of the SGA 5 seminar, to which this volume is indissolubly linked. On this subject, see, among others, the notes "La table rase" and "Le massacre", n°s 67 and 87, and especially "La dépouille. . ." (n° 88).

(June 17) The overall conception of the SGA 7 seminar (in which I made no distinction between parts "I" and "II", and still don't) was due to me, and Deligne had made important contributions (reported in my report on Deligne's work, written in 1969, see n°s 13, 14 of this report), the most crucial for the purposes of the seminar being the Picard-Lefschetz formula, proved by a specialization argument from the transcendental case already known. The split of the seminar into two parts was unjustified both mathematically and in terms of the respective contributions - there are substantial contributions from both Deligne and myself in each of the two "pieces" of SGA 7.

Of course, I would have been delighted if Deligne had continued the series of APG foundations I had inaugurated.

- which was nowhere near the end of its run! This "SGA 7 operation" is by no means a continuation, but I feel it is a sort of brutal "saw" (or chainsaw. . .), **bringing** the SGA series to an **end** with a volume that ostentatiously distances itself from my person, even though it is linked to my work and bears its mark just as much as the others. While my person is concealed as far as possible, the tone towards my work is not yet that of the barely disguised contempt of the "SGA 4 operation<sup>1</sup>", which represents an even more brutal saw cut in the unity of the SGA 4 and 5 seminar, and the means and pretext for the ruthless ransacking of the unpublished SGA 5 part of it, the torn-off pieces of which are shared equally between Deligne and Verdier.

...

p. 218 **Note 57** □ I hasten to add that the same remark applies to the other mathematician of great means of whom I ventured to say (in note no.° 19) that he was "a bit of a pupil", ten years after Deligne.

**Note 58** This reminds me that Notes readings (which had published six or seven "pre-1970" doctorates done with me) never wanted to publish Yves Ladegaillier's "post-1970" one (reason: they don't publish theses!). On the other hand, they did publish Saavedra's thesis a second time. ... Incidentally, I had told Deligne about Ladegaillier's beautiful isotopy result, which was being rejected everywhere (with the further secret hope that he would lend his help to publish it) - but didn't seem to interest him (reason: his incompetence in surface topology. . .).

Curtain. . .

#### 14.1.4. The new ethics (2) - or the fair d'empoigne

**Note 59** (April 20) In the few weeks since these lines were written, which note a contradiction and its price, I was surprised to discover that the person concerned had already, two years ago, found a very simple way of "resolving" the said contradiction - all it took was a little thought! We could call it "the early burial method" (which the reader can read about in the double note (50) (51), written yesterday in the fresh emotion of the discovery). I'm sorry to say that the unexpected reappearance of the anticipated deceased on the famous "mathematical stage" (which sometimes looks rather like a jostling match. . .) risks introducing technical complications for the smooth application of this brilliant method! In a previous note ("Deontological consensus - and control of information", n° 6) I felt (a little)

still confused) that the most universally accepted rule of ethics in the scientific profession "remained a dead letter" in the absence of respect, by those in control of scientific information, for every scientist's right to make his or her ideas and results known. At about this time, I also took the trouble to describe in some detail a case in point where, for me, the disregard for this right was flagrant, and where I also felt that this disregard was bordering on disregard for the primary rule, on which there is general consensus. (See "The note - or the new ethic", section 30).

□ It's not the only time I've felt this very particular uneasiness, when I saw the **spirit** of this The first rule was scorned, while the person who made it was "thumbed" both by his position (above suspicion!) and his means, and by the casualness of his form. I try to pinpoint this malaise in the note ("the snobbery of youth - or the defenders of purity") that relates to the quoted section. When one allows oneself to despise the "obvious" things I'm talking about there, and in the same spirit also (might I add now) the (perhaps profound) things that are neither demonstrated nor patented as published "conjectures" known to all, one might as well (given the little I) consider them common property (trivial, it goes without saying)<sup>11</sup> (\*), and therefore also, when the time comes, as "one's own" with the greatest casualness and the best conscience in the world - it being understood, of course, that one wouldn't dream of appropriating a ten-page or one-hundred-page (or just ten-line) muscular demonstration that establishes a result "that one hasn't been able to demonstrate" (59 ). I didn't think I had such a good feeling or such a good word to say (on the subject of "dead letter"), since I've just seen the undecided "limit" of the case cited above blithely crossed - and surely crossed with the best conscience in the world, **given how little: a dream**, and what's more, not even demonstrated (nor, above all, **published** . . . ).<sup>12</sup> (\*\*)

p. 219

Fortunately, I've got a bit of a backbone - when I need to, I can express what I feel as best I can, and that's not all. that I want to say, I've acquired (rightly or wrongly) credibility, and thus a chance to be listened to when I have something to say, or to publish it if I feel the need. On the other hand, I realize more vividly what "feeling of injustice and powerlessness" of one who □ is wronged without recourse, when he feels his hands and feet tied p.

220

to the arbitrariness of "those who have everything in their hands" - and use it as they see fit.

It's true that in my life as a mathematician, I've sometimes behaved badly with an equally good conscience, and I've had the opportunity in my reflection to talk about cases that this has brought to the surface from the mists of oblivion and ambiguity never examined. By probing them, I finally understood that I shouldn't be surprised if today (and for a long time now) the pupil has blithely surpassed the master, nor should I disown anyone to whom I have sympathy or affection. But it's healthy, for me as for everyone else, to call a spade a spade, whether that spade belongs to my house or to someone else's.

### 14.1.5. Appropriation and contempt

**Note!** 59' (June 8) I'm no longer convinced, as far as my friend Pierre Deligne is concerned, having had the opportunity to note that he has finally slipped into the game of "tacit paternity" with regard to the l-adic cohomology tool, i.e. what I call "mastery" of spread cohomology. There has been a remarkable evolution between the "SGA 4 operation<sup>1</sup>" (where my name is still pronounced, but with an affectation of disinterested disdain) and the "SGA 4 operation" (where my name is still pronounced, but with an affectation of disinterested disdain).

<sup>11</sup>(\*) Such was the fate of "Le théorème du bon Dieu" (alias Mebkhout).

(June 8) And, as in pattern yoga, we take care to cleverly create the appearance of authorship, without ever saying so outright! See on this subject (in the case in point) the note "Le Prestidigitateur" n° 75", and for the brilliant general method or style, the note "Pouce!" n° 77, as well as the note that follows "Appropriation and contempt", n° 59'.

<sup>12</sup>(\*\*) It would be wrong to be embarrassed, as the event seems to show that the general consensus these days is that the something quite normal - at least from someone of such high standing! What we call "good conscience" is no more, no less,

2. A walk through a work or the Child and Mother  
than a feeling of agreement with the prevailing consensus in the milieu to which one belongs.

(See the notes "La table rase" and "L'être à part" for the initial phase, and the notes "L' Eloge Funèbre (1), (2)" for the final phase).

Intermediary phases in this escalation include the "memorable article" on so-called "perverse beams" in 1981 (see the notes "L'Iniquité - ou le sens d'un retour" and "Pouce!", n° 75 and 77), and the exhumation of the motifs in LN 900 the following year (the Eloge Funèbre taking place the following year, in 1983). In all these cases and others of lesser scope that I've observed, the inner attitude and "method" that enables Deligne to appropriate the credit of others' ideas with a clear conscience is that of **contempt** (which remains partially tacit, so "little" in fact that it's not even worth talking about, when you're going to use it to do really powerful things - Weil's conjectures, the theory of so-called "per- vers" beams. . . Once the operation has been completed and appropriation accepted by all, it's always

time to put things right and strut modestly with what has been appropriated. The same contribution is the object of casual scorn, as long as it still seems tainted with the name of one of <sup>those</sup> ☐ it is intended to bury, and

p. 221

has been taken up when it has been appropriated by himself (*l-adic* cohomology, motifs, while waiting for Mebkhout's yoga) or by some good buddy (yoga of derived categories, yoga of duality, appropriated by Verdier with Deligne's active encouragement).

## 14.2. V My friend Pierre

### 14.2.1. The child

p. 223

☐ **Note** 60 (April 21) To take up this dream of a memory, which is not just the memory of birth a vision... I remember well (even though I've forgotten so much!) the pleasure I took in talking with him, who soon became a confidant of everything that intrigued me, or that enlightened and delighted me day by day in my love affair with mathematics, than he had ever been a "pupil". His ever-awakening interest, the ease with which he took in everything ("as if he'd always known. . . ") were a constant source of enchantment for me. He was a perfect listener, driven by the same thirst for understanding that animated him as me - a highly awakened listener, a sign of communion. His comments always met my own intuitions or reservations, when they didn't throw some unexpected light on the reality I was trying to pin down through the mists that still surrounded it. As I've said elsewhere, he often had the answers to the questions I raised, often on the spot, or would elaborate on them in the days or weeks that followed. In other words, the listening was shared, when he in turn explained to me the answers he had found, i.e. quite simply the reason for things, which always appeared with that perfect naturalness, with that same ease that had often enchanted me with some of my elders like Schwartz and Serre (and also, with Cartier). It was this same simplicity, this same "obviousness" that I had always pursued in my understanding of mathematical things. Without having to say it, it was clear that with this approach and these high standards, he and I were "from the same family".

I sensed from the moment we met that his "means", as they say, were of a very rare quality, far beyond the modest means at my disposal, even though we were on the same wavelength in terms of our passion for understanding and our demand for understanding mathematical things. I also had the vague feeling, although I couldn't put it into words at the time, that this "strength" I saw in him (and which I also sensed in him) was the same as the "strength" I saw in myself.

The ability to "see" obvious things that nobody else could, was the strength of childhood, the innocence of a child's eyes. There was something of the child in him, far more apparent than in any other mathematician I've known, and surely not by chance. He told me

that one day, when he was still in high school I think, he amused himself by checking the multiplication table (and along the way and by force of circumstance, the addition table too),  $\square$  for numbers from 1 to 9, in terms p. 224

definitions. He certainly wasn't expecting any surprises - if there was any surprise (a pleasant one, as always. . . ), it was that the demonstration could be done nicely and completely in just a few pages, the story of perhaps half an hour. When he laughed and told me the story, I could feel that it had been half an hour well spent - and that's something I understand even better today than I did then. This little story struck me, even impressed me (though I don't think I let it show) - I sensed in it the sign of an **inner autonomy**, a freedom from received knowledge, which had also been present in my relationship with mathematics in my childhood, from the very first contacts (69)<sup>13</sup> (\*).

This relationship of privileged interlocutor for each other, when we saw each other practically every day I believe<sup>14</sup> (\*\*), continued over a period of five years, from 1965 (if I remember correctly) to 1969 inclusive. I still remember the pleasure I had, in that year, in writing a detailed report on his work, when I was proposing to co-opt him as a professor in the institution where I had worked since its foundation (in 1958), and where most of my mathematical work was accomplished. I no longer have a copy of this report (64), in which I reviewed, I believe, a good dozen of my friend's works, almost all unpublished at the time (many have remained so), and most if not all of which, in my opinion, carried the weight of the main substance of a good state doctorate thesis. I was prouder and happier to present this eloquent report than I would have been had I been presenting a report on my own work (something I've only done twice in my life, and each time under compulsion. . . ). Many of these works were answers to questions I had raised (the only one published among them being the work already mentioned

on the degeneracy of the spectral Leray sequence for a clean and smooth morphism of schemes (63)). The two most important par $\square$ contre were answers to questions Deligne himself had asked, and he was p. 225

It was clear that their scope was of a completely different order than a "good state doctorate thesis". These were his work on the Ramanuyam conjecture (published in the Bourbaki seminar), and the work on mixed Hodge structures, also known as "Hodge-Deligne theory".

It's a strange thing, and one I was far from suspecting when I wrote this sparkling report, that I was to leave less than a year later this institution where I was about to have my young and impressive friend co-opted, and where I intended to end my days. And (now that I've put these two double episodes together) it's another strange thing, and no more surely the effect of mere "chance", that this same (now less young!) friend announced to me a month or two ago his own departure from this same institution, when it had also been a year since I had resumed regular mathematical activity, in the sense of a kind of unexpected "re-entry" onto the mathematical scene (if not into the "great world". . . ).

On more than one occasion in Récoltes et semailles, I've spoken of my departure - of this "salutary uprooting" - and even more of the "awakening" that closely followed it, and which made this episode a crucial turning point in my life.

<sup>13</sup>(\*) Incidentally, it seems to me that this freedom has never entirely disappeared during my life as a mathematician, and that it is once again present as it was in my childhood. Two or three years ago, I revisited the little episode of the multiplication table for my friend. I felt he was embarrassed by this evocation of a childhood memory, which no longer visibly corresponded to his self-image. I wasn't really surprised by his embarrassment, but saddened to see something that I knew well, but still found hard to admit, confirmed once again... ..

<sup>14</sup>(\*\*) This was the case at least as long as I lived in Bures, where he was housed in a studio at the IHES. From 1967 onwards (when I moved to Massy), I think we still saw each other once or twice a week, at least as long as I remained involved in mathematics.

my life. In the intense years that followed, the world of mathematicians, with those I had loved in it, and that very thing that had fascinated me most in mathematics itself, became very distant - as if drowned in the mists of memory of another "myself", who would have died ages ago... .

But both before this episode, and in the years that followed this first major turning point, I knew that the man who had been (a little<sup>15</sup> (\*)) my pupil and (a lot of) my confidant and friend, had only to follow the spontaneous impulse within him of a child who plays and wants to know, to discover and bring to light new and unsuspected worlds, and to fathom them and know their intimate nature - and thereby reveal them to his fellow creatures as well as to himself. So, if after my departure (with no spirit of return!) I saw "a bold and inspired mathematician" sketch out (for a start. . . ) the vast picture I had glimpsed, and of which I had still only drawn a series of partial and provisional sketches, it was indeed he - who had everything in his power to make the world a better place.

p. 226 hands to do it! Brushing up this first large-scale picture, a "master builder" bringing together in a common vision the essentials of what was known and guessed about the  $\square$  cohomology of varieties. For someone in whom such an overall vision was already ready to emerge from the mists of the as yet unwritten, this algebraic work was the work of a few months, not even years. (It would have to be taken up again and deepened over the years - or generations, if generations were needed - until the final word on the reality of the motifs was fully understood and established). And I had no doubt that this work, which used to "burn in my hands", would be done any moment now, and at least over the next two or three years, while it was still hot. After my departure, there was certainly only one person left who was called upon, by his very impulse of knowledge, to do this burning and fascinating work. Once the "maître d'oeuvre" had been written and tested, and the construction of the work more or less completed, I would leave it to others to continue this work, however fascinating it may be, and embark on other adventures, in this world of mathematical things, where every bend in the road reveals the promise of a new, limitless world, provided we have open, new eyes to see... .

At a time when my life was still taking place in the warm scientific incubator that isolated it from the noises of the world, and when Deligne was developing his extension of Hodge's theory (this must have been in 1968 or '69), it was a matter of course between us that this work was a very first step towards realizing, testing and refining a certain **part** of this "tableau des motifs", which had never been put down in black and white in its entirety<sup>16</sup> (\*). In the years following my departure from the "étuve", at a time when mathematics was a long way off for me, it came as no surprise to learn that Weil's conjectures had finally been demonstrated. (If there was any surprise, it was that the "standard conjectures" had not been demonstrated in the same breath, even though they had been developed precisely with a view to an approach to Weil's conjectures.

p. 227 Weil, at the same time as a means of establishing at least a theory of semisimple patterns on a body<sup>17</sup> (\*\*).) I was well aware that neither by  $\square$  this first draft towards a general theory of coefficients to the Hodge, nor by this demonstration of certain key conjectures (among a number of others that are more or less well known) he had yet reached his full potential - indeed, he was far from it. And I waited without impatience, while most of my attention was absorbed elsewhere. (-> 61)

<sup>15</sup>(\*) For the meaning of this scruple in me to consider the (too!) brilliant Deligne as one of my students, see the note "L'être à part" (n° 67).

<sup>16</sup>(\*) That this Hodge-Deligne theory never (as far as I know) went beyond this first draft, that it never expanded into a theory of "Hodge-Deligne coefficients" (and the "six operations" on them) above the type schemes finished on the field of complexes, is inseparable from this other strange fact: that this vast "tableau des motifs" has never been painted, and that its very existence has been carefully hushed up to this very day. ...

<sup>17</sup>(\*\*) It's only in recent years that I've become vaguely aware (but more precisely lately!) that the "standard conjectures", as much as the very notion of pattern for which they provided a first "constructive" approach, had been **buried**, for reasons that are now particularly clear to me. (Compare also the previous footnote).

## 14.2.2. The funeral

**Note** 61 I had been privileged to see the first flowering of a child's impulse, bearing the promise of a vast deployment. Over the next fifteen years, I came to realize that this promise was constantly being deferred. There was this delicate thing in him that I had been able to sense and recognize (at a time when I was insensitive to so many things!), a thing that is of an entirely different nature from cerebral power (which crushes as well as penetrates. . . ) - a thing that is essential above all for any truly creative work. I'd sensed it in others at times, but in no mathematician I'd ever known had it manifested itself with comparable force. And I expected (as a matter of course) that this thing would continue to blossom in him and transform itself, and express itself effortlessly in a unique work, of which I would have been a modest precursor. But strangely enough (and surely there's a deep and simple connection between so many "strange things") - I've seen this "delicate thing", this "strength" that's neither muscle nor brain, gradually fade away over the years, as if **buried** under successive layers, and thicker and thicker - layers of **something else** I know only too well - the most common thing in the world! It's not necessarily a bad match for brain power, consummate experience or a trained flair in a particular discipline, which can force the admiration of some and the fear of others, or both, through the accumulation of works, brilliant perhaps and surely having their strength and beauty. But **that's** not what I had in mind when I spoke of "unfolding" or "blossoming". The blossoming I had in mind is the fruit of an innocence, eager to know and always ready to rejoice in the beauty of the small and great things of this inexhaustible world, or of such and such a part of this world (such as the vast world of mathematical things. . . ). It is he who alone has the power of profound renewal, whether of self, or of knowledge of the things of this world. It is this power that has been fully realized, it seems to me, in the modest person of a Riemann<sup>18</sup> (\*). This true fulfillment is foreign to  $\square$ contempt: to the disregard of others (those we feel far below us... ), or that of things too "small" or too obvious for us to deign to take an interest in, or of those we feel fall short of our legitimate expectations; or the contempt of such a **dream** perhaps, speaking to us insistently about the things we profess to love... . It is foreign to contempt, just as it is foreign to the fatuity that feeds it.

p. 228

Certainly, with his impressive "means", but even more so with that delicate thing that impresses no one and **creates**, the "pupil" was destined to far surpass the "master". I had no doubt that, in the years following my departure from this place where I had witnessed such a beautiful flight, Deligne would give his full measure in the deployment of a vast and profound work, of which I would have been one of the precursors. The echoes of such a work would not fail to reach me over the years, while I myself, in the pursuit of other quests far from mathematics, could only imperfectly appreciate the full scope and beauty of the new worlds he was about to discover.

But the pupil cannot surpass the teacher by **disowning** him in his innermost self, by secretly striving, before himself and before others, to erase all trace of what he has contributed (whether the contribution was for the better, or for the worse. . . ) - any more than the son can truly surpass the father by disowning him. This is something I've learned above all through my relationship with my children, but also (later on) through my relationship with some of my former pupils; and above all with the one, of all people, whom I've always been scrupulous about calling "pupil", having sensed from the moment I met him that I had to learn from him.

---

<sup>18</sup>(\*) The work of Riemann (1826-1866) is contained in a modest volume of around ten works (it's true that he died in his forties), most of which contain simple, essential ideas that profoundly renewed the mathematics of his time.

of him, as much as he of me<sup>19</sup> (\*). But it was only almost ten years after that meeting, after 1975 and especially since I've been meditating on the meaning of what I experience and witness, that I began to sense this **hindrance** in the man who continued to be dear to me. And I also felt, obscurely, that this secret disavowal of my person and of a role I had played in crucial years of his life, was too,

more profoundly, a disavowal **of itself**, (It is so, no doubt, whenever we disavow and want to erase something that has well and truly taken place, and whose fruit is ours to gather. ... ).

p. 229

However, lacking any kind of "connection" to "what was being done in maths", and to what he was doing himself<sup>20</sup> (\*), I never realized, until I thought about it a few weeks ago, how much this hindrance also weighed on the very thing in which he had invested his all: his mathematical work. Certainly, more than once in the last eight or nine years, I've seen simple common sense or a mathematician's healthy instincts wiped out by a deliberate gesture of disdain (towards me) or contempt (towards others whom it was in his power to discourage) (66). Indeed, he was not the only one of my former students, with or without quotation marks, in whom I witnessed such attitudes towards people I cared about (or towards others). But in no other case have I been so painfully affected. More than once in the course of my reflections over the past two months, I've alluded to this experience, "the most bitter I've ever had in my life as a mathematician" - and I've also said what it ultimately taught me, at the end of this Harvest and Sow reflection. This sorrow was so vivid, it taught me something so far-reaching about a person who was still dear to me (while I continued to evade what it also taught me about myself and my past. . . ), that the question of its impact on his mathematical "creativity", or even on that of the person who had been discouraged or humiliated, became entirely secondary, not to say derisory.

The note "Refus d'un héritage - ou le prix d'une contradiction" (Refusal of an inheritance - or the price of a contradiction) is the first written reflection in which I took stock of what had come back to me in bits and pieces, here and there, over the years, both on the "state of art", and on the work of the man I had known so well and so little. It was also the first time I had seen, in a single glance, the full "**price**", or the full weight, in his work as a mathematician, of the refusal he had carried within him for more than fifteen years. In writing this note, however, I was "delaying", since for two years already (and without "anyone" seeing fit to inform me), the reasons had been brought out of the secrecy in which they had been kept.

for twelve years. ... And today, as I write this final stage (I believe) of my reflection on my mathematical past, two days after having read in large lines this memorable volume which

p. 230

the perception of this crushing weight has become striking. It's the weight that, day after day and through a hundred detours, those who are made to fly enjoy dragging along - a flight that's supple and light, joyful and intrepid in its pursuit of the unknown, for its own joy and that of the wind that carries it. ... <sup>21</sup>(\*)

If he doesn't steal, and if he's content to be a man admired and feared, accumulating proof of his superiority over others, I have nothing to worry about, If he drags the weights he likes to drag, surely he finds some

---

<sup>19</sup>(\*) (June 14) On the subject of my deliberate and persistent intention to minimize what I had to contribute, and to deny the reality of a master-pupil relationship, see the note "L'être à part", n° 67 . Clearly, there's no comparison between what my friend learned from me ("as if he'd always known", of course!), and what I learned from him. It would undoubtedly have been otherwise, had I continued my intense mathematical investment to this day, and maintained regular mathematical contact between us.

<sup>20</sup>(\*) Since 1970, I've received four offprints by Deligne, which (like most of the offprints I still receive) I skimmed through on the spot. It wasn't enough to give me an idea of a mathematical work, even in outline or through its main themes.

<sup>21</sup>(\*) I don't mean to suggest that it's the privilege of a few exceptional beings to be called upon to "fly" and discover the world - surely we're all called upon by birth! However, this capacity rarely finds the opportunity to blossom, even if only in a very limited direction (such as mathematical work). But in one person I've seen such an ability (in the "mathematical" direction) preserved as if by miracle, only to regress over the years.

satisfactions - just as I myself have taken pleasure in dragging along weights, and continue today to drag along those I haven't yet been able to part with along the way. Of what I had to offer, the best and the worst, he took what he liked. I don't have to worry about his choices, which are his alone; nor do I have to decide here whether they are the best or the worst (62). What's "best" for one person is "worst" for another, or sometimes for the same person (as long as he changes, which is admittedly not very common. . . ).

But the choices we make, and the actions that express them (even though our words often deny them), we make at our peril. While they often bring us the expected gratifications (which we receive as "the best"), these very gratifications sometimes end up having setbacks (which we reject as "the worst", and often as an outrage). When we finally understand that setbacks are not an outrage, we often regard them as a price to be paid, which we pay with reluctance. Sometimes, however, we come to understand that such setbacks are something other than ruthless cashiers, to whom we have to pay for the good time we've had, whether we like it or not. That they are patient and obstinate messengers, who never tire of coming back to bring us the same message over and over again - an unwelcome message, to be sure, and one that is constantly rejected. - because even more than the setback itself, it's its humble message, always rejected, that appears to us as "the worst": worse than a thousand setbacks, often worse than a thousand deaths and the destruction of the entire universe, for which we no longer care. ...

□ On the day at last when it pleases us to welcome the message, eyes suddenly open and see: what was and the crushing weight from which we are suddenly relieved is the very thing we were clinging to only yesterday, as "the best".

p. 231

### 14.2.3. The event

**Note** 62 (April 21) People will tell me that if I have nothing to worry about, then why am I going on for pages and pages about a personal relationship that concerns only me and the person concerned!

If I felt the need to reflect retrospectively on certain important aspects of a relationship, it was under the impact of a specific event that affected me closely (even though I learned of it two years late). This event, on the other hand, is in the public domain, in an even more obvious way than the behaviours and routine acts of prominent mathematicians (such as Deligne, or myself) towards others of lesser renown or beginners (although their effect on the lives of others is often of a quite different scope than in the present case). The event in question (i.e. the publication of the "memorable volume" of Lecture Notes LN 900, a.k.a. the "funeral volume"), like everything surrounding it, struck me as **unhealthy**, rightly or wrongly. I felt it was healthy for everyone, starting with the "interested party" himself, to give a detailed account of some of the ins and outs, getting to the bottom of things as I see them today.

With this account and these thoughts, I'm not trying to convince anyone of anything (far too tiresome, and moreover hopeless!)<sup>22</sup> (\*), but simply to understand the events and situations in which I found myself involved. If they inspire others to think beyond the usual clichés, this testimony will not be published in vain.

---

<sup>22</sup>(\*) (May 25) If I felt the need here to repeat to myself that it was "far too tiring" and "hopeless" to try to convince, it's undoubtedly because somewhere inside me, the intention to convince was nonetheless well and truly present, and also perceived. The entire period of reflection between April 19 (when I learned of the "memorable volume" LN 900) and April 30 was marked by a state of inner tension, and also division, in the face of the impact of an entirely unexpected "event", which I was trying as best I could to reconcile.

to assimilate the message. This tension was finally resolved with the note "Le retour des choses" (n° 73) of April 30, when in fact reflection had just returned to my own person, to immediately provide me with the obvious key to this message.

#### 14.2.4. Eviction

p. 232 23  
□  
**Note 63** (April 22) This article (\*) appeared in Publications Mathématiques in 1968, i.e. two years later. before I left the world of mathematicians. Its starting point had been a conjecture I'd told Deligne about, of a property of degeneracy of spectral sequences which at the time might have seemed quite incredible, but which nonetheless became plausible by "arithmetic" means, as a consequence of Weil's conjectures. This motivation was of great interest in its own right, as it showed how much could be gained from a "yoga of weights" implicit in Weil's conjectures (a yoga first glimpsed by Serre, in certain important aspects). Since then, I've routinely applied it to all sorts of analogous situations, to draw conclusions of a "geometric" nature (for the cohomology of algebraic varieties) from "arithmetic" arguments. These remained heuristic as long as Weil's conjectures were not established, but were nonetheless highly probative, and represented a first-rate **means of discovery**. Deligne's "geometrical" demonstration for the particular conjecture in question, using Lefschetz's theorem (established then in null char. only), had interest in an entirely different direction, in addition to the first merit of not depending on any conjecture. The link indicated by the two approaches between two seemingly unrelated things - Weil's conjectures (and the yoga of weights that represented the most fascinating aspect of them for me at the time), on the one hand, and Lefschetz's theorem, on the other - was in itself highly instructive.

The interesting thing here, for my own present purposes, and which only became clear to me today, is that the reader of this article will have very little chance of suspecting that I had anything to do with the initial motivation of the main result, and no chance at all of learning from this article what that motivation had been. (See also the beginning of note (49). The **spontaneous** approach (including, I'm sure, on the part of the author himself) to the exposition of a result like this would have been to start with the (admittedly striking) conjecture, to indicate the first, equally striking, reason found for it, which was a good opportunity to finally "sell" this famous yoga of the weights, of much greater scope in itself

p. 233 □  
that the main result of the work<sup>24</sup> (\*); then to follow with the "Lefschetz theorem" point of view<sup>25</sup> (\*\*) which proved the initial conjecture under slightly more general conditions (any basic scheme, not necessarily clean and smooth over a body), but in characteristic zero only. On the other hand, the exposition that follows begins with generalities of homological algebra (as pretty as can be, and presented with the author's customary elegance), generalities that he, like everyone else, must have since forgotten, axiomatization-style, of Lefschetz's theorem. The main result (the only one everyone remembers, of course) appears as cor. X towards the middle of the article, while in "remark 2.9" some

<sup>23</sup>(\*) This is Deligne's article on the degeneracy of spectral sequences and Lefschetz's theorem (Publications Mathématiques 35, 1968) cited in the note "Poids en conserve et douze ans de secret", n° 49).

<sup>24</sup>(\*) It was yoga itself that remained a secret (I think) for the next six years!

(June 7) And (as it has since appeared) which was then presented by Deligne "on his own account", without any allusion either to Serre or to me. (See notes n° 78<sub>1</sub>, 78<sub>2</sub>).

<sup>25</sup>(\*\*) (June 17) The idea of using Lefschetz's theorem ("Vache") to demonstrate a degeneracy of spectral sequences is a good one. due to Blanchard, who only obtained the degeneracy theorem under the draconian assumption (rarely verified) that the local system formed by the rational cohomology of fibres is trivial. I was familiar with Blanchard's work, and mentioned it to Deligne, who thus drew on Blanchard's idea for his demonstration, even though he hadn't read the article. Serre, who remembered Blanchard's demonstration better than I did, pointed out to Deligne that his demonstration was in fact an easy adaptation of Blanchard's. This is what Deligne points out in his remark 2.10. This remark, in which he quotes Serre, is written in such a way as to give the impression that he only learned of Blanchard's idea after the fact, which is in no way the case. The two main **sources** for his article have therefore been overlooked: on the one hand, the arithmetical **motivation**, which made it possible to foresee a considerable strengthening of Blanchard's result, and on the other, Blanchard's **demonstration idea**, which he elegantly adapts to obtain a result that Blanchard had probably not dared to hope for, and for that reason had not even tried to "get" by his method.

Somewhere near the end (the reader doesn't quite know why) the word "weight" and my name are pronounced. ...

I can't remember what impression the article made on me when it first appeared - as I was in the know, I must have just glanced at it. I must surely have sensed an intention to "distance myself", but also felt that it was only natural that my friend should be concerned about not risk appearing as a disciple (or "foal") of a "master"<sup>26</sup> (\*\*\*), It is true that if there had been in him the quiet assurance□in his own strength, he would have had no hesitation in writing a work of greater scope greater and more useful for everyone (including surely for himself), without fear of not being seen for what he is... . (65). p. 234

The situation was somewhat analogous with the publication of his first large-scale work the following year, on mixed Hodge theory. (At the time, I regarded this work as comparable in scope to Hodge theory itself, seeing it as the starting point for a theory of "Hodge- Deligne coefficients", which unfortunately never saw the light of day. ... ) As I said, it was obvious to both him and me that this work had its "motivation" in the yoga of patterns I had arrived at over the preceding years - it was a first approach towards a tangible realization of this yoga. To emphasize such a link in his work, it seemed to me (and it must have seemed to me then too), would at once have given his work an even wider scope than it already had on its own merits. At the same time, it was yet another opportunity to draw the reader's attention to the reality of patterns, perceptible at every step behind that of Hodge's structures (63 ).<sup>1</sup>

It's only with hindsight that these omissions take on their full meaning, against the backdrop of six years of silence on weight yoga<sup>27</sup>, twelve years of silence (not to say, banning) on<sup>28</sup> patterns, the unusual re-entry of these in the LN 900 volume-burial, stagnation in Hodge- Deligne theory after a dazzling start... . But no one can do great things in a bogeyman's mood!

In any case, had I been more mature when I left IHES in 1970, it would have been clear to me from that moment on that there was a profound ambiguity with regard to me in the man who, over the past five years, had been my closest friend. Moreover, behind the amiable facade of good company within the same hushed institution, my departure was ultimately to my advantage.

everyone, for reasons that I think I can discern with hindsight, and which were not the same for everyone. Visi□blement this departure suited my young friend, recently settled in the place, and to whom he would have all it took was a show of solidarity with me (in the face of the hesitant indifference of the other three permanent colleagues) to turn around an indecisive situation. If I didn't understand what was going on at the time, it was because I really didn't want to understand things that were quite clear and even eloquent! It was as if, often in the course of my life, there was an anguish in me (never called by that name!) that signalled a "take-off" between a reality that was tangible and simple, and an image of reality that I didn't want to understand. p. 235

---

<sup>26</sup>(\*\*\*) (May 26) About this attitude of mine, see the note that follows this one, "Ascension" (n° 63').

(June 8) Drawing a parallel with his own style of appropriating other people's ideas, which I see here the first typical example, I realize that my friend's motivation was in no way to preserve an "autonomy" in relation to a prestigious "master", but rather to conceal the role of other people's ideas in the genesis of his own.

We're also looking forward to appropriating these ideas from others (at a later date). (On this subject, see the two notes "Le Prestidigitateur" and "Appropriation et mépris", n° 75" and 59'.) Regarding my share of responsibility for the unfettered development of this propensity in my friend, see the two notes "The Ascent" and "Ambiguity", as well as "The Being Apart" (n° 63',

63", 67'), in which the role of my complacency towards the brilliant young man Deligne becomes apparent.

<sup>27</sup>(\*) (April 19, 1985) For corrections to "six years" and "twelve years", see b. de p. note (\*\*\*) p. 302 (part dated April 18, 1985), for weights.

<sup>28</sup>(\*) (April 19, 1985) For corrections to "six years" and "twelve years", see sub-note "Pre-exhumation" (n° 168<sub>1</sub>), for reasons.

the image of my role in the institution I was leaving, and perhaps even more so, the image of my relationship with my friend. It was this refusal to acknowledge an irrefutable reality, and the anguish of this contradiction to which I was clinging, that made the episode of this "salutary uprooting" so painful at the time<sup>29</sup> (\*).

To tell the truth, since I'd never written anything about this relationship (apart from the beginnings of a few episodic letters to my friend, none of which got any response. . . ), I hadn't realized before that the first signs (discreet, of course, but which can't be mistaken) of ambivalence in my friend's relationship with me go back at least to 1968. ), I hadn't yet realized that the first signs (discreet, admittedly, but unmistakable) of ambivalence in my friend's relationship with me date back at least to 1968, two years before "Le grand tournant". It was a time when the relationship seemed perfect, a mathematically unclouded communion, in the context of a simple, affectionate friendship. It's all very well to mock the beautiful "tartines" about innocence, the creative child and so on!

Yet I know that this communion was a **reality**, by no means an illusion; just as this "delicate thing" was a reality - this creative force, of which the work that followed gives only a pale reflection. "Innocence" and "conflict" are two tangible realities, recognizable to the slightest awakened perception, by no means concepts; and they seem to me by nature foreign to each other, one excluding the other. Yet there's no doubt that these two realities coexisted in my friend's relationship with me, at different times of the year.

p. 236 different levels<sup>30</sup> (\*\*). It doesn't seem that at the time I'm talking about here, "conflict" interfered with mathematical creativity - at least not in the work done in solitude, or the work done in interviews face-to-face. It's also true that in the two articles I've just mentioned, which after all are among the most tangible fruits of this work, the imprint of "conflict" is already clearly visible. And with the benefit of fifteen years' hindsight and the reflection of days and weeks gone by, I can see that this imprint (however discreet it may be) strikingly prefigures the particular form that this gradual grip of conflict on the initial impetus was to take, stripping it over the years of its rarest essence - that which makes for great destinies(\*).

**Note** 63<sub>1</sub> (May 26) Compare also with the remark in footnote<sup>31</sup> (\*) at the end of note 60, noting the "blockage" of the natural development of Hodge-Deligne theory, as a result of attitudes of rejection towards certain key ideas introduced by me (here, the six operations - to which the motives are indissolubly linked), of the same nature as that examined here, apparent therefore from the publication of Hodge Theory I and II.

The same attitude, striving as far as possible (if not beyond!) to erase all traces of my influence, can be found in the work (already mentioned in note n° 47) written in collaboration with Mumford, on Mumford-Deligne compactifications of modular multiplicities. (This work also predates my departure.) The work uses a principle of passing topological results on

---

<sup>29</sup>(\*) See note no.° 42.

<sup>30</sup>(\*\*) On two or three other occasions, I have witnessed such coexistence in the same person at a given time, y including myself at times.

<sup>31</sup>(\*) Such lofty lyricism has made me lose touch with down-to-earth realities. If I describe this "imprint" as "discreet", it's because I'm wrapped up in a layer myself, and I find it hard to separate myself from the blinders I still hold dear! Having finally got rid of them, I realize that the "imprint" in question is a crude concealment, which I didn't want to see because of a certain complacency in myself, which I clearly realize in the note of June 1 "Ambiguity", n° 63". As for the "grip of conflict on the initial impetus" of my brilliant young friend, I speak of it almost as a regrettable fatality of which the poor man would be the unwitting victim, losing in the process, alas, the benefit of "great destiny". Yet he is responsible for his own destiny, just as I am for mine. If, even before my departure, he chose the role of his master's gravedigger (for a start), and if circumstances (including the spirit of the times) were conducive to this choice, granting him the role of Big Boss to whom all blows are permitted, he also chose to taste to the dregs the privileges that prestige and power can give, including that of crushing (discreetly) and despoiling. You can't have it all, and it's in the nature of things that by this choice (in which he's in good company) he loses the benefit of more delicate and less sought-after things. ... (Undated footnote, early June).

the body  $C$  (known by transcendental means) to results in  $\text{car. } p > 0$ , which I had introduced in the late fifties' <sup>□</sup> for fundamental group theory. By the early sixties, I had suggested <sup>p</sup> to use this method to prove the connectedness of modular varieties in any characteristic<sup>32</sup> (\*). However, this idea ran up against technical difficulties that had stopped Mumford, and which were elegantly overcome in their work by the introduction of modular **multiplicities**, and a "compactification" of these that has perfect properties. The very idea of modular multiplicities can be found, "between the lines" at least, in my "Teichmüller" talks at the Cartan seminar, given at a time when the language of sites and topos did not yet exist. The very language used by Deligne ("algebraic stack") where there was a whole language of sites, topos, multiplicities tailor-made to express this kind of situation, shows quite clearly (with hindsight and in the light of much larger later "operations") the intention to erase the provenance of some of the main ideas implemented in this brilliant work. It was surely this attitude (as I first sensed in the note "Refus d'un héritage - ou le prix d'une contradiction", n° 47) that had a "chainsaw effect", cutting short further reflection on modular multiplicities, which nonetheless appear to me to be among the most beautiful and fundamental of all "concrete" mathematical objects identified to date.

In passing, I'd like to point out that the arguments I introduced in the late 1950s make it possible (thanks to Mumford-Deligne compactification) not only to prove the connectedness of modular multiplicities in any characteristic, but also to determine their " $p$ -first fundamental group", as the " $p$ -first profinite compactification" of the ordinary Teichmüller group.

#### 14.2.5. The ascent

**Note** 63 (May 10) With the additional hindsight of less than three weeks, I now realize that this attitude, which was intended to be "understanding" in relation to this "quite natural" intention to distance oneself, was in reality a lack of clear-sightedness and complacency towards my brilliant young friend. If I had relied on my healthy faculties of perception, instead of letting myself be dazzled and given the lie to vague clichés posing as "understanding" or even "generosity" ("I'm not going to give him a hard time just because he doesn't put my name up. . . ."), I would have realized that my friend's attitude was one of "understanding" and "generosity". ), I would have realized then what I realize now, sixteen years later. I could call it a lack of probity.

vis-à-vis the reader, vis-à-vis myself and vis-à-vis himself. Seeing things simply and unafraid <sup>to □ call</sup> them by name, I would have been able to talk about them simply, as I am now, and my <sup>p</sup> friend had the opportunity to learn from them - or at least he would have understood that even with the means at his disposal, his elders (or at least one of them) expected him to show the same probity in his work as they did themselves. So I can see that on that occasion, before my departure from the mathematical scene, at a time when I was by no means "out of the game" and undoubtedly exercised a certain moral ascendancy over my young friend, I failed to live up to my responsibility towards him, through the **laxity** I displayed at the time<sup>33</sup> (\*). This was confirmed by the publication of "Hodge Theory II", Deligne's thesis work, in which he makes no reference to my motives or to me. It's true that, even then, the mathematics and the very person of my friend were very far away and appeared to me as if through a fog!

<sup>32</sup>(\*) (September 1984) verified, this circumstance is indeed mentioned in the introduction to the work cited (p. 75).

<sup>33</sup>(\*) (May 28) The word "complacency" here better expresses the nature of my attitude, than the somewhat elusive word "laxity". This complacency in my relationship with my young and ; brilliant friend became clearer to me in yesterday's reflection, see the note "L'être à part", n° 67'.

In the light of what I've seen of my friend's development, both spiritual and mathematical (and the two aspects are closely intertwined), I can see that when I first met him and was impressed by his intellectual means, his acuity of vision and his liveliness of understanding in mathematics, I could discern no lack of maturity in him ; nor (subsequently) the effects of his meteoric social rise, in the space of just four years, from unknown student to mathematical star and tenured professor, vested with considerable privilege and power, at an already prestigious institution. I have no regrets about facilitating his ascent and speeding it up - but I can see that it was due to a lack of discernment and maturity on my part. The "favor" I did him was not a favor. It won't have been a "service", at least until my friend himself has completed this harvest, which he prepared with my carefree assistance.

### 14.2.6. Ambiguity

**Note 63** (June 1) In the three weeks since this observation of "laxity" (or "complacency", to use the more appropriate expression that has appeared in the meantime) in my relationship with my friend Pierre, I have had the opportunity in my reflection to realize more clearly a certain lack of rigor, a complacency in myself. They manifested themselves in my relationship, first of all, with the one I more than

p. 239 but also to other mathematicians for whom I was the eldest. What I have detected□justifiably so far in this sense has been expressed by a certain ambiguity in me, and without

I'm sure I was also a pupil, in situations where my pupil took on ideas and methods he'd learned from me, or even a detailed master builder of a whole body of work he was doing, without clearly indicating its source or even alluding to it. Such situations were quite common in the sixties, after my departure and right up to the last few years. It seems to me that in all these situations, at some level I sensed the ambiguity, which was expressed by a shadow of unease, never examined until these very last days. The motivation that made me play along with a certain connivance, and that made me pass over this malaise without ever paying attention to it, was to **conform to** a certain image I had of myself, and of what so-called "generosity" should be. True generosity is not born of conformism, of a concern to be (and appear, to oneself and others) "generous". The repressed discomfort was always a clear sign that this "generosity" was fake, that it was an **attitude**, not the spontaneous, unreserved gift of true generosity.

In this malaise, I see two components of different origins. One comes from the "boss", the "me" who remains frustrated, because he hasn't been able to have it both ways: taking credit for a job he knows he's done (to a greater or lesser extent), and at the same time living up to a certain brand image, which includes (among many other things) the eponymous label of "generosity". The other component comes from "the child", of the one in me who is not fooled by attitudes and facades, and who has the simplicity to feel what this situation has of false<sup>34</sup> (\*). Not only false towards myself, but also□vis-à-vis the other.

p. 240

---

<sup>34</sup>(\*) (June 5) When I say here that the discomfort comes (in part) from "the child", it's a way of speaking that gives a false image of reality. It's not the candid perception of a false situation that creates discomfort. The discomfort is the sign of **resistance** against this perception, of a take-off between the reality actually perceived at a certain level (in this case, that of a false situation), and an **image** of reality to which I cling (in this case, that I'm being "generous" and that I couldn't do less!), to the benefit of which **I dismiss**, I repress the unwelcome perception. In this case, as soon as I abandon resistance and allow the perception to appear in the field of conscious gaze, the "discomfort" has ceased, along with the false situation. I was going to add "assuming it's a false situation involving my present, and not a situation in the past". But on reflection, I realize that these false situations "from the past", of which I have just spoken, have remained present as such until today, or at least until the reflection of three days ago,

In short, my "generosity" consisted in entering into a game where the other presents as his own ideas that come from others, and thus gives an image of himself and of a certain reality, which he and I both know is false. So we're in this together, in what we might call a "cheating" game, in which both he and I have had our share. It's a "cheat" at least according to the consensus that prevailed "in my day", and which, it seems to me, is still being paid lip service to today. Surely I would not have entered into such a game if it had been a question of someone else's ideas being used as if they had been found by my "protégé"<sup>35</sup> (\*). However, the fact that I tacitly agree to my own ideas being presented as someone else's does not, it seems to me, change the essential nature of the thing - the only difference is that in this case there are two of us cheating, instead of just one. And even apart from this aspect concerning myself (that I myself am taking part in cheating, in behavior that goes against the very consensus I claim to adhere to), it's quite clear that there's no generosity in encouraging others to cheat (even if it looks like we're doing it at our own expense - which is in no way the case), or at the very least to adopt an attitude of ambiguity towards a consensus to which they too pretend to adhere, while at the same time violating it. True generosity is by nature beneficial to all, starting with the person in whom it manifests itself and the person to whom it is addressed. My ambiguous attitude, arousing or encouraging ambiguity in others, and allowing myself to pose as "generous" when, logically, the other must appear to be a bit of a cheat (and in fact we both are) - this attitude is a benefit neither to me nor to the other.

All I had to do was examine the matter and the obvious would become apparent, without even having to refer to an experience, a "lesson from events". Yet it was events that brought me to this point. examination, finally making me discover something obvious that I was just as capable of discovering thirty□years ago,

p. 241

before another student appeared on the horizon to learn a trade with me, and to imbibe a certain spirit in the exercise of that trade. I've had occasion to talk about the "rigor" in the work itself, which I believe I demonstrated (see the section "Rigor and thoroughness", n° 26). But today I've also noticed, outside the "work" itself, an absence of rigor, expressed in the ambiguity and complacency I mentioned earlier. It seems to me that this ambiguity in me was not communicated to me by any of my elders, all of whom (I believe) were as demanding of me as they were of themselves. Beyond the ambiguity of the particular attitude, I detect an ambiguity in my own person, which I had occasion to mention more than once in the first part of *Récoltes et Semailles*. This ambiguity began to be resolved with the discovery of meditation in 1976, although some of the signs of this ambiguity, expressed in attitudes and behaviour that have become habitual (notably in my relationship with my students) must have persisted to the present day.

Clearly, this ambiguity within me has found fertile ground in some of my students. What was done by tacit agreement has even become, it seems, a fundamental note in the mores of the mathematical "big world" today, where fishing in troubled waters (with or without the agreement of the "interested party"), or even plundering (when the one who allows himself to do so is part of the intangible elite), seems to have become such a common practice that nobody seems to be surprised by it anymore, even though everyone is careful not to talk about it. The "boss" in me

---

by the very fact of never having been examined and thus resolved. I remained a prisoner to the point of mechanically reproducing the same situations as soon as the opportunity arose. The knowledge of my meditation "power" (which I mentioned in the section "Desire and meditation", n° 36) was of no use to me, as I was unable to pay day-to-day attention to the situations in which I found myself.

I'm involved, and in the incessant game of perception and "sorting" of perceptions, this game of the child and the boss silencing him. ...  
<sup>35</sup>(\*) This expression "my protégé", used by one of my former pupils to refer to one of my current pupils who had just done some great things in mathematics, made me cringe. And yet, the ambiguous situation I'm now examining, on balance, establishes a false relationship in which one of the two protagonists does indeed act as the other's "protégé".

would like to stand out, to denounce, to take offense - and yet in doing so, I'm only perpetuating the same ambiguity in myself that I can now see has proliferated.

## 14.2.7.

**Note 63**<sup>36</sup> (April 24)<sup>36</sup> (\*) Flipping through an offprint of Mebkhout that I had just received two days ago, I came across a reference to a work by J.L. Verdier entitled "Catégories Dérivées, Etat 0" published in SGA 4<sup>1</sup><sub>2</sub> (Lecture Notes n° 569, pp. 262-311). I apologize for not realizing this earlier. publication, having never before had the honor of holding this volume in my hands, of which neither p. 242 Verdier nor Deligne (who is the author)<sup>37</sup> have seen fit to send me a copy, on its publication or later. I don't know whether C. Chevalley and R. Godement, who with me formed the jury that awarded J.L. Verdier the title of "docteur es sciences" on the strength of a 17-page introduction (still unpublished), were themselves entitled, ten years later, to receive "L'état 0" (50 pages this time) of this "thesis" like no other! I seem to remember once holding in my hands a serious work of foundations of some hundred pages, which could reasonably pass for a good doctoral thesis, and which corresponded roughly to the work of foundations I had proposed to Verdier around 1960 - except that it had already become clear by then that the framework of "triangulated categories" developed by him (to express the internal structure of derived categories) was insufficient.

Needless to say, my name is nowhere to be found in this "State 0" of a thesis. Indeed, one wonders what it would have to do with it. It's well known that the derived categories were introduced by Verdier, to enable him to develop the so-called "Poincaré-Verdier" duality of topological spaces, and the so-called "Serre-Verdier" duality of analytic spaces, while waiting for a vague unknown in the service<sup>37</sup> (\*) to develop a synthesis of the two on his behalf, appropriately called (the Elève Inconnu could do no less!) the "Poincaré-Serre-Verdier duality". After all that, all I had to do was follow suit and make the necessary adaptations to develop the Poincaré-Verdier duality and the Serre-Verdier duality within the very specific framework, my faith, of the coherent cohomology of schemes... .

I've only just become aware (libraries are useful!) of SGA 4<sup>138</sup> (\*\*), in which I've again been honored to be listed as Deligne's co-author, or rather "collaborator" (sic) (without seeing fit to inform me, let alone consult me). This was obviously a precursor to the memorable "volume enterrement" published five years later, which I had the pleasure of reading a few days ago (see notes n° 50, 51 and following, inspired by the event). But I didn't get to hold the pre-burial volume in my hands, with this piece of evidence of a phantom thesis that doesn't say its name

name, to understand as early as last year that the next state of this "thesis" would never be written by anyone but myself. And so I set to work on La **Poursuite des** ☐ **Champs**, where p. 243 seventeen years ago.

<sup>36</sup>(\*) This note comes from a footnote to "L'instinct et la mode - ou la loi du plus fort" (n° 48) - in which I stated that Verdier's work on derived categories had never been published, without realizing that a "Etat 0" of his thesis had appeared in 1977. For an overview of Verdier's strange twists and turns in relation to the theory that was supposed to constitute his thesis work, see the note "Thèse à crédit et assurance tous risques", n° 81.

<sup>37</sup>(\*) See the note "L'inconnu de service et le théorème du bon Dieu" for some information on this dubious character. (note n° 48').

<sup>38</sup>(\*\*) see note on this volume, "La table rase", n° 67.

## 14.2.8. The investiture

**Note** 64 (April 25) Yesterday, however, I found a copy in my office at the University. In fact, it's two consecutive reports, written a year apart in April (?) 1968 and April 1969. In seventeen pages, I review fifteen pieces of work carried out over three years of scientific activity at IHES. These included work on Ramanuyam's conjecture, the compactification of modular sites, and the extension of Hodge's theory. The body of work reviewed in this report (if only the works I have just named) bears witness to a prodigious creativity, unfolding with perfect ease, as if at play. Leaving aside the demonstration of Weil's conjectures, still in the wake of this first plunge into the unknown, it seems to me that the subsequent work gives only a pale image of this unique flight of a young mind with exceptional means, and also benefiting from exceptional conditions for its blossoming. Yet something about these "exceptional conditions" must have nourished this other force, foreign to the drive for knowledge, which ended up taking over and supplanting it, diverting and absorbing the initial impulse. And obviously, this "something" was also linked to me... .<sup>39</sup>(\*)

This short report with commentary (which I intend to include as an appendix to the present volume) seems to me to be interesting in more ways than one, including from a mathematical point of view (although some of the work reviewed remains unpublished to this day). In several places in the report, I anticipate that such work, which Deligne had confined himself to outlining and dealing with the crucial points, will be developed further by future students. These students never appeared, given the changes that subsequently took place in its relationship to the common man<sup>40</sup> (\*\*). Of the ideas I review, the only one to my □connaissance that was developed by someone else (who would thus appear to be a pupil of Deligne) was the theory of cohomological descent, developed by Saint Donat in SGA 4 (so still in the period of the initial impetus), a theory that has since become one of the most commonly used tools in the cohomological arsenal.

p. 244

Amusingly and characteristically, for three of the four works that have since been the subject of articles by Deligne<sup>41</sup> (\*), I take touching care to make clear, in passing, the relationship of these works to ideas I had introduced and questions I had raised - as if to pre-empt, one would say, the silence the author was going to make about them in his articles (none of which had appeared, or even, I believe, been written, at the time I reported).

## 14.2.9. The node

**Note** 65 (April 26) It's clear, too, that keeping a large-scale "yoga" (that of weights, and beyond that, that of motives), about which I had spoken here and there to others than him, but which he was the only one to know about, is not a good idea.

---

<sup>39</sup>(\*) (May 26) On the subject of a certain complacency within me that gave rise to this "something", see the note (two weeks later than the present one) "L'ascension" (n° 63').

<sup>40</sup>(\*\*) In the days when I worked with him regularly at IHES (in my seminar in particular), Deligne's relations with the other The kindness of the mathematicians, especially the young researchers (often beginners) who came to the seminar, was unmistakable. I noticed the same openness to other people's thoughts, even if they were awkward or confused, as in our mathematical tête-à-tête. He had that ability to follow the thoughts of others in their images and language, which I've always lacked, and which (it seems to me) predisposed him much more than me to the role of "master", able to stimulate the blossoming of a vocation, a creativity in others.

<sup>41</sup>(\*) The only one of the four works in question not directly influenced by me is the one on Ramanuyam's conjecture, deducing it from Weil's conjectures. It takes place in a research direction (that of modular forms) that constituted one of the most serious "holes" in my mathematical culture. The other three works are those on the degeneracy of the cence of Leray's spectral suite, on Hodge-Deligne theory, and on modular multiplicities (in collaboration with Mumford), discussed in the note "Eviction" (n° 63) and in sub-note n° 63<sub>1</sub>.

p. 245

to have assimilated it intimately and to grasp its full scope, conferred on him an additional "superiority", as the exclusive possessor of an incomparable instrument of discovery for an understanding of the cohomology of algebraic varieties. However, I don't think that this temptation played a decisive role, at a time when I was still very much present and active in the mathematical world, and when there was nothing to foreshadow my departure sine die. She must have appeared with or after my departure, which was an unhopd-for "opportunity" to seize an inheritance (which was rightfully hers!), hiding both the inheritance and its provenance. It is here that I see once again, in an extreme and particularly striking case, the crux of a profound contradiction, which goes far beyond any specific case. I want to bet on the ignorance, the disdain, the deep-seated doubt that surrounds the creative force that lies within our own person - that heritage. unique and of greater value than anything a person could ever pass on. It is this ignorance, this insidious alienation □ from what is most precious, most rare within us, that makes it possible for us to envy the strength perceived in others, and covet for ourselves the fruits and outward signs of this strength in others that we have forgotten in ourselves. As soon as this envy, this desire to **supplant**, takes root and finds an opportunity to proliferate, as soon as it channels the energy available for creative fulfillment, this alienation within us deepens, settles in permanently. The closer we come to the coveted "goal" of supplanting, crowding out, dazzling, the more we distance ourselves from and cut ourselves off from this delicate force within us, and clip the wings of our own creative impulse. In our tenacious effort to rise, we have long forgotten that we are meant to fly.

In his relationship with me, from the day we met, I felt my friend was perfectly at ease, without any sign that he was in the least impressed or dazzled by my reputation or person, or that there was any unspoken doubt in him, whether about his gifts or faculties in the mathematical field, or about anything else. It's also true, it seems to me, that he had received a friendly and affectionate welcome from me and my environment, including my family, which was likely to put him at ease. But the simple, seemingly unproblematic naturalness that drew me to him as it drew others to me, had surely not waited for this encounter to appear and blossom. The impression he gave off, which made him so endearing, was one of harmonious balance, where his penchant for mathematics was in no way a devouring goddess. Next to him, I was a bit of an unrepentant "polard", not to say a "thick brute" - and I remember his discreet astonishment at my lack of deep contact with nature around me and the rhythm of the seasons, which I passed through without seeing anything, as much as saying... .

p. 246

Yet this profound "doubt", which I would have been incapable of perceiving then (or perhaps even today, in similar circumstances), must have been present in my friend long before we met. Looking back, I can see the first unambiguous sign of this as early as 1968, and even clearer signs in the years that followed<sup>42</sup> (\*). These are "indirect" signs, however - none of the ones I've been able to First-hand observation doesn't come in the form of doubt, a lack of assurance - rather, and increasingly over the years by what may seem the opposite: a smugness, a □ propos deliberate disdain, even contempt. But such an "opposite" reveals its opposite, with which it forms a pair and of which it is the shadow.

I also heard through an intermediary that, for a prestigious (and notoriously awkward) mathematician whom he had never had the opportunity to meet on a personal level, he would have been in great tension at the prospect of a meeting, in a sort of irrational fear of not being considered by the great man as worthy of his own greatness. This testimony was so contrary to what I myself had seen in my young friend, that I found it hard to believe (this was in 1973). In retrospect, it

<sup>42</sup>(\*) (May 10) In fact, another "very clear" sign dates back to 1966, see footnote (\*) to note no. ° 82 (p. 329).

However, the signs of division that I'm aware of elsewhere all point in the same direction.

This division, and the role I played as a sort of fixer of a conflict that was undoubtedly diffuse before our meeting, would probably have remained hidden in the usual circumstances of the evolution of a relationship with someone who was (in one sense or another) a "master", or at least someone who transmits or confides. In this way, my departure will have **revealed** a conflict unknown to all, and which perhaps only I know about.

And my "return" today is a second, more untimely revelation. I can't imagine what it will reveal to me, beyond what it has already taught me about my own past and present, and about the people I have loved and to whom I am still linked today. Nor what it will reveal to the person who, for the past week, has been at the center of this final stage of my reflection, which I called last month (and I didn't think I was saying it so well. . . ) **"the weight of a past"**.

## 14.2.10. Two revolving

**Note 66** (April 25) This deliberate disdain and antagonism in my friend Pierre's relationship with me has been confined exclusively to the mathematical and professional level. The personal relationship has remained to this day one of affection and friendly respect, manifested more than once by delicate attentions that have touched me, surely signs of genuine feelings without ulterior motive.

In the intense years that followed my departure from the IHES, this episode faded into oblivion, as did the long misunderstood teaching it had given me. So, for more than ten years, my friend remained for me (as a matter of course) my privileged interlocutor in mathematics.

tics; or to be more precise, between 1970 and 1981 he was the only interlocutor (apart from one episode) with whom I consider addressing me during periods of my sporadic mathematical activity, when the need for a p. 247 the interlocutor was felt.

It was also to him, as the mathematician closest to me, that I turned just as spontaneously on the first occasions (between 1975 and 1978) when I had to ask for assistance, surety or support for students working with me. The first of these occasions was the defense of Mrs. Sinh's thesis in 1975, which she had prepared in Vietnam under exceptionally difficult conditions. He was the first person I contacted to sit on the thesis jury. He declined, suggesting that it could only be a bogus thesis, and that he had no intention of endorsing it. (I did, however, have the skill to circumvent the good faith of Cartan, Schwartz, Deny and Zisman to lend me a hand in this deception - and the defense took place in an atmosphere of interest and warm sympathy). It took three or four similar experiences over the next three years before I finally understood that my prestigious and influential friend was deliberately antagonistic towards my "post-1970" students, as well as towards work that bore only the stamp of my influence (at least that undertaken "after 1970"). I don't know whether the attitudes of overt contempt that I witnessed on several of these occasions are also to be found to a greater or lesser extent in his relationship with other mathematicians whom he considers to be far below him. The very spirit of a certain elitism he prides himself on professing would lead me to suppose so. The fact remains that since 1978 I have refrained from addressing him on any matter whatsoever. This has not prevented his power to discourage from manifesting itself effectively.

It was also around the same year that the first signs, discreet at first, of an attitude of disdain towards my own mathematical activity appeared. The first occasion had been my reflection on cellular maps, after a discovery about them that had flabbergasted me (see *Esquisse d'un Programme*,

par. 3: "Bodies of numbers associated with a child's drawing"). This discovery (admittedly "trivial", and which had nothing to move or even interest my prestigious friend) was the starting point and first material for that other mathematical **dream**, of comparable dimensions to that of the motifs, which began to take shape only three years later (January-June 1981), with "La Longue Marche à travers la théorie de Galois". These notes and others from the same period (some two thousand handwritten pages) constitute a very early version of his work.

p. 248

tour through this "new continent" that a trivial remark on a child's drawing had given me a glimpse of.

□ In the course of this intense work, I wrote two or three times to my friend, to tell him about some of my ideas, and occasionally ask him questions of a technical nature. When it pleased him to speak to my questions, his comments were always as clear and as pertinent, and bore witness to the same "means" that had impressed me even at his young age. But a smugness had dulled the eagerness to understand that had enchanted me then, and the ability to apprehend great things through "small" things, as well as to apprehend or conceive great designs, by listening to each other. This ability is not a matter of intellect, of simple "efficiency", or of "mastery" of an already established discipline or known techniques. It's a reflection, at the level of the intellect, of something of an entirely different essence - of the child's **gift of wonder**. This gift in him seemed extinguished, as if it had never been. It was so at least in his relationship with me, after it had been so first in his relationship with my "later" students. He had become an important man, and his approach to mathematics had become neither more nor less than that "sporting" attitude which I first examined only a month or two ago, and to which I myself was by no means a stranger. ...

Perhaps I would have been able to come to terms with the obvious absence of this communion in a shared passion, this deep bond that had once bound us together. I would no doubt have been content to submit (when the opportunity arose) more or less technical questions or simple requests for information to my friend's astuteness and vast knowledge of the world of mathematical things. But in that year (1981) the signs of this disdainful affection suddenly became so brutal<sup>43</sup> (\*), that I lost all interest in communicating with him again on mathematical matters, even occasionally. (⇒ 67 )

### 14.2.11. The table shaved

**Note 67** (April 26) It was while I was writing the preceding lines yesterday that I made the connection between this new turning point in our relations and the publication in 1982 (practically at the same time as this dramatic turnaround) of the "remarkable volume" of Lecture Notes, which consecrated my mathematical funeral without flowers or wreaths! At a time when I had been declared mathematically "dead", it was a kind of grace for my friend to continue answering mathematical questions here and there, which, in the end, were still valid, were no longer relevant...

p. 249

□ Essaying to tune into the meaning of events, I get the feeling that this isn't a ha- either. sard si la première apparition d'un dédain, d'un désintérêt mathématique (vis à vis de choses, de plus, dont son "sain instinct" mathématique devait lui dire qu'elles étaient brûnantes et ju juuuses), dans sa relation à ma propre personne tout au moins, se place à peu près le moment de la parution du volume de pré-enterrement  $SGA_2 4^1$ , cinq ans avant<sup>44</sup> (\*). The circumstances surrounding the publication of this volume already bear witness

<sup>43</sup>(\*) (May 28) For new insights into this second turning point, see also the note "La Perversité", n° 76.

<sup>44</sup>(\*) On this subject, see the note "Le compère" (n° 63" ) of the day before this one.

(June 5) The reflections of this note are taken up in this note and the three that follow ("La table rase", "L'être à part", "Le feu vert", "Le renversement"), which hint at the meaning of "operation  $SGA_2 4^1$ " and its link to the "dismantling" of the mother seminary SGA 5. This reflection is taken up again in the "My students" procession, and in particular in the continuation "My students (1)-(7)", where little by little the picture emerges of a veritable massacre of the seminary where my cohomology

The fact that I was introduced as Deligne's "collaborator", without consulting me or even informing me, and without sending me a copy, is in itself more eloquent. The mere fact of introducing me as Deligne's "collaborator", without deigning to consult me or even inform me, and without even sending me a copy, seems to me in itself more eloquent than a speech. Not to mention the fact that Deligne's book was essentially intended to make more accessible to a wider public the work I had developed over fifteen years earlier, at a time when I had not yet heard the name of my brilliant friend! This disdain, and later arrogance, must have been fuelled, on the one hand, by my absenteeism, which meant that I wasn't aware of anything and was, in fact, "cashing in" without knowing it; but also by a certain climate, which meant that this kind of misunderstanding could "pass", without apparently eliciting the slightest comment. The fact remains that I have not received a single echo from anyone (particularly among the many friends I had thought I still had in the world of mathematicians) about this volume, nor about the burial volume it has prepared.

□ In the introduction, the author doesn't beat about the bush to set the scene. The aim of the volume is to spare the non-expert "recourse to the lengthy presentations of SGA 4 and SGA 5", "to prune out unnecessary details", "to enable the user to forget SGA 5, which can be considered as a series of digressions, some of them very interesting" (how nice of these "digressions"! ). The existence of SGA 4<sup>1</sup> "will soon make it possible to publish SGA 5 as it stands" - a mysterious assertion, since one wonders how this publication (of something one is advised to forget), which had already dragged on for a dozen years, and which presented a perfectly coherent set of results (and which had not waited for Deligne to be identified and proven) could be subordinated to the existence of SGA 4<sup>1</sup> (\*).

p. 250

In asking this question, I also see a simple answer, and a possible explanation for the vicissitudes of this poor seminar SGA 5 (68), (which I had developed at length in 1965/66, eleven years before the publication of Deligne's volume SGA 4<sup>1</sup><sub>2</sub><sup>45</sup> (\*). The first hint of this can already be seen when it is stated (page 2) that in the original version of SGA 5 "the Lefschetz-Verdier formula was established only conjecturally" (which is harsh for Verdier, who is supposed to have been able to prove his theorem, which predates SGA 5<sup>46</sup> (\*\*)) and that "moreover, the local terms were not calculated". This may seem an unfortunate omission for the non-expert reader (for whom this volume is primarily intended). Readers with a bit of experience know that the said local terms are still not "calculated" today, and that the brilliant and peremptory author himself would be at a loss if asked what he meant in this case (in the general case) by "calculating"<sup>47</sup> (\*\*\*) (but apparently nobody thought of asking him this indiscreet question).

An ambiguous sentence "this seminar (?) contains another demonstration, it completes, in the case particular Frobenius morphism", seems to suggest that SGA 5 does not give (as one might have expected, for

p. 251

---

In all this, there's a casual contempt, of which the "discreet disdain" (which I saw appear around the same time), in my friend's relationship with me, was only a very pale reflection.

Another association came to me a week or two ago, for the moment of that "first turning point" in my friend's relationship with me, at the end of 1977 or during 1978. It was in 1978 that my friend got his well-deserved "medal" (for proving Weil's conjecture). The way in which this new title (linked to the demonstration of a conjecture "of proverbial difficulty") was internalized by my friend, is strikingly apparent in the Funeral Eulogy (concerning my late self) and its counter- Eulogy (concerning my late self).

part (concerning his own), published admittedly only five years later on a "grand occasion". See note "L'Eloge Funèbre (1) - ou les compliments", n° 104.

<sup>45</sup>(\*) See a footnote (April 28) to the note "Le feu vert" (n° 68) for an elucidation of this "mystery".

<sup>46</sup>(\*\*) (June 10) For further details, see sub-note n° (87) to "The massacre" note n° 87.

<sup>47</sup>(\*\*\*) (June 10) In the general Lefschetz-Verdier formula, for a cohomological correspondence between a bundle of coefficients and itself, the "local terms" (corresponding to the related components of the set of fixed points) are unambiguously defined by the very fact of writing the formula. The question of "calculating" these local terms only takes on a precise meaning in special cases, one of the simplest of which is that of the Frobenius morphism, where they are given simply by the ordinary traces of the endomorphisms induced on the fibres at these points. This formula was fully demonstrated in the oral seminar as a special case of a much more general one.

a volume of digressions!), at the end of the ends, a complete demonstration of the main "result" it announces, a trace formula implying the rationality of  $L$  functions à la Weil; fortunately, "this seminar" comes to save, better late than never, a very compromised situation. ...

On page 4, we learn that the aim of the "Arcata" lectures was "to give demonstrations of the fundamental theorems in stale cohomology, rid of the gangue of nonsense"<sup>48</sup> (\*) that surrounds them in SGA 4". He has the charity not to dwell on this regrettable nonsense that is rife in SGA 4 (such as topos and other similar horrors - the reader can flatter himself that he has escaped it by the providential appearance of this brilliant volume, finally making a clean sweep of the regrettable "gangue" that had preceded it. ... ) (67) (67<sub>1</sub>).

As I've just gone through the introduction to the volume and the introductions to its various chapters, I've re-produced the assessments and declarations of intent that seem to me to most clearly announce the color, among two or three others (style: digressions, admittedly, but "very interesting") that seem to me intended above all to "pass the pill" (which has indeed passed without a problem). For example, the author is honest enough to state at the outset that "for complete results and detailed demonstrations, SGA 4 remains indispensable". This volume, however ambiguous in spirit and motivation, is not a scam<sup>49</sup> (\*\*). Its role seems to me to be more that of a sounding board, obviously conclusive: there was really no need to bother!

p. 252 □ There's a kind of **escalation in absurdity** (seemingly unnoticed by all!) from one volume to the next. prepares (APG 4<sub>2</sub><sup>1</sup>, and LN 900). In both cases, we see a man of impressive means, made for discovering and exploring and probing vast worlds, set about "redoing" the work of a predecessor, first myself, then a former pupil of mine (Saavedra), when in so doing he had nothing essential to contribute to the work of these predecessors, which had been done with care and by getting to the bottom of things. (What he contributed in total could be set out in some twenty or thirty pages, it seems to me.). In the first case, the reason given was plausible: to give the non-expert user tear-free access to<sup>50</sup> (\*), without having to rely on the voluminous SGA 4 and SGA 5 seminars. (It's the first time, however, that we've seen the author show such concern for the common man, taking precedence here over the pleasure of doing math. ... ) The second time, the work consisted almost entirely of **copying** the thesis Saavedra had done with me! This thesis was a perfect reference, and the fact that the demonstration of one statement in it was false, and that another statement contained an unnecessary hypothesis, was surely no reason to rewrite the whole article. Of course, no "reason" was given for such a strange thing.

<sup>48</sup>(\*) In my day, the term "general non-sense" did not have a pejorative connotation, but rather a slightly jokey, good-natured one. It's no coincidence that the adjective "general" has been "forgotten" here, to mean "non-sensé", which in good French means neither more nor less than non-sens, and suggests the idea of bombast, of "bullshit".

<sup>49</sup>(\*\*) (May 26) See, however, the following day's note, "Le renversement" (n° 68'), where I go back over this impression, which turns out to have been hasty= In further reflection, a large-scale "SGA 4<sup>1</sup> - SGA 5" operation was gradually revealed, for the "benefi ce" mainly of Deligne, with the help or tacit agreement of all my "cohomologist" students, "The honesty" that I believe I can observe (on the strength of the statement, in line 7 of the introduction, which has just been quoted), plays here the role of

the "punch line" designed to give the impression of a "thumb". My friend used this style as early as 1968 (see "Poids en conserve et douze ans de secret", and "L'éviction", notes n° 49 and 63). See also the notes "Pouce!" and "La robe de l'Empereur de Chine", n° 77 and 77'.

<sup>50</sup>(\*) (June 10) When I wrote this note, I had only just "landed" and hadn't yet grasped the true meaning of "operation APG 4<sup>1</sup>" (and its link with the vicissitudes of SGA 5, of which I had only just had a sudden foreknowledge). I've since realized that the motley collection of texts published under the misleading name of SGA 4<sup>1</sup> (see the note "Le renversement", n° 68') is in no way intended as a popularization ("without tears") of the SGA 4 and SGA 5 seminar (which forms the core of my "SGA"). published mathematical work), but that it represents a manoeuvre to replace it (acting as a precursor that's a bit muddy around the edges), and to appear as the true masterwork on stale cohomology, which would be due to Deligne. For a striking formulation (by an anonymous writer) of such an imposture, six years after the "coup de sonde" named SGA 4<sup>1</sup>, see "L'Eloge Funèbre (1) - ou les compliments" (note n° 104).

Yet I didn't have to hold SGA 4<sup>1</sup> in my hands to feel the meaning of this seemingly absurd thing: Deligne "redoing" Saavedra's thesis, ten years later! It's surely the same as the meaning of that scarcely less absurd thing that had prepared it: Deligne doing (twelve years later) a "digest" (a little condescending around the edges), of a certain part of Grothendieck's published work. This is precisely the part of Grothendieck's work he can't pretend to do without, if he continues to be interested in the cohomology of algebraic varieties (from which he can't seem to detach himself). And Saavedra's thesis is the work of all, published and bearing the mark of my influence, which he can in no way do without, if he wants to take up "on his own account" the notion of motivic Galois group that I had developed, and finally exploit (fifteen years later!) this obviously crucial notion. First with SGA 4<sup>1</sup>, and five years later with the landmark Milne-Deligne (alias Saavedra) article in LN 900, my friend indulged in an illusory sense of liberation from something he surely felt a painful obligation to do: to have to constantly refer to the very person he was trying to supplant and deny, or even to such and such another who referred to him.

To arrive at this intimate conviction about the common meaning of these two "absurd" acts, I didn't need to go through all my prolific friend's (fifty-one) publications, a list of which I received (for the first time) about ten days ago. To tell the truth, I haven't even thought of going back through the four offprints in my possession<sup>51</sup> (\*), to seek confirmation of what I think I know. If, in the future, I consult any of my friend's works, it will be to find something other than what I already know. I'm sure I'll then have the pleasure of learning beautiful mathematical things, which I used to have the even greater pleasure of learning in person from him!

**Note** 67<sub>1</sub> (1) (June 14) I found two other micro-crooks (of detail) in SGA 4<sup>1</sup>. One is in the "Breadcrumb trail for SGA 4, SGA 4<sup>1</sup>, SGA 5" (admire the suggestive sequence!), where the author writes (p. 2) that to establish in étale cohomology a "duality formalism analogous to that of coherent duality. ... Grothendieck used the resolution of singularities and the purity conjecture", giving the impression that this formalism was ultimately established only by him, Deligne, in the case (sufficient for many applications) of finite-type schemes on a regular scheme of dimension 0 or 1 (see same paragraph). He knows full well that the formalism of the six variances (i.e. the theory of global duality) was established by me without any "conjecture", and that his restriction is only founded for the biduality (or "local duality") theorem - which, by the way, becomes in SGA 5 (under Illusie's pen) "Deligne's theorem"!

In addition, on page 100 there is a section entitled "The Nielsen-Wecken method", which is the method of which I introduced into algebraic geometry to prove a Nielsen-Wecken-type formula, proven by these authors (in the transcendental context) by a technique of triangulations unusable in the context algebraic. Deligne learned about this method (as well as the names of Messrs Nielsen and Wecken, whose fine German article he didn't need to read!) from me, in the SGA 5 seminar of "technical digressions", which SGA 4<sup>1</sup> is designed to make us forget! In this section, neither SGA 5 nor I are alluded to, and the reader has the choice, for the authorship of this method, between Nielsen-Wecken (if he's very misinformed) and the brilliant, modest author of the volume.

Interestingly, in this entire volume, Verdier's "Woodshoie" proof for a trace formula including the case I needed (for Frobenius morphisms) is not mentioned. This demonstration (apparently forgotten, in favor of the more general method developed in SGA 5) was the missing link to fully justify my cohomological interpretation of the functions

<sup>51</sup>(\*) Not counting the works in the IHES Mathematical Publications, which director Nico Kuiper has been kind enough to send me for nearly fifteen years.

L. Clearly, there was an agreement (tacit, no doubt) between Deligne and Verdier - Verdier giving Deligne credit for the trace formula for Weil's conjectures, in return for the part of SGA 5 he had taken over on his own account the previous year (1976). (See note "Les bonnes références" n° 82.) Other compensation: the appearance in SGA 4<sup>1</sup> of the "Etat 0" of derived and triangulated categories, from which my name is equally absent. Four years later, under Deligne's pen, the duality of algebraic geometry took on the name of "Verdier's duality" - Verdier had not done a bad job! (See the end of note n° 75 "L' Iniquité - ou Le sens d'un retour").

### 14.2.12. The being at part

**Note 67'** (May 27)<sup>52</sup> (\*) The passages quoted, like all the circumstances surrounding the publication of this remarkable volume, SGA 4<sup>1</sup>, testify to my friend's deliberate intention to divert and scorn the central part of my work, represented by the two interrelated seminars SGA 4 and SGA 5. Not the least of these "circumstances", which came to light in the course of reflection from April 24 (see the note "Le compère", n° 63) to May 18 (see the notes "La dépouille. . .", ". . . et le corps", n° 88, 89), was the ransacking of the original SGA 5 seminar, which took the form of the 1977 edition-massacre (see in particular the note "Le massacre", n° 87).

p. 255 This deliberate attempt at derision on my friend's part takes on its full meaning if we remember that the SGA 5 oral seminar represented the young  $\square$ homme Deligne's first contact with schemas, cohomological techniques

and in particular the duality formalism, and with  $\chi$ -adic cohomology, when he arrived at the IHES in 1965 at the age of 21, with the specific aim of learning "algebraic geometry" with me. It was in this oral seminar, and in the notes of the SGA 4 seminar that had taken place two years before, that he had the privilege of learning first-hand the ideas and techniques that have dominated his work to this day<sup>53</sup> (\*).

This essential aspect of the context of the "SGA 4<sup>1</sup> - SGA 5 operation", and beyond it, of the relationship between the company and its customers.

even from my friend Pierre to myself, was clearly not present when I wrote the previous note ("La table rase (1)", n° 67), nor in the part of the reflection on the Burial that precedes it. The memory of this "young man Deligne", arriving at the SGA 5 seminar where he still had everything to learn and where he did indeed (and very quickly) learn a lot, only came back in the last stages of the reflection, as if against my will. My deliberate intention, from the very year of young Deligne's appearance in my mathematical "microcosm", not to count him among my students (as if by doing so I would have failed in my obligation of modesty towards such a brilliantly gifted person), made me downplay, or to put it more accurately, totally ignore until these very last weeks, a reality that is nonetheless obvious and tangible, and which is commonly expressed by the double appellation (which I objected to) of "teacher-student"<sup>54</sup> (\*\*). I was happy to forget, to ignore, that there had indeed been a "transmission" of something from me to him, something that for me as for him had great **value**, in a sense that was surely quite different for him and for me. What I was passing on, in those four years of close mathematical contact between him and me, was something in which I had put the best of myself, something nourished by my own experience.

<sup>52</sup>(\*) This note is a footnote to the previous note "La table rase", of which it is a complement, written one month later to the day.

<sup>53</sup>(\*) A similar comment can be made for each of my other cohomologist students Verdier, Illusie, Berthelot, Jouanolou - see the note "Solidarity", and the four notes that follow it (notes n° 85 to 89).

<sup>54</sup>(\*\*) (June 14) This deliberateness is quite apparent in the way I finally resolve to talk about him (as if in so doing I was violating an obligation of reserve or modesty towards someone who liked to distance himself from me... ) four months ago, in the note "Jesus and the twelve apostles" n° 19.

of my strength and my love - something that (I think) I gave without reserve and without really measuring or even, perhaps, feeling the price.

Surely, what I was giving was fodder for a passion to know in him ☐ in tune with the one that ani- me. mait - and to **something else** too, which I didn't feel until much later, and without yet linking it to this "transmission" that had taken place and which I was happy to ignore. To put it another way, what I gave was **also** received, at another level that remained hidden from me, not as tools to fathom a fascinating and inexhaustible Unknown, but as **instruments** to supplant (at first), and later to establish a domination, a ruthless "superiority" over others.

p. 256

Without even taking into account what came back to the "child" in my friend, eager to discover, and what came back to the "boss" in him, eager to supplant, dominate (or even crush), but from the more superficial point of view of the part certain ideas play in a work, techniques, tools - it's been an unexpected discovery over the past six weeks to what extent my friend's work, which took off the year we met, has been nourished to this day by what I'd passed on to him. I had imagined, when I left the mathematical scene fifteen years ago, that "the little" I had given my friend-non-student (a "little" whose role in his impressive initial impetus I could see clearly) would be a springboard for a flight that would take him far beyond his starting point, **away from** my work and my person. What happened, however, was that my friend remained attached to this point of departure to this day, **attached** to the very work that was simultaneously to be disowned, derided or forgotten, and "used". It's a typical case of a conflicted link to one's father or mother, which indefinitely holds one in the orbit of those he or she is destined to leave and surpass, the one who takes pleasure in cultivating this conflict within him or herself, instead of launching out to meet the world. ...

I can see today that by my deliberate intention to treat my young friend as a "being apart", and not simply as one of my students who seemed to have more means than the others - and by my deliberate intention to minimize or forget in my relationship with him the price of what I was transmitting (and the **power** that I was thereby placing in his young hands . ) - through these attitudes within myself, I was unwittingly feeding a fatuity and a conflict within him, both of which remained hidden from me. At the same time, I was entering into a certain game - or rather, there was a game between the two of us in perfect harmony, and I'd be hard pressed to say who "started it" (assuming the question makes any sense): myself out of "modesty", claiming that my young friend was far too bright to be anyone's pupil, and that the little I'd been able to bring him wasn't really worth the trouble.

to talk about it - and himself distancing himself (even before I left) from my person and my work, disowning (under my <sup>com</sup>☐plaisant eye) the soil that had well and truly nurtured it.

p. 257

It's only by writing this note that I'm finally seeing clearly this game, of which a diffuse perception had only been present for a week or two. And I also see that this "modesty" or "humility" in me was a false modesty, a false humility: a lack of simplicity, to see things simply for what they are. In this game, there was complacency towards my young friend - seed that proliferated a hundredfold! - and, more subtly, an indulgence in myself, by making a kind of pedestal of a "privileged relationship", extraordinary and all<sup>55</sup> (\*). (Just as any lack of simplicity, perhaps, is basically a self-indulgence... .)

<sup>55</sup>(\*) Compare with the note of May 10 "L'ascension" (n° 63') where for the first time I perceive this ingredient of complacency in what was my relationship with my friend Pierre. This perception had remained isolated and fragmentary until now, when it has been which is the subject of this note "L'être à part".

## 14.2.13. The green light

**Note** 68 (April 27) To tell the truth, I've never given much thought to the meaning behind the strange vicissitudes of the SGA 5 seminar. The oral proceedings in 1965/66 had not given rise to any particular difficulties, whereas the drafting by successive and often failing volunteers dragged on for **eleven years**<sup>56</sup> (\*\*)! It was in 1976 that Illusie finally took matters into its own hands, writing up what was left over and publishing the whole thing. Today is the first time (after almost twenty years since that seminar) that I realize "there's something to understand". Maybe I'm the only one...

p. 258 The first idea that comes to mind is that among the seminar's more or less active listeners, who were also more or less familiar with the previous seminars SGA 1 to SGA 4, there must have been a phenomenon of **satur- ration in** relation to the tide of "grothendieckeries", breaking over them like a sort of tidal wave without reply<sup>57</sup> (\*\*\*). Clearly, some of the editors lacked faith, and must not have sensed this very well. where it was all going, and why on earth I'd been so stubborn, for a whole year, to want to turn it around and around until I'd completely mastered the <sup>es- sential</sup> formal properties of the cohomology, and the whole arsenal of new notions associated with it. The fact that no trace remains of either the seminar's final lecture, setting out open problems and conjectures (never published to my knowledge), or the introductory lecture reviewing Euler-Poincaré and Lefschetz-type formulas in various contexts, is a particularly eloquent sign of a general disaffection. I don't recall perceiving this disaffection at the time (or even afterwards, until today<sup>58</sup> (\*)), as I was so engrossed in my tasks at the time.

The fate of SGA 5, which originally had as strong a **unity** as any of my other seminars, and which was gradually **dismantled** (68 ) in the eleven years that followed without being written up, could have shown me that the great projects I had so doggedly pursued, and for which I had for some years found arms to assist me, had by no means become a joint undertaking, but remained personal to me. My program gave rise here and there to occasional collaborations, but failed to become a driving force in any of my students at the time - a force that would have inspired him to work on a longer-term, more far-reaching project than the one he had pursued with me in his thesis, whose main role in his life would have been to help him learn the mathematical profession he had chosen.

p. 259 The only one, it seems to me, to have grasped as a whole (if not made his own) a certain overall vision, going beyond the framework of a particular "collaboration" on such and such a question or for the development of such and such a particular tool, was Deligne. This is why I must surely have seen in him (without ever having to formulate it) much more a designated "heir" than a "pupil". The term "heir" here better captures what I'm trying to express than the term "continuator", which came to mind at first, but which might suggest the idea of a "successor". of a work that would be limited by a received inheritance. On the contrary, I felt this "inheritance" to be a simple **contribution** I was in a position to make □ for the deployment of a personal vision, which would be nourished

<sup>56</sup>(\*\*) Writing the whole seminar, based on my detailed notes for the oral presentations, would have taken me just a few months.

<sup>57</sup>(\*\*\*) This goes hand in hand with the impression of students who remained "a little dumbfounded", expressed in the letter quoted in the note "Teaching failure (2) - or creation and fatuity" (n° 44').

<sup>58</sup>(\*) (May 26) After getting back into the swing of things at the SGA 5 seminar, I remembered an impression I'd had for some time. of unease I'd had, when I leafed through (it must have been 1977, the year of its publication) the copy of the published seminar I'd just received. This impression of "mutilation" (which then remained in a diffuse, informal form) was due above all, perhaps even entirely (I must not have spent much time looking more closely, although it would have been well worth it. . . ), to the absence of the introductory and final presentations, and above all (I think) to the casualness with which this absence was announced, as something almost taken for granted - why on earth would anyone have bothered to include them! At some level, I must have "sensed something", which I only took the trouble to let rise and examine this month (almost seven years later!), in the note "Le massacre" and in the two notes "La dépouille. . . ", ". . . and the body" that follow it.

of many other contributions (as was indeed the case even before my departure), and which was destined to effortlessly surpass all that had preceded and nourished it.

Returning to the sad fate of SGA 5, the thought that occurred to me yesterday was that this fate was perhaps not unconnected with the ambiguity of Deligne's relationship with me and my work, particularly given the as- cendant that his strong mathematical personality could not fail to exert on all my students<sup>59</sup> (\*). I'm sure he must have found some inner satisfaction in the vicissitudes that affected the notes of this seminar, stripped of what made up the unity and impetus of the oral seminar. On reflection, however, it is clear that the primary and es- sential cause of these vicissitudes does **not lie** in the dispositions of a single participant. Without yet clearly discerning this cause, there is no doubt that it concerns above all myself **and** the people who pretended in 65/66 to take charge of editing the seminar. Surely it lies in their relationship to my person, or perhaps also in their relationship to a certain way of doing mathematics (or a certain program, or a certain vision of things) that I embodied for them. The fate of SGA 5 now seems to me to be an eloquent and tenacious **revelation** of something I've never yet taken the trouble to examine, for want of even realizing it, and which even now I'm only glimpsing<sup>60</sup> (\*\*). Perhaps these lines will encourage some of the protagonists of this collective misadventure to share their own impressions with me.

□ Perhaps there is a lesson, however (at least a provisional one) that I can draw from the episode right now SGA 5, which first prefigured, and then illustrated, this spectacular **halt** after my departure, on almost the entire line, from the famous "program" in which I was embarked. Contrary to what I must have more or less believed in the euphoric sixties (happy as I was to have finally found some goodwill to back me up!), it seems to me today that the concretization of a vast per- sonal vision through tenacious and meticulous work cannot be in the nature of an adventure or a **collective** undertaking. Or rather, if there is such a thing as a "collective undertaking", it's not one that would be achieved through ten or twenty (or even thirty) years' work around a single person. If the vision is to become a common heritage for all, it will be embodied here and there under the pressure of needs alone, through the day-to-day work of this or that other person who may only know the predecessor by name (and even then!), whose vision had been too vast for his arms alone to be enough to bring it to fruition<sup>61</sup> (\*)

p. 260

<sup>59</sup>(\*) (April 28) An eloquent sign of this ascendancy is that SGA 5 was only published when Deligne saw fit to signal to Illusie to take an active interest in it - in other words, at the **precise moment** when he himself needed it as the basic text for his "digest" SGA 4<sup>1</sup>, destined to replace it. (See the end of the introduction to SGA 5, written by Illusie.) This sheds light on and gives full meaning to this statement (which I still described as "mysterious" only yesterday) in the "Table rase" note (note n° 67)), that "the existence of SGA 4<sup>1</sup> will soon enable us to publish SGA 5 as is". The "tel: quel" here is a touch of humor that I was probably the only one to sense (as early as the day before yesterday), and to appreciate at its true value! (Seen on "dismantling" that the published version represents in relation to the original seminar).

<sup>60</sup>(\*\*) (May 26) This is the very "something" referred to in the penultimate footnote, which has come to the surface in the course of reflection over the past few weeks, and especially since the moment (May 12) when I took the trouble, for the first time since its publication, to take a closer look at what had become of "a splendid seminar" in the hands of my cohomology students, in the massacre-edition that had been published, for the first time since its publication in 1977, to take a closer look at what had become of "a splendid seminar" in the hands of my cohomology students, in the massacre edition that was made eleven years later.

<sup>61</sup>(\*) (April 28) Perhaps "my arms alone" would have been enough to carry out the vast program of work I had in mind towards the end of the sixties, but only if I had made myself the exclusive servant of that program for the next twenty or thirty years. Today, I'm glad I didn't follow that path, which could have been mine, but whose pitfalls and dangers I now clearly see.

## 14.2.14. The reversal

**Note!** 68' (April 28) As an example (among many others<sup>62</sup> (\*\*)) of this dismantling, I thought back to the fate of one of the key presentations in SGA 5, which ended up being written by none other than Deligne (who I believe had taken charge of it as early as 1965, to "keep" his commitment eleven years later. . . ) according to my oral presentation, only to be incorporated without further ado into SGA 4<sup>1</sup> ! This is the formalism of the cohomology class associated with an algebraic cycle on a regular scheme, which develops with ease by passing to "sup-ports" cohomology in the support of the cycle under consideration. Like almost all constructions in stale cohomology (useful also in many other contexts, where they have become common practice), I had developed this one at the end of the fifties in the framework of coherent cohomology (here, Hodge and

p. 261 De Rham, which, in the context of "abstract" algebraic geometry, are first studied in one of my early Bourbaki lectures). It is so <sup>natural</sup> that it self-evidently implies the compatibility usual with cup-products<sup>63</sup> (\*).

As I write these lines, I realize that the sleight of hand used to include this crucial talk in SGA 4<sup>1</sup> has led to the brilliant result that Deligne, who did take part in the SGA 5 seminar in 65/66<sup>64</sup> (\*\*), **does not appear** on the cover as one of my "collaborators" (something that had already struck me yesterday, while leafing through the published volume Lecture Notes n° 589) and that I am the one entitled (eleven years after the seminar) to be listed as Deligne's "collaborator". It's quite a **reversal of fortune**, I must say! At the time of publication of SGA 4<sup>1</sup>, to which I had unknowingly contributed, I had stopped all public mathematical activity for seven years - so much so, in fact, that I never bothered with the publication of poor SGA 5, which for me was part of a past I'd left behind... .

(April 30) As for SGA 5, it now appears to be a rather motley collection of texts with no tail or head (they got lost along the way!), and which only "stand up" with reference to the text APG 4<sup>1</sup><sub>2</sub>. Remarkably, and something I've only just noticed, the very name SGA 4<sup>1</sup> actually suggests that this text **precedes SGA 5, which exists only by reference to it**<sup>65</sup> (\*\*\*). If the author of this text had been less ambiguous<sup>66</sup> (\*), and for sentimental reasons wished to insert his "digest" ("plus a few new results") into the SGA series in which he had played his part, the obvious name would have been SGA 5 1/5.

I see this as a second sleight of hand, which makes me realize that Deligne's share of SGA 5's fate is heavier than I thought even three days ago. It also brings me back to the feeling

<sup>62</sup>(\*\*) (May 28) I didn't get round to this "dismantling" until the May 12 reflection, in the note (more appropriately named) "The Massacre" (n° 87).

<sup>63</sup>(\*) (May 28) In the coherent framework, see my Bourbaki lecture no. ° 49 (May 1957), § 40 In the note "Les bonnes références" (no. ° 82) of May 8, I discovered that these ideas, as well as those I had developed in the same SSA 5 seminar for the of homology associated with cycles (and many others) were taken up by J.L. Verdier, without a word about the existence of an SGA 5 seminar or about myself. This operation took place in 1976, a year before the "SGA 4 operation<sup>1</sup>" (with which it seems to me to be closely associated), and in full view of all the ex-auditors and participants of the 1965/66 SGA 5 mother seminar.

<sup>64</sup>(\*\*) (May 28) And it was even there that he first heard of the things he so brilliantly exposes in the SGA 4 pirate-volume<sup>1</sup> ! On this subject, see yesterday's note "L'être à part" (n° 67' ). Compared to the methods used by his friend Verdier the year before, and to those he himself has used on other occasions, my friend here nevertheless stays below the line patent plundering, since he presents me as the author of the paper on cycles (with, admittedly, the brilliant result of being able to present me as his collaborator), and doesn't even pretend to be unaware that I've had something to do with the theory of stellar cohomology, the formula of traces, and so on. For a decisive step in this direction, see however, the note "L'Eloge Funèbre (1) - ou les compliments" (n° 104).

<sup>65</sup>(\*\*\*) (May 28) For a deeper meaning of this "violent insertion" of SGA 4<sup>1</sup> between the two indissoluble parts SGA 4 and SGA 5 at one end, forming the heart of my written work, see the note "La dépouille... ." (n° 88).

<sup>66</sup>(\*) (May 28) The expression "ambiguous provisions" is definitely an understatement here!

expressed the day before, that SGA 4<sup>1</sup> was not a scam operation. If apparently nobody (starting with Illusie, whose good faith is certainly not in question<sup>67</sup> (\*\*)) noticed the "operation", this is undoubtedly due to this "ascendancy" that I've already noticed, and also I think to the charm of my friend's person, both of which place him above suspicion!

## 14.2.15. Squaring the circle

**Note 69** (April 27) Around the age of eleven or twelve, when I was interned in the Rieucros concentration camp (near Mende), I discovered compass drawing games, enchanted in particular by the six-pointed rosettes obtained by dividing the circumference into six equal parts using the opening of the compass.

compass transferred to the circumference six times, causing it to fall right back on the starting point. This experimental finding had convinced me that the length of the circumference was exactly equal to **sixp** times that of the shelf. When, later on (at the lycée in Mende, I think, where I ended up going), I saw in a textbook that the relationship was supposed to be much more complicated, that we had  $l = 2\pi R$  with  $\pi = 3.14 \dots$ . I was convinced that the book was wrong, that the authors of the book (and no doubt those who had preceded them since antiquity!) must never have drawn this very simple line, which clearly showed that we simply had  $\pi = 3$ . Typically, I realized my error (which consisted in confusing the length of an arc with the length of the rope that joins the ends) when I expressed my astonishment at my predecessors' ignorance to someone else (an inmate, Maria, who had given me some voluntary private lessons in maths and French), just as I was about to show her why we should have  $l = 6R$ .

The confidence a child can have in his or her own abilities, rather than taking things learned at school or read in books at face value, is a precious thing. Yet it is constantly discouraged by those around us. Many will see in the experience I relate here an example of childish presumption, which had to bow to received knowledge - with the facts finally revealing a certain ridiculousness. As I experienced this episode, however, there was no sense of disappointment or ridicule, but rather that of a new discovery (after the one I had hastily interpreted by the false formula  $\pi = 3$ ): that of an error, and at the same time that we should have  $\pi > 3$ , because obviously the length of an arc is **greater** than that of the string joining the two ends. This inequality was well in line with the rejected formula  $\pi = 3.14 \dots$  which, as it turned out, looked reasonable, while at the same time I had to admit that there might be some not-so-idiots out there who had looked into the matter. At that point, my curiosity was satisfied, and I don't remember wanting to find out more about the ins and outs of this all-important number,

<sup>67</sup>(\*\*) It's high time we took this opportunity to thank Luc Illusie for the care and self-sacrifice with which he saw to the successful completion of a number of distressed presentations and the publication of the "package"; and this under conditions that were certainly not the least encouraging, not least of which was my total absenteeism!

(May 26) In the light of subsequent reflections, pursued in notes n° 84 to 89 and especially in the note "The Massacre", these thanks lavished on Illusie take on an enormous and unforeseen comic dimension, which I was far from expecting. I had no idea when I wrote these lines! It's true that I wrote them against a certain reluctance on my part, which expressed itself in particular by "forgetting" the (already planned) acknowledgements in the "main" text of the note, so that I had to "make up for it" with a footnote. This reluctance was undoubtedly due to the unease I had already felt from the first time I held in my hands this volume called SGA 5 (and which I didn't have the opportunity to hold in my hands again, I believe, until the last few weeks), an unease I mentioned in the footnote (dated today, May 26) to the previous note "The Signal". This inattention illustrates the importance, in meditation, of vigilant attention to what's happening within oneself at the very moment. In the absence of such vigilance, the reflection here remained below the level of meditation, on a superficial level - whereas attention to this reticence would have led me to probe its origins, and thus also to take a closer look at what had become of this fine seminar (something I didn't do until two weeks later).

you had to believe that they were sending him a letter<sup>68</sup> (\*)

p. 264

□ This experience was undoubtedly one of the very first that taught me a certain caution, when my own insights seem to contradict generally accepted knowledge: that such a situation may merit careful consideration. Prudence, which is a fruit of experience, marries and complements (without altering) the spontaneous confidence in one's own ability to know and discover, and the assurance given by the original knowledge of this power within us.

## 14.2.16. funeral

**Note 70** (April 28) Thinking back last night to this story about the cover of SGA 4<sup>1</sup>, where I unknowingly appear as a "collaborator" of my illustrious ex-student, the thing seemed so incredible that a doubt came to me if I wasn't being betrayed by my memory, and hadn't indeed been consulted and would have given my agreement without thinking too much about it. But this assumption goes so far against the grain of the attitude that was mine until last year, namely that there was no question of my publishing maths again (and even less so, not as a "collaborator" with someone, and of someone whose relationship with me already seemed to me to be fraught with profound ambiguity) - that it is even more "incredible" than what it was supposed to "explain", and which in the end has nothing mysterious or inexplicable for me! As a matter of conscience, I checked my friend's letters between 1976 and the present day (there aren't many of them, and it was a quick job), without finding, of course, any allusion to the publication of SGA 4<sup>1</sup>. I did write a few lines to the person concerned himself, to ask him if he could give me some explanations about this "hoax", which I didn't really appreciate...<sup>69</sup> (\*)

p. 265

When, in my reflection three days ago, I mentioned the turning point that took place three years ago in my relationship with my friend Pierre, when I lost interest □ in continuing to communicate with him on mathematically (see "Two turning points", note (66)), I remembered a certain impression that had been strongly present at the time. To put it in context, I should first point out that, during the ten years that had elapsed, while my friend had played for me the role of practically the one and only mathematical interlocutor, I had expected (as much a matter of course as the role I was making him play) that he would **relay** the mathematical thoughts and ideas I shared with him, and in turn communicate them to mathematicians who might be interested in them. As I've explained elsewhere (see section 50, "The weight of a past"), it was the feeling of having such a relay interlocutor that gave my sporadic periods of mathematical activity a deeper meaning than that of satisfying a craving, by linking them to a collective adventure that went beyond my own person. It was this feeling, no doubt, that

<sup>68</sup>(\*) (April 28) The above evocation brought back other memories, which show that this famous number  $\pi$  intrigued me more than I first thought I remembered. The approximate value 344/133, found in a book (perhaps the same one), had struck me - it was so pretty that I could hardly believe it was only approximate! Knowing only fractional numbers at the time, I was intrigued by what the numerator and denominator of the irreducible fraction expressing  $\pi$  might look like - they must have been quite remarkable numbers! Needless to say, I didn't get very far with these childish musings on squaring the circle.

<sup>69</sup>(\*) (May 26) My friend kindly honored me with a reply, which dispelled the last trace of doubt. He had indeed listed me as a "collaborator" because of the presentation of SGA 5 that he had written and included in SGA 4<sup>1</sup> - and he hadn't thought it necessary to ask for my agreement to this transfer, or to be listed as a "collaborator", nor had he thought it necessary to send me a copy of this volume to which I had collaborated so well, given that "I hadn't done maths for seven years".

(June 5) I have just received (better late than never!) a letter (dated May 30) from Contou-Carrère, replying to a letter of April 14 in which I asked him (as a matter of conscience) if he had ever seen a copy of SGA 4<sup>1</sup> among my books. It would seem that there was such a copy, which Contou-Carrère had kept with him (unless he bought it and no longer remembers?). On the other hand, Deligne's reply seems to confirm that he hadn't thought it worth sending a copy: "It might indeed have been a good idea to send you a copy of 4 1/2; I doubtless thought that you wouldn't have seen the point" (letter of May 15).

The fact that, for so long, I felt no desire to publish what I found, and even less regret at having withdrawn from the mathematical scene (such regret, incidentally, never appeared, and I "reappeared" on the said "scene" without any deliberate intention, and before I even realized it! )

I can't say to what extent my friend lived up to this expectation - it's possible that he played the expected role as long as he maintained that mathematical availability, driven by curiosity and affectionate sympathy at the same time, which had made possible and quite natural this exceptional role he played in my relationship to the world of mathematicians (and also, to some extent, in my relationship to mathematics itself). When I asked myself the previous question, a day or two ago, I received (as if in immediate partial response!) a letter from Larry Breen, sending me copies of various correspondence from 1974 and 1975, including two lines from Deligne from 1974, accompanying a copy of a letter (which I had just written to him about Picard's field formalism), which asked his opinion about my letter. In it, he refers to me as "the master", in which I think I sense a half-pleasant, half-affectionate intonation. I can't recall any other occasion when I heard from others about things I'd told my friend since I left in 1970. It's quite possible that there have been and that I've forgotten, not to mention the fact that even during the episodes of my mathematical activity, he was relatively uninvolved.

I rarely felt the need to consult my friend, and until 1977 or 1978 the reflections I made to him on occasion were limited in scope. So there wasn't much to "relay", to *proprementally* speaking, p. 266 until this moment<sup>70</sup> (\*).

Things changed in 1977, when for the first time since the sixties, I was strongly "hooked" on an exceptionally rich substance. This was the beginning of my reflections on maps, and one thing leading to another (around the same time), on a new approach to regular polyhedra (see *Esquisse d'un Programme*, par. 3 and 4). By this time, too, it was clear to me that the facts I had just put my finger on opened up unsuspected vistas, comparable in breadth and depth to those I had glimpsed (and more than glimpsed, subsequently) with the birth of the notion of pattern.

It's strange that, on this occasion, I was still addressing my friend with the expectation that he would echo these things that had amazed me and what they were making me glimpse - whereas the total silence that for seven or eight years already had surrounded the very name "motif" was eloquent enough to teach me that my expectation was illusory! This astonishing lack of discernment illustrates the deliberate intention I had (even after discovering meditation a year or two earlier) to pay no attention to my relationship with mathematics or mathematicians, supposedly part of the distant past.

---

<sup>70</sup>(\*) I could make an exception for my first thoughts on a theory of unscrewing stratified structures, which I must have mentioned to Deligne in the early '70s. He had greeted my expectations on this subject with indulgent sympathy, rather like that accorded to a grown-up child who doubts nothing. (These were dispositions he often had in his relationship with me, and which were surely often well-founded!) My friend's scepticism, motivated by his knowledge of certain phenomena of savagery of which I was unaware, didn't convince me - rather, the facts he was pointing out made me suspect from that moment on that the context of "topological spaces", commonly adopted for "doing topology", was inadequate for flexibly expressing certain topological intuitions I felt essential, such as that of "tubular neighbourhood". Over the next ten years, I had little occasion to return to these reflections, and I had to forget my "suspicions" for a while, which were brought up to date again (and then became an intimate conviction) by my reflections of December 81.

- January '82, stimulated by the need for a theory of "unscrewing" the "Teichmüller tower". (Compare *Esquisse d'un Programme*, par. 5, 6).

(June 5) As another exception, I could count my reflections on virtual relative patterns and virtual patterns (above a general basic pattern), which I seem to remember sharing with Deligne. As these were things closely related to a yoga he had decided to bury (until the time of exhumation in 1982), it's not surprising that he didn't make

For some hints, see note no. ° 46, .

and well out of date! My first thought was along these lines (\*) takes place precisely in 1981, the year the second "turning point" in my relationship with my friend, which I've had occasion to mention. But even in this meditation, which lasted for several months, the relationship with the other mathematicians was barely touched upon, and the relationship with the one among them who had been undoubtedly the closest of all (at least in terms of our shared passion) was not even touched upon, as far as I can remember. It would have been very useful!

Looking back and reflecting on it now, it's clear that what happened at that moment, which surprised and frustrated me so much (the sudden appearance of a discreet disdain, where I had expected to share the still fresh joy of a discovery that had made a deep impression on me), was indeed what had to happen. It was precisely the **scope** of what I had to communicate, which had motivated my expectation of an interest in tune with my own, that was to arouse in my friend, for the first time in his relationship with me, the reflex of **discouragement**. This reflex must have been all the stronger, given that I was already "pre-buried" by the publication of SGA 4<sup>1</sup>. When I returned to the fray three years later, as my friend (armed with his beautiful theorem on absolute Hodge cycles) was about to take care of the burial in due form, with the "memorable volume" published the following year<sup>72</sup> (\*\*), this same reflex came into play, but with a completely different brutality. (This episode put an end to communication on a mathematical level, but without "discouraging" me... .)

In both cases, the disinterest was obviously sincere, as it had been in other cases, when it had been expressed towards others than myself. It wasn't the first time I'd seen in him (or in others) forces alien to the thirst for knowledge neutralize it, and take the place of the mathematician's flair.

It was on these two occasions, in 1978 and again in 1981, that I first glimpsed, as if in a flash, the **"price"** of this contradiction in my friend that had been known to me for many years, but whose significance, as a hindrance and limitation in his work and in his understanding of mathematical things, had never been clear to me until then. But it was only in the course of the meditation that I pursued for the past month, on the sense of a certain **burial** that had been taking place insidiously since I left, that this □ ported ended up gradually appearing in full view.

On an obvious level, the funeral I've discovered over the last few days and weeks, which I'd been anticipating for several years but never thought of attributing a particular role to anyone, has been first and foremost the funeral of **my mathematical work**, and through it and above all, of **myself**. The best placed of all, of course, to put a hand to this burial (which many others, in their heart of hearts, were calling for), and to preside over the anonymous obsequies, was the friend who, in the eyes of all, had once been the legitimate heir. If he presided over the funeral, he was certainly not alone! But at a deeper level, the one my friend was so discreetly burying, throughout those twelve long years, was none other than **himself**; that thing in him, rather that impresses no one, a delicate and elusive thing like the fragrance of a flower or a fruit, and that has no price. (⇒ 71)

## 14.2.17. The tomb

**Note** 71 But following the thread of associations, I've strayed from my purpose, which was to evoke a certain "strong impression", the memory of which has come back to me insistently over the last three days. This impression occurred at the time of the "turning point" in my relationship with my friend, when I was confronted with signs of

<sup>71</sup>(\*) On this subject, see "The troublemaker boss - or the pressure cooker" (s. 43).

<sup>72</sup>(\*\*) This is the Lecture Notes 900 volume, see note "Souvenirs d'un rêve - ou naissance des motifs" (n° 51).

(at once muted and brutally obvious) of a kind of deliberate contempt - signs that made me put an end to our relationship on a mathematical level. I then understood that the moment had arrived when I had nothing more to expect from the continuation of such a relationship, and the "decision" was made on its own, without division or regret, as the first fruit of this late (and very partial) understanding.

There was no anger in me, and even less bitterness (I don't remember during the course of our relationship feeling any movement of anger towards my friend, nor any bitterness, except at the time of my departure from the IHES, when he was not the only one to be included in it). But there was a sadness, as I turned that page in my relationship with someone who continued to be dear to me, when the strongest bond that had attached me to him had dried up and perished. And like a sting that stayed with me in the years that followed, there also remained this unresolved frustration, of the joy I had brought to share with him, to the one who seemed closest and best placed to share it, and which had come up against the closed doors of complacency. This frustration has finally been resolved, it seems to me, through the meditation I'm currently pursuing. Just today, this one has come back to show me that what was happening to me was what was supposed to happen' ☐ and that the person primarily responsible for this frustration is no one else

that I myself, who had seen fit to indulge in an illusory image of a certain reality, rather than use my healthy faculties and look at this reality with awakened eyes

p. 269

It was against the backdrop of this sadness, and also of this frustrated expectation, that this strange impression appeared, which came not as the fruit or outcome of reflection (which didn't happen then), but as an immediate and irrefutable intuition. It was that everything I could say to my friend on a mathematical level, and everything I'd been saying to him for years, I was entrusting or had entrusted to a **tomb**. While I never mentioned this impression to anyone, nor did I write it down in black and white in the course of any subsequent reflection, I do remember that it was this image of a **tomb** that was then present, and the very word that expresses it (in French), and which I have just written down. This "impression" or image must have arisen, at that moment, as the visual expression (so to speak) of some understanding that, at some level, must have been forming and present for a long time, as the fruit of a whole set of perceptions that must have taken place over months and years, without attention retaining them or memory registering them; perceptions that were simple and obvious, no doubt, but which I hadn't "retained" because they seemed undesirable to someone inside me who often has the power to sort them out as he pleases. . . Neither at the time, nor since, has this peremptory image been associated with any precise, tangible recollection of an "event" in line with this image, and which could have given rise to it in me - the memory of this sudden image must have crossed my mind only rarely afterwards, and today is the first time I've dwelt on it in the slightest.

If no memory or association arose at the time, it's surely because I didn't have the minimum availability to welcome it. Strangely enough, at the time I was engaged (if I place the<sup>73</sup> (\*) moment correctly) in a meditation on my relationship with mathematics, without this episode, which spoke to me strongly enough, after all, of a certain past through a present, making me think of interrupting the "thread" of my reflection, to include a reflection on the ins and outs of what had just happened and which was not without consequence in my life.

☐ The first (and, to be honest, the only) association that arose even now (having just evoked and to say that on the spot it had appeared disjointed from any memory or association. . . ) was the fate that had befallen my "dream" of patterns - the mathematical vision of all that had been dear to me,

p. 270

<sup>73</sup>(\*) (June 11) Cross-checking confirms this to be the case. This "second turning point" occurred in the second half of 1981.

in my mathematical past. If that past perhaps still had some secret hold over me, it was through that dream - and that secret hold (which I think I glimpse as I write these lines) itself had the force, beyond words, of the dream. If, as the legacy of a past investment, a passionate investment in mathematics, an unspoken, deep-seated frustration had arisen over the past ten years, it was indeed that of seeing a deathly silence surround those things which for me were alive, and which I had entrusted to my friend as living, vigorous things, ready to leap into the light of day! With me gone, it was he and no one else who had the power and vocation to watch over this blossoming, to make available to everyone what he alone (with me) could intimately feel. And without ever saying it to myself in these or any other terms - without ever stopping (as far as I can remember) even for a thought about what I had left behind - somewhere inside me I must have realized, over the years, that this dream that was always dear to me, I had entrusted to a "tomb".

And then, with this evocation and the first association it arouses in me, I see a flood of other associations appearing in its wake, revealing to me that I have indeed touched a nerve center - the point of all, perhaps, through which the (long-ignored) weight of my mathematical past is exerted.

But this is not the place, it seems to me, to follow these associations, as this "final" stage of my reflection is already getting long in the tooth. It seems to me that I've said enough in this reflection about my friend Pierre as well as about motives - and surely too much for many people's taste! And I think it's time, as far as these notes are concerned, to bring them to a close, with a sort of **assessment** of what this reflection on a double funeral is teaching me, for the time being.

## 14.3. VI The return of things - or the Unanimous Agreement

### 14.3.1. One foot in the merry-go-round

**Note 72** (April 29) .....

p. 271

□ It seems to me that most of the descriptive and decanting work that had to be done, on the subject that occupies, is complete, as far as the "partial images" about a certain situation are concerned. (It's obvious that these notes, intended for publication, only give an abridgment of the actual work, while it's out of the question here to spell out in detail all the elements that contribute to the formation of this or that partial "image". . . .) Surely, through this same work, a certain overall image could not fail to take shape, still vague, and waiting to be formulated to take shape and life and tell me what it has to say. From yesterday's reflection, I feel it's ready to blossom, urging me to give it a voice.

To tell the truth, what yesterday's reflection (which I've just reread) taught me most of all **concerns none other than myself**. It's with a certain relief that I see the reflection returning to the firm ground of a reflection on myself, whereas for the past week it has often given me the feeling of involving someone else's person more than my own. Yesterday's reflection finally revealed to me something that is surely quite obvious: the strength of my attachment to a certain past, to my "mathematician past", and the particular role played in it by this famous "dream" of motives.

Once the point is finally made, its obviousness is obvious - the most recent and clearest sign perhaps being the emotion triggered by the discovery (two years later) of a certain "event", of this

---

<sup>74</sup>(\*) I thought it wise to spare the reader a good page of considerations on meditation in general, which were a way of beating around the bush - a sign of the resistance to getting to the heart of the matter.

the "furtive" (and belated) re-entry of motifs into the mathematical menagerie, under the guidance of my former "pupil" and friend! This emotion was immediately translated into the resumption of a reflection that seemed to be over, - a resumption that materialized as dry as a fifty-page stream of retrospective reflections! As a result (and I've already realized this several times during this untimely resumption), it would seem that that I'm not yet as "off the merry-go-round" as I thought I was a month or two ago, in my exultation.

of the end of a stage and the feeling of liberation (by no means illusory) that this stage had brought me - □avec p. 272 the teaching that "I wasn't better than the others", and that "I shouldn't be surprised if the pupil surpassed the teacher"<sup>75</sup> (\*). Yet this teaching didn't stop me from being surprised - it was enough for the "pupil" to overtake me in a direction I hadn't anticipated at all! But if the teaching didn't prevent me from being "astonished", it was nonetheless invaluable to me on more than one occasion in the course of the past reflection, to save me from the usual pitfalls (or at least **some of them**).

To come back to the strength of this "hold", to the strength of my attachment to this dream of motifs, it has already appeared in many other places in the present volume, whether in Récoltes et Semailles (where motifs are mentioned several times and in quite eloquent terms), or in the Esquisse d'un Programme (where, "objectively", motifs had nothing to do with it), or in the Esquisse Thématique (where motifs are a bit like unhatched eggs in a flock of vigorous chicks). In the latter text, which dates back twelve years and is obviously written in distant dispositions, this last paragraph on motifs is the only one, it seems to me, where we suddenly feel a warmth passing through... ..

The remarkable thing is that this attachment never occurred to me in the fourteen years since I left, until yesterday, when I finally glimpsed the obvious, and finally formulated it for myself today. During the meditation of almost three years ago (July to December 1981), I came to realize the first obvious fact: that I still had a passion for mathematics, which had expressed itself eloquently over the years. But my attachment to a past, as far as I can remember, went unnoticed at the time, and has remained so to this day.

I must have begun to glimpse it, however, with the reflection "The weight of a past", which came to me as a matter of conscience at a time when the meditation on my past as a mathematician seemed already complete (except that I hadn't yet been able to perceive the **weight** of that past!). In fact, as I wrote it, I sensed that I was still on the surface of things, without really penetrating them. The notes I had to add later (first

(46) (47)) then led me in a direction that for a good while distanced me from myself, focusing my attention on a mathematical work (and on those aspects of it that seemed most "important" to me), then on the vicissitudes of that work and the role of others in them, rather than on myself.

□I just reread this reflection "The Weight of a Past" (s. 50). Towards the end of it, I begin to Indeed, I glimpse that the "tipping force" (towards a mathematical investment other than episodic) could be due to an "attachment to the past" (as a mathematician), but rather to "the past of these last ten years, the past "after 1970", and not the past of things already written in black and white, of things done, those before 1970". A few lines later, however, I recall, but only "in passing", that in the "vast program I had before my eyes at the time ... only a small part of it has been realized". In writing these lines, I must have been thinking above all of those parts of the "vast program" that were immediately realizable, whose motivating force (!) was nevertheless nowhere near that represented by the "dream of motives". (Its justification (but by no means its formulation) appeared then as one of the great tasks "on the horizon". . . )

p. 273

---

<sup>75</sup>(\*) See "No more merry-go-round!", n° 41.

It's clear that my attachment to the "motive dream" is (as I'm sure all attachments are) primarily (if not exclusively) egotistical. It's the desire not only to **contribute** to a collective work, but also to have that contribution **recognized**. Assuming that the "vast picture of motives" had indeed been painted to the full extent I saw it since the late sixties, but that my part in the blossoming of this vision had been silenced, my displeasure would no doubt have been no less (and perhaps greater?) than the displeasure I felt when I came across the "memorable volume" (in which I see certain notions and ideas that I had identified and brought to light, but (so I felt, at least) deprived of the breath and intense life that had so fascinated me in them)<sup>76</sup> (\*).

Until this egotistical desire to see things from my distant or more recent mathematical past "recognized" is consumed, it's probably premature to claim that I'm "off the merry-go-round". The mathematical "merry-go-round" no longer **contains** me, as it once did some of my friends. But I've certainly still got a foot in it, and I suspect it'll stay there as long as I keep on doing maths!

### 14.3.2. The return of things (or a foot in the flat )

**Note**<sup>73</sup> (April 30) I've been thinking about the fate of the SGA 5 seminar, and how this fate was linked to the publication of SGA 4<sup>1</sup>. A situation that had been confusing, and which I've only examined in the last few months.

p. 274 days and glimpses in passing,<sup>2</sup>  $\square$  is now very clear to me. I've just added a note footnote<sup>77</sup> (\*) on this subject to my thoughts of three days ago (see "The signal", note (68)), and it seems to me that with the comments I had already made there before yesterday (also in footnotes) and with the thoughts of the day before ("Table rase", note (67)), I have expressed myself clearly enough for there to be no point in making yet another overall summary of a situation which now appears eloquently enough<sup>78</sup> (\*\*).

Having reached this point, it's important to note that the first and foremost person responsible for the "sad fate" that befell SGA 5, and for the use that was made of a situation of abandonment, is none other than myself. If the various "volunteers" (who took on editorial work they didn't really want to do) were clearly not in tune with themselves, neither was I, who stubbornly refused to heed the lesson of a situation that spoke for itself. After all, three whole years elapsed between the end of the oral seminar and my departure from the world of mathematics (which immediately translated into a virtually total lack of interest in my published work over the following fourteen years). It's true that during those three years I was fully occupied with my other tasks, including continuing the SGA seminar (with SGA 6 and SGA 7), writing the EGA, reflecting on the often juicy questions arising from day to day, and among these, the gradual maturation of an overall vision of patterns. . . Taken up with these tasks, I chose to turn a blind eye to the fate of a past seminar, which (together with SGA 4 from the previous year) constituted the most profound mathematical contribution I've been able to make, in terms of fully accomplished work I mean, and also the one with undoubtedly the widest scope.

<sup>76</sup>(\*) (June 14) This "displeasure" is due above all, it seems to me, to this impression of impudence, of deliberate disregard for a link that one affects to ignore, to hold as negligible. The situation is quite different when ideas or results you've discovered are rediscovered by others, which happens quite often.

<sup>77</sup>(\*) This prohibitively long footnote has been turned into a separate footnote, "Le renversement" (n° 68').

<sup>78</sup>(\*\*) I return to this subject on May 9 and the following days, see notes n° s 84-89.

The situation could only deteriorate further after my unavoidable departure, allowing the most prestigious of my ex-students to carry out the ingenious operation of inserting his famous SGA 4<sup>1</sup> between the gangue of nonsense and superfluous details of SGA 4 and SGA 5, and doing me the honor of promoting me to collaborator on what is presented as the central key-text, destined (as he says with that candor that makes up his charm) to do the following charitably "forget" the heavy gangue that surrounds it. ...

□ In short, the choices I made, from before my departure and through my departure, implied consequences for the fate of my published work, or (in the case of SGA 5) work awaiting publication, as well as for the part of my "work" that remained in the state of a dream - an **unpublished** dream, that is. I don't regret my choices, and it's not my place to complain, when I see today certain consequences of those choices that are not to my liking! It is my responsibility, however, to examine these consequences (and all the more so when I don't like them!), to get an overall picture of the facts<sup>79</sup> (\*) (which I've done), and to learn from them what I can. That's what I've still got to do, and today's reflection will perhaps be, at the very least, a first step in that direction. A number of things have come together for me over the last few days, and I'd like to start by putting them in black and white.

p. 275

The main force, the "drive" behind my investment in my pupils in general, in the first period of the sixties, was the desire to **find "arms"** to carry out "**tasks**" that my instinct told me were urgent and important (at least from my own mathematical point of view). This "importance" was certainly not purely subjective, it was not simply a matter of "taste and color", and often (I think) the student who took on such a task that I proposed to him felt that it "fit the bill", and also, perhaps, what its place might be within a larger scheme of things.

Yet, as far as this "drive" was concerned, this motivating force within me that pushed me towards completing the tasks, it wasn't some "objective" importance that was at stake - whereas the "importance" of Fermat's conjecture, Riemann's hypothesis or Poincaré's hypothesis left me perfectly cold, that I didn't really "feel" them. What distinguished these tasks from all others, in my relationship to them, was that they were **my** tasks; those I had felt, and made my own. I knew that having felt them had been the culmination of a delicate and profound work, a creative work, which had made it possible to identify the crucial notions and problems that were the subject of this or that task. They were, and no doubt still are (to a large extent), a part of who I am. The link that bound me (or still binds me today) to them, was by no means clear-cut, when I entrusted such and such a task to a pupil - well on the contrary, this link was acquiring new life, new vigor! This link didn't have to be said □ (and I'm "saying" it here, don't

p. 276

if only to myself, for the first time). This link was as obvious to the student who had chosen to work with me, and on the task of his choice, as it was to me, and also (I'm convinced) to anyone else. It's the deep bond between the person who conceived a thing, and that thing - and which is not altered, but (it seems to me) strengthened by those who, after him, also make that thing "theirs" and bring the best of themselves to it. It's a bond I've never examined closely. It seems to me deeply rooted in the nature of the "I", and universal in nature, It's a link that we sometimes affect to ignore, as if we were above such pettiness - it's even possible that I've sometimes entered into such an affectation<sup>80</sup> (\*). But the few times in recent years (or in recent days and weeks) when I've been confronted with an attitude in others that affects to ignore this link (of which they are aware) that links me to such and such a task that has

<sup>79</sup>(\*) (May 28) Read here "facts known to me". On the following day, entirely unexpected new facts rekindled my thoughts on the Burial and led me to triple the volume of my notes on the subject.

<sup>80</sup>(\*) What's certain is that I was following the "bon ton", which consists in ignoring this kind of thing, contrary to the de rigueur images! (May 30) On this link, see the note ". . and the body", n° 89.

has been accomplished (by another, or by myself) or merely designated, I am touched in a sensitive place. We can call this place "vanity" or "fatuity" and put other names to it - and I don't claim that these terms are out of place here, but whatever we call it, I'm not ashamed to talk about it or to be as I am, and I know that the thing I'm talking about is the most universal thing in the world! No doubt this attachment to "one's work" is not as strong from one person to another. In my life, where "Doing" has been the constant focal point of my great investments of energy since childhood, this link has been strong and remains so today.

I can therefore say that the main force driving my relationship with my students was that I saw in them welcome "arms" for the accomplishment of "my" tasks. The formulation may sound cynical, but it simply expresses an obvious reality, surely felt by my students as well as myself. The fact that they were "my" tasks in no way prevented them from also doing "their" tasks - and it was this 'identification in them with their task that mobilized in them the energy necessary for their accomplishment; just as identification with this same task had mobilized in me the energy that had brought it into being and taken shape, and continued to mobilize the energy I continued to invest in the subject. This energy was essential if I was even to "function" as the "master", i.e. as the elder who teaches a craft (which is also an art), and which cannot be done without mobilizing considerable energy. Never in my teaching past have I felt a contradiction in the fact that the same task was profoundly "his" for the student who was working with me, while remaining just as deeply "mine". I don't believe that this situation is in the least conflictual, nor that it has ever given rise to the desire for conflict<sup>81</sup> (\*). In this situation of simultaneous investment in, and identification with, the same task, both the student and myself found (it seems to me) our account, in a working relationship that was perfectly clear, and which in itself (it still seems to me) contained no conflictual elements. On the personal level, on the other hand, the relationship remained superficial - which in no way prevented it from being cordial, even friendly and sometimes even affectionate.

p. 277

The investment in my tasks, and **through them** in my students-collaborators for these tasks, was (as I said) of an egotistical nature (like any investment, no doubt). Surely, carrying out these tasks was above all, for the "I", a means of enlarging itself, through the realization of an overall work of vast proportions that "my arms alone" would not have been able to bring to fruition. From a certain point in my life as a mathematician, there was this constant ambiguity of a cohabitation, a close interpenetration between **the "child"** and his thirst for knowledge and discovery, his wonder at things seen and those examined closely, and, on the other hand, the **ego**, the **"boss"**, rejoicing in his works, eager to expand and increase his glory by multiplying his works, or by the dogged, relentless pursuit of an overall construction of grandiose proportions! In this ambiguity, I see a division that continues to weigh on my life and leave a deep mark on it - a division that perhaps will remain as long as I live. Such a division is certainly not unique to me, but perhaps in my life, filled with the "best" as well as the "worst", this division has taken more extreme forms than in others.

So I can say that for this invasive, eager-to-expand "I" (who wasn't alone in this respect) my pupils were first and foremost welcome "collaborators", not to say "instruments" - welcome "arms" for the construction of an imposing work that would say "my" glory!<sup>82</sup> (\*\*)

<sup>81</sup>(\*) If, encouraged by a certain context, one of my students has wanted to take over a role that had been mine, in a work done with me, this was done at a time when he had long since ceased to be a student.

<sup>82</sup>(\*\*) I wrote this sentence with some hesitation, weighing up my words in the full knowledge that it could be seized upon as a sort of cynical admission of the horrible Mandarin finally throwing off the mask! But I'm well aware that I won't prevent anyone who wants to drown an embarrassing fish from doing so at their leisure. It won't stop me from pursuing my aim of discovering and stating the obvious, including the humble truth written above, which will only surprise those who have never bothered to look.

This is something, it seems to me, that became quite clear□already in the course of my meditation three years on my relationship to mathematics (and beyond that, to "doing" in general), even if I sometimes forgot about it afterwards. It's the thing that's been on my mind these last few days, to make the connection with this other remarkable fact: that it was precisely by one of my students (with quotation marks, mind you!) from that time, and the one who was closest to me of all, and the only one to "feel" effortlessly and in their entirety these great designs within me that seemed to push me relentlessly to realize them - that it was he of all people who, after I left (and in his own heart, no doubt even before.

«.) a mis en oeuvre au cours des ans cet **Enterrement** aux dimensions de l' Oeuvre (les majuscules ici ne sont pas de trop !), et qui a finalement "présidé aux Obsèques" (avec une majuscule de plus, pour faire bon poids !). What's striking about this situation is the enormous, irresistible, **Ubuesque comedy of the whole thing!** I must have sensed this comedy in a vague way over the last few days, but it only revealed itself to me in its true nature at this very moment, when I placed the last capital letter over my solemn funeral - in a sudden, irresistible burst of laughter! It was precisely **laughter** that had been lacking until now in this so-called "final" stage of reflection, where the dominant note was rather the pained air of the "Monsieur bien" disappointed in his legitimate expectations (or even abominably deceived), when the pained air gave way to sarcastic, well-sent comments (one is used to expressing oneself, or one isn't!). I definitely feel I'm on the right track again, after this long digression (that word reminds me of something. . . ) in the sad tones.

And just now I've come up with a name for this "note" (I'm not sure what it's a note to, but whatever.) that it's time to close. It will be "**Le retour des choses**". (⇒ 74)

### 14.3.3. The agreement

**Note 74** I finally feel - phew! - that I'm nearing the end of this "final stage", which has stretched over twelve days, each of which (as in the past) was presented as "the last". Perhaps the final word was spoken just a few minutes ago. My (symbolic) funeral was a **return of things**, a harvest of seeds made by my own hands. (And my burial in□chair and bone, if I have this happiness of dying leaving behind me living men and women who can bury me, will also be a return to something I left at birth... .<sup>83</sup>(\*)). It seems to me that whatever remains to be added will be little more than an **epilogue**.

p. 279

The famous "dearest pupil of them all" was not the only one of my dear pupils to bury me with gusto, and those who did indeed put their hand to the dough may not be the only ones among them, present at the funeral without displeasure! But I don't really care who it was! (Knowing more about it, if nothing else, won't tell me anything more). I've finally understood this "return of things", and having understood it, I'm reaping the benefits.

Yet I haven't yet extracted all the substance this benefit has in store for me. It's not yet clear to me exactly **what it was about** me that made certain ex-students take advantage of the funeral and burial. Is it only this "greed" of which I spoke, which (it seems to me) does not

---

itself.

<sup>83</sup>(\*) (May 28) This sudden association with my own death presented itself forcefully. I was tempted to dismiss it, and then to suppress this unexpected parenthesis, which seemed to come like hair on the soup. I refrained from doing so, out of a kind of respect. Strangely enough, the next day I learned that on the evening of April 30, when I was continuing my reflection, in the commune where I live, the (seriously ill) sister of a friend had died. I saw Denise for the first time, and on her deathbed, the very same day. The following day, May 2, I joined my friend and many other living men and women to lay her to rest on a beautiful spring day...

which they had accommodated without difficulty (and probably without even noticing it, at least not on a conscious level) when they first started working with me? Was it then the "occasion" (my departure, etc.) that "made the thief", and **revealed a general propensity**, in them as in the "pupil of all", to bury his "master" or his "father", when the circumstances were propitious? Perhaps I was more "master" (or more "father". . . ) than nature, and this circumstance played a part in triggering this "burial syndrome" with a vengeance! For the moment, I don't know! Perhaps the echoes I gather (I hope) will enable me to see more clearly, and to better assimilate the unexpected food before which I am now sitting.

There weren't any students to discreetly take part in the funeral and burial, even though no non-ex-students were in a position (as far as I know) to play a prominent role. Clearly, many of my old friends found this to their liking. The whole thing doesn't seem too mysterious to me.

p. 280 □As I've had occasion to say in passing, more than once I've witnessed the deep malaise created in my friends of yesteryear by my untimely departure from the mathematical scene. It's the malaise that arises from anything that obscurely feels like a **provocation** to profound questioning, to renewal. In this particular case, it was natural that this unease among mathematicians should be strongest among my friends, those who had known me, and who could feel the full force of the investment I had made in the values that are still theirs; not to mention the fact that each of these friends has made, and continues to make, an investment of comparable strength in these values, and in the substantial "returns" they offer. I had already had ample opportunity to observe such unease among other scientists, right from the start of the Survivor period. But that didn't stop me from being surprised every time I saw unequivocal signs of distancing, and sometimes even enmity, among one of my old friends, to whom I continued to feel the same sympathy. What must have made my "abandonment" particularly intolerable for some of them was precisely the fact that I was supposed to be one of the "best" of them, surely the last one they would have suspected of playing such a trick on them! (And I did indeed sometimes sense a tone of **resentment** in such of my old friends in the mathematical world.) It's only natural, then, that they should find it in their hearts to see that all this "grothendieckery" was, after all, a lot of paper for very little money, etc. etc. A single person, no matter how prestigious, is not enough to make a fashion - it's even more important that the fashion you want to launch responds to an expectation, a secret desire, in many others, before it becomes a consensus and the law<sup>84</sup> (\*).

In the fourteen years since my departure, I have perhaps tended to underestimate the unease it has created in the "wider world" - even though, for me, my departure in June 1970 came so naturally that there was not even a "decision" to be made: new tasks had taken over from the old ones overnight, and the latter had suddenly receded into the background as if from the distant past! (It's also true that I didn't experience such unease among my colleagues at the University of Montpellier, who form a completely different milieu from the one I'd left). Perhaps I also underestimate the role that such unease may have played among my ex-students "before 1970", including

p. 281 many of them belong to this same milieu, and "go all out" in their mathematical investment. It's possible that□this uneasiness played a role no less strongly in them than in the other friends I thought I had in the same environment. In any case, each situation (between me and one of my former friends or students) is unique and different from all the others, and any general assumptions I may make are of very limited and provisional scope.

Returning once again to the more solid ground of the case in point, I am struck by the fact that the two ex-students

---

<sup>84</sup>(\*) (May 28) See in the same vein the note of May 14, "Le Fossoyeur - ou la Congrégation toute entière", n° 97.

whose active participation in my beloved master's funeral I was able to witness, were also the very ones who had first drawn my attention to themselves by their contemptuous, discouraging attitudes: towards younger mathematicians who were "post-1970 students", where the influence of my ideas and approach to mathematics was clearly visible. This coincidence certainly came as no surprise (although, of course, events surprised me at every turn!). Another interesting coincidence is that both were among those with whom the personal relationship was the most friendly and even affectionate (and for one, this relationship has continued, and in this tone, to this day). This is in line with the general observation that it's the closest relationships that have the greatest virtue of attracting and fixing the forces of conflict.

Yet another coincidence struck me. Among all the students I've had over the past twenty-five years, there are two who stand out for me, both for their exceptional "means", and for their investment in mathematics commensurate with these means. (An investment of a strength comparable to that which I myself made during twenty-five years of my life). For both of them, moreover, I made a point of counting them among my pupils, even though it's true that they both learned things from me that were useful to them<sup>85</sup> (\*). It was in the nature of things that both of them would discover their own tasks, without my having to suggest any of those I had (or have) in mind.

reserve - and the thesis work of both was carried out independently of me<sup>86</sup> (\*\*).

So many □ points in common! As a point of dissimilarity, I would say that the youngest (unless I'm mistaken) of the p.

282

two is today "at the pinnacle of honors" (whose detailed enumeration I'll spare the reader, and to the known modesty of the person concerned), and that he is one of the most influential mathematicians, that is to say, also one of the most powerful; the other is for the moment a delegated assistant, in a position that the incumbent will take over next year. There are other points of dissimilarity, which explain to some extent this difference in fortunes - just as there are other points of similarity on which it is pointless to dwell here. Except for the fact that, of all the students I've had, it was with both of them that my personal relationship was also the closest and friendliest, while a common passion had from the outset created a strong bond between each of them and me. The **coincidence** I'd like to mention now is that, as far as I know, they were the only students too (in quotes, that's a given!), who vis-à-vis the "big world" did their utmost to minimize or erase, as far as possible, this very simple and obvious link to me.

It's a truly striking coincidence, the meaning of which still eludes me at the time of writing. For both, I could invoke reasons of conjuncture, different from one to the other. And it is quite possible and even probable that for both of them, at a certain level which is probably no longer that of fully conscious intentions, such a reason (of fatuity for one, of prudence for the other) came into play. I doubt, however, that this ready-made explanation will provide an understanding of the matter, in either case.

---

<sup>85</sup>(\*) (May 28) That's an understatement, as I later found out to my chagrin! See yesterday's note "L'être à part", n° 67'.

<sup>86</sup>(\*\*) (May 28) That's not quite true. Both of them made essential use in their work of tools that I had and which they learned from me. Beyond this role, Hodge-Deligne's theory in the work that constitutes his thesis (Hodge Theory II, Publications Mathématiques n° 40, 1972, p. 5-57) stems directly from the yoga of motives that he got from me - "mixed Hodge structures" being the "obvious" answer to the (also "obvious") question: "What is the difference between the two?

in the perspective of motives) to "translate" in terms of Hodge "structures" ("in a suitable sense") the notion of motive not necessarily semi-simple on the field of complexes. Beyond a brilliantly conducted "translation exercise", there are of course original and profound ideas in this work that are "independent of my person". But it is also clear that the Hodge-Deligne theory would not exist today (nor, doubtless, almost all of the work of Deligne or any of my other students) if they had not had access to the ideas and tools that I introduced into mathematics, and which they learned from me.

the other. Surely, deeper still, other forces must have been at work, the real ones, behind the familiar appearances of fatuity or pusillanimity. Surely, these acts that express them have something important to say to each other. But surely, too, the appearance of the same acts in two such different people, as if they'd given each other the word (something certainly unthinkable, given the difference in their personalities), is a sign that they're on the same wavelength.

p. 283 fortunes!), also has something important to say to me, and about none other than myself. Could this be nothing more or less than a reproduction of the eternal **rejection of the father**? The latter, however, has  
□'embarras du choix

among the avenues open to him to express himself! Or is it because that sure instinct of the unconscious, which makes it touch "just right" in the most sensitive or vulnerable places (when it comes to "touching"), has meant that both have fallen on the **same** spot? I'd actually be inclined to think so. But that's an inferred thing, not a seen thing, whereas lacking eyes with the gift of seeing clearly and deeply, I feel a bit like a blind man groping around in the dark, trying as best he can to "see" with his hands or his ears or his epidermis, which aren't really made for seeing.

So as not to close on this note of **perplexity** (prejudicial to my reputation), but on a note that would be pleasing to a benevolent and hypothetical reader, I will only say the concluding name, which appeared earlier, and which seems to me to express well the content common to the various considerations of this **epilogue** (to a reflection on a funeral), namely:

**The Unanimous Agreement!**

# 11. C) THE BEAUTIFUL WORLD

## 11.1. VII The Colloquium - or Mebkhout and Perversity bundles

### 11.1.1. Iniquity or the meaning of a return

□

p. 285 **Note 75** (May 2) I'm definitely not done learning! I've just read two

texts, which shed unforeseen light (for me at least) on the "escamotage" (of Meb- khout's work) already mentioned ("L'inconnu de service et le théorème du bon Dieu", note (48)). It concerns the role played by the two illustrious colleagues and former students whose disdainful indifference to Zoghman Mebkhout I noted, without however questioning their professional bona fides. Both texts are part of the Proceedings of the **Luminy Colloquium** (July 6-11, 1981) entitled **Analyse et topologie sur les espaces singuliers**, published in Astérisque n° 100 (1982).

The first of these texts is the introduction to the Colloquium, signed by **B. Teissier** and **J.L. Verdier** (the same man who acted as Z. Mebkhout's official thesis director). This one-and-a-half-page text begins with an explanation of a certain "Riemann-Hilbert correspondence", which is clearly destined to play a leading role in the Colloquium (and which is none other than the "theorem of the good Lord" alias Mebkhout). In this correspondence (and this is what gives it its charm and depth, and necessitates the introduction of derived categories), a regular holonomic **module** (i.e., a regular holonomic complex reduced to degree zero) is associated with a constructible complex of C-vector bundles, which can be characterized (it is said) by purely topological properties that make sense for constructible complexes of sheaves over a not necessarily smooth variety defined over any body.

This, it is explained, is the starting point for the Colloquium's "main theme", "**perversity, intersection complex, purity**" - the (complex  $\square$  of) so-called "**perverse**" beams<sup>1</sup> (\*) being none other than those which, "morally", correspond ("à la Mebkhout") to the simplest complexes of regular holonomic differential operators, expressed using a single D-Module.

The second text is part<sup>2</sup> (\*\*) of the long article by **A.A. Beilinson, J. Bernstein and P. Deligne** on perverse bundles, referred to in the introduction as the central work of the Colloquium. As can be seen from the table of contents and the other pages at my disposal, this paper marks the sudden re-entry of derived and triangulated categories into the public arena, in the wake of Mebkhout's obscure work and the famous "Riemann-Hilbert" theorem.

Incredibly, in both texts, Z. Mebkhout's name is absent. Mebkhout is absent, just as he is absent from the bibliography. I should point out that not only was J.L. Verdier perfectly aware of Mebkhout's work (and with good reason!), but so was Deligne (and it would be difficult even to imagine that it could be otherwise, for someone so well-informed about current mathematical events, and when it's about the subject that touches him most closely<sup>3</sup> (\*\*\*)).

I don't know what happened to B. Teissier<sup>4</sup> (\*\*\*\*) and the other participants in the Colloque de Luminy, notably the two co-authors with Deligne of the article cited<sup>5</sup> (\*\*\*\*). It seems that none of the participants was so curious to know the authorship of the ideas and the key theorem that had had the virtue of mobilizing them.

<sup>1</sup>(\*) (May 4) See note no. ° 76, "Perversity", on this strange application.

<sup>2</sup>(\*\*) (May 4) I've since received the full article, which confirms what the part I had already shown me.

<sup>3</sup>(\*\*\*) In particular, Mebkhout's work and his "theorem of the good God" represent a decisive advance on Deligne's earlier work (from 1969), which he refrained from publishing. On this subject, see note n° 48' already quoted.

<sup>4</sup>(\*\*\*\*) (June 12) B. Teissier had long been interested in Mebkhout's work, and had thus been one of the very few to have an encouraging attitude towards him. He was therefore perfectly aware of the scam, to which he knowingly lent his support. He justified himself to Mebkhout by assuring him that, in any case, he "couldn't have done anything about it".

<sup>5</sup>(\*\*\*\*\*) (May 28) I have since learned that A.A. Beilinson and J. Bernstein were informed of Mebkhout's results by P. Deligne (in October 1980) and by Mebkhout (in detail in November 1980, at a conference in Moscow). These two authors made essential use of the God's theorem in their demonstration of a famous conjecture known as the Kazhdan-Lusztig conjecture, even before the Colloque de Luminy in June 1981 - Compare the quotation from Zoghman Mebkhout's letter in the note "A feeling of injustice and powerlessness" (note n° 44").

(June 3) For further details on the solidarity of all Colloquium participants, see the following note "The Colloquium", n° 75'.

I assume that it was taken for granted, a little (a lot) like in the volume of the lecture Notes LN 900 which, the following year, was to consecrate the re-entry of motifs on this same "public square"<sup>6</sup> (\*\*\*\*\*); that paternity belonged to the most brilliant among the brilliant mathematicians who had taken the initiative of the Colloquium and

p. 287 had animated it. What everyone knew for sure was that it was neither Riemann nor Hilbert, otherwise the brilliant Colloquium ☐ would have taken place in 1900 and not in 1981, two years after the pupil's thesis defense.

Unknown by Jean-Louis Verdier.

The kind of operation I've witnessed here is perhaps now commonplace<sup>7</sup> (\*) and perfectly acceptable, as long as it's carried out by mathematicians who are at the top of their game, and the one who pays the price is a vague unknown (even though he's been kindly invited to join in the fun). The fact that one of these men is a great mathematician, both in terms of his means and his work (which puts him above suspicion from the outset), doesn't change the nature of the matter. Surely I'm old-fashioned - in my day, this kind of operation was called a **swindle**, and this one strikes me as a **disgrace** to the generation of mathematicians who tolerate it.

The brilliance of genius takes nothing away from such a disgrace. It adds an unprecedented dimension, perhaps unique in

p. 288 the history of our science<sup>8</sup> (\*\*). ☐ Behind the apparent absurdity and gratuitousness of the act (carried out by someone whom fate has blessed beyond measure, yet who delights in plundering. . . ), we can glimpse the action of forces other than the mere desire to shine, or the gratuitous desire to humiliate or despair those who feel defenceless and voiceless. ), the action of forces other than the mere desire to shine, or the gratuitous desire to humiliate or despair those who feel defenseless and voiceless.

Since I'm definitely in the middle of a "tableau de mœurs", I'd like to point out (almost as a matter of course) that my name is equally absent from the quoted texts. Yet I was pleased to note that there is not a single page of the quoted article (among those in my possession<sup>9</sup> (\*)) that is not deeply rooted in my work and bears its mark, right down to the notations I introduced, and the names used for the notions that come into play at every step - which are the names I gave them when I first became acquainted with them before they were named. There are, of course, some minor adjustments - for example, the biduality theorem that I had worked out in the fifties<sup>10</sup> (\*\*) has been renamed "Verdier duality" for the occasion, still the same Verdier, there's no mistake. ... <sup>11</sup>(\*\*\*). However, it has not been possible for my name not to appear at least implicitly, through occasional references to texts that are still irreplaceable (despite SGA 4<sup>1</sup>, which is not quite sufficient<sub>2</sub> for its purpose), namely EGA and SGA. (In the explanation of the acronym SGA = Séminaire de Géométrie Algébrique du Bois Marie, my name of course does not appear, but in EGA, honest or not, the full designation is given, with the names of the authors including mine... . ) Another detail that struck me, and which testifies to the obsessive strength of the burial syndrome (in someone who, however, has no obsessive "profile" whatsoever): the two references I saw to SGA make a point of explaining each time especially "Mr. Artin's theorem in SGA 4. ... .", lest the misguided reader get the idea that said theorem might be due to the carefully non

<sup>6</sup>(\*\*\*\*\*) See notes n° s 51,52,59.

<sup>7</sup>(\*) I'm thinking of two other "operations" along the same lines, which took shape with the publication of LN 900 (see previous b. de p. note) and APG 4<sup>1</sup> five years earlier (see notes n° s 67, 67', 68, 68').

(May 9) For a third such operation, closely related to the previous ones, see the "Good references" note (n° 82). on another "memorable article", this time by J.L. Verdier.

<sup>8</sup>(\*\*) Nor have I ever heard of such a thing in the history of any other science or art than mathematics.

<sup>9</sup>(\*) (May 4) And the others too, of which I have since become aware.

<sup>10</sup>(\*\*) The same goes for the theory of dualité étale, which becomes "dualité de Verdier" under the pen of his generous friend Deligne!

<sup>11</sup>(\*\*\*) (May 5) Compare notes n° s 48', 63". Throughout this long Burial, which has been going on for nearly fifteen years, and throughout the discovery that the principal "anticipated deceased" has just made over the past month, J.L. Verdier seems decidedly inseparable from his prestigious friend, who lavishes him with the wreaths of flowers that are de

named, when it is quite clear that the presentation was indeed made, thank God, by a named author! (77)

□ It's <sup>all</sup> fair game in today's "beau monde", it seems. Without indulging myself (and it's not meant for that. ... ) this guéguère is not really detrimental to the anticipated deceased, whose symbolic remains are thus left to the vagaries of this fairground, which I have been discovering with wonder for barely two weeks. It doesn't gnaw at my life with the feeling of **iniquity** suffered in impotence. It hasn't broken the joy and impetus that carry me to the encounter with mathematical things and those of the world around me, nor has it burned the delicate beauty of these things in me. I can consider myself happy, and I **am...**

p. 289

And I'm happy too about my unexpected "return", the meaning of which had escaped me. If it were to teach me only what I have learned in these past days, this return will not have been in vain, as it has already fulfilled me ( $\Rightarrow$  76).

### 11.1.2. The symposium

**Note 75'** (June 3) I have received details of the other participants in the colloquium, which dispel all doubts. Although no talk by Mebkhout had been scheduled in the Colloquium's official program, Verdier was obliged to ask him on the spot and in extremis to give a talk, to make up for the shortcomings of one of the official talks (which had been entrusted to Brylinsk'i, who knew little about D-Module theory). Mebkhout was thus able to set out his ideas and results, and in particular the Good God Theorem, in such a way as to leave no doubt as to the authorship of this theorem, and of the philosophy that goes with it, which had led to the spectacular revival of the cohomology of algebraic varieties, culminating in this Colloque. So, **all the participants in the colloquium were made aware of this paternity**, through this presentation. I also assume that all of them, without exception, have since been acquainted with the Colloquium Proceedings, and in particular with the Introduction and the cited article by Beilinson, Bernstein and Deligne. Not a single one, apparently, found anything wrong with it - or if they did, they didn't let on. Zoghman Mebkhout received no such feedback. So, all the Colloquium's participants can justifiably be considered to be in solidarity with the mystification that took place during the Colloquium.

This collective mystification was already clear at the Colloquium, since no one found anything wrong with the fact that, in Deligne's oral presentation on so-called "perverse" beams, the name of Mebkhout is not pronounced. The speaker confined himself to stating the good Lord's theorem, saying □ **that** he wasn't going to demonstrate this in his talk. He made it clear, moreover (with the modesty with which he

p. 290

is accustomed to) that "there was no merit" in guessing the extraordinary and a priori unpredictable properties of the beams he calls "perverse", obviously suggested by the "Riemann-Hilbert correspondence" he had just mentioned<sup>12</sup> (\*). Everyone found it normal that he should refrain from naming the person who had had the "merit" of discovering this providential correspondence, and that he should give the appearance that the author was none other than himself, even though they had just learned, or would learn in the following days, that this was not the case. It must have been some sort of inadmissible misunderstanding that a vague participant in the Colloquium should be the author of such a remarkable theorem, and everyone did their utmost to rectify the situation and establish a consensus which attributed authorship to the one who was clearly the right person for the job - the one who **should have** been the author<sup>13</sup> (\*\*).

<sup>12</sup>(\*) Compare with pages 10 and 11 of the article quoted.

(June 7) For details on the art of escamotage, see the following note "Le Prestidigitateur", n° 75".

<sup>13</sup>(\*\*) (June 5) everything fits together! The reflection that continued in the "l'Elève" procession (following on from the "Le Colloque"), and a certain tone as well (notably again in a recent and brief exchange of letters with Deligne, see first footnote to the note "Les obsèques", n° 70), show me that for Deligne and my other cohomology students, it is clear that

Characteristically, **Mebkhout's paper does not appear in the Colloquium proceedings**. Verdier had asked Mebkhout not to write his paper, saying that the Colloquium was intended to present new results, whereas Mebkhout's had already been published for over two years.

When you don't get bogged down in a technical discourse, and look at what's actually been done, you'll be able to see what's really going on.

p. 291 the forces and appetites that animated uni 'and the others, you'd think you were watching a film about mafia rule in the underworld of some distant ☐Megapolis, It's

The actors are among the noblest jewels of French and international science. The Grand Chef, who runs the operation with his finger on the pulse, is none other than the man who once looked to me like a modest, smiling spiritual son, or at least a (no less modest and smiling) legitimate heir. As for the one who can be drilled and cut, the "soft" one in a world of "hard" ones who don't give quarter, by a strange "coincidence" whose meaning I still don't fully grasp, he too is closely linked to me. He's my "pupil" like the Great Chief (and like him, "pupil" with quotation marks... ) - the one who took me on when I'd already been declared dead and buried for years... .

### 11.1.3. The conjurer

**Note!** 75" (June 7) The "memorable article" (referred to in the previous two notes) displays a consummate art of casual evasion. The equivalence of categories that has been the essential motivation of the whole work is introduced for the first time in a sentence in the fourth rage of the Introduction (page 10, lines 9 to 15), without giving it a name, only to be followed immediately by the kyrielle of consequences for the notion of the so-called "perverse" bundle (pages 10 and 11). No further mention is made until the end of page 16, when we read<sup>14</sup> (\*):

"We would like to point out that on the following points, **which would have found their place in these notes**, we have failed in our task.

- The relationship between perverse beams and holonomic modules. As mentioned in this introduction, it has played an important heuristic role. The essential statement is 4.1.9 (**not proved here**). . . "  
(To continue with other "points that would have found their place. . . ")

I hasten to find out what this "essential statement" is that the authors haven't found the leisure to include in their work, or at least not to demonstrate. Let's look for it:° 4.1.9. ... I'm looking for an "essential statement", a theorem in the form of a scholia, with a reference **where** the authors have demonstrated it or are going to demonstrate it, since they don't prove it **here**. . .

p. 292 But no matter how hard I look, there's no trace of a "theorem 4.1.9" - there's only one passage that answers the number 4.1.9- So I start reading the "remark" at random (without conviction☐- there must be a mistake of numbering. ... ), I read that "the analogue of 4.1.1 in complex cohomology is true... . "Unfortunately, I'll have to go back to 4.1.1 to find out what it's all about. I skipped over it and skimmed through the text that followed - and lo and behold, I couldn't believe it, eleven lines later, a sentence that starts with "We know that... . " and ends with "induces an equivalence of the category . . with that of perverse beams".

Phew - so that was it after all! But no matter how hard I looked, I couldn't find the slightest hint to clarify that cryptic "We know that... . ". Readers who didn't already "know" it must be feeling pretty silly, not to the

---

it's been a long time since Deligne should have been the one to discover and master staggered cohomology; and at a certain level (that which commands behavior and attitudes), they're convinced that it's really him, next to whom I'd be a sort of clumsy, clumsy auxiliary who would be more detrimental than anything else to the harmonious unfolding of a theory (leading to Deligne's theorem-ex-Weil's conjectures) and to a distribution of roles satisfactory to all concerned. . .

<sup>14</sup>(\*)Emphasis added.

the situation. What's clear to him in any case (apart from the fact that he's not up to it), is that this result "which would have found its place in his notes", which is "recalled" here in the course of a technical remark - something the reader should know anyway - is obviously due to the authors of the "notes" in question, or to one of them; the most prestigious perhaps and who wrote the article (there's an unmistakable "house style" . ), or the one who gave the oral presentation, whose well-known modesty prevents him from saying "it's me! - but everyone understood without having to say it...

It immediately brings back memories of my reflections over the last few weeks. The very first is Deligne's first work in 1968, which I finally (sixteen years later) took the trouble to look at a little more closely in the note "L'éviction" (n° 63) of April 22 (three days after the discovery of the pot-aux-roses LN 900). Here I find the same style, with variations no doubt due to the intervening thirteen years of "breaking-in". In the 1968 article, whose main inspiration came from me, he names me in passing and in a sybilline way towards the end of the article, just to be "in order". Here, he no longer takes such care - experience has long since shown him that there's absolutely no point! On the other hand, in the article of his young age, since he felt obliged to name me, he compensated by entirely retracting the initial motivation for his work (and the yoga of the weights with it, only to release it under an alternate paternity six years later, while awaiting the exhumation of the motives eight years later still... .). In any case, even hiding (and keeping for his own benefit. ... ) the article's essential arithmetical motivation, it "stood up," this article was perfectly understandable, living up to the author's reputation for doing things ☐ perfectly .

p. 293

Here, the theory he develops would be incomprehensible without the heuristic motivation. So he points to the latter, referring to it as "the essential statement", while treating it from under the leg - without honouring it with a name, or a formal statement baptized theorem or proposition, there isn't even a "correspondence" (known as Riemann-Hilbert) - he left that to his friends Verdier and Teissier. He doesn't have to give it a name (given the few<sup>15</sup> (\*) - surely he'd demonstrate it in five minutes!) or name anyone - others will take care of that for him and to his complete satisfaction. There is clearly a yoga, a philosophy, that the author handles with perfect mastery and authority, without having to name anything - this "little" that he pretends to disdain ("which would have found its place in these notes"), he knows full well he'll get more of, as long as he knows how to keep quiet and wait. The first time he played this game successfully, the "few" were "weight considerations" alluded to in a sibylline remark (waiting to bring out the philosophy of weights with great fanfare, six years later). The second time, as far as I know, was when I left in 1970 - the "little" was the "dream of motives", which for twelve years didn't deserve to be honored with a word (just think - a dream, and a dead man's dream at that, not to mention unpublished!), while we wait to discover the real motifs this time (and what we can do with them) and to claim, as modestly as ever, undisputed authorship<sup>16</sup> (\*\*\*).

#### 11.1.4. Perversity

**Note 76** (May 4) I well remember the first time I heard the name "faisceaux pervers", must be two or three years ago, that it struck me unpleasantly, arousing in me a feeling of unease. This feeling reappeared the two or three times I heard this unusual name again. There was a sort of inner "recoil", which remained at the surface of my consciousness and would have been expressed without a doubt (if I had stopped to examine it), but which was not.

<sup>15</sup>(\*) (June 14) To put this "little" in context, I'd like to remind you that Deligne devoted a seminar at the IHES to trying to develop a translation of constructible discrete coefficients in terms of continuous coefficients, without arriving at a satisfactory result.

On this subject, see the note "L'inconnu de service et le théorème du bon Dieu", n° 48'.

<sup>16</sup>(\*\*)For further comments on this technique of "appropriation through contempt", see the following day's note, n° 59'.

then) by something like: what an idea to give such a name to a mathematical thing! Or even

p. 294

□ any other living thing or being, except at a pinch a person - for it is obvious that of all "things" of the universe, we humans are the only ones to whom this term can sometimes be applied. ...

It seems to me (although I'm not entirely sure) that it was none other than Deligne himself who first spoke to me about so-called "perverse" beams, when he dropped by my place after the Colloque de Luminy<sup>17</sup> (\*). It must even have been one of the last mathematical conversations between us - there were no others after his visit. It was precisely during this visit that this "sign" appeared, which led me a few weeks or months later (while this sign was reconfirming itself in the exchange of mathematical letters that followed this encounter) to put an end to a communication on the mathematical level<sup>18</sup> (\*\*). (For this episode, see the note "Two turning points", n° 66. )

Coming back to the so-called (wrongly i) "perverse" beams, it's obvious that "normally", these beams should have been called "Mebkhout beams", which would only have been fair. (On more than one occasion, I've named mathematical notions I've worked out and studied after predecessors or colleagues who were much less closely associated with them than Mebkhout was with this beautiful notion - which, incidentally, would seem to me to be more "sublime" than perverse!) The circumstances in which Deligne found himself at the time he was discovering and naming this notion derived from Mebkhout's work, preparing to rob him when he himself was already "fulfilled beyond measure" - these circumstances can rightly be called "perverse". Surely my friend himself must have felt it in his innermost being, at a certain level where one is not fooled by the facades one likes to flaunt. I sense in the attribution of this name (which seems aberrant at first sight) an act of **bravado**, a kind of drunkenness in a power so total, that it can even allow itself to display (symbolically, by the display of a provocative name whose true meaning no **one** will allow themselves to read!) its true nature of "perverse" spoliation of others.

p. 295

□ It seems by no means impossible that at some deep level, I perceived the tone of these dispositions in my friend, and that this contributed to the unease I mentioned<sup>19</sup> (\*). This uneasiness was expressed in particular by my inattention to the explanations he had to give me, although I don't think there had been an occasion before this meeting when I hadn't followed what he was telling me with sustained attention, and especially when it concerned mathematics. There was a kind of blockage in me with regard to this notion called (God knows why) "perverse" - I didn't really want to hear about it, even though it was very closely linked to issues I was (and still am to some extent) very close to.

In fact, the whole article by Deligne et al. was typical "**grothendieckery**" and all

---

<sup>17</sup>(\*) If this is indeed the case (as I'm now convinced it is) I must give credit to my friend's modesty, for I had no idea (on a conscious level at least) that it was none other than he who had introduced and named them. I had to read the "memorable article" to realize this.

(May 28) To tell the truth, the article doesn't say this any more than it says that Deligne is the father of the Riemann-Hilbert correspondence. However, I had no doubts about his authorship of the term "faisceaux pervers", which was subsequently confirmed to me.

<sup>18</sup>(\*\*) On a purely personal level, this relationship continued in the same tone of affectionate friendship as before, with no apparent change. My friend used to come every other year or so to visit me, usually on some kind of hike. I did have a visit again last summer, which was a welcome opportunity to get to know his wife Lena and their infant daughter Natacha. I think it was on the way back from yet another Colloque de Luminy, about which I've heard very little (apart from a few vague, morose allusions from Mebkhout, who had been given the honor of being invited again, and who could think of nothing better to do than to get back into the game... .). They stayed at my place for two or three days, and the contact was excellent all round.

<sup>19</sup>(\*) I would even be inclined to think that this is indeed the case. On more than one occasion, I've been able to see for myself the extent to which the deepest perception of things is of a finesse and acuity that have no comparison with what skims the surface at the conscious level. The fully "awakened" man is undoubtedly the one in whom these perceptions are constantly integrated into conscious vision and conscious experience - the one who lives fully according to his true means, and not just on a paltry portion of those means.

that could just as easily have come from my pen (with the sole exception of the name of the main concept)! It's something I've already expressed in the second part of the previous note (n° (75)), and something I've also sensed from the moment I read the article quoted - but without this diffuse feeling yet being embodied in the striking observation I've just made. It makes me aware once again, in a striking way, of the profound contradiction of the person who cannot help (in a certain sense

sense) to reproduce and assimilate the very one it is a question of denying, of handing over to disdain - the one it is a question of burying, and who is also at the same time  $\square$  the one one **wants to be** and that (in a certain sense) one **is**.

p. 296

The day before yesterday, as I was writing the previous note ("l'Iniquité - ou le sens d'un retour"), I had already been struck by the coincidence that this turning point in the relationship between my friend and me, suddenly impoverished of a communion in a common passion, which had been its *raison d'être* and most powerful mainspring, took place on my friend's return from that memorable Colloque, the meaning of which had just revealed itself to me. What had puzzled me at our meeting in July '81, which on one level was as friendly and affectionate as on the other occasions we met, was this "sign", discreet in tone and air, yet brutally obvious, of a deliberate gesture of disdain. It was like a sort of **down payment** that my friend was making, this time at the level of a personal relationship, on the implicit and equally "discreet" (and just as "brutally obvious") disdain that he had just publicly expressed towards me, as a public figure, at the Colloque de Luminy, in the context of a brilliant display of technical virtuosity between the stars of the day. It was the same "disdain" that had just been expressed (but this time with an altogether different "perverse" brutality) towards the man who had dared (even a little) to claim to be me, and who had thereby condemned himself to be, for my friend Pierre (at a certain level at least), nothing more than "another Grothendieck"<sup>20</sup> (\*) who had to be crushed at all costs. . .

#### 11.1.5. **Pouce!**

**Note 77** (May 5) Another detail struck me as I perused this memorable article<sup>21</sup> (\*\*) which dominated (at this that no less memorable Colloque de Luminy in June 1981. The last chapter, under the suggestive title "From F to C", describes at length a remarkable principle that I had introduced into algebraic geometry twenty years ago - that must have been before the birth of the notion of pattern (which in gives the **most  $\square$  deep** illustrations, via Weil's ex-conjectures). This principle ensures that for some p . 297

In the case of statements concerning schemes of finite type over a body, it suffices to prove them over a finite base body (i.e., in a situation "of an arithmetical nature") to deduce their validity over any body, and in particular over the body of complexes - in which case sometimes the algebraic-geometric result envisaged can be reformulated by transcendental means (e.g., in terms of integer or rational cohomology, or in terms of Hodge structures etc.)<sup>22</sup> (\*). My friend learned this from none other than me and from me, on numerous examples over the years<sup>23</sup> (\*\*). The authorship of this principle (which in an elementary form is even spelled out in EGA IV - don't ask me which paragraph and which number... .) is well known<sup>24</sup> (\*\*\*) . So much so that

<sup>20</sup>(\*) In our personal relationship, my friend calls me by the affectionate diminutive (of Russian origin) of my first name, Alexander, which is also what my family and closest friends have called me since childhood.

<sup>21</sup>(\*\*) See note n° 75 about the "memorable article".

<sup>22</sup>(\*) (May 6) It seems to me that the first example of the use of such a principle can be found in Lazard's theorem on the nilpotence of algebraic group laws on the affine space  $\underline{E}$  (over any body). I was struck by his demonstration, and drew inspiration from it for a number of other statements, as well as for a "philosophy" that has dominated my thinking on pattern theory.

<sup>23</sup>(\*\*) See the note "Eviction" (n° 63) for one such example.

<sup>24</sup>(\*\*\*) (June 5) It is perhaps abusive for me to claim to be the "father" of a principle whose first known application is by Lazard (see previous note (\*)). My role, as on other occasions, was to sense the generality of someone else's idea,

When my brilliant friend was awarded the Fields Medal at the Helsinki Congress in 1978, N. Katz couldn't resist mentioning it in passing in his speech in honor of P. Deligne, thus rectifying a somewhat embarrassing systematic "oversight" on the part of his illustrious laureate. I read this speech just a few days ago, along with the "memorable article" itself.

p. 298 In any case, in this article, the philosophy behind the transition from "arithmetic" to "geometry" is presented in such terms that there can be no doubt in the mind of an uninformed reader that the brilliant lead author (excuse me, I impair. . . ) has only just discovered this wonderful principle of such far-reaching significance.

It's true that I haven't patented the method, and nowhere does my brilliant friend say that he's the brilliant inventor; nor does he claim in plain English that he's the father of that famous "correspondence" (admire the term, which smacks of his nineteenth century!) modestly attributed to Riemann and Hilbert (men worthy of sponsoring the children of such a prestigious successor) - nor does he specify in the "memorable volume" (LH 900) that it was indeed he who invented motives, motivic Galois groups and the whole philosophy that goes with them (and of which he has still only released a fragment). There's nothing to be said either for this famous SGA 4<sup>1</sup>, where I've even been honored to be listed as a "contributor" to this volume, which so brilliantly develops ab ovo étale cohomology, deigning to call on (despite their regrettable gangue of superfluous details etc.) the two satellite volumes SGA 4 and SGA 3.) to the two satellite volumes, SGA 4 and SGA 5, which have been consigned to oblivion, but to which I am generously credited with providing a few technical additions and digressions (some of them even "very interesting")<sup>25</sup> (\*).

In all these cases - and in many other micro-cases I've witnessed over the last five or six years, without it ever occurring to me to **pinpoint my discomfort** and give a name to what I was witnessing or co-acting in<sup>26</sup> (\*\*) - in all these cases, I recognize the same **style**. My friend is always and totally "**thumbed**" - he can help himself at ease, with the complete good conscience that comes from admiring his peers and his blunders (with all due respect), guaranteeing total impunity.

### 11.1.6. The Chinese emperor's robe

p. 299 **Note 77** (May 7) Of course, those who see what my friend Deligne is doing and are in the know at all for the ins and outs, I mean those who haven't just learned about the maths "being done" from the publications of the person concerned himself, or other brilliant (though not always golden) stars of his generation - these colleagues (and they're not that rare after all!) are well aware, at **some level**, of what's going on. They must have sensed, in the "big" cases, that particular uneasiness that I myself have felt on more than one occasion in the face of these "micro-cases" a hundred times less serious than the "big" ones.

and systematize it to the point of making it a "reflex" or "second nature". In the context of the yoga of weights and patterns, it's likely that the first to use this principle was Serre (not me), with his idea of virtual Betti numbers, which set me on the path to just such a general yoga of weights and patterns. (See note n° 46, for Serre's idea in question.) It is

It's also true that it's common practice to attribute the authorship of a "principle" of reasoning that has become commonplace, not to the author, but to the author's "principle".

It's not the first time we've seen a trace of it, but the one who first perceived its general scope, systematized and popularized it. In this sense, we can say that N. Katz's correction (mentioned in the following sentence), attributing the paternity of this principle to me, is justified.

<sup>25</sup>(\*) For details of the "SGA AT operation", see the four notes "La table rase", "L'être part see the four notes "La table rase", "L'être à part", "Le Feu vert", "Le renvers- ment" (notes n° s 67, 67', 68, 68').

<sup>26</sup>(\*\*) The first step towards "pinpointing my discomfort" in a specific case was taken in Récoltes et Semailles less than a year ago, three months ago, in the reflection (which turned out to be quite laborious - and with good reason) "The note, or the new ethic" (section 33). This reflection was taken up again in a note to that reflection, "Le snobisme des jeunes, ou les défenseurs de la pureté" (note n° 27), and then again less than two weeks ago (under the impact of the discovery (the day before) of the "memorable volume" (LN 900)) with note n° 59: "La nouvelle éthique (2) - ou la foire d'empoigne". As I wrote this, a nuance remained in my mind I had no hesitation in using the rather crude term "foire d'empoigne". The discoveries that have followed since have shown me that no hesitation was required.

bigger than these. But what they sensed was so **enormous**, so **incredible** that it must never have surfaced - as it finally began to surface with me, in the course of a **work**, which expressed itself in these two texts around a micro-case referred to in the previous b. de p. note. Indeed, I've never heard of anything like it in the history of our science or any other. Instead of "surfacing", for some people "it" must have **become the norm**, or at least been considered **normal** - as long as an obviously brilliant man, admired by all, practised it with the greatest naturalness in the world, in full view of everyone and without the thing ever (as far as I know) eliciting the slightest comment.

Over the past few days, I've been reminded many times of the tale "The Dress of the Emperor of China", in which the aforementioned emperor, deceived by unscrupulous swindlers and his own vanity, announces that he will appear in a solemn procession wearing the most sumptuous garments the world has ever seen, prepared for him at great expense by so-called tailor artists. And when he appears in the procession, surrounded by the pomp and circumstance of his Court in full regalia, the "artists" bowing and scraping, and the entire imperial family, no one in the procession or among the people gathered to contemplate the seventh wonder dares to believe the testimony of his eyes, and everyone makes a point of admiring and raving about the unsurpassable splendor of the garments with which he is now adorned. Until a small child who had strayed into the crowd exclaimed, "But the emperor is naked!" - and then all of a sudden the whole crowd, as if with one voice, cried out with the little child: "But the emperor is naked!"

And I feel like the little child who believes the testimony of his eyes, even though what he sees is quite unheard of, never seen before and ignored and denied by all.

□ Whether the child's voice will be enough to bring some back to the humble testimony of their healthy faculties, that's another story. A tale is a tale, it tells us something about reality - but it's not reality<sup>27</sup> (\*).

p. 300

### 11.1.7. Encounters from beyond the grave

**Note 78** (May 6) It's only been five days since I received this generous package of documents from my friend Zoghman Mebkhout, including above all the two texts already examined from the "memorable Colloquium" - that Colloquium built around a monumental **mystification**! The note "l'Iniquité - ou le sens d'un retour", in which I try to assimilate the quite incredible meaning of this new "event", was written on the very day (the day after May 1st) that I received these documents, still in the emotion of discovery<sup>28</sup> (\*\*).

Since April 19, when I finally became aware of the "memorable volume" of the Notes readings (LN 900 - see notes (51) (52)), this has been the third great discovery on the subject of the solemnities of the Great Burial, and the one that seems to me to be of the greatest significance, both in terms of the light it sheds on the actions of the "Great Burial".

<sup>27</sup>(\*) (June 14) After writing this note, the name "The robe of the Chinese Emperor" struck me as a natural sub-title for the Burial, expressing a particularly striking aspect of it. Later, as the focus shifted to my students as a whole, and even to "the entire congregation" of the Mathematical Establishment, this subtitle seemed less appropriate. However, I've come to realize that the parable that first came to mind when thinking of my friend Deligne, applies equally to all aspects and adventures of the Burial, which at every step reach the Ubuesque in the unbelievable (which everyone makes a point of modestly ignoring) that is nonetheless true. For reflections along these lines, see in particular the notes "On n'arrête pas le progrès!", "Le Colloque", "La Victime - ou les deux silences", "La plaisanterie - ou les deux silences", "La plaisanterie - ou les deux silences", "La plaisanterie - ou les silences", "La plaisanterie - ou les silences".  
ou les complexes poids", "La mystification", "Le Fossoyeur - ou la Congrégation toute entière" (n° s 50, 75', 83, 85', 97), none of which particularly concern my friend Pierre.

<sup>28</sup>(\*\*) Along with the section "The note - or the new ethic (1)", this note is the only note or section I've had to rewrite several times, because what "came out" in the first version (and even in the next one) was weighted down by the inertia of my customary vision of things, which fell far short of the reality I was examining.

of people to whom I have been closely linked, than by its implications as a "tableau de mœurs" of an era, apparently unique (but it is true that I am ignorant of history. . . ).

p. 301

The second discovery had closely followed the first - that of the exhumation of the "motifs", for twelve years buried. After the "memorable volume", I was treated to the "memorable seminar" - that "seminar" that never took place, given a bogus name (both SGA and number 4 1/2), and enriched with the "State 0" of a phantom thesis, not to mention a central presentation from the (real) SGA 5 seminar (which appears later, even though it predates it by twelve years); a presentation "borrowed" for the purposes of the operation without further ado. This brilliant operation, and the role it played in the strange vicissitudes that befell this poor SGA 5 seminar (dismantled from the head, the tail and the middle!) were gradually revealed in the course of a reflection that continued between April 24 and 30. (See the five notes "Le compère", "La table rase", "L' Etre à part", "Le signal", "Le renversement", n°s 63", 67, 67', 68, 68'.)

As soon as I had digested this discovery, and as my retrospective reflection on "Mon ami Pierre" drew to a close, and on April 30 I had proudly put the final and definitive mark (that was a sure thing!) on my life, I decided to take the plunge.

- this time I was finally there i) under this interminable Burial, with the "final note" with the doubly euphoric name "Epilogue - ou l'Accord Unanime" - that I receive this package of misfortune, which calls into question final point, epilogue, page layouts and numbering... . A quick glance at the documentation and the accompanying annotations and letters made it clear that my period was gone, as were the beautiful arrangements for a first-class Funeral, the final details of which I was about to polish - I was ready to take up the master of ceremonies' harness. . .

God knows my friend Zoghman had plenty of time to inform me of the situation! It must have been going on for ten years in latent form, and three years at least in "acute form" (and that's putting it mildly) - ever since the Colloquium in question, where he must have sensed the wind without having to wait for the publication the following year of the highly official "Proceedings" under the patronage of his illustrious ex-patron and protector.

p. 302

A few months after he had defended his thesis (in February 1979), he had come to bring me a copy to the village where I had lived for six years. Unluckily, I had just left (never to return).  
return, except in passing... ) a few days before, to retire in solitude. He only met my daughter, who later handed me the thesis. It was the following year, I think that we finally got to know each other, in college. in Montpellier, where we chatted for an hour or two. I wasn't really into maths at the time, and couldn't really remember either a thesis I'd flipped through in a few minutes, or the name of its author. That didn't stop the contact from being warm. I remember an immediate current of mutual sympathy. We didn't talk so much about maths (not that I can remember), but mostly about more or less personal things. Zoghman told me afterwards (something I'd forgotten) that he'd been able to explain the D-Modules "philosophy" to me a little, and that he'd been pleased with the meeting, to have felt me "vibrate" if at all by learning new things from him, and yet also (in a way) "expected". What I remember most of all was the impression he made on me - an impression of stubborn, calm strength, that of a "go-getter". At the time, much more than when we met last year or during the correspondence that followed, I had the impression of a strong affinity of temperaments - this "go-getter" side in particular. But the two or three years that have elapsed between the two encounters seem to have dented it quite a bit. ...

I don't remember Zoghman telling me at our first, brief meeting about the isolation in which he had worked, the lack of any encouragement from the "luminaries" who had been my students. If he hinted at it, he must not have insisted. Even then, the whole thing didn't appeal to me.

surprise<sup>29</sup> (\*). I couldn't say whether this was before or after the Colloque de Luminy in June 1981<sup>30</sup> (\*\*). If it was afterwards, he would still have had some hot stuff on his stomach - and he really didn't give the impression of it. Rather that of a man who knows what he wants to do and what he wants, and who follows his instincts.

quietly, without seeking trouble and without being sought out.

□ We didn't continue then to write to each other. But I remembered him well, and early last year I wrote to him I wrote him a note, at random, to ask if he might be in a position to tackle a magnificent work on the foundations of a "moderate topology" which (it seemed to me) was just waiting for someone of his calibre to take it up. Although Zoghman didn't make it clear to me at first, it turned out that he wasn't really interested in this prospect - on the other hand, he seemed happy to seize the opportunity of a new encounter. At the time, I was too out of the loop to fully appreciate the situation, and imagined that D-Module theory was now a done deal, as is, say, coherent duality theory (78<sub>1</sub>), and that Mebkhout had perhaps run out of "big tasks". It was only when we met last summer that I realized that in the very theory he had started, there was no shortage of "big tasks" - and some of them had not even been started, because they had not even been seen!

p. 303

In any case, it was a perfect opportunity for a second meeting, and this time not as casual as the first. Zoghman must have stayed at my place for maybe a week last summer, in June I think. Mathematically speaking, our meeting served mainly to bring me up to speed as best we could on D-Module yoga. I've been slow to "thaw out", having lost touch with my old cohomological loves, and being mostly embroiled in the writing of "Poursuite des Champs", which is set in rather different registers. Zoghman wasn't discouraged to see me listening with a slightly distracted ear, and returned to the charge without tiring, with a touching patience. I was finally triggered, I think, when I realized that these famous D-Modules were nothing other than what I had long ago called **module crystals**, and that as such they still made sense in singular spaces. All of a sudden, I saw a whole network of intuitions from my crystalline-differential past rising up from forgotten depths, and slightly rusty reflexes from my "six operations" past being reactivated...

Perhaps it was Zoghman who was a bit of a loose cannon, or maybe it was more that he decided afterwards that he wasn't going to risk his fingers in that particular gear (any more than my friend Pierre wanted to put his - although he'd been all fire and brimstone while I'd been around... ). (⇒ 78)

**Note 78** □ There are, however, a number of "fine" results of consistent duality, notably on the structure of "dualizing differential modules", their relation to "naive" differential modules, and trace and residue applications in the non-smooth flat case, which I had developed in the late fifties which, to my knowledge, have never been published. Nevertheless, for the most part, the theory of coherent duality (in the schematic framework at least), as well as that of stellar duality (and its variant for the discrete cohomology of locally compact spaces, developed by Verdier on the stellar model), or linear algebra or general topology, appear to be theories that have essentially **been completed**<sup>31</sup> (\*), in the nature, therefore, **of tools that are** perfectly perfected and ready for use, and not so much of a **substance**.

. 304

<sup>29</sup>(\*) (May 30) That's not quite true - I'm reprojecting more recent disillusioned dispositions onto the past. When I met Zoghman just last summer, I remember being surprised that none of my cohomology students (Deligne, Verdier, Berthelot, Illusie in particular) had supported Zoghman in his work. This surprise was repeated when Deligne came to see me ten days later (I must have mentioned something to him about Zoghman, but I got no response) and by the

(See "Mystification", n° 85').

<sup>30</sup>(\*\*) (June 3) That was back in February 1980, a year after he defended his thesis.

<sup>31</sup>(\*) (June 12) This is not quite true for stellar duality, until the purity conjectures and the "biduality theorem" are proved in all generality.

that would have to be penetrated and assimilated.

### 11.1.8. The victim - or the two silences

**Note** 78 We met in an atmosphere of friendly trust and affection. This atmosphere, however, did not live up to its promise. I realize now that from that moment on, my friend's trust was far from complete. It was two years after the famous Colloque, and a year after the publication of the "Actes" in *Astérisque*<sup>32</sup> (\*\*)-at a time when he was the victim of a scandalous spoliation.

p. 305 But he didn't bother to inform me until just four days ago! When he came last year, he was returning from another Colloque de Luminy<sup>33</sup> ('\*\*\*') (this time squarely on the theme of D-Modules)'□où<sup>ou</sup> on which he had again generously invited and rushed to attend. He spoke of it in terms both bitter and vague, suggesting that now that he'd pulled the chestnuts out of the fire, it was "the others who had done it all". I could imagine the picture indeed - especially Verdier suddenly remembering the paternity of the triangulated categories (and derived ones too, while we're at it!) he had left to one side for ten or fifteen years, barely tolerating his "pupil" Mebkhout's use of them in his work... (81).

Although he didn't want to explain himself clearly at the time, Zoghman seemed to have his heart set on Verdier, which was understandable given his ex-boss's less-than-encouraging behavior. And yet, my other cohomology students - Deligne, Berthelot, Illusie - hadn't bothered to take an interest in what he was doing or to support him in any way. But it almost seemed as if Zoghman took this for granted, having never (or so it seemed) experienced anything other than this attitude among his elders. If he held a grudge against any of my former students, it was solely and exclusively against Verdier.

From Zoghman's hints (which he obviously didn't want to spell out), I understood that "they" were systematically putting the scope of what he'd done - period. This is, after all, the most common thing in the world. Since judging the importance of a thing is largely subjective, it's commonplace and almost universal to attribute more merit and importance to one's own work, to that of one's buddies and allies, than to that of others, and especially to those one feels like minimizing for one reason or another. (And the "reason" in this case wasn't exactly a mystery to me!) Nothing could have made me suspect that, far beyond such common attitudes, there was here an operation of pure and simple swindling, where there was no question whatsoever of "minimizing", but rather of **swindling** Mebkhout's authorship of the ideas and results that were breathing life back into where there had been stagnation... .

p. 306 And yet, if there was one person in the world to whom it was natural for my friend to open up, it was me. whose work had inspired him during those years of obstinate work, sometimes bitterly, against the fashion of the day - I who received him affectionately in my home, making myself a bit□his pupil at my learning as best I could what he took pleasure in teaching me<sup>34</sup> (\*).

<sup>32</sup>(\*\*) (October 9) Zoghman tells me that these "Actes" were not published until early 1984.

<sup>33</sup>(\*\*\*) (May 7) There's a slight memory lapse here - I think he was getting ready to go to the Colloquium. At the time, of course, there was no shortage of reasons for those "bitter terms" (and vague ones) I remembered. But this bitterness was further heightened by his visit to Luminy after his stay with me. I had echoes of it in a phone call he gave me on his return from Luminy. From that moment on, I had the distinct feeling that he had come to Luminy for the pleasure of being mistreated by "the people" (without really asking me which ones) who had generously invited him, for the pleasure of being able to treat him as a negligible quantity. I must have told him so, or let him know, which must not have improved my friend's attitude towards me.

<sup>34</sup>(\*) Zoghman didn't tell me about mine, and he didn't tell me about his own funeral either, even though he'd had a front-row seat to the proceedings for nearly ten years! To tell the truth, his "protectors" (a little reluctant on the edges) had even agreed to let him carry with his hands a small corner of the coffin carrying my remains - but they couldn't forgive him for being the only one among the guests who sometimes took the liberty of uttering the name that all the others kept quiet!

So my friend must have felt at odds in his relationship with me, and he couldn't find it in himself to take on the responsibility.

After my friend had passed through an atmosphere of warm affection, there was an immediate "backlash". I had the impression that he had decided to transfer to me the mistrust and bitterness that had built up in him over the past eight or ten years, under the sting of the indifference and disdain he had encountered in some of my former students. In the months that followed, the correspondence between us never left the *aigredoux* register - it finally stopped with a New Year's greetings card, which never received a reply.

It was only at the end of March that I contacted Zoghman again, to send him "Le poids d'un passé" and the notes I had then added to this section (n° s 45, 46, 47, 50). It was to ask him if he would agree to my including him, as I had done, in the short reflection on my work (in the note "My orphans", n° 46), when it would be clear to all that I was using information he had given me, and which he might consider confidential. I was by no means sure that my friend would not prefer (like others before him) to "crush rather than displease". It would have hurt my feelings if he had.

It took me a long time to get her answer, which I received only ten days later. I was somewhat expecting her to would still be half-flesh, half-fish - but □ this time she was downright warm. He'd give me his p . 307 I agreed wholeheartedly, even emotionally, with the terms in which I spoke of him.

It's on page 6 of his long (eight-page) letter that he points out, as if in passing and with reference to the "impressive number" of applications of his theorem ("both in the framework of stale topology and in the transcendental framework") that it still appears in the literature under the name of the "Riemann-Hilbert correspondence"<sup>35</sup> (\*). He says it in such an almost incidental way, and with such a delightfully illegible handwriting, that it almost went completely unnoticed! But then I remembered, it really was a strange thing. So strange, in fact, that it hardly seemed believable, and then perhaps my friend was exaggerating, obviously he was angry with everyone, including me, even though I only wanted good things for him. So I added a note (holy Zoghman, I thought I'd finished!) called "L'inconnu de service et le théorème du bon Dieu", in addition to two others "L'instinct et la mode - ou la loi du plus fort" (I'd also thought a lot about him, among others, when writing it) and "Poids en conserve et douze ans de secret". This note on "L'inconnu de service", I wrote at first without total conviction; Zoghman seemed to me so knotted up and full of contradictions that I wondered what I was getting myself into by simply echoing him, without knowing the facts for myself. The thought hadn't occurred to me that there might be a scam, let alone that Verdier or Deligne themselves were involved. There was nothing in what Zoghman had told me to suggest this... .

Yet both of them were so closely linked to this theorem of the good Lord, that its authorship could hardly be concealed without at least their tacit agreement. It must have worked on me in the days that followed. I remembered that Deligne had given it a lot of thought, this problem solved (ten years later) by Zoghman - and then Verdier, after all, acted as research director; even if he didn't go out of his way for his pupil and would rather have beaten him cold and discouraged him than anything else, he

must at least have known what the two main theorems in this work were - Zoghman surely explained them to him, during those famous "interviews" that Verdier □ was kind enough to grant him! I have therefore added to the note on p . 308

a commentary on the relationship of Mebkhout's work to an earlier attempt by Deligne, and a b. de p. note on the role of Verdier. At the same time, it was also a sounding board for my friend

---

a past fraught (as mine was) with ambiguity, and speak to me plainly and clearly. Talking about his funeral also meant talking about mine and the role he himself had played in it ... . In any case, if I ended up discovering this famous funeral in all its splendor, it was against a kind of "conspiracy of silence" that encompassed both my friend Zoghman and my friend Pierre - and no doubt most of the friends I had in the "great mathematical world".

(June 3) For further details, see note n° !78" below.

<sup>35</sup>(\*) See the quotation from his letter in the note "A feeling of injustice and powerlessness", n° 44.

Zoghman...

You'd think that Zoghman would jump at the chance to finally, finally reveal his batteries, hidden for three years, which will finally bring out the clear truth and triumph the cause of the oppressed! But not at all! Fifteen days of silence, followed by a letter about everything (in maths) except God's theorem - or rather, he confined himself to giving me the precise reference in his thesis, which I had asked for. (I still wanted to know where this famous theorem, to which I was so firmly committed, had been proved!)

In my reply to this letter, I had to say a few words to him about the "vast swindle with regard to my work" I had just discovered (with the "memorable volume" LN 900, and moreover "promising me much pleasure" in the days to come in making the acquaintance of SGA 4<sup>1</sup> in the college library) - so<sub>2</sub> that after another ten days' silence, my friend finally got in touch!

This time, at last, he "pulled out all the stops" - a **great deal**, in fact, of judiciously-chosen documents, enabling me (who hardly ever haunts libraries, or even the piles of separate prints piling up in my office at university... ) to give me a well-balanced idea of an "atmosphere", in which many of those who didn't take part in my long and solemn Obsèques still remain<sup>36</sup> (\*). Alongside the main "piece of evidence" (the two articles from the famous Colloquium, exposing the incredible mystification), and another "memorable article" (this time from the pen of Verdier<sup>37</sup> (\*\*)). there was the speech by

p. 309 N. Katz on the "Fields Laureate" Deligne, plus a presentation by Langlands and another by Manin at the same Helsinki Congress 1978; then Deligne's "Théorie de Hodge I" at the Nice Congress 1970 (where he is made another allusion in line 3 to a "conjectural theory of Grothendieck's motives" (78<sub>1</sub> ), and "Weight in the Cohomology of Algebraic Varieties" by the same Deligne, Vancouver Congress 1974 (where my name is not mentioned (78<sub>2</sub> )); plus finally a correspondence with A. Borel (yet another old friend, whom I learn at the same time is back in Zurich. . . ), and two notes to Mebkhout's CRAS, one of which from 1980 is a summary of Chap. V of his thesis (passed the previous year), giving a little more emphasis to the theorem of the good Lord<sup>38</sup> (\*). Not to mention another document - shhh! communicated under the seal of secrecy, and of which I won't say another word here. ...

Two letters accompany this substantial dispatch (letters of April 27 and 29), one very long and both substantial. Now that he's finally let the cat out of the bag (the real one, this time!), Zoghman continues to urge me to exercise extreme caution, as he had been doing ever since I contacted him again. If I listened to him, I'd be careful not to make public my reflective notes, which would remain an absolute secret between him and me - at least not the part that implicates anyone, since "they" have "all the power" and "everyone is with them"<sup>39</sup> (\*\*)! And yet, I had warned Zoghman that these notes, from which I sent him the extracts concerning him, were destined to be made public, and as soon as possible.

All the elements seem at last to be in place for the just cause of the oppressed to triumph, but the "victim" seems to be doing everything in his power to continue muddying the waters as if by magic.

<sup>36</sup>(\*) (June 12) Katz, Manin, Langlands don't seem to be part of it. . .

(March 1985) For a different take on Katz, see "Dotting the I's", n° 164 (II5), and "Maneuvers" (n° 169), "Episode 2".

(April 1985) Similarly for Langlands, see note "Pre-exhumation (2)", n° 175 . 1

<sup>37</sup>(\*\*) For more on this article, see "Les bonnes références", n° 82.

<sup>38</sup>(\*) For a precise reference for this note, Mebkhout's thesis and the Good God Theorem, see the note "Le pavé et le beau monde - ou vessies et lanternes", n° 80.

<sup>39</sup>(\*\*) (May 30) Carried away by my impetus, I'm exaggerating a little here. At no time did Zoghman suggest that I refrain from publishing

this or that part of my notes. Lately, he's even been insisting that these notes should actually appear in book form, for the benefit of "posterity", whereas a limited edition like a preprint seems to him to be a bit "like a sword in the water".

secret regret (one would say) at having sold that famous "fuse" of which Zoghman must have been (until the fateful May 2) the one and only holder. This ambiguity is apparent in every line (I'm hardly exaggerating), right down to the latest letters I've just received - including the very last one, in which he sends me, with an air of sombre triumph, the "memorable article" in its entirety (whereas, with the "big package" he first sent me, he had only managed to part with the first twenty pages of this masterpiece<sup>40</sup> (\*\*\*)).

□ As for the friend Pierre I mean Deligne (who is neither Pierre nor "friend" to everyone. . . ), it's p. 310  
it's just that he doesn't sing its emotional praises - it seems that it's no longer he, Zoghman, who's the "victim", but no, it's Deligne, poor fellow, who's been so badly influenced by those around him - the only villain, and the one who surrounded him so badly, is Verdier (and yet. . . follow my gaze instead, . . .): it's clear that I "must have done something" to Verdier for him to be such a coward for the sheer pleasure of doing harm, not to mention the fact that I was also his boss and I was also the one who awarded him the title of doctor and the glory and all the rest - the means, in short, of "absolute power"!<sup>41</sup> (\*)

Clearly, if my friend has a grudge against anyone, it's not really against his illustrious ex-boss, whom he's only had the honor of meeting for an "interview" three times in ten years in all (if I've understood correctly what he wrote to me most recently) - a vertiginously distant man, entirely out of reach - but it's the one he can come and see whenever he pleases, and share both his bread and his lodgings...<sup>42</sup> (\*\*).

Each time Zoghman takes a new step to divulge some new element, making me a little more aware of a situation of despoilment in which he is the victim (and can help a little to unravel it), I feel that it's like a **wrench**, the culmination of an exhausting inner struggle. I

has a **role** with which he seems to have identified body and soul, clinging to it as if it were his most precious possession - a role with which he seems to have identified body and soul, clinging to it as if it were his most precious possession.

this role of <sup>victim</sup>□ which he can only maintain by keeping around this role and the situation that justifies it, p. 311  
absolute secrecy<sup>43</sup> (\*). And he may indeed be torn, and resent me more than ever, at this moment when, with his reluctant collaboration (snatched away, as it were, by the logic of a situation created by none other than me, with those unfortunate reflections on an uneventful Funeral. . . ), this secret will come to an end, and with it, perhaps, this role in which it has pleased him to maintain himself, for how long I cannot say.

This "burial" of my friend Zoghman was achieved by the combined care of **two silences**, each responding to the other and provoking it in turn, in a seamless round in which the role of one closely matches the role of the other - the despoilers and the despoiled. If on more than one occasion I was struck by the fact that the "burier" was at the same time, and more profoundly, his own "buried", I was equally struck by the fact that in the person of another friend, the "buried" was at the same time, and more profoundly, his own "burier" - in close connivance.

<sup>40</sup>(\*\*\*) (October 9) Zoghman told me that, in fact, he didn't have a Xerox of the complete article in his possession at first, which he pulled out only later.

<sup>41</sup>(\*) It's not the first time I've heard this "absolute power" claptrap, with which one would like to convince oneself of one's own powerlessness and justify it. If anyone has invested anyone with "absolute power" over himself, Zoghman, it's none other than Zoghman himself!

<sup>42</sup>(\*\*) (May 8) It's no coincidence, moreover, that the unequivocal signs of conflict in my friend's relationship with me appeared in the very aftermath of this stay, when he "shared my hand and my bed" in an atmosphere of unreserved affection, abolishing a feeling of "distance" that our first brief encounter no doubt couldn't entirely erase.  
Here I come across a situation with which I have long been familiar, and which I discuss (in relatively general terms) in the two notes "The Enemy Father (1), (2)" (sections n° s 29, 30). Little did I suspect, when I wrote them as a commentary on the preceding reflections, the extent to which the archetypal situation I describe there would become the constant focus of a long reflection yet to come, just when I thought I was nearing the end of my journey!

<sup>43</sup>(\*) (May 30) Since these lines were written (May 6), my friend's attitude has changed dramatically, and lately I've seen no signs of attachment to a victim role. It goes without saying that the lines which follow (like those which preceded) concern certain episodes in my friend's life, and in no way claim to define a temperament or describe a permanent bias.

with the very people whose willing victim he delights in being.

And I can see that the person primarily responsible for his own spoliation is none other than my friend Zoghman himself, who for three years has acquiesced by his silence to his humiliation by those who take their pleasure in him. He had everything in his hands to fight for - and for three years he chose to forget he even had hands, and to be defeated without having fought<sup>44</sup> (\*\*).

p. 312 **Note 78<sub>1</sub>** I had never held this short preliminary communication in my hands, but only the more circumstantial "Hodge Theory II, III" publications that appeared in Publications Mathématiques. This is why I had been under the impression that Deligne had not seen fit to ever allude to a role motive theory in the genesis of his ideas on Hodge theory. I thought that if he had wanted to mention any role I might have played with him<sup>45</sup> (\*), he would probably have done so with "Hodge Theory II", his thesis work, which was the perfect opportunity to mention such things<sup>46</sup> (\*\*). I've just seen that he's fulfilled the formality of mentioning me once and for all, with this lapidary line<sup>47</sup> (\*\*\*) alluding to "Grothendieck's conjectural theory of motives", with even a reference at the key (to Demazure's talk at the Bourbaki seminar).

Once again, nothing to say! The idea never occurred to him to specify that he had learned this theory (all conjectural, let's not forget!) from **another source** than this meagre text by Demazure, which can give no image of a theory of great richness (all conjectural!), which runs like a thread through all Deligne's subsequent work on weight yoga - pending the escalation of the "pirate volume" LN 900, where the motivic Galois groups are finally exhumed (fifteen years later) (this time without even a laconic reference line containing the name of the deceased. . . ).

p. 313 On reflection, in this laconic quote, I recognize the same "thumb!" style. - a quote from pure form, to be fair, with a reference that is in no way likely to enlighten the reader (in this case, on obvious and deep-rooted relationships with ideas that it is precisely to hide<sup>48</sup> (\*) - and which have remained hidden during the twelve years that followed), but **of a nature to deceive him**.

**Note 78<sub>2</sub>** I didn't have to hold this<sup>49</sup> (\*\*) text in my hands (which I learned about a few years ago). weeks) to know that my name wasn't on it. Nor was Serre's, who was the first to glimpse a "philosophy of weights", which I later worked out in great detail.

<sup>44</sup>(\*\*) (May 30) This is an admittedly subjective view of someone with the temperament of a fighter, someone in whom this fibre might have seemed absent. It would seem, however, that since these lines were written, my friend's fighting spirit has been reawakened, and he is determined to fight back against an iniquity of which he has been the victim.

(April 18, 1985) For a different, less "harsh" take on my friend's provisions, see also the "Roots" note (n° 171 ).<sub>3</sub>

<sup>45</sup>(\*) (May 30) Until a few weeks ago, I systematically downplayed this role. See note

"Being apart" n° 67' of May 27, where I first became aware of this attitude in myself and perceived its meaning.

<sup>46</sup>(\*\*) (May 30) Nor do I remember being asked to sit on the thesis jury. The funeral was already going well train. . .

<sup>47</sup>(\*\*\*) Serre is also implied in the same line by the cross-reference sign [3] - the curious reader will find his name in the bibliography at Hodge I. This expeditious reference line is the only one between 1968 and the present day where there is any allusion (however cryptic) to the "sources" it mentions in a single breath: Serre (alias [3]), motifs, Grothendieck. ...

(May 28) However, I have since come across another such allusion, very interesting in view of the very special occasion. On this subject, see the note "L'Eloge Funèbre (1) - ou les compliments" n° 104 , and the end of the note that precedes it ("Le Fossoyeur - ou la Congrégation toute entière" n° 97), situating this "particular occasion".

<sup>48</sup>(\*) As I write these lines, I am reminded of a revealing incident involving "weights" two years earlier, mentioned at the start of the note "Canned weights and twelve years of secrecy" (n° 49), and in more detail at the start of the note "The eviction" (n° 63). For the "pouce! style" in general, see the reflection in the note "Pouce!" (n° 76). It's a style with which I'm becoming quite familiar!

<sup>49</sup>(\*\*) "Weights in the Cohomology of Algebraic Varieties", by P. Deligne, Vancouver Congress 1974, Proceedings, pp. 78-85.

### 11.1.9. The Boss

**Note!** 78" (June 3) Zoghman explained to me that he only gradually became aware, and confused at first, of the "swindle" that was going on around my work. The manuscript Verdier had given him in 1975 (see "Les bonnes références" note n° 82) had been providential for him, notably in introducing him & to the notion of constructibility and its essential properties, as well as to the biduality theorem, from which he had drawn inspiration for the biduality theorem (or "local duality") in the context of D-Modules. It was only years later, while reading SGA 5 (a massacre edition, admittedly, but not so massacred as to give an attentive reader like him the slip) that he began to realize something. For a long time, he had been filled with admiration and gratitude for his distant elder, convinced that the ideas he drew on were his own. In fact, it would seem that for years he was convinced that the theory of duality known as "de Verdier" was indeed due to Verdier, or at least to "Serre-Verdier", and that the idea of duality he calls "de Poincaré-Verdier" was also due to Verdier. It was only around 1979 (the year he defended his thesis) that he began to realize that there was something wrong - but I presume he had to be careful not to let anything show about it to his prestigious "boss", nor to me, when we met in February 1980 and June 1983.

It was only with the Colloque Pervers, in June 1981'□ then that he began to sense the escamotage that was p . 314 that he also began to realize more clearly the world he had strayed into<sup>50</sup> (\*)! Surely, for him, I had to be part of that world, where my former students (or at least some of them) had the upper hand and plundered the posthumous pupil with the same casualness as the departed master. The only difference, as it turned out, was that I was dead and they were alive and kicking. ...

I can imagine that even after the Colloque Pervers, Zoghman still found it hard to believe the testimony of his healthy faculties, which told him quite clearly what had happened. He only received the famous Introduction to the Colloquium Proceedings, signed by B. Teissier and his "patron-sic" Verdier, in January 1984. After denying the evidence for almost three years, the shock was all the greater, I understand. It was two months later that I contacted him again, sending him the notes "Mes orphelins" and "Refus d'un héritage - ou le prix d'une contradiction" at the end of March, and it was another month later that he finally decided to "let me in on the joke" and tell me about the "Mystification du Colloque Pervers".

### 11.1.10. My friends

**Note** 79 And here I am about to finish and make public this reflection which will put an end to the secrecy that Zoghman himself has maintained around the spoliation of which he is the victim, and from which he also reaps the obscure benefits<sup>51</sup> (\*\*). Perhaps it will be unwelcome to him, just as it may be unwelcome to my friend...

Pierre, to whom I'll hand-deliver it as soon as it's finished and the text cleaned up and printed<sup>52</sup> (\*\*\*).

The □ best thing I have to offer my friend Zoghman as well as my friend Pierre, perhaps both the p . 315

<sup>50</sup>(\*) Zoghman ended up having such a low opinion of his ex-boss, that he was convinced that everything Verdier had done in the sixties (which I review in a b. de p. note to note no. ° 81 "Thesis on credit and comprehensive insurance") had been more or less dictated or at least blown by me.

<sup>51</sup>(\*\*) (May 30) I would remind you that this reflection was inspired by a disposition in my friend that now seems outdated. (Compare two b. de p. notes of May 30 with note n° 78'.)

<sup>52</sup>(\*\*\*) I didn't think I'd ever have the chance, in the years that lie ahead, to go back for a few more years. days in the capital. But my friend Pierre has travelled often enough, for more than ten years, to meet me deep in the remote countryside, for me to travel on this exceptional occasion, following up on an often-repeated invitation that has never yet been put to good use.

Will they receive it as the worst: as a calamity, or as an outrage. All the worse, since my testimony is public - just as the silences of both have been rites of public acts, and which commit one as they commit the other.

Whether they reject or accept my testimony is their choice, and the same goes for Jean-Louis, whom I counted among my friends, just as Zoghman and Pierre do today. These choices affect me closely, and they are not mine. I have no temptation to predict what they will be. It won't be long before I know, and I await what the weeks and months ahead will bring with intense interest, suspense - and without a shadow of anxiety. My only concern and responsibility is that what I offer is the best I have to offer - that is, to be true.

Some may be surprised that I speak so bluntly of people I call "friends", and see in this name a stylistic clause, or even an intonation of irony that is absent. When I refer to Zoghman Mebkhout or Pierre Deligne as "friends", it's a reminder of the feelings of sympathy, affection and respect that are within me as I write. Respect tells me that I don't have to "spare" a friend, any more than I have to "spare" myself - like me, he is worthy of encountering the humble truth, and no more than me, he needs sparing.

If I don't refer to Jean-Louis Verdier as a "friend", it's in no way because I consider him less "good", or less "deserving", than my friends Zoghman and Pierre, or myself, but because life has distanced us from each other. The feelings of sympathy and affection that bound me to him fifteen or more years ago have more or less faded with time, and have not had the opportunity to be revived by any kind of personal contact. The few attempts I have made to re-establish such contact have met with no response, and I don't know whether reading these reflections will revive a relationship that had frozen. But even though he's no longer a "friend" to me, I don't think I'd be disrespecting him by not treating him more kindly than myself or my friends, and I know that to do otherwise would be a disservice to him or anyone else. Not to mention that both he and my friend Pierre, if any

that they insist on "defending" (or attacking) themselves rather than taking the risk of looking at themselves, are not lacking in means or support. And not to mention that where they have had the opportunity to discourage

or to crush, more than once both have done so, ruthlessly and mercilessly.

p. 316

### 11.1.11. **The pavement and the beautiful world (or: bladders and lanterns. . . )**

**Note 80** (May 9) It's about time I finally gave a reference for this famous Riemann-Hilbert-(Deligne qui ne dit pas son nom) theorem - Adam and Eve - bon Dieu - (and especially not Mebkhout), which everyone quotes at length (including myself), and for which apparently nobody has yet thought to ask where it is demonstrated. Having been led to believe by my friend Zoghman that the "me- morable theorem" was to be found in his thesis, I did indeed find it in the table of contents, under the name (admittedly down-to-earth and worthy of a cad) "Une équivalence de catégories", Chap. III, par. 3, p..

75. To make matters worse, it's not even entitled to the name "theorem" but is called "Proposition 3.3" (and what's worse, my name appears, again underlined, on the same page). I'll even admit that, having failed to read the previous 75 pages to recognize myself, I wasn't entirely sure whether this was it - Zoghman confirmed that it was, and I trust him<sup>53</sup>. The demonstration (it would seem) is the subject of Chap V of the same thesis - which was passed at the University of Paris VII on February 15, 1979, before a Jury comprising D. Bertrand,

---

<sup>53</sup>(\*) (April 17, 1985) It would appear that the generally used form of the "God's theorem" is not that of the theorem quoted here, but a related form demonstrable by the same methods. See the note "Ecllosion d'une vision - ou l'intrus" (n° 171<sub>1</sub>), and in particular today's b. de p. note therein.

R. Godement, G. Houzel, Le Dung Trang, J.L. Verdier. Interested parties who have not yet received a copy from the author (who sent his thesis to all those he could suspect, rightly or wrongly, might be interested) need only ask him, and he will be pleased to do so... ... Of course, he sent a copy to each of my former cohomology students, none of whom has been heard from since. They must have changed subject in the meantime, unluckily. ...

It has to be said that Zoghman definitely doesn't have the knack of selling his merchandise, of presenting it in a clear and appealing way - these are things that have to be learned, and he wasn't as lucky as my former students to learn the ropes from a virtuoso of the trade who didn't skimp on his time. But he can't complain, he's had his "three interviews", and perhaps one day one of the "luminaries" will have the idea of even acknowledging his indigestible pamphlet. He must have realized himself that the paving stone was not easy to read (even if it wasn't lost on Riemann or Hilbert. . . ): he wrote a note to the CRAS, which is still shorter, to draw attention to his famous theorem, the title of which I'll give you in a thousand:

"On the Hilbert-Riemann problem"! I knew my friend Pierre Deligne wasn't any better at history than I was, so all he had to do was restore the chronological order,  $\square$  and contribute the pretty folklop designation . 317  
 "Zoghman had it coming. ... This note is dated 3.3.1980, Series A, p. 415-417.

Verdier must have learned of the theorem in one of the "three interviews" he gave to his pupil - sic (or at the time of the defense), but he must not have realized it. As for Deligne, he finally realized something, I can't say when, but what's certain is that he knew about it in October 1980, and so did Bernstein and Beilinson, according to what he himself says. Mebkhout himself went to Moscow to explain his results (at length) to Beilinson and Bernstein (in case they had trouble reading him). I don't know if they or Deligne ever read the thesis or the subsequent note to the CRAS, but they must have figured out what was in it, since next year's "memorable Colloque" at Luminy was, coincidentally, all about it.

To sum up, and according to the latest information from my intelligence service, there were at least five people perfectly aware of the situation, who took part in the mystification known as the "Colloque Pervers", namely (in alphabetical order of the actors) A.A. Beilinson, J. Bernstein, p. Deligne, J.L. Verdier and Z. Mebkhout - plus a whole Colloque acultees, surely brilliant mathematicians to boot, who apparently wanted nothing better than to be mystified and take bladders. Mebkhout - plus a whole Colloquium of aculturous people, surely brilliant mathematicians to boot, who apparently wanted nothing better than to be mystified and to take bladders for lanterns<sup>54</sup> (\*). Which proves once again that we mathematicians, from the illustrious Medalist to the obscure unknown student, are not a hair smarter or wiser than the average person.

## 11.2. VIII L' Elève - alias le Patron

### 11.2.1. Credit thesis and comprehensive insurance

**Note 81**  $\square$  (May 8) It seems time to express myself in more detail on the "thesis-" affair. p. 319  
 phantom", which I had only mentioned "in the aftermath" in two previous notes (notes (48) and (63" )). An inattentive or ill-disposed reader might say that I am simultaneously reproaching my ex-student J.L. Verdier for two contradictory things - for having "buried" the derived categories, and for having "published" them

<sup>54</sup>(\*) (June 3) In fact, it appears that all Colloquium participants, without exception, had been briefed on the situation on the spot. On this subject, see the note "Le Colloque", n° 75', written today.

(in SGA 4<sup>1</sup>) and claim authorship; just as the same reader would say that I reproached P. Deligne for both "burying" the motifs, and exhuming them (in LN 900). So it may not be superfluous to give a retrospective of the situation, from 1960 to the present day.

Around 1960 or 1961, I proposed to Verdier, as a possible thesis project, the development of new foundations for homological algebra, based on the formalism of derived categories that I had developed and used in previous years for the purposes of a coherent duality formalism in the context of schemes. It was understood that in the program I was proposing to him, there were no serious technical difficulties in prospect, but above all a conceptual work whose starting point was acquired, and which would probably require considerable developments, of dimensions comparable to those of the Cartan-Eilenberg book of foundations. Verdier accepted the proposed subject. His foundations work continued satisfactorily, materializing in 1963 in a "Etat 0" on derived and triangulated categories, multigraphed by the IHES. This 50-page text is reproduced as an Appendix to SGA 4<sup>1</sup> in 1977.

2

(as stated in note (63' "))<sup>55</sup> (\*).

p. 320

□ If the defense didn't take place in 1963, but in 1967, it's because it was unthinkable that this 50-page text, the embryo of a foundational work yet to come, could constitute a state doctorate thesis - and the question of course didn't even arise. For the same reason, when he defended his thesis on June 14, 1967 (before a Jury including C. Chevalley, R. Godement and myself, who presided), there was no question of presenting this work as a thesis. The text submitted to the jury, 17 pages long (+ bibliography), is presented as an **introduction** to a major work in progress. It outlines the main ideas behind this work, placing them in the context of their many uses. Pages 10, 11 give a detailed description of the chapters and paragraphs planned for this seminal work.

If the title of Doctor of Science was awarded to J.L. Verdier on the strength of this 17-page text, outlining ideas which he himself says are not his own<sup>56</sup> (\*), it was clearly a contract of good faith.

p. 321

□ between the jury and himself: that he was committed to completing and making available to the public this work for which he

<sup>55</sup>(\*) This text alone may seem a meagre result for two or three years' work by a gifted young researcher. But most of Verdier's energy was then devoted to acquiring the indispensable basics of homological algebra and algebraic geometry, by attending my seminars in particular, and by working one-on-one. His contributions to the duality formalism (see below) came later, once Artin and I had developed the stale duality formalism in detail in SGA (1963/64), when I suggested (in parallel with his work on the foundations of derived categories) that he develop the same formalism in the context of "ordinary" topological spaces and smooth morphisms of such spaces.

It was around the time I began my "Séminaires de Géométrie Algébrique" series with SGA 1 (in 1960) that I was contacted by Verdier, along with Jean Giraud and Michel Demazure, asking if I had any work for them - and they were knocking at the right door! A coincidence that struck me from the moment I wrote the note "Mes

Orphans" (n° 46) when the three of them contacted me, they had just formed a small seminar called the "Orphans' Seminar" (on the theme of automorphic functions, approaching calculations with a zinc strand), given that their boss (or godfather to the CNRS?) had just left for a year without warning, leaving them hungry and a little empty. This void was quickly filled... .

<sup>56</sup>(\*) The beginning of the thesis reads:

"This thesis was written under the supervision of A. Grothendieck. The essential ideas it contains are due to him. Without his initial inspiration, his constant help and his fruitful criticism, I could not have completed it. I would like to express my deep gratitude to him.

I would like to thank Claude Chevalley for chairing my thesis jury and for his patience in reading this text. My thanks to R. Godement and N. Bourbaki for introducing me to mathematics.

"The term "this thesis" can hardly refer to anything other than the body of foundational work undertaken, of which the text submitted constitutes the introduction - work which was therefore not, strictly speaking, "completed" at the time of the defense.

(May 30) This inconsistency reflects the ambiguity of a situation for which I was primarily responsible, as thesis director and (if the cover of the copy of the thesis in my possession is to be believed) as president of the Jury. At For me, the lack of "rigor" towards a brilliant pupil is a complacency in the same direction as the one I showed towards Deligne (see the note "L'être à part", n° 67'), and has contributed its share to bringing about the same results.

presented a brilliant introduction. This contract was not kept by the candidate<sup>57</sup> (\*): the text he announced, a text on the foundations of homological algebra from a new, proven point of view, was never published.

Clearly, if Verdier's work between 1961 and 1967 had been limited to writing the skeletal "Etat 0" of 1963, the jury would not have considered accepting this "thesis on credit". The writing of his work had to be sufficiently advanced to allow completion within a year or two, and for practical reasons it seemed appropriate that Verdier should have the title without waiting for the work on which it was based to be completed.

It should be added that between 1964 and 1967, Verdier had made some interesting contributions to duality formalism (81<sub>1</sub>), which, together with the foundational work he was supposed to be pursuing, could justify the credit given to him. His contributions to duality as a whole could, in a pinch, have constituted a reasonable doctoral thesis. Such a thesis, however, would by no means have been in the style of the work I am accustomed to proposing, all of which consists in the systematic development to completion of a theory whose need and urgency I sense (82<sub>2</sub>). I don't recall Verdier ever raising the question of presenting such a "thesis on titles", and I doubt I would have accepted, since such a thesis would have in no way corresponded to the "contract" that was signed between him and me, when I entrusted him with the beautiful subject of derived categories, with the task of developing foundations on a vast scale.

As J.L. Verdier's thesis supervisor and president of the jury, I accept full responsibility for my thoughtlessness in awarding him (jointly with C. Chevalley and R. Godement, trusting the title of doctor on work that had not yet been done<sup>58</sup> (\*\*)).

□ I am not justified in complaining if I now see some of the fruits of my levity. But this p. 322 does not prevent me from stating this publicly, and that the actions of my ex-student J.L. Verdier are his responsibility alone, and that of no one else.

Not to keep the contract he had made with me and with the Jury who had placed their trust in him, was a way of burying the point of view of derived categories that I had introduced and that he had taken on the task of founding through a major work. This work may have been done, but it was never made available to the user. It was a way of "writing off" a set of ideas that he himself had helped to develop.

Mebkhout's revival of the notion of derived category met with no encouragement from Verdier (nor, for that matter, from any of my other cohomological "luminaries"). The de facto boycott of derived categories seems to me to have been total until about 1981<sup>59</sup> (\*), when they made their comeback in force at the "memorable Colloque" at Luminy (see note (75)), under the sudden impetus of need.

However, State 0 of Verdier's "thesis" had already been published four years earlier, in 1977, as an appendix to the

<sup>57</sup>(\*) It is all the more remarkable that J.L. Verdier should have refused my proposal to sit on Contou-Carrère's thesis jury in December 1983, with J. Giraud, and myself acting as research director, believing that the thesis (though entirely written and carefully read by J. Giraud) and the jury would not offer sufficient guarantees of seriousness, without referring to the control of a Commission des Thèses des Universités **Parisiennes** (Sic).

<sup>58</sup>(\*\*) To this responsibility, I should add that of not having ensured, during the two years that followed (before my departure from the mathematical scene) that Verdier actually kept to the contract he had made. It has to be said that my energies were so focused on pursuing the foundational work I had taken on myself, not to mention motivational reflections and the like, that I didn't have to think too much about the unpleasant task of reminding others of their obligations. I had to learn of Verdier's decision to abandon the publication of the planned work in the early '70s, at a time when I was absolutely no longer into maths, and when the idea would not have occurred to me to "react".

<sup>59</sup>(\*) (May 30) These somewhat dubious forms of style are in fact out of place. As Zoghman Mebkhout (who paid to find out) confided to me, what I said about the status of homological algebra "Grothendieck style" corresponds to reality.

volume SGA 4<sup>1</sup> (see note n° 63'') - so ten years after the defense of his thesis, and at a time when (to my knowledge(\*))  $\frac{1}{2}$  Mebkhout was the only one to make use of derived categories in his work, against the fashion of the seven years that had preceded. Unless I'm mistaken(\*) , he remained the only one to do so, right up to the time of the great "rush" around the famous "Riemann-Hilbert correspondence" at the Colloquium already mentioned, where Deligne alias Riemann-Hilbert appeared as the father of this "correspondence" - sic, and Verdier (with his providential Etat 0 abundantly quoted by his generous friend) appeared as the father of derived categories and algebra.

p. 323 homological style 2000, with no mention of my humble self and even less of Mebkhout<sup>60</sup> (\*\*).

□ In light of these events, I believe I understand the reason for the unexpected publication of this State 0 which (as it says in the introduction to SGA<sub>2</sub> 4<sup>1</sup> by the same friend) "had become unobtainable" and that nobody cared about "finding", except (perhaps) Zoghman Mebkhout<sup>61</sup> (\*). So there was just this one unfortunate fellow who, in his own corner and against all odds, persisted in using these notions of a bygone age, without anyone really knowing what he was getting at - so stubborn, in fact, that we began to doubt whether he wouldn't one day come up with something that would do the trick, you never knew... . After all, the man to whom he sometimes imprudently referred as one of his sources of inspiration (alongside the Master's works) had, in the past, proved or found things with all that, things that couldn't be ignored even if the author - and the Master himself - were forgotten, Jean-Louis Verdier himself, had he not made his start to stardom with this "Lefschetz-Verdier" formula, which he would have been hard-pressed even to write down, let alone prove, without all these notions fit for the dustbin. . .

While my influential ex-student of almost ten years (since he had rid himself of a certain annoying formality. . . ) **was betting against** derived categories and would continue to bet against them until time X (of the famous Colloquium), he must have thought it prudent (you never knew. . . ) to pre-empt events that might occur. . . ) to anticipate events that might occur, in other words, to take out "all-risk insurance", by publishing (not the large-scale work that was one day supposed to constitute a thesis, but) a "text-witness", a sort of exhibit "in case... ."; a text that would "attest to his claim to paternity over an **orphan** whom he] had taken a liking to, and whom he continued, pending events, to disown<sup>62</sup> (\*\*).

p. 324 **Note 81<sub>1</sub>** □ The contributions in question are: 1) Foundations of a duality formalism in the context.

of locally compact spaces and 2) that of Galoisian modules (in collaboration with J. Tate); 3) the Leschetz-Verdier **fixed-point** formula; 4) duality in locally compact spaces.

Contributions 2) and 3) are "unexpected" compared with what was known. The most important contribution seems to me to be 3). Its demonstration follows easily from the duality formalism (both for "discrete" and "continuous" coefficients), which does not prevent it from being an important ingredient in the arsenal of "all-purpose" formulas available to us in cohomology. The existence of this formula was discovered by Verdier, and came as a (pleasant!) surprise to me<sup>63</sup> .

<sup>60</sup>(\*\*) Compare with the comments in the notes "Le compère" and "L'Iniquité - ou le sens d'un retour" (n° s 63''' and 75).

<sup>61</sup>(\*) In any case, it was while perusing the bibliography of a work by Z. Mebkhout that I had just received, towards the end of April, that I learned of the publication of this "State 0", when I had even forgotten the existence of this text from another age. ...

<sup>62</sup>(\*\*) If J.L. Verdier had really wanted to make known the yoga of derived categories, which has been buried for seven years, he would have chosen to publish the introductory text which constitutes his thesis, rather than a technical text which nobody cared about and which only acquires interest in the background of yoga and its many uses. But it's understandable that he had no desire to append to the 50-page text the 17 pages of his thesis, containing now embarrassing statements about the role of the one who must not be named. ...

<sup>63</sup>(\*) (April 19, 1985) I return to this beautiful formula, its role and its strange vicissitudes during the Burial, in the three notes "Les vraies maths. . .", ". . . and "nonsense", "Tricks and creation" (n° 169, 169, 169), in the fourth

part of Récoltes et Semailles.

The formalism of duality in the context of locally compact spaces is essentially the "necessary" adaptation of what I had done in the context of scalar cohomology of schemes (and without the difficulties inherent in this situation where everything was still to be done). He did, however, contribute an interesting new idea, that of the direct construction of the functor  $f^!$  (without prior lissification of  $f$ ) as a right-hand adjoint of  $Rf_!$ , with an existence theorem to boot. This procedure was taken up by Deligne in étale cohomology, enabling him to define  $f^!$  in this framework, without any lissification hypothesis.

These comments make it clear, I think, that by 1967 Verdier had demonstrated his capacity for original mathematical work, which of course; was the determining factor in the credit he received.

**Note 81<sub>2</sub>** As another example, I would point to the detailed development of the duality formalism in the context of locally compact spaces, in the spirit of the "all-purpose" formalism of the six operations and derived categories, of which Verdier's presentation at the Bourbaki Seminar would constitute an embryo. Even in the context of topological **varieties** alone, there is still, to my knowledge, no satisfactory reference text for Poincaré's duality formalism.

□(June 5) There are two other directions in which I note with regret that Verdier did not see fit to go all the way.

325

the end of work that he had started off strongly enough to **take credit for** (I mean, by starting up a duality formalism in the context of discrete coefficients and locally compact topological spaces), whereas the essential ideas are not due to him and he doesn't care (any more than for the derived categories) to make himself the **servant of a task** and put at the user's disposal a complete formalism (as I tried to do in the three seminars SGA 4, SGA 5, SGA 7).

The duality program that I was planning and that I suggested he develop was part of the general topological spaces (not necessarily locally compact) and applications between such that are "separated" and locally "smoothifiable" (i.e. locally the source is immersed in a  $Y \times \mathbb{R}^n$ , where  $Y$  is the goal space). This was clearly suggested by the analogy with the stale cohomology framework

**any** schemes. Verdier was able to see, in the context of locally compact spaces, that the assumption of local smoothness of applications was unnecessary (which came as a surprise). Nevertheless, the context of locally compact spaces (which excludes "parameter spaces" that are not locally compact) is visibly short-sighted. A more satisfactory context would be the one that would cover both the one chosen by Verdier, and the one I was planning, i.e. the one where topological spaces (or even topos?) are (more or less?) arbitrary, and where applications  $f : X \rightarrow Y$  are subject to the restriction of being 1) separate and 2) "locally compactifiable", i.e.  $X$  plunges locally into a compact  $Y \times K$ ,  $K$ .

In this context, the fibers of an "admitted" application would be locally compact quel- conical spaces. Another step would be to admit that  $X$  and  $Y$ , instead of being topological spaces, are "topological multiplicities" (i.e. topos that are "locally like a topological space"), or even topos of any kind, by restricting the applications in a suitable way (to be made explicit), so as to find fibers that are **locally compact multiplicities**, subject if need be to additional conditions (close perhaps to the point of view of Satake's  $G$ -varieties), for example (and lastly, to the point of view of Satake's  $G$ -varieties).

rigorously!) to be locally of the form  $(X, G)$ , where  $X$  is a compact space with **finite** operator group  $G$ .

To my knowledge, even the "ordinary" de Poincaré duality has not been developed in the case of multi- smooth compact topological cities (smooth: which are locally like a topological variety). The case of a classifying space of a finite group seems to show that we can hardly hope to have a duality theorem (absolute global) other than module torsion, more precisely, by working with a ring of coefficients that is

p. 326

a  $\mathbb{Q}$ -algebra. With this restriction, I wouldn't be surprised if Poincaré's duality ("six operations" style) worked as is in this context. It's not surprising that nobody has ever looked at it (except some unrepentant differential geometers, pretending to look at the cohomology of the "leaf space" of a foliage), given the general boycott of the very notion of multiplicity, instituted by my cohomology students, led by Deligne and Verdier.

To put it bluntly, what's missing is a fundamental reflection of the following type: describe (if you can) in the context of any topos and bundles of "discrete" coefficients on them, notions of "cleanliness", "smoothness", "local cleanliness", "separation" for a morphism of topos, enabling us to derive a notion of "admissible morphism" of topos  $f: X \rightarrow Y$ , for which the two operations  $Rf_!$  and  $Lf^!$  make sense (one adjoint of the other) so as to obtain the usual properties of the six-operation formalism. Here, topos are considered as non-ring, or perhaps as provided with Rings (which are assumed if necessary to be constant or locally constant), assuming (initially at least) which ringed topos morphisms  $f: (X, \mathcal{A}) \rightarrow (Y, \mathcal{B})$  are such that  $f^*(\mathcal{B}) \rightarrow \mathcal{A}$  **is an isomorphism** (81<sub>3</sub>). The foregoing considerations suggest that when we restrict ourselves to Rings of coefficients of carac-

(i.e., which are  $\mathbb{Q}$ -algebras), we can be much broader in the notion of "morphism".  
admissible", so as to encompass "fibers" that are e.g. multiplicities (topological or schematic), rather than ordinary "spaces" (topological or schematic).

A first step in this direction (apart from the cases treated by me, then by Verdier on the same model) is due to Tate and Verdier, in the context of discrete or profinite groups. The memory of this first step encouraged me to pursue a reflection along these lines last year, in the context of small categories (generalizing discrete groups) serving as homotopic models. Without going very far, this reflection was nevertheless enough to convince me that there must be a complete formalism of the six operations in the context (Cat) of the category of small categories. (See on this subject the  $\square$  "Pursuit of Fields", Chap.VII, par.136, 137.) The development of such a theory in (Cat), or even in Pro(Cat), just like a theory of this type in the context of topological or schematic spaces and multiplicities, would for me have as its main interest to be a step towards a better understanding of "discrete duality" in the context of general topos.

p. 327

Illusie told me last year that he had struggled with duality perplexities in the case of semisimplicial spaces (or schemes). It seemed to me to be the same old tobacco - to be able to detect the existence of a six-operation formalism in a particular case, and to understand it. But it would seem that the mere prospect of a fundamental reflection has the gift of freezing each and every one of my former students - at least among my cohomology students. If I went to any trouble with them, it was with the conviction that they would not stop right where they had left off (in terms of conceptual work) with me, and remain wringing their hands every time a new situation showed that the work they and their buddies had done with me was insufficient. The conceptual work we do is **always** insufficient in the long run, and it's by taking it up again and going beyond it, and not otherwise, that mathematics progresses. Between 1955 and 1970, each year again I found that what I had done in previous years was not sufficient to the task, and I went back to the drawing board, at least when someone else (e.g. Mike Artin) with the point of view of "algebraic varieties" in his sense) hadn't already done so. But it would seem that my students have also buried the example I set them, along with myself and my work.

**Note 81<sub>3</sub>** I seem to recall that in the formalism of the six variances in (say) staggered cohomology, the assumption that the ring bundles serving as coefficients are locally constant is unnecessary - the essential assumption is that they are prime torsion bundles with residual characteristics, **and** that  $f^1(B) \rightarrow A$  is an isomorphism. When we abandon this last assumption, we have to enter a theory (never yet made explicit, to my knowledge) that "mixes" the "discrete space" duality, and the "coherent" duality (relative to the rings of coefficients and their homomorphisms). As a result, we envisage replace, on the diagrams (or more general topos)  $X, Y$ , the rings of coefficients  $A, B$  by relative (not necessarily affine) schemes  $X', Y'$  on  $X, Y$ , and ringed topos morphisms  $\square$  p. 328  $(X, A) \rightarrow (Y, B)$  by commutative diagrams of the type

$$\begin{array}{ccc} X' & \xrightarrow{\quad} & X \\ \downarrow & & \downarrow \\ Y' & \xrightarrow{\quad} & Y \end{array}$$

with a "six operations" formalism in such a context. When  $X, Y$ , etc. . . are the ponc- tual topos, we should find the usual coherent duality.

## 11.2.2. The right references

**Note 82** (May 8) This is J.L. Verdier's article "Classe d'homologie associée à un cycle", published in Astérisque n° 36 (SMF), p.101-151 in 1976. In a way, this rather unbelievable article (although nothing should surprise me any more. . . ) is a counterpart to the "perverse article" by Deligne et al. With one reservation: it practically consists in **copying** over fifty pages, in a slightly different context, notions, constructions and reasoning that I had developed at length ten or fifteen years earlier - terminology, notations, everything is there verbatim! I'd have thought I'd returned to a session of the APG 5 seminar held in 1965/66, where these things were spelled out (apparently to the satiation of the participants<sup>64</sup> (\*) for an entire year. After this seminar, at least, all these things became part of the "well-known" for people in the know<sup>65</sup> (\*\*). Verdier had attended, of course, as had Deligne (the only one who was never left behind, even though it was the first time he'd set foot in my  $\square$  séminaire<sup>66</sup> (\*) - it took p. 329 do it... ). It's true, well, well, that in 1976 the "writing-sic" of this famous seminar by "volunteers-sic" who were fed up with it had been dragging on for ten years - I see now that one of these "volunteers" took charge of the "writing" in his own way, even before the publication of SGA 5 in

<sup>64</sup>(\*)For comments along these lines, see notes n° s 68, 68' "Le signal" and "Le renversement", in which I examine the strange vicissitudes of the writing of this seminar, and the relationship between these and Deligne's "SGA 4 operation<sup>1</sup>", The following reflections are my own.

reveals another unforeseen aspect of these vicissitudes and of the dismemberment of the mother seminary by the combined efforts of Verdier and Deligne. Verdier's and Deligne's publications on this dismemberment date from 1976 and 1977 - they constitute the "green light" given to Illusie to prepare (eleven years later. . . ) the publication of SGA 5 (which, Deligne, dixit in SGA 4<sup>1</sup>, "can be seen as a series of digressions, some of them very interesting").

<sup>65</sup>(\*\*) For a reflection on this "hasty" impression, see the note on "Silence" (n° 84).

<sup>66</sup>(\*) The year of this seminar was (I think) the year I met Deligne, who must have been nineteen at the time. He was "got into the swing of things" very quickly, and even took on the task of writing up my lectures on staggered duality from the previous year (which he must have known from my explanations and notes), and also the lecture on the cohomology class associated with a cycle, which was discussed in the note quoted n° 68' ("Le renversement"), and which will be discussed a little more in this one. The fact that with the means at his disposal, and a complete mastery of the subject, he waited eleven years to write the essay, to include it then in his SGA 4<sup>1</sup> without informing me, now shows me, in retrospect, that as early as 1966 (and not only as early as 1968 as I may have assumed - see note n° 63, "L'éviction") - therefore as early as the first year of our meeting, there was a profound ambiguity in my friend's relationship with me, expressing itself from that moment on in a perfectly clear way, of which I I've refrained from reading it until now!

1977 ! It would appear that the vicissitudes of this unfortunate seminar were not only to Deligne's advantage, as he took advantage of the situation in his own way. But at the time, Deligne still took care to mention in his essay (on the cohomology class associated with a cycle) "d'après un exposé de Grothendieck" (after a paper by Grothendieck), while dismantling SGA 5 from one of his key lectures and attaching it to his SGA 4<sup>1</sup> as a matter of course. (It's true that this compensated him for being able to present me as his "collaborator"! - see note "Le renversement", n° 68).

Coming back to the **homology** class (not to be confused!) associated with a cycle (which, according to the title, is the subject of Verdier's article), I had developed this formalism in great detail, over several presentations, during the oral seminar, before an audience that, incidentally, begged for mercy (except always the only Deligne, always dashing and fresh... ). It was one of the innumerable "long exercises" I developed that year on the formalism of duality in the étale frame, feeling the need to arrive at a complete mastery of all the points I felt needed to be thoroughly understood. The interest here was to have a valid formalism on an ambient scheme that was not necessarily regular - the passage to the **cohomology** class in the case of

p. 330

regular, and the link with my old construction using cohomology with supports and immediately giving compatibility with cups-products, being immediate. I also found that □ this part of the seminar does part of the lot that didn't make it into the published version - no doubt Illusie (on whom all the hard work of preparing a releasable (hmm) edition eventually fell) must have been quite happy that Verdier took care of it, mutatis mutandis (i.e. here: without changing a thing!).

As the saying goes, "it hardly needs saying" that my name does not appear in either the text or the bibliography (except implicitly by the ever-present reference SGA 4, which we'd still have to find a replacement for... ). There's no allusion to a "Seminar on Algebraic Geometry" under the acronym SGA 5, which the author might have heard of - although I seem to remember seeing him busy taking notes (like everyone else, except Deligne of course. . . ).

Incidentally, I've exaggerated just a little by saying that my name is absent from the text - it makes a single, mysterious and lapidary appearance on page 38, section 3.5, "Fundamental cohomology class, intersection" (here we come, the crux of the matter!). The reference consists of a cryptic sentence whose meaning escapes me, I confess: "The idea of systematically using weight complexes (??? those damn weights again!) is due to Grothendieck and was put into shape by Deligne" - without any further explanation of these mysterious "weight complexes" whose idea I had and of which I hear mention here for the first time. There will be no further mention of them in the rest of this article (nor was there any mention of them in the 37 pages before). Understand who can! As for the content of the said section, it is copied without further ado from the SGA 5 seminar which had taken place ten years earlier (and by which time this construction was already five or six years old, see note n° 68'), a seminar which he is careful not to quote. The reference to Deligne (who is said to have "perfected" an idea that had already been perfected when my friend was still in high school!) is a "flower", the idea of which no doubt came to the author because the young and newcomer Deligne had indeed taken on the task of writing my paper on this subject (and refrained from doing so for eleven years, for the benefits we know, see note cited). This "flower" is part of the exchange of courtesies between inseparable friends.

p. 331

There is, however, one (undoubtedly) new and very interesting result in the article (th.3.3.1., page 9) on stability of discrete bundles analytically constructible by direct higher images through an analytic and proper morphism. Verdier had learned about all-round constructibility from me one day, fifteen years earlier, as well as □ the stability conjecture, which I had asked myself (and told who would listen) in the late fifties, before I had the pleasure of making his acquaintance. Reading the article, the idea wouldn't occur to an uninformed reader (but those are becoming rare. . . ). I

I'm still repeating myself, I'm afraid) that the author isn't serving up hot-off-the-press notions and statements he's only just discovered. He doesn't have to say it's him - because it's self-evident. It's the famous "thumb" style that's so obviously catching on.

Apart from this detail (which, I feel, is in line with the new canons of the trade), there must still be around ten pages (out of fifty), around this interesting result, that present the author's personal work. All things considered, what strikes me most about Verdier, as with Deligne, is that he's perfectly capable of doing beautiful mathematics. Even in this sad article, there's a hint of it in the theorem quoted. But by keeping himself (like his friend) in a gravedigger's mood, he operates, like his prestigious friend, on a paltry fraction of his means. A sign (which astounded me) of apparent mediocrity, in a mathematician who nevertheless gave proof of astute and flair, was the total lack of instinct to feel the scope of the work of his "pupil-sic" Mebkhout, whom he took pleasure in treating from the height of his greatness, without ever having been able to do himself a work of comparable depth and originality<sup>67</sup> (\*). Not that he isn't just as capable as Mebkhout or me. But he has never given himself a chance to do great things, that is, to let go of a passion - rather than **using** mathematics and its gifts **to** dazzle, dominate or crush. Up until now, he's been content to take up as is the fruitful notions and points of view that have already been baked in. Indeed, he seems to have totally lost touch with the meaning of **mathematical creation**.

Yet I seem to remember that when he worked with me, that sense was still there. Nothing external about him prevents that sense from resurfacing. Just as in his friend, in whom I often felt this same eclipse of something delicate and lively, obturated by the same fatuity. .332

This incredible 50-page article, which appeared in a standing magazine, sheds new light on the "The note - or the new ethic" incident (s.33). where a note to the CRAS of **a few pages**, summarizing a solid and **original** work, on an important subject (in my humble opinion), the fruit of **two years' work** by a highly gifted young mathematician, was rejected by two eminences as "devoid of interest"<sup>68</sup> (\*). One of these eminences was none other than Pierre Deligne - the same Deligne who did not disdain to copy in toto and in person the humble doctoral thesis of one of my students (whom he made a point of quoting). (This duplicate, enhanced by a prestigious signature, makes the largest article in the "memorable volume" LN 900 of a no less prestigious collection! See end of notes (52), (67)).

The "tableau de mœurs" is growing by the day, without my having to come out of retirement and hit the streets to mingle with the "big world". A few hours spent here and there leafing through a few well-chosen "great texts" were enough to edify me...

### 11.2.3. The joke or the weight complex

**Note 83** ( May 8-9) I've been thinking about this "weight complex" referred to in the "reference - thumb" in Verdier's memorable article<sup>69</sup> (\*\*) - a reference that's sheer nonsense. As soon as I saw this ludicrous reference, an association came to mind that kept running through my head. This isn't the first time, far from it, that I've found myself faced with something

<sup>67</sup>(\*) The same astonishing lack of flair was evident on this same occasion in Deligne, who didn't "feel the wind" (the importance of Mebkhout's ideas) until 1980 it seems, even though Mebkhout had been working in this direction since 1974. On more than one occasion, I've had occasion to observe my friend's natural flair blocked by sufficiency, especially since 1977 (or 78), which seems to have been a first "turning point" (see notes "Two turning points" and "Funerals", n° s 66,70).

<sup>68</sup>(\*) For details, see the note "Casket 4 - or topos without flowers or wreaths", n° 96.

<sup>69</sup>(\*\*) See previous note "Good references".

that seem to defy rational explanation - even though the meaning is clear and unambiguous and clearly perceived, but at a different level from that of conventional logic. This was the only one on which I had consciously operated for most of my life - with the result that I was constantly overwhelmed by "bizarre", incomprehensible events - distressing in their irreducible saugrenousness! My life changed a lot from the moment (less than ten years ago) when I started

p. 333 to live on a wider register of my faculties. I've come to understand that every absurdity, every so-called "nonsense" has a **meaning** - and the mere fact of <sup>□</sup>knowing this, and from then on being curious about the meaning behind the nonsense, often opens me up to its obvious meaning.

In this nonsense about "weight complexes", I think I sense an act of **bravado** of the same nature as in the appellation "faisceaux pervers"<sup>70</sup> (\*) - the pleasure, in this case, of proving to oneself that one **can afford**, in a journal of standing and in a text that claims to be a standard reference text<sup>71</sup> (\*\*), to say a related nonsense, and that **nobody** will dare to even ask a question! And I'm convinced that the wager contained in this bravado, in the eight years since the article appeared, has **been won to this** very day: that I was the first today to put the naive question to the author.

Of course, the time (or place) at which a saugrenuité appears, in this case at the precise moment of the one and only reference to my person, is by no means coincidental; nor is the form it takes, here by allusion to a type of notion, "weight", entirely foreign to the theme of the entire article, and by the improvisation of a composite notion "weight complex" that never existed! The association that immediately presented itself to me could well provide the key to the more precise meaning of the saugrenuité, beyond the bravado, the demonstration of power. It's the association with an allusion just as sibylline and just as purely formal (but without yet having the added dimension of saugrenuité!) in Deligne's article quoted at the beginning of note (49)<sup>72</sup> (\*\*\*). It was an obscure allusion, in an article where the word "weight" was rigorously absent and where nobody but Serre or I would have been able to see them, to "weight considerations" which had led me to conjecture (in a less general form, it is clearly stated) the main result of the work. As I explain in the more detailed note "The eviction" (n° 63), behind this rhetorical allusion lies the intention to **conceal** both my role, and the ideas (concerning "weights" and "weights") that I'd been working on.

p. 334 their relationship to cohomology in general, and Hodge's in particular) which he intended to reserve for himself alone. This intention must have been all the more clearly perceived by Verdier as he himself <sup>□</sup>me "operates" on the same diapason (in his relationship with me, at least, which seems to me to be the main cement between the two inseparable friends). In either case, an honest presentation would have consisted in starting the article by clearly indicating the source(s) for the main ideas, or for the question(s) that motivated the article.

Having said this, here's the meaning I see behind the symbolic language of apparent nonsense: I can allow myself, without the slightest embarrassment, to display patent **nonsense** in front of everyone, and at the same time express through this nonsense my true intention, with this absurd allusion-reference to the "weight complex": that is, I have no more intention of revealing anything about the role of Gr. in this work, any more than Deligne had such an intention with his empty allusion to "**weight** considerations"-which allusion made no more sense to the reader then than it does now with the imaginary "**weight-complexes**" I've just mentioned.

<sup>70</sup>(\*) See "Perversity", n° 76.

<sup>71</sup>(\*\*) And it would seem that this text is indeed a standard reference today - or at least it has been for years.

was one of Zoghman's bedside texts (he recently sent it to me). It was there that he learned about the notion of constructibility (which plays an essential role in his theorem), and for a long time he was convinced that Verdier was the brilliant inventor of this crucial notion for him.

<sup>72</sup>(\*\*\*) This is the note "Poids en conserve - et douze ans de secret". For a more detailed examination of this Deligne article from the point of view that interests us here, see "L'éviction", note n° 63, quoted below.

to invent right now, for the sake of the cause and my own pleasure!

I've just posted this note, written yesterday - I was interrupted earlier by a phone call from Verdier, whom I'd tried to reach during the day, to ask him just that question. I explained to him that I was trying to learn a little about cohomology, something he knew I'd never understood, and that Mebkhout had passed on to me for my instruction an old article by him, Verdier, a work that had long served as his bedside text. I was now trying my best to read it, but there was this cryptic reference - it was nice of him to quote me, of course - but I had no idea what he was talking about.

He was quite happy, even a little flattered, but yes, with a broad smile that protruded behind an air of paternal joviality, that I'd end up like this in my old age, learning cohomology on this old paper of his. I didn't expect him to contradict me when I said that he knew I'd never understood anything about cohomology - obviously that had been agreed long ago. ... As for those famous "weight complexes", I could feel his broad smile again at the end of the line (I'm making it up!), delighted that someone (and the addressee himself, no less) had finally picked up on his point.

something that had gone by the wayside for so long. At the same time, there was also a hint of embarrassment - more the embarrassment (I think) of not having been able to hide from a  $\square$  pleasure (like the pleasure one would take in ap

. 335

slightly salacious story... ), than not knowing what to answer. Dumped as I was, he really didn't have to worry about that! Without a moment's hesitation, he turned to Deligne (whose name I hadn't mentioned), who had given a demonstration in one of his articles, in which he also quoted me (he couldn't quite remember where) - in any case, it was a question of weights, but yes, he'd forgotten a little, of course - but not arithmetical weights, because I was quite right, it wasn't the same....

His tone was jovial and unapologetic, and he made it clear that he'd already given me quite a bit of his time - with a slightly hurried air, but without losing his debonair, slightly protective tone. I apologized for bothering him like that, with a rather stupid question, and thanked him for his explanation. My apologies were sincere and so were my thanks - he had indeed taught me everything I wanted to know.

<sup>73</sup>(\*).

## 11.3. IX My students

### 11.3.1. The silence

**Note 84**  $\square$  (May 9) I was perhaps a little brisk yesterday, writing that in "the correct reference" (see note (82)) p. 337 what the author and ex-student shamelessly recopied as "part of the realm of the 'well known' for those in the know". I tried to explain who these "people in the know" were - with the conclusion that **they were no more, no less, than the dear listeners of this SGA 5 seminar** in 1965/66 - listeners, as I've had occasion to say, and judging by the vicissitudes of the writing of this seminar in the hands of volunteers whose lack of conviction I hadn't wanted to sense, it was often more "more" than "less" (always with the exception of the same Deligne ; of course). Indeed, there was no risk of other people "getting involved" as long as SGA 5 had not been written and published, precisely to enable people to "get involved" by reading it! This seminar was in fact published (as fate would have it) after the two "memorable

<sup>73</sup>(\*) Even with my droopy airs, I didn't really feel like I was putting on an act (I don't have the gifts for it), it was perfectly natural - in truth, I'm a bit droopy in all this stuff I haven't handled for nearly fifteen years! But I think that even when I'm old and ripe for the hearse, I'll still be able to feel the difference between an empty walnut and a full one. .

publications" by two of my dearest students and comrades-in-arms, namely the article in question by Verdier in 1976 (in which he says nothing about the origin of the ideas he develops, published there under his pen and for the first time), and Deligne with SGA 4<sup>1</sup>, which has already been discussed at length<sup>74</sup> (\*). After that, we cordially invite Illusie to take care of publishing the rest!

I can't remember in detail who took part in this seminar - whether Artin was there or not, for example. I think that more or less all my students from the first period must have been there in any case.

- with the exception of Mrs. Sinh and Saavedra (whom I hadn't met at the time) and perhaps Mrs. Hakim. There was also Bucur (since deceased). Houzel, Ferrand - I'm not counting Serre - who never had a taste for big cohomological fuss, and who came to put his feet up cautiously from time to time. While no one except Deligne perhaps had a good sense of where all this was leading,

it seems to me that there must have been ten or twelve listeners (not very involved) who were at least

p. 338 following enough to be considered "in the loop" ☐ <sup>the</sup> thought that ran through my head since yesterday, it's that among all these people "in the know", thus representing cohomological expertise (if not all "luminaries" like Illusie and Berthelot, with their "cohomological" theses that were decidedly weighty), and even apart from Verdier and Deligne - there must be quite a few who've had Verdier's article in their hands! A certain air in Verdier gives me the conviction that nobody ever suggested to him that something might be wrong. And I also know that nobody ever drew my attention to it - I learned of the existence of this article on May 2. exactly a week ago today, thanks to Mebkhout, who of course had known about the scam for years.

This gives concrete meaning to the euphoric observation of the "Unanimous Agreement" (to bury my modest self) made ten days ago (note (74))! This agreement encompasses many (if not all) of my "pre-1970" students, i.e. many of those who today set the tone in the mathematical world; and it includes (or has included) my friend Zoghman himself, treated as a Cinderella by the beau monde and clinging against all odds to a kind of "fidelity to my work" (to use his own expression<sup>75</sup> (\*)), which he has had the temerity and obstinacy to claim for himself at times, with the consequences that we know. Go figure!

In short, I was wrong to suggest that such and such a standing journal published a sort of "boilerplate" article that merely copied what was "well known". What the author was copying in full view (if not of everyone, but) of many witnesses was neither published nor "well known" (except for the cohomology class of a cycle in the coherent framework, where I had published it ages ago); and these were additional ideas that I would be remiss to play down, given that I didn't consider it a waste of my time to spend a year developing these and other ideas in a seminar, in front of a large audience. Verdier's article is probably a useful and well-done "digest" of a small part of the ideas and techniques I had developed: precisely so that they can be passed on to a wider audience.

the realm of the "well-known", the daily bread of those who use cohomology (or homology) for objects that more

p. 339 or less deserve the name "varieties" ☐ From this point of view, then, Verdier has done what was useful to do<sup>76</sup> (\*), and in the end I have no reason to be unhappy. However, from what I sensed from my ex-student

<sup>74</sup>(\*) See notes n° s 67, 67', 58, 68'.

<sup>75</sup>(\*) (June 7) Reading all the notes on L'Enterrement during a recent visit. Zoghman points out that this expression that he had used of "fi délité à mon oeuvre" didn't really capture his thoughts. Rather, he had in mind a ~~confidence~~ in his own judgment and mathematical instincts, which told him that my work provided him with some of the ideas he needed. It's all about **self-confidence, which is** essential if you want to do something truly innovative.

<sup>76</sup>(\*) He did so, it's true, at the expense of the "dismantling" of the original SGA 5 seminar, of which he and Deligne were the main players and "beneficiaries".

(June 7) The reflection of May 12, three days later (see note "The massacre" n° 87) made it clear that Illusie was even more directly associated than Verdier with what appears to be more a "massacre" indeed than a dismantling - even if he

and friend even today, on the phone, and through many other things I've sensed from him (the "biggest" of which, or at least the most "spectacular", is the mystification of the Pervers Colloquium) - I can feel that **something is amiss**. That memorable Colloquium was certainly brilliant, mathematically speaking, in many respects. What's "wrong" is at a completely different level. I could try to define it in words, but I'm afraid that wouldn't make much sense. Anyone who doesn't feel what's wrong with this Colloquium - and I'm sure with many other Colloquia too, without mystification or anything - won't feel it a hair more, once I've made this attempt to "pin it down" and even succeeded in doing so to my complete satisfaction... ..

The question that remains open for me is whether this "sign" represented by what is undoubtedly a relatively common occurrence today (of an author presenting as his own the unpublished ideas of others) - whether this sign is that of a general degradation of morals, So, is it just a typical sign of a "spirit of the times" in today's mathematical world, or does it have more to teach me about myself - about the person I once was, and who is now coming back to me, through the attitudes towards me of those who were my students?

The two possible meanings are by no means mutually exclusive. My ex-students' relationship with me could not have found this way of expressing itself, if a certain state of morality didn't encourage them to do so. In fact, even before this "sign", I saw many others that seem to me to be even more eloquent in terms of a "picture of morals". What struck me about this sign is the particularity that sets it apart from all the others: it seems to **involve most of my former pupils at the same time**.

Such a circumstance cannot be fortuitous. To simply put it down to a "deterioration of the mores" (all that's real) would be a way of evading its more personal meaning, which implicates me as a "person".

it involves each and every one of my ex-students. If I say "each", which seems to go beyond the actual amplitude of this

p. 340

sign, I'm weighing my words carefully. For this sign is a timely reminder that it is scarcely conceivable that one of my former students has not at least been confronted with situations of this kind. For years now, I've felt a certain "wind" about me, blowing through the world of mathematicians I've left (a wind whose origin and reasons I now clearly see, it seems). There's no way that any of them could have failed to feel the breath of this wind, be it on the occasion of an "incident" such as the publication of this gravedigger-article, or on any other occasion. Whether he wanted to or not, such an encounter inevitably raised (or raised again) the question of his relationship with me, who had taught him his trade. And the sign I've noticed, beyond the one that just brought me to this point, is that **I haven't heard a single echo on this subject from any of my students**<sup>77</sup> (\*). This is a "coincidence" the meaning of which still escapes me - but which cannot fail to make sense (84 ).<sub>1</sub>

p. 340

The day is dawning - I feel it's time to stop. I'm not sure that this is the time and place, in Harvest and Sowing, to pursue further the meaning of this striking coincidence. It's a harvest perhaps reserved for other tomorrows, if my reflections of this night meet with an echo in one or other of those who were my students.  
⇒ 85

**Note 84<sub>1</sub>** (May 16) This perfect agreement between my former students, in this complete silence towards me, goes in the same direction as other signs. One is the complete silence that also greeted the episode "Les étrangers" (see section 24) - a silence I have already pondered somewhat in note n° 23v.

---

was not the "beneficiary" and that he acted on behalf of others.

<sup>77</sup>(\*) (May 31) Interestingly, the one and only person who ever hinted at the existence of a funeral was an African friend of mine who had done a 3° cycle thesis with me about ten years ago (so "post-1970 student", and of modest status), with whom I have remained on friendly terms. The letter in which he implied this must be from two or three years ago, at a time when I wasn't at all surprised. I didn't then ask for details about his impressions, which he has only recently returned to.

## 2. A walk through a work or the Child and Mother

On the other hand, with the exception of Berthelot, who sent me numerous separate prints, and Deligne, who sent me four (out of some fifty publications) and one from Illusie, I haven't received separate prints from any of my former students. That says a lot about the ambivalence in their relationship with me. Send prints to

p. 341 part, even though it was doubtful whether I would ever make use of it in my work<sup>78</sup> (\*), would have been the way to

p. 341 to let the person who had taught them their trade know that this trade in their hands did not remain inert, that it was alive and active. But it is also true that for at least some of them, their publications also testify to their participation in a tacit burial of which it was better not to inform the anticipated deceased, trade or no trade... . On the other hand, I have received numerous offprints from several authors working in crystalline cohomology<sup>79</sup> (\*\*), and even a good number of offprints from fellow analysts whom I hardly know by name, when their work takes up (and sometimes solves) questions I had asked thirty years ago or more, when it was obvious that I would not return to the subject I had left and that, from a "utilitarian" point of view, they were wasted offprints. But these colleagues must have sensed something that my students didn't want to sense. - Of course, in the sixties, my students were the first to be served for all my publications, both my articles and the great EGA and SGA series, and every one of them (except Mrs. Sinh and maybe Saavedra) must be in possession of my complete work published between 1955 and 1970 (in the ten thousand pages I presume).

It's true that my ex-students are in good company: none of my former close friends in the mathematical "big world", including those whose work is closely related to mine or who played a role in the development of my program of work in the sixties, have seen fit to conti-...

continue to send me separate prints after my departure from<sup>80</sup> (\*\*\*). Only recently, among

p. 342 the fifteen or twenty friends of yesteryear (including some students) to whom I sent the Esquisse d'un Programme

p. 342 (which, among other things, announced the resumption of intense research activity, after a hiatus of fourteen years and on research themes closely related to those we used to pursue together), only two (Malgrange and Demazure) took the trouble to send me a few lines of thanks. The few more detailed (and, what's more, warm) feedbacks I've received have come from young mathematicians I've only recently met, and from my old friend Nico Kuiper, who is in no way connected to the kind of things I do. He found out about the text via an intermediary, and was delighted with my unexpected "homecoming"<sup>81</sup> (\*).

---

<sup>78</sup>(\*) (May 31) This may even have seemed out of the question until 1976, when I made it quite clear in the early '70s that I had no intention of ever returning to mathematics. The lecture I gave at the IHES in 1976, on De Rham complexes with divided powers, showed quite clearly that I was still interested in mathematics.

<sup>79</sup>(\*\*) (May 31) These are young authors whom I don't know personally, and I presume they've followed the example of Berthelot, who for them must be a figurehead. The strange thing here is that for at least the last two years (since the Colloque de Luminy, September 6-10, 1982), Berthelot is actively trying to bury me (see on this subject the b. de p. note of May 22 to the note "les cohéritiers. ...", n° 91) - could this be a recent turning point in his relationship with me? I don't recall receiving the offprint of the article-survey on crystalline cohomology et al. in which he passes my name under silence - he had to be careful not to send it to me!

<sup>80</sup>(\*\*\*) (May 31) Of course, the psychological reasons that might have prompted them to send me some were far less strong than in the case of my students - but, one might naively think, far stronger than among my fellow analysts, or even among the many algebraic geometers whose prints I received separately, and whom I know little or nothing about personally. Clearly, after my departure from the common milieu, the fact of having been friends has created or reinforced, in my former friends in the mathematical world, the automatisms of rejection that I have had occasion to observe. (On the subject of these attitudes, alluded to in passing here and there in Récoltes et Semailles, see the note "Le Fossoyeur ou la Congrégation toute entière" of the 24th.

May, n° 97.)

<sup>81</sup>(\*) (May 31) This is almost the only echo from an old friend of mine (or one of my former students) in the of acquiescence to my "homecoming". This is hardly surprising, given that the appearance of the deceased unseemly interrupts the normal course of a funeral ceremony... ..

(June 17) However, I recently had the pleasure of receiving a warm letter from Mumford, who says he is "thrilled" and

"very excited" by the ideas sketched out in the Esquisse, and who confirms that the key technical result I needed was

### 11.3.2. **solidarity**

**Note 85** (May 11) This story of the ill-fated SGA 5 seminar keeps running through my head. The "good reference"<sup>82</sup> (\*\*) definitely sheds new light on this story, and at the same time gives new meaning to the brilliant "SGA 4 operation"<sup>1</sup>.<sup>2</sup>

The more I think about it, the **bigger** the SGA 5 story seems. My first impression, when I "disembarked" just a few weeks ago (see notes n°s 68, 68'), was that a situation of debandade among the poor ex-auditors of this seminar in 65/66 had been put to good use in his own way by my friend Pierre, for his famous operation, and that no one else had anything to do with it. And as for the misfortunes of SGA 5, this was neither he nor anyone else, but rather "ut other than myself, who had not, alas, known how to enthuse my volunteer-editor listeners, nor do for them the □ work they stubbornly refused to do while saying they p. 343 were about to get down to business. Then it turned out over the last few days that there was one, after all, whose enthusiasm was reawakened ten years later, to publish (without reference to the seminar) what he liked to take from it, thus creating a good reference for his own account, at a time when the other "volunteers" still hadn't decided to get going.

What's become increasingly clear to me since yesterday is that it's not just two "villains", but **every single one of my "cohomologist" students** who are directly involved in the cover-up that took place at this seminar. Unless I'm mistaken, every single one of them attended this seminar - namely (in chronological order of appearance of my "cohomologist" students): Verdier, Berthelot, Illusie, Deligne, Jouanolou. (I'm not counting Jean Giraud, who operated on quite different registers from those mostly discussed in SGA 5 or its predecessor SGA 4).

This seminar, which I did **for the benefit of my students** in the first place, and even though they sometimes asked, grace - **I consider that it wasn't crap**. Every one of them, during that year, learned a good deal about his job as a "cohomology user mathematician"! The things I was doing to them, taking up in the spread-out framework and in a much more circumstantial way ideas I'd first developed in the coherent framework - these things they couldn't find anywhere else but in that one seminar made for their benefit, given that nobody before me had ever bothered to do them - and that nobody but me even felt what there was to do, and why. (Except always Deligne, who learned it over the months in this very seminar, being quicker on the uptake than the others). It was having taken this seminar (and the previous one) and having worked on it at home as best they could, and nothing else, that meant they were now "in the know" about duality formalism, and they were **the only ones** to be. This **privilege**, it seems to me, created an **obligation** for them: to ensure that this privilege did not remain in their hands alone, and that what they had learned from me, and which has been indispensable baggage in all their subsequent work up to the present day, was made available to all, and this within a reasonable and customary timeframe - of the order of a year at most, or even two at a pinch.

□ We'll say, not without some reason, that it was up to me above all others to see to that. But if I accepted in good faith when students and other listeners offered to help with the writing (which, for those who took it seriously, could only be good for them) - not for the benefit of being able to twiddle my thumbs while they did a job that fell to me. I've

p. 344

---

for my combinatorial description of Teichmüller's tower is well and truly proven. This is the first time since 1978 that an old friend of mine has latched on to my "Anabelian" ideas, whose exceptional scope (comparable to that of pattern yoga) has been obvious to me since the very beginning. ...

(March 28, 1985) Since these lines were written, I have also received a very warm letter from I.M. Gelfand (dated Sept. 3, 1984), in response to the Esquisse.

<sup>82</sup>(\*\*) See note n° 82.

continued, with the help of Dieudonné and others (including, incidentally, Berthelot and Illusie in 1966/67) to develop' basic texts that seemed equally urgent to me, and that no one else would have done in my place or without my assistance<sup>83</sup> (\*). These texts have themselves become indispensable references, including for my "cohomology students", who are just as happy as everyone else to find them ready when they need them.

With the mastery of cohomological ideas and techniques they had acquired through their work with me and the seminars they had attended or participated in, writing this seminar through their joint efforts represented a task of derisory dimensions, if we compare it with the service that was being rendered to the famous "mathematical community", or perhaps also, later on, with an obligation of loyalty they might feel towards me. I've already said that for me (the one with the helping hand), it must have been a job of the order of a few months to write the entire seminar. By dividing the work between the five of them, with the writing experience they had each acquired in those years, and with my detailed manuscript notes at their disposal, the investment for each of them was of the order of a month or two at the very least. They were much better equipped to do this than other editors, such as Bucur, who would have liked nothing better than to entrust a task, which was clearly beyond him, to younger, more directly motivated hands.

As long as I was around (so in the three years that followed), I can see how a "leave it to me" reflex might have come into play - I was supposed to coordinate everything and deal with the "volunteers". It's likely that if I'd asked each of them to give two or three presentations

within a short space of time, it was up to me to do the same, and finally get it over with, they wouldn't have recused themselves. It was from the moment I withdrew from the mathematical world that the situation changed completely. They

p. 345

found themselves **the sole trustees of a certain inheritance**, both implicit (in the absence of a will) and very concrete. It's true that, from a practical point of view, my departure was tantamount to a **disappearance** - I was indeed "deceased", in the sense that there was no one outside them to know about the inheritance, to be able to use it and to be concerned (for better or for worse. . . ) about its fate.

If, for the seven years following my departure, this heritage remained hidden (apart from "the good reference" in 1976!), it's because **my students didn't want it to become public during that time**. All things considered, the situation doesn't seem very different to me from that of the "yoga of motives", which was thoroughly known only by Deligne (apart from myself), and which he saw fit to keep to himself for his own benefit. If there is a difference at first sight, it is that in this case there is only one "beneficiary" instead of five, and that there is no common measure between the depth of what was, concealed by one, and what was jointly concealed by the five.

I certainly don't know everyone's deeper motivations - even in Deligne's case I have an apprehension that remains hazy and no doubt will remain so. But on a "practical" level, Deligne's game (with the SGA 4 "s operation - and all the rest) is quite clear. And what's also clear is that these operations couldn't have been carried out **without everyone's solidarity**. It seems to me that Jouanolou isn't too much in the picture - he doesn't strike me as a "luminary", I have the impression that he has long since left the cohomological quagmires (85<sub>1</sub>). But I can't imagine Illusie and Berthelot not having had their hands on both SGA<sub>2</sub> 4<sup>1</sup> and "la

good reference", and they can read as well as me and are no stupider than I am.

If Illusie suddenly became involved in the publication of SGA 5, at the precise moment when Verdier used, where

where Deligne needs a logistical base for his famous SGA 4<sup>1</sup> (by unpacking it) the two seminars from which this text and all his work derive), whereas Illusie had

2

<sup>83</sup>(\*) Between the 1960s and 1970s, I had to work at an average rate of a thousand pages a year of texts (EGA, SGA, articles), almost all of which were to become standard references (something that was quite clear to me when I wrote them, or when I encouraged a collaborator to do so with my assistance).

had ten years to do it, it's surely no coincidence. If the closing presentation on open problems and conjectures that I  $\square$ vais made in 1966 "has unfortunately not been written, any moreover [sic] than p. 346 his very fine introductory talk, which reviewed the formulas of Euler-Poincaré and Lefschetz in various contexts (topological, complex analytic, algebraic)", it's surely no coincidence either - but that's a funeral I don't know anything about. And it's no coincidence either that it seemed as natural to Illusie as it did to Deligne (and just worthy of a mention in passing among the "changes of detail") to amputate the seminar from one of its key presentations, which passes into SGA 4<sup>1</sup> without further ado<sup>84</sup> (\*).

I don't know what were the intentions (conscious or unconscious) of Luc Illusie, whom I like like Pierre Deligne, and who (like him) has always shown me great kindness<sup>85</sup> (\*\*). But I've noticed that, alongside Deligne, he's become the co-actor of a **shameless mystification**: that which passes off the SGA 5 mother seminar of 1965/66 (the very one in which Deligne first heard of schemas, stale cohomology, duality and other "digressions") as a kind of shapeless, vaguely ridiculous appendix to a collection of texts with the misleading name SGA 4<sup>1</sup> written eight years later, which pretends to present itself as anterior (both by the number in its title, and by the number of publication in the Notes readings, and finally by the author's unusual comment "Its existence (of SGA 4<sup>1</sup>) will soon allow us to publish SGA 5 **as it stands**"<sub>2</sub> - emphasis added) - and which, moreover, affects to treat with undisguised disdain the works from which this meagre collection is entirely derived.

Without these works, treated with this beautiful casualness, **none** of Deligne's great works, which are the foundation of his career, would have been possible.

its well-deserved prestige, would not be written now, nor in a hundred years (and the same without doubt for Illusie and my other cohomology students). There is in the esprit of this "SGA 4 V operation a p. 347 **impudence**, of which Illusie is the guarantor (without even realizing it, no doubt), and which could only have been displayed with the tacit approval of a **consensus**. The first people involved in this consensus, apart from Deligne himself, are the very people who were my students and the main beneficiaries of a certain heritage, handed over before their very eyes to the vagaries of the jockeying for position and disdain.

And those airs of peremptory smugness, those paternal, protective airs that I was able to appreciate in my ex-student as recently as the day before yesterday in our telephone conversation<sup>86</sup> (\*), and also those more discreet airs of condescension that I was able to appreciate in my friend Pierre in the aftermath of the brilliant double operation "SGA 4<sup>1</sup> - SGA 5" (of which I was far from having the slightest suspicion at the time and for another seven years) - these airs are **not the** products of solitude, but the signs of a consensus that has **never been called into question**. These tunes tell me something not only about Verdier and Deligne, but also about all those who were my students, and before all others, about those who were (by virtue of their work themes and the tools they wielded every day) the first to be concerned.

The term "mystification", which came to me without having sought it out, opportunely reminds me of that other mystification, in which the same cynicism is on display - that of the so-called "Pervers" Colloquium. The two now seem **intimately, indissolubly linked - it's the same spirit that made both possible**. With the possible exception of Jouanolou, who is no longer so much a part of the "big world", I consider these same ex-students to be the same.

<sup>84</sup>(\*) (May 16) In fact, as I discovered the very next day (see note n° 87), there had been a veritable "massacre" of the mother seminary (or father!) SGA 5, at the hands of Verdier, Deligne and Illusie.

<sup>85</sup>(\*\*) Even after I left in 1970, Illusie showed me a lot of kindness - for a long time he sent me beautiful Christmas cards at the end of the year. I'm afraid I didn't have to write back very often to thank him and give him some sign of life - these signs of a faithful friendship came to me like messengers from a past that seemed so infinitely distant, and with which I'd lost touch.

(May 16) On the other hand, there has been no inclination on Illusie's part to continue or resume contact on a mathematical level, and even last year (when I contacted him about mathematical questions) I sensed his reluctance. In the fourteen years since I left, I have received one and only one offprint from him, dated 1979.

<sup>86</sup>(\*) For this conversation, see the note "Jokes - or 'weight complexes'" (n° 83).

cohomologists jointly and severally responsible for this disgrace. As far as Berthelot and Illusie are concerned, nothing allows me to prejudge malice or bad faith (which cannot be doubted in the case of Verdier as in that of Deligne). But at the very least, I note a blindness, a blockage in the use of healthy faculties, the underlying reason for which, of course, escapes me. If it weren't for a deliberate intention of indifference and disdain, surely Zoghman Mebkhout, as the only person in the '70s to openly claim to be an admirer of my work, and on subjects that were close to both of them (without that they deign to notice it), would have had the benefit of the minimum "favorable prejudice" so that they would at least be aware so  $\square$  so it little of what he does, and hence realize the interest of the direction in which he had been engaged since 1974, an interest that was **obvious**! Neither of them deigned to notice anything, coming from a vague stranger who still pretends to be a Grothendieck. I don't know if they've opened it, or if they've gone through the shorter, more digestible texts that explain what it's all about - in any case, they haven't deigned to acknowledge receipt of it (nor has Deligne, who obviously sets the tone).

That didn't stop them and the other participants in the memorable Colloque<sup>87</sup> (\*) from learning about the remarkable "Riemann-Hilbert correspondence", without the slightest thought of questioning its origin or authorship, or at least (as solid mathematicians) where it was demonstrated (85<sub>1</sub>). But I trust that Deligne was happy to explain this demonstration, which is surely quite obvious to people like them - precisely the kind of demonstration, using Hironaka-style resolution of singularities, that they learned a long time ago from none other than me (85<sub>2</sub>). Riemann-Hilbert, Hironaka abracadabra - that was it!

Clearly, like Verdier and Deligne, they've completely forgotten what **mathematical creation** is all about: a vision that gradually unravels over months and years, bringing to light the "obvious" thing that no-one had seen, taking shape in an "obvious" statement that no-one had thought of (even though, in this case, Deligne had been trying in vain for a whole year. . . ). ) - and which anyone can then demonstrate in five minutes, using the ready-made techniques he had the advantage of learning sitting on the benches of a distant seminar he doesn't deign (or hasn't kept) to remember. ...

If I've spoken bluntly of Berthelot and Illusie, it's not because I particularly want to smear them (after an initial settling of scores with their two friends). I know that they're no "worse" or dumber than most of their dear colleagues or me, and that the lack of flair and sound judgment that

I see in them in this instance (and sometimes, too, that of the necessary respect for others. . . ) is by no means inveterate, but the effect of a **choice**. This choice undoubtedly offered **them**  $\square$  **returns** that pleased them - and may have done so.

Perhaps this other "return" that comes with my reflection will be unwelcome to one or the other. If it were, it would simply be that he's still reproducing the same choice, which is also that of operating on a tiny part of his faculties, even if it means mistaking bladders for lanterns and vice versa, and hopelessly confusing empty nuts (from the boyfriend) and full nuts (from a vague stranger). To each his own! ( $\Rightarrow$  86, 87)

**Note** 85<sub>1</sub> Jouanolou is the only one of my students, along with Verdier, who did not publish his thesis. This seems to me to be a sign of disaffection with the foundational work he had developed, namely that of  $\chi$ -*adique* cohomology from the point of view of derived categories. Since most of his work on this theme took place **after** my departure, i.e. at a time when my students, Deligne and Verdier in

<sup>87</sup>(\*) (June 12) I have since learned that neither of them took part in this Colloque (Luminy, June 1981). See, however, the note "La mystification", n° 85'.

head, had given the signal for a general disaffection with the ideas I had introduced into homological algebra, and in particular that of the derived category, the context hardly encouraged Jouanolou to identify with his work and to do him the (well-deserved) honor of publishing it. As these same Deligne and Verdier, in the wake of the work of Zoghman Mebkhout (aka Elève Inconnu (de Verdier) aka élève posthume (de Grothendieck)), have come to discover (with great fanfare and mutual publicity) the importance of derived categories (see notes n°s 75,77,81), Jouanolou's scorned thesis has, since the Colloque Pervers, regained all its topicality ; a relevance it would never have ceased to have, had the development of the cohomological theory of schemas continued normally after my departure in 1970. A striking detail that illustrates a certain drastic "turn" in Deligne's options after my departure: it was Deligne himself (who had clearly understood the importance of developing the formalism of  $\chi$ -adic cohomology in the context of triangulated categories) who provided Jouanolou with a key technical idea for a formal definition of the triangulated  $\chi$ -adic categories he was studying, an idea that is developed in the thesis. (See my 1969 "Report" on Deligne's work, par.8.)

(May 30) See also, on the subject of Jouanolou's work, the note "Les cohéritiers. . . ", n° 91.

**Note** 85<sub>2</sub> Significantly, it was in this same SGA 5 seminar that everyone learned this demonstration principle, which is used to prove the biduality theorem in cohomology as well.

(in cases where singularity resolution is available), that  $\square$  finitude theorems for p. 350

$Rf_*$  without any cleanliness assumption on  $f$ , and similarly for  $RHom$ ,  $Lf^!$ . (These finiteness theorems were also omitted from the published version of SGA 5, to be appended to SGA 4<sub>2</sub><sup>1</sup>, without Illusie even seeing fit to point this out in his introduction - I only realize this as I write these lines!) Zoghman, who didn't have the advantage of attending the seminar (he got "the right reference" instead), learned the procedure in another place where I had used it (for De Rham's theorem for smooth schemes on  $\underline{C}$ ).

He could also learn it from "the good reference", where my demonstrations are copied into the analytical framework, to establish what my students and listeners at SGA 5 have since liked to call the "Verdier duality" (which was known to me before I had the pleasure of making his acquaintance). It all adds up! **The same demonstration** (copied from me at the same time as the statement) is used by Verdier as a title of authorship for a duality he learned nowhere else than in that dislocated and scorned SGA 5 seminar - and it is used **against** Mebkhout, becoming (by its very "obviousness") a (tacit) pretext and means for shamelessly robbing him of the credit for an important discovery.

(May 30) It seems to me that the first time I used singularity resolution à la Hironaka, and understood the extraordinary power of resolution as a demonstration tool, was for a "three spoonfuls" demonstration of the Grauert-Remmert theorem, describing a complex analytic structure on certain finite coverings of a complex analytic space, and the analogous statement

in the case of schemes of finite type on  $C$ . (It's not impossible that the principle has been blown to me, in this on the same occasion, by Serre). This last result is the main ingredient in the proof of the comparison theorem between étale cohomology and ordinary cohomology (the rest being reduced to unscrewing, thanks to the formalism of  $Rf_!$ , plus a bit of solving to go from  $Rf_!$  to  $Rf_*$  . . . )

### 11.3.3. The mystification

**Note!** 85<sup>1</sup> (June 3) In fact, I'm learning that they didn't have to wonder about paternity, since both Berthelot and Illusie learned the theorem from the mouth of Mebkhout, the first...

p. 351 in February 1982, the second as early as 1979 (the year Mebkhout defended his thesis). Although neither of them took part in the Colloquium in question, they are nonetheless in solidarity with the mystification that took place at the Colloquium.

place at this Colloquium, because it is impossible that they were unaware of the cover-up that took place of Mebkhout's authorship of the *theoreme du bon Dieu*. I can imagine that, along with all the other Colloque participants, they were the first to be fooled by the collective mystification organized by their friends Verdier and Deligne (a mystification in which four of my five cohomology students appear to be involved). As far as Illusie is concerned, at least, I was struck, during a telephone conversation with him after Mebkhout's visit to my home last summer, by how little he obviously thought of him - he was quite astonished (almost pained on the part of his old master, in whom he would surely have expected better judgment... ) to see me give Mebkhout a leading role in restarting the cohomological theory of algebraic varieties. Consensus of considerable force had decided to rank Mebkhout among the vague unknowns, and my friend Illusie blithely lived with this triple contradiction, without asking himself any questions: the leading role played by the theorem of the good God and the philosophy that goes with it; the evasion surrounding the authorship of these things (an evasion in which he himself participates in the company of many); and the low esteem he has for the format and role of Mebkhout (who he knows perfectly well is the unnamed author of these things, which have renewed a field of mathematics in which he, Illusie, is a figure of eminence).

I find here again the complete blockage of common sense and sound judgment, even in something as seemingly impersonal as judgment on scientific matters, a blockage to which I have had occasion to allude more than once already, and which each time again baffles me. And this contradiction I see here in Illusie's (and surely many others') relationship with Mebkhout, my "posthumous pupil", is surely no more than one of the many effects of a more crucial contradiction to be found in his relationship with me. It is this contradiction, in him more particularly and in my other pupils too, that becomes increasingly clear in the reflection pursued in the notes of the present procession to the Funeral, formed by my pupils of yesteryear...

#### 11.3.4. The deceased

**Note 86** ( May 11) As is so often the case, it was with some reluctance that I set about this task.

new reflection, on the theme "SGA 5 - SGA 4<sup>1</sup> - Perversity", which might have seemed to have been examined and

re-examined over and over again: "It's going to make a deplorable impression on a reader who's probably had enough of it ever since he heard about it; it doesn't look elegant at all to go into details again, SGA 5 çî SGA 4<sup>1</sup> that, it's and doesn't deserve any more toast... .".

p. 352 □ I'm glad I didn't let myself be intimidated by that well-known refrain, which would like to prevent myself from getting to the bottom of something (at least as far as I'm able to go at the time), on the pretext that it's decidedly "not worth it", that there's nothing to do but let it run its course... . If there have been times when I've discovered things that I consider useful and important, it's always been in moments when I've known not to listen to what presents itself as the voice of "reason", or even "decency", and follow this indecent urge inside me to go and see even what is supposed to be "uninteresting" or of poor appearance, or even messed up or indecent. I can't remember a single time in my life when I've regretted having looked at something a little more closely, against inveterate reflexes that would have prevented me from doing so. These inhibition reflexes were even stronger in *Récoltes et Semailles* than on other occasions, because this reflection is destined to be made public, which immediately imposes certain

child parties), and conciseness (for the sake of the reader). But I don't think so,

finally, that these constraints never prevented me from either tackling something I wanted to tackle, or going as far into it as I felt I wanted to. In the cases that may at one time have seemed like borderline cases, I forged ahead with the assurance that, should the need arise, I would always have the resource of not including in Harvest and Sowing anything that would "escape" my indiscreet reflection. These "borderline cases" arose exclusively when I hesitated to involve others, and never when it came to involving myself. But even in the first case, it turns out (and this came as a surprise) that I never had to make use of this "resource": the text of Récoltes et Semailles represents the complete version of my reflection - at least of the part of this reflection that found its way into writing to express itself.

I feel that with the brief reflection of the previous note<sup>88</sup> (\*), the situation has become considerably clearer. I mean that a certain essential aspect of a situation which had been confusing to pleasure, and which I have just evoked by the triple name of a "theme" (SGA 5 - SGA 4<sup>1</sup> - Perversity), has appeared to me in full light: that of a "solidarity", a "connivance" which had only been confusedly perceived until then. This doesn't mean that I believe I've fathomed and understood all the ins and outs of a "solidarity", a "connivance" that had only been dimly perceived until then.

complex situation, directly and particularly obviously involving at least seven people: Zoghman Mebkhout (acting in a sense as a "revealer" of a certain situation), my five ex-students cohomologists, and myself. I don't even flatter myself to have perceived all the springs and motivations that have been at play in my own person, in relation to the "SGA 5 etc. ... .", in the nearly twenty years since that "unfortunate seminar" took place! But I feel in a much better position than I was yesterday (or even just this morning), to understand and situate the echoes that I hope will reach me on this subject from at least one or other of the main parties involved.

p. 353

The main question that arises for me (it seems to me that it was already present at another stage of reflection, and now reappears with new vigour) is (it seems to me) this: is what happened with this Burial by my students, (more or less) in their entirety, something completely **atypical**, linked to certain particularities of my person and my singular destiny (such as my departure from the mathematical scene nearly fifteen years ago, the circumstances surrounding it, etc. ) ? Or is it, on the contrary, something "quite natural", due to a simple combination of circumstances - following the principle that "opportunity makes the thief"? I hesitate to think so, though I can't at the moment discern, or even glimpse, what particular aspect of myself has had the virtue of creating such perfect and unanimous **agreement** among my former students, to bury both the "master", and those who claim to be his followers or whose work clearly bears his mark (without, however, being "theirs"). Is it this sort of "aura" of Father that surrounds me, and which I've had occasion to mention? Or is it the challenge posed to each of them by the mere fact of my departure? At the moment, I wouldn't be able to say, for lack of eyes that can see... . Perhaps the coming months will teach me something on this subject<sup>89</sup> (\*).

More than once in the last three weeks, I've thought of this other strange "coincidence": it's that the discovery of the Burial "in all its splendour" (with the four-stroke LN 900 - SGA 4<sup>1</sup> - SGA 5 - Colloque Pervers, then back to SGA 5 and SGA 4<sup>1</sup>)<sup>2</sup> - that this discovery came at a time when I had just completed an in-depth reflection on my past as a mathematician and my relationship with my students. It was a time, therefore, when I had just come "to terms with myself" on the subject of my students.

of this past, to the best of my ability, and as far as the facts then known to me allowed, as they were often hazy memories. Or to put it another way: it was leprendered by

. 354

<sup>88</sup>(\*) This refers to the note "La solidarité" n° 85, dated the same day.

<sup>89</sup>(\*) (May 30) For a reflection along these lines, see the note "Le Fossoyeur - ou la Congrégation toute entière", n° 97.

the exact moment when I was finally **ready** to learn and profit from it.

Chance" did things so well that there wasn't even a break in the meditation. The reflection that had begun with this short retrospective on the fate of the most important notions (in my opinion) that I had introduced<sup>90</sup> (\*) (a reflection that remained in a certain vagueness, where only a certain basic tone emerged insistently... ) - this reflection continued quite naturally on Thursday April 19. It was, it's true, still in the throes of the emotion aroused by that impression of "impudence" (to use the term from earlier, which also aptly describes something I felt at the time), on reading the "memorable volume" LN 900.

In this new departure from "the same" thinking, the main driving force was "the boss" - my self-esteem and sense of decency were affected, and by writing down my emotions I freed myself from them to a certain extent. It was indeed "me", "the boss", who visibly led the dance in the ten days that followed - days marked by the absence of smiles and laughter, by unfailing seriousness. I had to go through this ten-day detour before the reflection returned to the center it had left - to myself. I still remember the relief of that return - like coming out of a tunnel when daylight appears again! It was then that I found myself laughing and smiling again, as if we'd never left each other. It was April 29th. The next day, the 30th, the last day of the month, I was happy to put the finishing touches to this ultimate stage of reflection.

It was also the moment, surely, when I was ready to receive the next "package", this time sent by my friend Zoghman - the "Colloque" package received the day after tomorrow. Today is the tenth day I've been working on assimilating the substance of this package. But at this stage, while I've been gnawing at the bit to get to the bottom of this rebound that just kept on rebounding, the smile hasn't faded for a single day. And today, I truly believe (for the thirtieth time, it's true!), is finally the day of closure.

Five days ago I'd already had that same feeling that I'd reached the end of my rope, that there was nothing left but work to be done.

of stewardship: adding a few footnotes here and there, retyping pages too overloaded with ratures (each time a sign of a thought that had remained somewhat confused, and which needs to be put into

This seemingly mechanical work, from which the text always emerges with a new face... ). . . This was when I had just written what is now the note "Mes amis" (n° 79), which spontaneously flowed into "final chords". However, I ended up separating these chords from the beginning of the note. In fact, it turned out that this famous stewardship work had broken down: the "footnotes", typed without line spacing, became real notes (**not** footnotes) of nice dimensions, which had to be retyped with line spacing, and then tried as best I could to fit in here and there. It took days before I realized that another procession, after the one called "The Colloquium", was forming to join the procession - and that the last of the processions would not (as I had decided in my head) be the said Colloquium, but would be led by **the Student**. And just today, as the first procession, reduced to a single note, was enriched by a second ("A feeling of injustice and powerlessness"), I also knew who would lead it: it was "**L'élève posthume**". So the procession, opened by a Pupil (posthumous and lower-case, as befits his humble state) and closed by yet another Pupil (by no means humble this time), seems to me to be complete at last!

It's also time, it seems to me, after a first "false arrival", to return to the chords of a final De Profundis, which are more appropriate today than they were five days ago. Here they are, as I wrote them down then, and which also express my feelings at the moment.

---

<sup>90</sup>(\*) See notes "My orphans" and "Refusal of an inheritance - or the price of a contradiction" of March 31 (n° s 46,47).

(May 31) Finally, it was another "false arrival" - the "final agreements" were premature this time too! Twenty days went by, during which the "housekeeping work" continually broke down into rethinking this and that aspect that had been neglected. Six more notes joined the "L' Elève" procession, which was supposed to close the parade. The Fourgon Funèbre appeared in the wake of the Elève, carrying four coffins accompanied by the Fossoyeur. He was definitely lacking to give body and meaning to a funeral convoy that didn't seem to be conveying anyone.

Having become cautious through experience, I'm waiting for events to unfold and won't take any chances for the time being.

to predict whether the procession is finally complete, or whether a forgotten procession will sneak in again at the last minute, so as not to miss the ultimate Ceremony<sup>91</sup> (\*).

p. 356

### 11.3.5. The massacre

**Note 87** (May 12)<sup>92</sup> (\*\*) For the edification of the somewhat cohomologist reader, and above all for my own, I would like to review the details of this plundering of a splendid seminary, in the hands of two of my former cohomologist students and under the benevolent eye of the others<sup>93</sup> (\*\*\*) - of the same seminary where they learned, twelve years before anyone else and from the hand of the workman himself, the basics and finesses of the trade that made their reputation.

Two of my oral presentations have never been made available to the public in any form. One is the closing lecture on open problems and conjectures, which "unfortunately was not written up", given how little - and indeed, the author of the introduction to the murder-edition deemed it unnecessary even to mention **what** open problems and conjectures it was. And why should he have taken the trouble, when these were merely problems (which everyone is free to pose as they please!) and conjectures (not even demonstrated!) (87<sub>1</sub>). The other was the lecture that opened the seminar, placing it right from the start in a broader context (topological, complex analytic, algebraic) and reviewing formulas of the Euler-Poincaré, Lefschetz, Nielsen-Wecken type, some of which constituted one of the seminar's main applications. The ". . . any more than. . . ." with which the author of the introduction goes on to point out, in the course of a sentence, the disappearance of this presentation, speaks volumes about a **casual attitude** which at the time was clearly self-evident, even though the author of the seminar had been out of circulation for seven years.

There's a whole series of talks I gave on the formalism of homology and cohomology classes. logie associated with a cycle (regular ambient pattern in the cohomological case)<sup>94</sup> (\*\*\*\*). They have been equally divided: cohomology for Deligne, homology for Verdier - who nevertheless overflows a little on cohomology, even if it means making the small reference to Deligne with the famous "complexes". p. 357 weight"<sup>95</sup> (\*). (Not to mention the finitude theorem for RHom and the biduality theorem, copied verbatim from the seminar - in any case, the lion's share will go to Deligne, which was to be expected. ... ) The author of the introduction does not see fit to mention the homology lectures alone. Indeed, there was no need, since the previous year his friend Verdier had taken on the task of providing the missing "good reference" (without alluding to a seminar, or to me).

<sup>91</sup>(\*) (June 12) Caution was the order of the day, as a new "Mes élèves" procession separated from the one originally called "L'Elève", which became "L'Elève - alias le Patron".

<sup>92</sup>(\*\*) This note follows on from the previous day's reflection on "Solidarity" (n° 85).

<sup>93</sup>(\*\*\*) Further reflection reveals that one of these "others" lent a hand efficiently for this operation. on behalf of others.

<sup>94</sup>(\*\*\*\*) For details, see note no. ° 82 "Good references".

<sup>95</sup>(\*) See note (83) "The joke - or weight-complexes".

There were oral presentations on finiteness theorems for the operations  $R f^! \wedge$  ( $f$  not proper), and as a corollary, for the operations  $RHom_*$  ; and  $Lf^!$  . The key theorem was proved using a Hironaka-style singularity resolution technique (valid only in cases where the resolution is available).

These arguments, which I used, have come into common use since the seminar (see note (85<sub>2</sub>)). Deligne has managed to prove these finitude theorems, as well as the biduality theorem, under other, more helpful hypotheses, which have already been verified in most applications. It might have been expected that he would ask to include these refinements in the seminar where he had the privilege of learning étale cohomology, and the ideas and techniques at the basis of all his subsequent work. But this circumstance is used as a "reason" for amputating this part of the seminar. As for the biduality theorem, under Illusie's pen (and within the framework of the diagrams) it became "Deligne's biduality theorem" (introduction to Lecture I). This was only fair, since in the analytical case, Verdier had already claimed it as his own the previous year (without even having to go to the trouble of finding another demonstration).

Then there's Illusie's "generic Kûnneth formula". No one before had thought of developing this kind of statement, inspired by the intuition that "generically" i.e. in the vicinity of the generic point of the basis, a relative scheme behaves like a "locally trivial fiber" in the topological context. In an elegant demonstration similar to the one mentioned above, Deligne manages to eliminate the singularity-resolving hypothesis I had made. It's awarded - presentation deleted and "replaced" by a reference to a presentation by the same Illusie in the so-called "earlier" seminar.

SGA 4<sup>1</sup><sub>2</sub>.

p. 358

There is a series of lectures on the formalism of non-commutative traces, developed as a means of explicating the local terms of the Lefschetz-Verdier formula in cases that had never been treated. These lectures were eventually written, it seems, by Bucur, whose manuscript "got lost in a providential move" - it's turning into a vaudeville!<sup>96</sup> (\*) In the introduction to SGA 5, written by Illusie, these lectures become "Grothendieck's theory of **commutative** traces, generalizing [brilliantly] Stallings" (which were non-commutative!). The slip of the tongue<sup>97</sup> (\*\*) can only be due to a badly (or too well. . . ) inspired secretary, who must have been involved with my friend Ionel Bucur's movers. (The word "brilliantly" is an interpolation of my pen, to better render the thought infallibly suggested by this slip of the tongue, also providential).

I've got nothing to complain about, since Illusie has taken on the job of redoing the work (and even, he tells us, a "more sophisticated" version, since it's put in the Beamtique sauce - I seem to remember, though, Illusie, that you made more "sophisticated" innovations than this in my day... .). It must have taken a long time even, if I remember that I spent weeks putting the machine together; my manuscript also got lost in the same providential move, and God knows if one of the dear listeners, overwhelmed by my oral faconde, was at least able to take comprehensible notes... .

Remarkably, and this is something I hadn't noticed before, he doesn't insert this talk in the place in Lecture XI where it was intended (which no doubt also corresponds to the place it had in the oral seminar), preferring to leave a gaping hole there and make his talk an apocryphal one, called "Calculs de termes locaux" ("Calculations of local terms"). The title does, however, seem to correspond to what I seem to remember him doing in the oral seminar.

<sup>96</sup>(\*) It was no doubt this circumstance that inspired Deligne's unexpectedly brilliant criticism of SGA 5, in which the local terms of Lefschetz Verdier's formula (which "remained conjectural", remember!!!) were not even calculated! (See note "la table rase", n° 67, about the absurdity of this criticism, which for an informed reader is similar to that of Verdier's famous "weight complex" the previous year (see note n° 83). So it was Verdier who became the schoolmaster!)

<sup>97</sup>(\*\*) This is the slip of the tongue attributing to me the authorship of a theory of "commutative" traces (for which I was not expected), instead of "non-commutative". That it has survived into the published edition is all the more remarkable given that Illusie was perhaps the most meticulous of my students, down to the last detail.

strange. But from line 1 of his introduction to this talk, the author is quick to □detrompt us: "Cetp  
 exposé, written in January 1977, **does not correspond to any oral presentation in the seminar**". And he  
 continues with Lefschetz-Verdier formulas (that name rings a bell, though, and I thought I'd actually developed  
 a theory of non-commutative traces, in order to calculate "local terms" in certain cases. . . ), then on a formula  
 by Langlands and a demonstration by Artin-Verdier in 1967 (this was a year after the final agreements of  
 the oral seminar, which must have influenced these authors, at least one if not both of whom followed him).  
 Towards the end of the page, we learn as if in passing, contrary to what had been announced at the  
 beginning, that there is also a "second part of this talk, of a much more technical nature" (I've read this  
 language somewhere. . . ) which is (admire the nuance) "**inspired by the method used by Grothendieck**  
 to establish the Lefschetz formula for certain cohomological correspondences on curves", with a reference to  
 Lecture XII of the same seminar and above all to the indispensable SGA 4<sup>1</sup> ; Obviously, there was no  
 reason, for so little, to include this lecture in<sub>2</sub> place of the gaping hole - the "more sophisticated version" of  
 earlier will have done things right. It was even nice of Illusie and Deligne to cite me as a source of  
 "inspiration", when the example of their friend Verdier the previous year had clearly shown that there was  
 absolutely no need for such scruples.

I return to Illusie's introduction to the volume that goes by the name of SGA 5. In it, we learn once again -  
 as Deligne had already announced in his introduction to SGA 4<sup>1</sup> - that it was indeed **thanks to**  
**his friend** that the seminar has finally been published:

"I would like to thank P. Deligne for having convinced me to write, in a new version of Lecture III, a  
 demonstration of the Lefschetz-Verdier formula, **thus removing one of the obstacles to the publication of**  
**this seminar**".

Once again, we're in the middle of a farce - repeated as is by the docile Illusie in the introduction to SGA  
 4<sup>1</sup> ! If the seminar remained unpublished for more than ten years, it's because no one (until Deligne saved  
 the day in 1977) had yet considered the possibility of publishing it.

good idea to write a demonstration of the so-called (and rightly so) "Lefschetz-Verdier formula", of which none  
 other than □ his inseparable friend and my ex-student Verdier himself has proudly borne the paternity **since aup**  
 .360

**minus** 1964 (87<sub>2</sub>), i.e. for at least two years by the time my seminar ended, and was just waiting to be made  
 available to everyone!

Finally, as another and last (?) mutilation of the seminar, there was the disappearance of the fine talk  
 Serre had given on the "(Serre-) Swan module" - a talk entitled "Introduction à la théorie de Brauer". It's  
 fortunate that Serre, seeing the turn events were taking, had the good sense to include his talk in his book  
 "Représentations linéaires des groupes finis" (Hermann, 1971), and make it available to the mathematical  
 public.(87)<sub>3</sub>

This time, I think, I've come full circle. The picture of the fate of a seminar in which I had put the best of  
 myself (88)<sup>98</sup> (\*), and which I find twenty years later unrecognizable, butchered by the very people who had  
 been its exclusive beneficiaries - or at least by three of them, and with the assent of all the other participants.

I don't regret having taken the trouble, once again, to follow through on what had gradually come to my  
 attention. This "return of things"<sup>99</sup> (\*\*) that I noticed, at the end of a long retros-

<sup>98</sup>(\*) For the meaning of this expression "of the best of myself", see the following notes "La dépouille. . . ", ". . . and the body", n°  
 88, 89. The first of these situates the SGA 5 seminar, with SGA 4 inseparable from it, as the masterpiece of the part of my  
 work "entirely completed".

<sup>99</sup>(\*\*) See note of this name (n° 73) dated April 30.

pective about my relationship with one of my former students, sensing even then that he wasn't the only one to "bury me with gusto" - I've only now become aware of his breath, his "smell" (to use an expression that then appeared in one of my dreams) - the breath of **violence**. This breath is concealed and revealed at the same time by the speech<sup>100</sup> (\*\*\*) (seemingly detached and impassive) presenting a highly technical substance. What this violence is aimed at, through a "corpse" delivered at mercy,

p. 361

is the very person of the one who was the "master", the "Father" - at a time when the "pupils" have long since taken his envied place, without encountering any resistance; and that □ also long ago they have elected from among themselves the new "Father", called to replace the old and reign over them.

I feel this breath, and yet it remains for me a foreign thing, misunderstood. To "understand" it, this breath would have to live in me, or have lived in me. But four years ago, for the first time, I felt and measured the significance of something in my life that I had never thought about, that had always seemed self-evident: that my identification with my father as a child **was not** marked by conflict - that at no time in my childhood **did I fear or envy my father**, while at the same time devoting unreserved love to him. This relationship, perhaps the most profound that has marked my life (without my even realizing it before this meditation four years ago), which in my childhood was like a relationship with an other self both strong and benevolent - this relationship was not marked by division and conflict. If, through all my often-torn life, the knowledge of the strength that lies within me has remained alive; and if, in my life by no means free of fear, I have not known fear either of a person or of an event - it is to this humble circumstance that I owe it, ignored until well into my fifties. This circumstance has been a priceless privilege, for it is the intimate knowledge of the creative force within one's own person that **is** also that force, enabling it to express itself freely according to its nature, through creation - through a creative life.

And this privilege, which has exempted me from one of the most profound marks of conflict, is at the moment also like a hindrance, like a "void" in my experience of life. A void that's hard to fill, where many others have a rich tapestry of emotions, images and associations, offering them the path (provided they're curious enough to take it) to a profound understanding of others as well as themselves, in situations that I manage (by dint of repetition and cross-checking) to apprehend as best I can, but in the face of which I remain like a stranger - with the desire for knowledge within me still hungry.

**Note** 87<sub>1</sub> (87<sub>1</sub>) (May 31) This closing presentation, surely one of the most interesting and substantial with the opening talk, was obviously not lost on everyone, as I see from reading Mac Pherson's paper "Chern classes for singular algebraic varieties" (Chern classes □ for singular algebraic varieties, *Annals of Math.* (2) 100, 1974, pp. 423-432) (received April 1973)-In this paper, under the name of "Deligne-Grothendieck conjecture", I repeat one of the main conjectures I had introduced in this paper in the schematic framework. It is taken up by Mac Pherson in the transcendental framework of algebraic varieties over the field of complexes, the Chow ring being replaced by the homology group. Deligne had learned this conjecture<sup>101</sup> (\*) in my talk in 1966, the same year he had appeared in the seminar where he began to familiarize himself with the language of diagrams and cohomological techniques (see the note "L'être à part" n° 67)-It's nice of you to have done me the honor of including me.

p. 362

<sup>100</sup>(\*\*\*) These are mainly the introductory texts accompanying SGA 5 (written by Illusie) and SGA 4. <sup>1</sup>  
(written by Deligne).

<sup>101</sup>(\*) (June 6) In a slightly different form, see the rest of today's note.

(March 1985) For further details, given by Deligne himself, see the note "Les points sur les i", n° 164 (II 1).

in the name of conjecture - a few years later it would no longer have been appropriate... .

(June 6) I'd like to take this opportunity to explain the conjecture I'd put forward in the seminar in the schematic framework, while also pointing out the obvious variant in the complex analytic (or even rigid-analytic) framework. I conceived it as a "Riemann-Roch" theorem, but with discrete coefficients instead of coherent coefficients. (Zoghman Mebkhout told me, incidentally, that his view of D-Modules should make it possible to consider the two Riemann-Roch theorems as contained in a single crystalline Riemann-Roch theorem, which would thus represent in zero characteristic the natural synthesis of the two Riemann-Roch theorems I introduced into mathematics, one in 1957, the other in 1966). We fix a ring of coefficients  $\Lambda$  (not necessarily commutative, but noetherian to simplify and moreover of prime torsion to the characteristics of the schemes under consideration, for the purposes of stable cohomology... ). For a scheme  $X$  we denote by

$$K(X, \Lambda)$$

the Grothendieck group formed by constructible étale bundles of  $\Lambda$ -modules. Using the functors  $Rf_!$ , this group depends functorially on  $X$ , for  $X$  noetherian and scheme morphisms which are separated and of finite type. For regular  $X$ , I postulated the existence of a homomorphism of groups canonical, playing the role of the "Chern character" in the consistent RR theorem,

p. 363

$$ch_X : K(X, \Lambda) \rightarrow A(X) \otimes_{\mathbb{Z}} K(\Lambda), \quad (15.1)$$

where  $A(X)$  is the Chow ring of  $X$  and  $K(\Lambda)$  the Grothendieck group formed with  $\Lambda$ -modules of finite type. This homomorphism was to be determined solely by the validity of the "discrete Riemann-Roch formula", for a **proper** morphism  $f : X \rightarrow Y$  of regular schemes, which formula is written as the consistent Riemann-Roch formula, with Todd's "multiplier" replaced by the total relative Chern class :

$$ch_Y(f_!(x)) = f_* (ch_X(x) c(f)), \quad (15.2)$$

where  $c(f) \in A(X)$  is the total Chern class of  $f$ . It's not hard to see that in a context where we have the resolution of singularities in Hironaka's strong form, RR's formula does indeed uniquely determine the  $ch$ .

Of course, we assume that we're in a context where the Chow ring is defined (I'm not aware of anyone having even attempted to write a theory of Chow rings for regular schemes of finite type over a body). Alternatively, we can also work in the graduated ring associated with the usual "Grothendieck" ring  $K^\circ(X)$  in the coherent context, filtered in the usual way (see SGA 6). Alternatively, we can replace  $A(X)$  by the even  $l$ -adic cohomology ring, the direct sum of  $H^{2i}(X, \mathbb{Z}_l(i))$ . This has the disadvantage of introducing an artificial parameter  $l$ , and giving formulas that are less "purely numerical" fines, while the Chow ring has the charm of having a continuous structure, destroyed by switching to cohomology.

Already in the case where  $X$  is a smooth algebraic curve over an algebraically closed field, the calculation of  $ch_X$  involves delicate local invariants of the Artin-Serre-Swan type. In other words, the general conjecture is a profound one, the pursuit of which is linked to an understanding of the higher-dimensional analogues of these invariants.

Remark. Designating in the same way by  $K(X, \Lambda)$  "the Grothendieck ring" formed with the construc-

of finite tor-dimensional  $\Lambda$ -spreads (which ring operates on  $K(X, \Lambda)$  when  $\Lambda$  is commutative. . . ), we must likewise have a homomorphism

$$ch_X : K(X, \Lambda) \rightarrow A(X) \otimes_{\Lambda} K(\Lambda)$$

again giving rise (mutatis mutandis) to the same Riemann-Roch (RR) formula.

p. 364

□ Let  $cons(X)$  now be the ring of constructible integer functions on  $X$ . We define less tautological canonical homomorphisms

$$K(X, \Lambda) \rightarrow Cons(X) \otimes_{\Lambda} K(\Lambda),$$

$$K^*(X, \Lambda) \rightarrow Cons(X) \otimes_{\Lambda} K^*(\Lambda),$$

If we now restrict ourselves to schemes **of zero characteristic**, then (by using Euler-Poincaré characteristics with proper supports) we see that the group  $Cons(X)$  is a covariant functor with respect to finite-type morphisms of noetherian schemes (in addition to being contravariant as a ring functor, which is independent of characteristics), and the preceding tautological morphisms are functorial. (This corresponds to the "well-known" fact, which I believe was not proved in the SGA 5 oral seminar, that in **zero characteristic**, for a locally constant bundle of  $\Lambda$ -modules  $F$  on an algebraic scheme  $X$ , its image by

$$f_! : K(X, \Lambda) \rightarrow K(e, \Lambda) \rightarrow K(\Lambda)$$

is equal to  $d\chi(X)$ , where  $d$  is the rank of  $F$ ,  $e = Spec(k)$ ,  $k$  the base field assumed to be algebraically closed. . . ). This immediately suggests that the Chern homomorphisms (1. ) and (1' ) must be derivable from the tautological homomorphisms (2. ), (2' ) by composing with a "universal" Chern homomorphism (independent of any ring of coefficients  $\Lambda$ )

$$ch_X : Cons(X) \rightarrow A(X),$$

so that the two " $\Lambda$ -coefficient" versions of the RR formula appear to be formally contained in an RR formula at the level of constructible functions, which is always written in the same form.

When working with schemes on a fixed basic body (again, of any characteristic), or more generally on a fixed **regular** basic scheme  $S$  (for example  $S = Spec(\underline{\mathbb{Z}})$ ), the form of the Riemann-Roch formula most in line with the usual writing (in the coherent framework familiar since 1957) is obtained by introducing the products

$$ch_X(x)c(X/S) = c_{X/S}(x)$$

p. 365

(where  $X$  is in a  $K(X, \Lambda)$  or  $K^*(X, \Lambda)$  indifferently), which we might call **the Chern class of  $X$  relative to the basis  $S$** . When  $x$  is the unit element of  $K(X, \Lambda)$  i.e. the class of the constant bundle of value  $\Lambda$ , we find the image of the total relative Chern class of  $X$  with respect to  $S$ , by 1 "canonical homomorphism of  $A(X)$  into  $A(X) \otimes K(\Lambda)$ . This being the case, RR 's formula is equivalent to the fact that the formation of these relative Chern classes

$$c_{X/S} : K(X, \Lambda) \rightarrow A(X) \otimes K(\Lambda),$$

for a regular variable scheme  $X$  over  $S$  (of finite type over  $S$ ), with  $S$  fixed, is functorial by

with respect to eigenmorphisms, and similarly for the variant (5'). In null characteristic, this reduces to the functoriality (for eigenmorphisms) of the corresponding application

$$c_{X/S} : \text{Cons}(X) \rightarrow A(X) .$$

It is in this form of the existence and uniqueness of an absolute "Chern class" application (6), in the case where  $S = \text{Spec}(C)$ , that the conjecture in Mac Pherson's work is presented, the relevant conditions (here as in the general case of zero characteristic) being a) the functoriality of (6) for proper morphisms and b) we have  $c_{X/S}(1) = c(X/S)$  (in this case, the "absolute" total Chern class). Compared with my initial conjecture, however, the form presented and proved by Mac Pherson differs in two ways. One is a "minus", in that it is placed, not in the Chow ring, but in the whole cohomology ring, or more precisely the whole homology group, defined by transcendental means. The other is a "plus" - and it is here perhaps that Deligne has made a contribution to my initial conjecture (unless this contribution is due to Mac Pherson himself<sup>102</sup> (\*)). It's that for the existence and uniqueness of an application (6), we don't need to restrict ourselves to regular schemes  $X$ , provided we replace  $A(X)$  by the entire homology group. The same is likely to be true in the general case, where we denote by  $A(X)$  (or better, by  $A_*(X)$ ) the **Chow group** (which is no longer a ring in general) of the noetherian scheme  $X$ . Or to put it another way: while the heuristic definition of *ch-invariants* $_X(x)$  (for  $x$  in  $K_*(X, A)$  or  $K^*(X, A)$ ) makes essential use of the assumption that the ambient scheme is regular, as soon as we multiply it by the "multiplier"  $c(X/S)$  (when the scheme  $X$  is of finite type over a fixed regular scheme  $S$ ), the product obtained (4) seems to retain a meaning without any assumption of regularity<sup>about</sup>□, as an element of a tensor product.

366

$$A_*(X) \otimes K_*(\Lambda) \text{ or } A_*(X) \otimes K^*(\Lambda) ,$$

where  $A_*(X)$  denotes the Chow group of  $X$ . The spirit of Mac Pherson's demonstration (which does not use singularity resolution) would suggest the possibility of an explicit "computational" construction of the homomorphism (5.), by "making do" with the singularities of  $X$  as they are, as well as with the singularities of the coefficient bundle  $F$  (whose class is  $x$ ), to "collect" a cycle on  $X$  with coefficients in  $K_*(\Lambda)$ . This would also be in the spirit of the ideas I had introduced in 1957 with the coherent Riemann-Roch theorem, where I did self-intersection calculations in particular, taking care not to "move" the cycle under consideration. A first obvious reduction (obtained by immersing  $X$  in an  $S$ -scheme) would be to the case where  $X$  is a firm subscheme of the regular  $S$ -scheme. . .

The idea that it should be possible to develop a **singular** (coherent) Riemann-Roch theorem was familiar to me, I can't say how long ago, but I never tried to test it seriously. It was more or less this idea (apart from the analogy with the "cohomology, homology, cap-product" formalism) that led me in SGA 6 (in 1966/67) to systematically introduce the  $K_*(X)$  and  $K^*(X)$  and the  $A_*(X)$ ,  $A^*(X)$ , instead of just working with the  $K^*(X)$ . I don't remember whether I also thought of something like this in the SGA 5 seminar in 1966, and whether I hinted at it in the oral presentation. As my handwritten notes have disappeared (in a removal perhaps?) I'll probably never know... .

(June 7) Looking through Mac Pherson's article, I was struck by the fact that the word "Riemann-Roch" is not mentioned - which, incidentally, is why I didn't immediately recognize the conjecture I made in the SGA 5 seminar in 1966, which was for me (and still is) a "Riemann-Roch" type theorem. It seems that when Mac Pherson wrote his article, he didn't even realize that it was a "Riemann-Roch" theorem.

<sup>102</sup>(\*) (March 1985) This is indeed the case, cf. note no. ° 164 cited in the previous footnote.

of this obvious kinship. I presume that the reason for this is that Deligne, who after my departure put this conjecture into circulation in the form he liked, took care as far as possible to "erase" it.

p. 367 the obvious kinship with the Riemann-Roch-Grothendieck theorem. I think I sense his motivation for doing so. On the one hand, it weakens the link between this conjecture and myself, and makes it more plausible to call-

the "Deligne-Grothendieck conjecture" under which it is currently circulating. (NB I don't know if it's in circulation in the schematic case, and if so, I'd be very curious to know under what name). But the deeper reason seems to me to lie in his obsessive desire to deny and destroy, as far as possible, the fundamental unity of my work and my mathematical vision<sup>103</sup> (\*). This is a striking example of how, in a mathematician of exceptional means, a fixed idea entirely unrelated to any mathematical motivation, can obscure (or even completely block out) what I have called the "healthy mathematical instinct". This instinct cannot fail to perceive the analogy between the two "continuous" and "discrete" statements of the "same" Riemann-Roch theorem, which I had of course emphasized in the oral presentation. As I indicated yesterday, this kinship will no doubt soon be confirmed by a statement in form (conjectured by Zoghman Mebkhout), at least in the complex analytic case, allowing both to be deduced from a common statement. Clearly, given Deligne's "gravedigging" attitude towards the Riemann-Roch theorem<sup>104</sup> (\*\*), he was not likely to discover the unique statement that links them in the analytic framework, and even less likely to raise the question of an analogous statement in the general schematic framework. Nor was he able, in such circumstances, to find the fruitful point of view of D-Modules in the cohomological theory of algebraic varieties, arising all too naturally from ideas that had to be buried - or even to recognize, for years, the fruitful work of Mebkhout, succeeding where he himself had failed.

p. 368 **Note** 87<sub>2</sub> (May 31) This is the year of my Bourbaki paper on the rationality of *L-functions*, in which I heuristically use Verdier's result (???) (and especially the expected form of local terms in the case of d'espèce), without waiting for Illusie to demonstrate it thirteen years later, at Deligne's invitation. It seemed to me, moreover, when Verdier showed me his ultra-general formula that came as a surprise, that he demonstrated it with a few lines of "six operations" formalism - this is the kind of formula where (almost) to write it is to demonstrate it! If there was any "difficulty", it could only be at the level of verifying one or two compatibilities<sup>105</sup> (\*). What's more, both Illusie and Deligne knew perfectly well that the demonstrations I had given in the seminar for various explicit trace formulas **were complete**, and did not depend in any way on Verdier's general formula, which had simply acted as a "trigger" to encourage us to make explicit and prove trace formulas in as general a range of cases as possible. The bad faith of both is obvious here. As far as Deligne is concerned, it was already clear to me when I wrote the note "La table rase" (n° 67) - but probably not to an uninformed reader, nor of course to an informed reader who renounces the use of his healthy faculties.

<sup>103</sup>(\*) Compare with the commentary in the note "La dépouille" (n° 88) on the deeper meaning of the SGA 4 operation<sup>1</sup>, similarly aimed at shattering into an amorphous set of "technical digressions" the deeper unity of my work around staggered cohomology, through the "violent insertion" of the foreign text SGA 4<sup>1</sup> between the two indissoluble parts SGA 4 and SGA 5 which develop this work.

<sup>104</sup>(\*\*) These dispositions, with regard precisely to the Riemann-Roch-Grothendieck theorem, are particularly clear in the "Funeral Eulogy"; see the note "Funeral Eulogy (1) - or compliments", n° 104.

<sup>105</sup>(\*) (June 6) It would also seem that, via the biduality theorem (now known as Deligne's theorem), the demonstration of the Lefschetz-Verdier formula depended on a singularity resolution hypothesis, which Deligne manages to dispense with in the case of *fi ni* type schemes on a body. This is a good opportunity to fish in troubled waters and give the impression that SGA 5 would be subordinate to the "seminar-sic" SGA 4<sup>1</sup> which "précède" it (and which was actually published before it). him!).

(June 6) As for Illusie, he played right into his friend's hands, trying to muddy the waters to give the appearance of an ultra-technical oral seminar that didn't even give complete demonstrations of all the results, especially the trace formulas. These were, however, demonstrated there (and for the first time) in 65/66, and it was there that both he and Deligne had the privilege of learning them, and the delicate technique that goes with it<sup>106</sup> (\*\*).

□ This reminds me that, of course, I had taken the trouble to demonstrate Lefschetz-'s formula.

p. 369

Verdier in the seminar - it was the least I could do, and a particularly striking application of the formalism of local and global duality that I set out to develop. The question came to me these days: why on earth, when there were a dozen or so papers still being written by my dear students, so that Deligne and Illusie were spoilt for choice when it came to naming their technical "obstacle" to the publication of SGA 5, they chose the theorem of their good friend Verdier, who at the time was taking the credit for it as his own, just as he had never bothered to write (or at least make available to the public) the theorem of derived and triangulated categories. There's a kind of **defiance** in the absurdity (or in a kind of collective cynicism in the group of my ex-cohomology students, whom I consider to be in solidarity in this operation-massacre), which reminds me of the "weight-complexes" brilliantly invented by Verdier the previous year (see the note of that name, n° 83), or (in the iniquitous register) with the "perverse" name given by Deligne to bundles that should be called "Mebkhout bundles" (see the note "La Perversité", n° 76). I sense such inventions as acts of domination and contempt towards the entire mathematical community.

- and at the same time a **gamble**, which was clearly won until the unexpected appearance of the deceased, who appears almost as the only one awake before a community of sleepyheads...

**note 87<sub>3</sub>** (June 5) After this assessment of a massacre, we will appreciate the value of Illusie's statement in line 2 of his introduction to the volume entitled SGA 5:

"Compared with the original version, the only significant changes concern Lecture II [generic K nneth for- mules], which has not been reproduced, and Lecture III [Lefschetz- formula], which has been reproduced.

Verdier], which has been completely rewritten and expanded with an appendix numbered III B<sup>107</sup> (\*). A part some changes of □ detail and additions of footnotes, the other presentations have been left **as they are**" (emphasis added).

p. 370

Here again, Illusie complacently echoes another well-sent joke from his inenarrable friend, namely that the existence of SGA 4<sup>1</sup> "will soon<sub>2</sub> allow SGA 5 to be published **as is**" (see "Clean slate" note n° 67) - and Illusie does his utmost in his talks and introductions to lend credence to this.

<sup>106</sup>(\*\*) In the second paragraph of the Introduction to the volume published as SGA 5, Illusie presents as "the heart of the seminar" the three lectures III, III B, XII on Lefschetz's formula in stale cohomology, whereas we have seen that in the introduction to lecture III B., he takes care to specify (contrary to reality) that "this lecture corresponds to no oral lecture of the seminar" and that in the introductions to lectures III and III B., he does his utmost to give the impression that these are "the heart of the seminar", he is careful to specify (contrary to reality) that "this lecture does not correspond to any oral lecture of the seminar" and that in the introductions to lectures III and III B, he does his utmost to give the impression that these are subordinate to SGA 4<sup>1</sup>, and that lecture III is presented as "conjectural"! ! In fact, the entire SGA 5 seminar was technically independent of Lecture III (Lefschetz-Verdier formula), which played the role of a heuristic motivator, and Lecture III B is no more than the "hole" (Lecture XI) created by the move to Bucur, which was the welcome pretext for this further dismemberment.

To lend credence to the version of a seminar of "technical digressions" (blown up by his friend Deligne), Illusie was c a r e f u l t o skip the introductory presentation, in which I had painted a preliminary picture of the main themes that were to be developed in this seminar, a picture in which the trace formulas form only a small part (taking on particular importance because of their arithmetical implications, in the direction of Weil's conjectures). For an overview of these "big themes", see sub-note no.° 87<sub>5</sub> below.

<sup>107</sup>(\*) Which is presented as part of the "heart of the seminar"! (See previous b. de p. note.)

imposture (that SGA 5, where he and his friend learned their trade, would depend on the volume-pirate SGA 4<sup>1</sup>, made of bries and bracs gleaned or plundered over the following twelve years), by a luxury of cross-references to SGA 4<sup>1</sup> every page turn...

The final word goes (as it should) to Deligne, who wrote to me a month ago (May 3), in response to a laconic request for information (see the beginning of the note "Les Obsèques", n° 70):

"In short, if it had been seven years since you were doing maths [?!] when this SGA 4 text<sup>1</sup><sub>2</sub> appeared, this simply corresponds [?] to the long delay in editing SGA 5, **which was too incomplete to be usefully published as it stood.**

I hope these explanations please you."

If they haven't "approved" me, at least they've edified me. . .

**Note 87<sub>4</sub>** (June 6) Perhaps it's time to indicate what the main themes were that were developed in the oral seminar, and of which the published text gives an idea only by cross-checking.

I) Local aspects of duality theory, whose essential technical ingredient is (as in the coherent case) the biduality theorem (supplemented by a "cohomological purity" theorem). I have the impression that the geometrical meaning of the latter theorem, as a local Poincaré duality theorem, which I had explained so well in the oral seminar, has since been entirely forgotten by my former students<sup>108</sup> (\*).

p. 371

II) Trace formulas, including "non-commutative" trace formulas more subtle than the formula of the usual traces (where both members are integers, or more generally elements of the ring of coefficients, such as  $\mathbb{Z}/n\mathbb{Z}$  or an  $\ell$ -adic ring  $Z$ , or even  $Q$ ), placing ourselves in the algebra of a  $\square$ -finite operating group on the considered scheme, with coefficients in a suitable ring (such as those considered in the previous parenthesis). This generalization came very naturally, since even in the case of Lefschetz formulas of the usual type, but for "twisted" bundles of coefficients, we were led to replace the initial scheme by a Galois coating (usually branched) serving to "untwist" the coefficients, with the Galois group operating on it. Nielsen-Wecken" type formulas are thus naturally introduced into the schematic context.

III) Euler-Poincaré formulas. On the one hand, there was a detailed study of an "absolute" formula for algebraic curves, using Serre-Swan modules (generalizing the case of moderately branched coefficients, giving rise to the more naive Ogg-Chafarévitch-Grothendieck formula). On the other hand, there were novel and profound conjectures of the "discrete" Riemann-Roch type, one of which reappeared seven years later, in a hybrid version, under the name of the "Deligne-Grothendieck conjecture", proved by Mac Pherson by transcendental means (see note n° 87 ).<sub>1</sub>

The comments I couldn't fail to make on the profound relationships between these two themes (Lefschetz formulas, Euler-Poincaré formulas) were also lost without trace. (As was my habit, I left all my handwritten notes to the volunteer-writers, and no written trace remains of the oral seminar, of which I did, of course, have a complete set of handwritten notes, even if some of them were succinct).

IV) Detailed formalism for homology and cohomology classes associated with a cycle, derived naturally from the general duality formalism and the key idea of working with the cohomology "with supports" in the cycle under consideration, using cohomological purity theorems.

<sup>108</sup>(\*) This geometrical interpretation has at least been preserved in Illusie's writing.

V) Finiteness theorems (including generic finiteness theorems) and generic Künneth theorems for cohomology with any support.

The seminar also developed a technique for passing from torsion coefficients to  $\ell$ -adic coefficients (lectures V and VI). This was the most technical part of the seminar, which as a rule worked with torsion coefficients, and then "go to the limit" to deduce the corresponding  $\ell$ -adic results. This point of view was a  $\text{pro-}\ell$ visory  $\text{pis-aller}$ , pending Jouanolou's thesis (still unpublished at (at present) providing the formalism needed directly in the  $\ell$ -adic framework.

I don't include among the main "themes" the calculations of some classical schemes and the cohomological theory of Chern classes, which Illusie highlights in his introduction as "one of the most interesting" of the seminar. Since the program was so full, I didn't feel it necessary in the oral seminar to dwell on these calculations and this construction, since it was sufficient to repeat, practically verbatim, the reasoning I had given ten years earlier in the context of Chow rings, on the occasion of the Riemann-Roch theorem. On the other hand, it was obvious that it had to be included in the written seminar, to provide a useful reference for the user of étale cohomology. Jouanolou took on this task (Lecture VIII), which he had to regard not as a service to the mathematical community, while learning basic techniques essential for his own use, but as a chore, since its writing dragged on for years<sup>109</sup> (\*). It was no different, it seems, for his thesis, which remains a ghostly reference just like Verdier's. ... The "passage à la limite" section shouldn't be counted as one of the seminar's "main themes" either, in the sense that it isn't associated with any particular geometrical idea. Rather, it reflects a technical complication peculiar to the context of étale cohomology (distinguishing it from transcendental contexts), namely that the main theorems on étale cohomology concern in the first place **torsion** coefficients (prime to residual characteristics), and that to have a theory that corresponds to rings of coefficients of zero characteristic (as is necessary for Weil's conjectures), one must pass to the limit on rings

coefficients  $Z/\ell^n Z$  to obtain "l-adic" results.

All this said, the only one of the five main themes of the oral seminar that appears in complete form in the published text is theme I. Themes IV and V have simply disappeared, absorbed by SGA 4. Themes IV and V have disappeared altogether, absorbed by SGA 4<sup>1</sup>, with the advantage of being able to refer to them extensively and give the impression that SGA 5 depends on a text by Deligne that appears to predate it. Themes II and III appear in the published volume in mutilated form, still maintaining the same imposture of dependence on the SGA 4 text<sup>1</sup> (which in reality emerged entirely from the mother seminar SGA 4, SGA 5).

### 11.3.6. The skinning

**Note 88** □(May 16) The set of two consecutive seminars SGA 4 and SGA 5 (which for me are like a single "seminar") develops from nothingness both the powerful instrument of synthesis and discovery represented by the **language of** topos, and the perfectly perfected, perfectly effective **tool of** stable cohomology - better understood in its essential formal properties, from that moment on, than even the cohomological theory of ordinary spaces<sup>110</sup> (\*). This whole represents the most profound and innovative contribution I have made to mathematics, at the level of a fully completed work. At the same time, and without wishing to be, while at every moment everything unfolds with the naturalness of

<sup>109</sup>(\*) (June 12) Going through the presentation in question, I was convinced of Jouanolou's perfect connivance with my other cohomology students.

<sup>110</sup>(\*) Even if we restrict ourselves to the spaces closest to "varieties", such as triangulable spaces.

obvious things, this work represents the most extensive technical "tour de force" I've accomplished in my work as a mathematician<sup>111</sup> (\*\*). For me, these two seminars are indissolubly linked. They represent, in their unity, both the **vision** and the **tool** - the topos, and a complete formalism of scalar cohomology.

While the vision is still rejected today, the tool has, over the last twenty years or so, profoundly re-imagined algebraic geometry in its most fascinating aspect for me - the "arithmetic" aspect, apprehended by an intuition, and by a conceptual and technical baggage, of a "geometric" nature.

It was certainly not only the intention of suggesting that his cohomological "digest" **had anteriority** over the SGA 5 part that motivated Deligne to give it the misleading name SGA 4<sup>1</sup> - nothing prevented him from doing so.

after all, while we're at it, to call it SGA 3<sup>1</sup> ! In "Operation SGA 4<sup>1</sup>" I sense the intention to present the work from which all his own work stems (the work from which he cannot detach himself!) - a work of obvious and profound unity, clearly apparent in the two seminars, SGA 4 and (the real) SGA 5, as thing **divided** (as itself is divided. . .), **cut in two** by this violent insertion of a foreign and disdainful text; of a text that would like to present itself as the living heart, the quintessence of a thought, of a vision in which he had no part<sup>112</sup> (\*), and the two "quarters" that surround it as a sort of vaguely grotesque appendix, like a collection of "digressions" and "technical complements" to the work that Deligne claims to be central and essential, and in which my humble self is graciously admitted (before total burial) to the number of "collaborators"<sup>113</sup> (\*\*).

p. 374

Chance" had done it right. This "corpse left to mercy - this "unfortunate seminar" always left behind by the "editors", and at the time of my departure in the hands and at the discretion of my cohomology students - this was not **just any** part of the master's work! It wasn't SGA 1 and SGA 2 (where I was developing, in my corner and without even realizing it, the tools that were to be the two essential technical aids for the "take-off" of the main work to come), nor SGA 3 (where my contribution consisted mainly of incessant - and sometimes arduous - scales and arpeggios to hone the "all-out" technique of schematics), nor SGA 6 (systematically developing my ten-year-old ideas on the Riemann-Roch theorem and the intersection formalism), or even SGA 7 (which, through the inner logic of a reflection, stems from the possession of the central tool, mastery of cohomology). It is indeed the **main part of** my work, the writing of which had remained unfinished (and by their care. . .), that I have left, at least in part, in the hands of my cohomology students. It was this main part of the work that they chose to massacre and appropriate as their own, forgetting the unity that is their meaning and beauty, and their creative virtue (90).

And it's no coincidence either that, equipped with heterogeneous tools and denying the spirit and vision that had brought them into being from nothing, none were able to discern the innovative work where it was being reborn, against their indifference and disdain. Nor that after six years, when at the end of the line the new tool was finally

apprehended by Deligne, they unanimously buried the one who had created it in solitude - Zoghman Mebkhout, ☐the disowned master's posthumous pupil! And it's no more a coincidence that, after the momentum had died down

p. 375

Deligne's initial work (which in just a few years had led him to launch a new theory of

<sup>111</sup>(\*\*) Some difficult or unforeseen results were obtained by others (Artin, Verdier, Giraud, Deligne), and some parts of the work were done in collaboration with others. This in no way detracts (in my mind at least) from the strength of my appreciation of the place of this work in my body of work. I intend to come back to this point in more detail, in an appendix to the Thematic Outline, and to dot the i's and cross the t's where it has obviously become necessary.

<sup>112</sup>(\*) This line of thought had reached full maturity, in terms of both key ideas and essential results, even before the young man Deligne appeared on the scene to learn algebraic geometry and cohomological techniques from me, between 1965 and 1969. (May 30) On this subject, see the note "L'être à part", n° 67'.

<sup>113</sup>(\*\*) See notes "Le feu vert", "Le renversement", n° s 68, 68'.

Hodge, and towards the demonstration of Weil's conjectures), and despite its prodigious means and the brilliant means of my cohomology students, I note today this "morose stagnation" in a field of prodigious richness where everything still seems to be to be done. This should come as no surprise, when for nearly fifteen years the main source of inspiration and some of the "big problems"<sup>114</sup> (\*), even though they are present and confronting us at every step, remain carefully bypassed and concealed, like the messengers of the one whom for fifteen years it has been our constant aim to bury.

### 11.3.7. . . and the body

**Note** 89 (May 17) The thought, the vision of things that lived within me and that I had thought I was communicating, I see as a living body, healthy and harmonious, animated by the power of renewal of living things, the power to conceive and engender. And now this living body has become a **corpse**, shared between some and others - this limb or quarter, duly stuffed, serving as a trophy for one, another, butchered, as a puzzle or boomerang for another, and yet another, who knows, as it is, for the family kitchen (we're not that far from it!) - and all the rest is good for rotting in the dump... .

That's the picture I've come to see, in terms that may be colorful but seem to express a certain reality of things. The puzzle may well fracture a skull here and there<sup>115</sup> (\*\*)

- but never will these scattered pieces, neither trophy nor puzzle nor family soup, have the power so simple and obvious in the living body: that of the loving embrace that creates a new being. ...

(May 18) This image of the living body, and of the "remains" with its pieces scattered to the four winds, must have been forming in me throughout the past week. □ The comical form in which it presented itself under my pen-p

typewriter in no way implies that this image is in the least an **invention**, a tad macabre, a burlesque improvisation on the spur of the moment. The image expresses a **reality**, felt pro- fondly at the moment it took material form through a written formulation. I must have been aware of this reality in bits and pieces, here and there, over the fourteen years since my "departure", and perhaps even before. Bits and pieces of information recorded at first on a superficial level by a distracted attention, absorbed elsewhere - but which all pointed in the same direction, and which must have assembled, o n a deeper level, into a certain image - an unformulated image that I didn't bother to take note of, when I had other things to worry about. This image has been considerably enriched and clarified in the course of reflection since the end of March, six or seven weeks ago. More precisely, scattered pieces of information, finally examined by the care of a fully present conscious attention, have been gradually assembled into **another** image, at the more superficial level of the thought that examines and probes, through work that might seem independent of the presence, in deeper layers, of the first. This conscious work culminated six days ago in the sudden vision of the "massacre" that took place - when I felt the "breath", the "smell" of a **violence**, for the first time I believe in the whole reflection<sup>116</sup> (\*). It was also the moment when, in the layers close to the surface, that

<sup>114</sup>(\*) This "main source of inspiration" is, of course, the "yoga of motives". It has been active in Deligne alone, who has kept it to himself for his own "benefit", and in a narrow form deprived of much of its force, denying some of the essential aspects of this yoga. Among the "great problems" inspired by this one, which have been ignored or discreetly discredited, I see right now (outsider that I am) the standard conjectures, and the development of the formalism of the "six operations" for all the usual types of coefficients, more or less close to the "motifs" themselves (which play in their respect the role of "universal" coefficients - those which give rise to all the others). Compare with the comments to this

See "My orphans", n° 46.

<sup>115</sup>(\*\*) (May 31) And it will even be used to prove a theorem "of proverbial difficulty"!

<sup>116</sup>(\*) (June 12) In recent years, I've sensed violent intent on the part of some of my ex-students towards some of my "co-students", but never a violence that could be felt as coming from a collective will (grouping five of them here).

the feeling of a living, harmonious body, which is well and truly "massacred" - and also the one in which the deeper, diffuse image must have begun to surface, perhaps bringing to the image-in-form a carnal dimension, a "smell" that thought alone is powerless to give.

This "carnal" aspect came to the fore again in a dream last night - it's under the impulse of this dream that I now return to the lines I wrote yesterday. In this dream, I was cut quite deeply in several places on my body. First of all, there were cuts on my lips and in my mouth itself, bleeding profusely as I rinsed out my mouth with copious amounts of water (heavily reddened by blood) in front of my face. an ice pack. Then wounds in the belly, also bleeding profusely, especially one from which blood was coming out.

p. 377

□ by jerks, as if it were an artery (the Dreamer didn't care about anatomical realism). The thought I pressed my hand in front of the wound and curled up to stop the blood - it did indeed stop flowing, eventually forming a clot and a very large scab. Later, when I carefully lifted the scab, delicate healing had already begun. I was also cut on one finger, and it was surrounded by an impressive dressing doll... ...

I have no intention of embarking on a more delicate and detailed description of this dream, nor of probing it in depth here (or elsewhere). What this dream "as is" already reveals to me with startling force is that this "body" of which I spoke yesterday, and which as I was writing I saw as detached from me, like a child perhaps that I had conceived and procreated and which had gone out into the world to follow its own path - this body remains today an intimate part of my person: that it is **my** body, made of flesh and blood and a life force that enables it to survive deep wounds and regenerate itself. And my body is also, without doubt, the thing in the world to which I am most deeply, most indissolubly linked. ...

The Dreamer did not follow me in the image of the "massacre" and the sharing of the remains. This image was meant to convey the reality of intentions, of dispositions in **others** that I had strongly perceived, and not the way in which I myself experienced this aggression, this mutilation of which I was the object through something to which I remain closely linked. The Dreamer has just given me a glimpse of the extent to which I remain linked to it. This ties in with what I perceived (albeit less forcefully) in the reflection in the note "Le retour des choses - ou un pied dans le plat" (n° 73), where I try to pinpoint the feeling of this "deep link between the one who conceived a thing, and this thing", which appeared in the course of the reflection that day. Before that reflection on April 30 (barely three weeks ago), and for the rest of my life, I have pretended to ignore this link, or at least to minimize it, following the well-trodden path of current clichés. Worrying about the fate of a work that has left our hands, and of course worrying about whether our name remains attached to it in any way, is felt to be petty and mean-spirited - whereas it seems natural to everyone that we should be deeply touched when a child of the flesh we have raised (and believe we have loved) chooses to repudiate the name he or she was given at birth.

### 11.3.8. The heir

□

p. 378

**Note 90** (May 18) I don't know if any student in the sixties (apart from Deligne) was able to sense this essential unity, beyond the limited work he was doing with me. Some may have sensed this in a confused way, and that this perception was lost without return in the years following my departure. What is certain, however, is that from our first contact in 1965, Deligne sensed this living unity. It was this fine perception of a unity of purpose in a vast design that was surely the main stimulus for his intense interest in everything I had to communicate and pass on. This interest

---

people) and directed against me, through my work.

demonstrated, without ever wavering, throughout the four years of constant mathematical contact between 1965 and 1969<sup>117</sup> (\*). He gave mathematical communication between us that exceptional quality I've already mentioned, and which I've experienced with other mathematician friends only in rare moments. It was this perception of the essential, and the passionate interest it stimulated in him, that enabled him to learn as if by playing everything I could teach him: both the technical means (zinc strand diagram technique, Riemann-Roch yoga and intersections, cohomological formalism, étale cohomology, topos language) and the overall **vision** that unites them, and finally the **yoga of patterns** that was then the main fruit of this vision, and the most powerful source of inspiration I had yet discovered.

What's clear is that Deligne was the only one of my students, right up to the present day, who at a certain point (as early as 1968, I believe) had fully assimilated and made his own the totality of what I had to transmit, in its essential unity as well as in the diversity of its means<sup>118</sup> (\*\*). It was, of course, this circumstance, felt by all, that made him the designated "legitimate heir" to my work. work. Clearly, this heritage neither encumbered nor limited him - it was not a burden, but gave him a sense of identity. wings; I mean: he nourished with his vigor these "wings" <sup>□</sup>which he had from birth, like other visions and p. 379 other heritages (less personal of course...) would nourish it...

The heritage he had nurtured in those crucial years of growth and development, and the unity that makes up its beauty and creative virtue, which he had sensed so well and which had become like a part of himself - my friend subsequently<sup>119</sup> (\*) disowned them, striving relentlessly to hide the heritage, and to deny and destroy the creative unity that was its soul. He was the first among my students to set an example by appropriating tools, "pieces", while striving to dislocate the unity, the living body from which they came. His own creative impulse was slowed down, absorbed and finally dislocated by this deep division within him, driving him to deny and destroy the very thing that made him strong, that nourished his impulse.

I see this division expressed in three interdependent, indissolubly linked effects. One is the dissipation of energy, scattered in the effort to deny, dislocate, supplant, hide. The other lies in the rejection of certain ideas and means, essential to the subject's "natural" development. which he has chosen as his central theme<sup>120</sup> (\*\*). The third is the attachment to this theme, of all themes, which is about to supplant, to oust a master who is present every step of the way and who must be constantly erased - the very theme p. 380

who is most intensely invested with the fundamental contradiction that dominated his life as a mathematician.

What I know at first hand, and a basic instinct or flair that has never deceived me, make

<sup>117</sup>(\*) This period comprises five years, of which my friend spent one (1966) in Belgium doing his military service.

<sup>118</sup>(\*\*) When I say "totality", I mean everything that was essential, both in vision and in means. This doesn't mean, of course, that there weren't unpublished ideas and results that I never thought of telling him about. On the other hand, I don't think there was any mathematical reflection from the years 1965-69 that I didn't talk about "on the spot" to my friend, always with pleasure and profit.

<sup>119</sup>(\*) Strangely enough, this division must have been present as early as the first year of our meeting (already expressed in an ambiguous attitude towards the SGA 5 seminar, which was his first contact with schemes, Grothendieck-style cohomological techniques, and staggered cohomology), and at the latest and in unequivocal form as early as 1968 (see note "L'éviction", n° 63). - at a time, therefore, when mathematical communication was perfect, and when the growth of his mathematical thought seems to me not yet marked by the conflict. At the time, he made a number of interesting contributions (which I take great pleasure in highlighting in the Introduction to SGA 4) on topics that he did his utmost, immediately after my departure, to bury.

<sup>120</sup>(\*\*) This refusal has manifested itself in the burial of derived and triangulated categories (until 1981), of the formalism of the six variances (until today), of the language of topos (also), and by a sort of "blocking by disdain" of the vast program of foundations for homological and homotopic algebra, which I'm now trying (twenty years later) to sketch out with La Poursuite des Champs, and which he had of course also felt the need for. However, even though it was inspired by the yoga of motifs (buried until 1982), this yoga remained mutilated of part of its force, being detached from the formalism of the six variances which constitutes an essential formal aspect. It seems to me that this aspect has also been rigorously banished from Hodge-Deligne's theory.

it's quite clear to me that if Deligne hadn't been torn by this profound contradiction in his own work, mathematics today wouldn't be what it is<sup>121</sup> (\*) - that it would have undergone, in several of its essential parts, far-reaching renewals like the one I myself had been the main instrument of - the very one that this same Deligne was bent on countering and diverting!<sup>122</sup> (\*\*)

There was also no doubt that he was ideally suited to be the driving force behind a powerful school of geometry, a continuation of the one that had formed around me - a school nourished by the vigor of the one from which it had emerged, and the creative power of the one who was taking over from me. But this school that had formed around me, this nurturing matrix that had surrounded intense years of training - it broke up the day after my death.

p. 381 of my departure. If this was the case, it was precisely because I couldn't find, in the person who was obviously taking over from me<sup>123</sup> (\*\*\*), the person who would also be the soul of a group united by a common adventure, for a common task.

whose dimensions are beyond anyone's means.

I have the impression that, after my departure, each of my students found themselves in their own corner, with a wealth of work to do - there's no shortage of that anywhere in maths - but without this "corner" fitting into a whole, and without this "work" being carried along by a current, by a wider purpose. Surely, as soon as I left, if not even before, the eyes of most of my students or ex-students were focused on the designated "successor", the most brilliant among them and also the closest to me. At this sensitive moment, my friend must have felt, perhaps for the first time in his life, the power over others that was suddenly in his hands, the power of life or death he had over the fate of a certain school from which he had come, and whose friends he had rubbed shoulders with for four years were no doubt expecting him to ensure its continuity. The situation was entirely in his hands, and it was he who would set the tone... He did indeed set the tone, by destroying the legacy, and first and foremost that confidence and expectation<sup>124</sup> (\*) which those who, with him, had been pupils of the same master, could not fail to bring him. ...

I'm sure many people are impressed by Deligne's work, and not without reason. But I'm also well aware that this work, beyond the impressive initial impetus (ending with the demonstration of Weil's conjectures), is far from "living up to its potential". It certainly testifies to an uncommon technical mastery and ease, placing him among the "best". But it lacks the humble virtue that

<sup>121</sup>(\*) When I wrote these lines about "mathematics today", I wasn't just thinking about the more or less profound knowledge we have of mathematical things today. I was also thinking, in the background, of a certain **spirit** in the world of mathematicians, and more particularly in what might be called (without sarcastic or mocking intonation) "the big mathematical world": the one that "sets the tone" for deciding what is "important", even "licit", and what is not, and the one that also controls the means of information and, to a large extent, careers. Perhaps I'm exaggerating the importance that a single person, in the position of figure de proue, can have on the "spirit of the times" in a given milieu at a given time. Deligne's career seems to me to be comparable (for better or for worse) to Weil's in the milieu that had welcomed me twenty years earlier, and with which I had identified myself for twenty years.

(May 31) Compare with the (complementary) reflections in the note "Le Fossoyeur - ou la Congrégation toute entière", n° 97.

<sup>122</sup>(\*\*) (June 16) I'm convinced that the very fact that the key ideas I've introduced into mathematics are already developing normally, on the momentum gained in the sixties (cut short by the "chainsaw effect" discussed in the next two notes. . . ), mathematics today, fifteen years after my departure, would have been different from what it is, in some of its essential parts.

...  
<sup>123</sup>(\*\*\*) This **de facto succession** was expressed by unequivocal concrete signs: he took over from me at the IHES (from which I left the year after he joined - see note "L'éviction", n° 63), and he took over, with the means I had developed at this final for some fifteen years (from 1955 to 1970), the central theme of the cohomology of algebraic varieties.

<sup>124</sup>(\*) (May 26) In the course of further reflection, I detected yet another "expectation" regarding my tacit heir, this time coming not from my students alone, but from "the entire Congregation" - see the end of the note "Le Fossoyeur - ou la Congrégation toute entière" (n° 97). I have little doubt that these two opposing expectations, one linked to a moment in time and the other continuing throughout the fourteen years of Burial, are both real. Much more so, I'm inclined to think that for many of my former students, the two expectations must have been present simultaneously: that of finding in the most brilliant among them the one who would ensure the continuity of a School and a work in which they had their place and their part - and that of seeing erased (if that were possible) all trace of the one whose departure suddenly called out to them with such force, in the quietude of the well-trodden paths. ...

the virtue of renewal. This virtue he carried within him, this freshness or innocence of the little child, has long since been deeply buried, denied. I was about to write that by this "virtue" and by his not very <sup>common</sup> gifts, as well as by the exceptional circumstances of which he p. 382 benefited from the deployment of his gifts, Deligne was called upon to "dominate" the mathematics of our time, just as a Riemann, or a Hilbert, had each "dominated" the mathematics of their time. Inveterate habits of thought, rooted in common parlance, have suggested to me this image of "domination", which nevertheless gives a distorted apprehension of reality. These great men undoubtedly fully "grasped", "assimilated", "made their own" the mathematics known in their time, which undoubtedly also gave them an exceptional mastery of technical means. But if they rightly seem "great" to us, it's not through their technical prowess, "wresting" difficult demonstrations from surly substance. It's by the renewal each of them brought to several important parts of mathematics, by simple and fruitful "ideas", that is to say: for having turned their gaze on simple and essential things, to which no one before them had deigned to pay attention. This childlike ability to **see** simple, essential things, however humble and disdained by all - **this is the** power of renewal, the creative power in everyone. This power was present to a rare degree in the young man I knew, unknown to all, a modest and passionate lover of mathematics. Over the years, this humble "power" has seemed to disappear from the person of the admired and feared mathematician, enjoying unfettered his prestige, and the (sometimes discretionary) power it gives him over others.

This **stifling** in my friend of something very delicate and very vivid, neglected by everyone and which has creative power, I've felt it many times since I left, and more and more in recent years. But it took the discoveries of the last few weeks, and the reflection I've been pursuing since the end of March (following on from Récoltes et Semailles), to begin to feel the full extent of the devastating effect of this suffocation in the life of my friend, and among many others I've known closely. Not only on some of my "later" (and assimilated) students, who were subjected to his malevolence (perhaps unconscious in some cases), which was exercised against each and every one of them and weighed heavily on three of them; but also, it seems to me

glimpse it now, among my students "before", by the destruction of a **continuity** in the subject, and that of a sense of a whole, a unity, giving a deeper and broader meaning to their work than ce <sup>lui</sup> p. 383 an accumulation of separate prints bearing their names (91)<sup>125</sup> (\*).

More than once in the last seven years, and more than once again in the last few weeks and days, I've felt a sadness, at what feels, on some level, like an immense **waste** - when what is most precious in oneself and in others is squandered or smothered as if for pleasure. Yet I've also come to learn that such "waste" is a staple of the human condition, to be found in one form or another everywhere, in the lives of individuals, from the humblest to the most illustrious, as well as in the lives of peoples and nations. This very "mess", which is nothing other than the action of conflict and division in everyone's life, is a substance of a richness and depth that I have barely begun to fathom, a nourishment that it is up to me to "eat" and assimilate. So this mess, and every other mess I encounter at every step, and every other thing that happens to me at the turn of the road and is so often unwelcome - this mess and other unwelcome things carry within them a  **blessing**. If meditation has meaning, if it has the power of renewal, it's insofar as it enables me to receive

<sup>125</sup>(\*) (June 16) This second aspect only came to my attention in the course of my reflection on L'Enterrement. If ever I saw a prestigious mathematician make use of the "power to discourage", it was the very man who once seemed to me to be my heir apparent. When I wrote the section "The power to discourage", I had thought a lot about him (before the thought came back to me), but without yet having the slightest inkling (at least not on a conscious level) of the extent to which this power had found occasion to be exercised among the very people for whom he must have been (as he was for me) the model of the perfect mathematician. ...

the benefit of that which (through my inveterate reflexes) presents itself as "evil", where it allows me to **nourish** what seems designed to destroy.

Nourishing yourself with your experience, letting it renew you instead of constantly evading it - that's what it means to take full responsibility for your life. I have this power within me, and it's up to me at any given moment to make use of it, or to let it go to waste. It's the same for my friend Pierre, and for each of my students - free, like me, to feed on the "mess" I'm finishing reviewing in these last days of a long meditation. And the same goes for the reader who reads these lines, intended for him or her.

### 11.3.9. The co-heirs

□

p. 384 **Note** 91 (May 19) The echoes that have reached me here and there about my former pupils have been more than sparse.

Hardly any of them gave me any sign of life after my departure, if only by sending me prints<sup>126</sup> (\*). However, by collecting the few that have reached me, I can form an idea, admittedly very approximate. Perhaps it will become clearer in the months to come, if this reflection prompts some of them to come forward.

I've already had occasion to note the profound rupture in Deligne's work after my departure, even though in some respects he appears, unwillingly, as a successor, and therefore as part of a certain continuity. And I had the feeling that this rupture must have had a profound effect on the work of all my other students. It's this impression that I'd like to explore a little more closely.

The only one of these students whose work seems to be an obvious (at least at first sight) extension of the work he had done with me, seems to be Berthelot<sup>127</sup> (\*\*). He's also the only one who, for a long time, sent me numerous separate prints - perhaps even all his separate prints. They are all on the difficult subject of crystalline cohomology, the systematic start-up of which is the subject of his thesis. Yet it seems to me that, as with my other (commutative) "cohomology" students, his work is marked by the disaffection of some of the main ideas I had introduced: derived categories (and triangulated categories, cleared by Verdier), six-operation formalism, topos (91<sub>1</sub>). As Zoghman Mebkhout himself says, his own work, so close in theme to Berthelot's (91<sub>2</sub>), is in line with these ideas, combined with those of the Sato school. If they hadn't been repudiated by my cohomology students, led by Deligne and Verdier, there's a good chance that from the very beginning of the seventies,

p. 385 Mebkhout's crystalline theory (which he began to develop only from 1975, against the disinterest of these same students) would already have reached the full maturity of a formalism of <sup>six</sup>□operations, which it still hasn't reached today<sup>128</sup> (\*).

Incidentally, I remember talking to Verdier about the question, which intrigued me, of the link between constructible discrete coefficients and continuous coefficients, without it seeming to catch his eye. It must have caught on later

<sup>126</sup>(\*) (May 31) On this subject, see note no. ° 84, following the note on "Silence" (no. ° 84).

<sup>127</sup>(\*\*) Based on the theme of duality that Verdier pursued for several years after I left, in the context of the spaces

I'm sure that, in the case of Berthelot, there's an impression of continuity. But it seems to me that this has been something of a "routine continuity", whereas the one whose signs (or absence of signs) I'm mainly looking for is a creative continuity, continuing an initial impulse into the unknown. ...

<sup>128</sup>(\*) (June 7) I hesitated to hazard this assessment, which could be interpreted as minimizing the originality of Mebkhout's theory. This would not be at all in line with my thinking, and all the more so as I have an excellent opinion of the abilities of each of my cohomology students (when they are not blocked by prejudices alien to mathematical common sense). My friend Zoghman himself dispelled any scruples I might have had, saying that he was convinced that "normally", it was my students who should have been developing his theory from the very beginning in the 70s. At a certain level, they're surely the first to be convinced: it's they, or Deligne, who **should have** developed it - and with the general degradation of morals, that's all it takes to behave as if they did (or as if Deligne did).

was) well and truly! On this subject, see the notes "Le Colloque" and "La mystification", n° s 75' and 85'.

(See note "L'inconnu de service et le théorème du bon Dieu", n° '48.) In fact, he was so "blocked" by his burial syndrome that, until October 1980, he failed to perceive the importance of Mebkhout's work - and when he finally did, it was in the grave-digging mood we all know (see notes n° s 75 to 76).

As far as I'm aware, Verdier's work since his thesis defense has essentially been limited to redoing in the analytical context (which sometimes presents additional technical difficulties) what I had done in the coherent schematic framework, without introducing any new ideas. It's even rather extraordinary, with the reflexes he was supposed to have developed, and well-informed as he was, that he didn't come across Mebkhout's theory himself, by dint of turning his crank - and that he didn't at least recognize that his "pupil" was doing some interesting things, which had escaped him (as they had escaped Deligne).

To tell the truth, while intrigued by the question of the relationship between discrete coefficients and coefficients continuous, I hadn't really had any inkling of Mebkhout's crystalline theory, which would blossom in the decade following my departure. On the other hand, there was a vast theme, arising from my <sup>reflexions</sup> of cohomology both commutative and non-commutative of the fifties (1955-1960), and which was just beginning (in the "commutative" context i.e. in terms of additive categories) in Verdier's work, started in the early sixties and left behind after his defense (see note n° 81). The non-commutative aspect was initiated later in Giraud's thesis, which developed a geometric language, in terms of 1-fields over a topos, for non-commutative cohomology in dimension  $\leq 2$ . By the second half of the sixties, the inadequacy of these two primers was quite obvious: both in terms of the inadequacy of the notion of "triangulated category" (teased out by Verdier) to account for the richness of structure associated with a derived category (a notion destined to be replaced by the considerably richer notion of **derivator**), and in terms of the need to develop a geometric language for non-commutative cohomology in any dimension, in terms of n-fields and  $\infty$ -**fields** over a topos. One sensed (or I sensed) the need for a synthesis of these two approaches, which would serve as a common conceptual foundation for homological algebra and homotopic algebra. Such a work was also in direct continuity with Illusie's thesis work, in which both aspects are represented.

Bousfield-Kan's seminal work on homotopic limits (Lecture Notes n° 304), published in 1972, was also in line with this diffuse program, which since at least 1967 had been just begging to be developed. In January of last year, without yet suspecting that I would be embarking on the Pursuit of Fields a month later, I submitted to Illusie some thoughts on the "integration" of homotopy types (familiar to homotopists as "homotopic (inductive) limits"), at a time when I was still completely unaware of the existence of Bousfield and Kan's work, and that this type of operation had already been examined by others than myself. It turned out that Illusie was equally unaware of it, despite the fact that he was supposed to have remained in homologous-homotopic waters for all the time since my "death" in 1970! This just goes to show how far he seems to have lost touch with certain realities that are part and parcel of the fundamental thinking he himself had been pursuing in the sixties<sup>129</sup> (\*). He must have made his own little hole, from which he hardly ever emerges. ...

□ With the disdain that has befallen the very notion of topos and all the "categorical nonsense", it is not surprising

387

<sup>129</sup>(\*) This notion of "integrating" homotopy types had come to me again, in the context of unscrewing stratified structures, which I took up at the end of 1981.

that Giraud now has a total disaffection for what had been his first major theme of work. It's true that Deligne, with the exhumation of motives two years ago, pretended to have suddenly discovered the interest of the arsenal of non-commutative cohomology, sheaves, links and consorts, as if he had just introduced them himself, along with motives and motivic Galois groups<sup>130</sup> (\*). It's doubtful that this kind of circus will rekindle a flame that he himself has worked so hard to extinguish. ... In February last year, I sent Giraud a copy of the twenty-page letter that became Chapter 1 of the opening chapter of *La Poursuite des Champs*. It's a non-technical reflection, in the course of which I managed to "jump with both feet" over the "purgatory" that had once stopped Giraud (and many others) from handling the notion of "non-strict"  $n$ -category (which I now call " $n$ -field"), which remained heuristic and yet was visibly fundamental. This was the start of the *Poursuite des Champs*. When we met (on friendly terms) last December for Contou-Carrère's thesis defense, I learned from Giraud that he hadn't even had the curiosity to read the letter! I got the impression that he'd drawn a long line under such things. The idea that there might be some rich substance, in a direction he had long since abandoned, didn't even seem to occur to him. I tried, unsuccessfully I'm afraid, to get him to understand that there was a juicy and vast work here that had been waiting for nearly twenty years to be done, and which I finally got round to in my old age, to at least give a broad outline, under the dictation of things themselves, of a rich substance that the "deceased" me continues to feel strongly about, while my students have long since forgotten about it.

p. 388

Jouanolou also abandoned a research direction he had just begun with his thesis. This direction had become the object of the disdain of a fashion established by the very person who had provided him with a master technical idea for the theme he had chosen. With the "rush" on triangulated categories with the Colloque Pervers three years ago, this same Deligne suddenly pretended (without laughing) to discover the big job of foundations in perspective, the lack of which is suddenly being felt at all ends, and which he had been the first to discourage for ten years - The need for such a job was quite obvious to me as soon as 1963/64 with the beginnings of étale cohomology; and for Deligne just as much, from the moment he started hearing about  $l$ -adic cohomology and triangulated categories, i.e. when he arrived at my seminar the following year. Beyond the construction of "constructible triangulated categories" on the ring  $\mathbb{Z}_l$  (above a basic scheme, let's say), and the development of the formalism of the "six operations" within this framework (something accomplished, it seems to me, in Jouanolou's thesis), to make analogous work by replacing the base ring  $\mathbb{Z}_l$  by an arbitrary (more or less?) Noetherian  $\mathbb{Z}_l$ -algebra, e.g.  $Q_l$  or an (algebraic?) extension of  $Q_l$ . This is one of the things for which time has been ripe for some twenty years, and which are still waiting to be done, when the wind of contempt that has blown over them has died down... .

The natural continuation of Ms. Raynaud's work (weak Lefschetz theorems in staggered cohomology, in terms of 1-fields) would have been placed in a context of strictly taboo  $\infty$ -fields, let's not talk about it! The same goes for Ms. Sinh's work, begun in 1968 and completed only in 1975 - a natural continuation would have been the notion of an enveloping  $\infty$ -category of Picard of a so-called "monomial" category, or of triangulated variants of such a category<sup>131</sup> (\*) - let's not! Another was to transpose her work in terms of fields onto a topos - what a horror! As for Monique Hakim, she too had the misfortune to write her thesis on a subject which, these days since my untimely departure, looks a little ridiculous on

<sup>130</sup>(\*) See "Souvenir d'un rêve. . . - or the birth of motifs", note n° 51.

<sup>131</sup>(\*) See "Souvenir d'un rêve. . . - or the birth of motifs", note n° 51.

edges - relative diagrams on a locally ringed topos, I ask you! His little book on the subject, published in Grundlehren (Springer), must sell three or four copies a year - no wonder I've got bad press there, and they're not too keen to accept any text I might recommend. For me, it was a first test-step towards a "relativization" of all "absolute" notions of "varieties" (algebraic, analytic, etc. . . ) on general "bases", the need for which is obvious to me (91<sub>3</sub> ). It's true that we've done just fine without them until now. But it's also true that we've done without maths for the two million years we've been around.

The fact remains that Monique Hakim, who was not motivated to write her thesis in the same way as I was to offered it to him, surely had no desire to keep any contact with a theme which (detached from p . 389

In the context of a favorable consensus, or stubborn thought pursuing a tenacious and sure vision against all odds, it can no longer make the slightest sense.

As for Neantro Saavedra Rivano, he seems to have disappeared entirely from circulation - I can find no trace of his name even in the official world directory of mathematicians. What is certain is that his somewhat categorical thesis subject could hardly have been in good press with the gentlemen who decide what is serious and what is not. The most natural continuation of this thesis, in my opinion, would have been neither more nor less than this "vaste tableau des motifs", a theme decidedly a little broad for this student's more modest aims. Yet he ended up having the unexpected honor of having his thesis redone ab ovo et in toto by one of these great gentlemen himself, barely two years ago (see notes on "L' Enterrement - ou le Nouveau Père" and "La table rase", n° s 52 and 67.)

Finally, the only ones among my twelve "pre-1970" students for whom it's not too clear to me whether or not there was a more or less drastic or profound **break in** their work, compared to the one they had to follow in my contact, are Michel Demazure and Michel Raynaud (91<sub>4</sub> ). All I know is that they've continued to do maths, and that they're part (as you'd expect, given their brilliant means) of what I called earlier "the great mathematical world".

The foregoing brief reflection, based on what is sometimes very little data, is of course largely hypothetical and very approximate. I hope that those mentioned here will forgive me for any perhaps gross errors of assessment, which I'll be happy to rectify if they'd be so kind as to let me know. Here again, I realize that everyone's case is surely different from everyone else's, and represents a much more complex reality than someone as distant as me can reasonably apprehend, let alone express in a few lines. All these reservations aside, I have the impression that this reflection has not been in vain, for me at least, to identify by a few concrete facts, a still diffuse impression that had emerged yesterday (and which was undoubtedly present at an informal level for many years): that of a **break** that was made p . 390

in many of my students in the aftermath of my departure, reflecting on a personal level the sudden disappearance, overnight, of a "school" to which they must have felt a part during crucial formative years in their mathematical profession.

**Note** 91<sub>1</sub> (May 22) I've just come across an article-survey from the Colloque "Analyse *p*-adique et ses applications" at CIRM, Luminy (September 6-10, 1982), by P. Berthelot, entitled "Géométrie rigide et cohomologie des variétés algébriques de car. *p*" (24 pages), which outlines the main ideas for a synthesis of Dwork-Monsky-Washnitzer cohomology and crystalline cohomology. The initial ideas (and the very name) of crystalline cohomology (inspired by Monsky-Washnitzer cohomology), and the idea of complementing these with the introduction of sites formed by rigid-analytic spaces, ideas that I had introduced in the

In the sixties, they became the daily bread for all those working in the field, starting with Berthelot, whose thesis developed and fleshed out some of these initial ideas. Nevertheless, my name is conspicuously absent from both the text itself and the bibliography. Here we have a fourth clearly identified pupil-croquemort. Who's next?

(June 7) It's a remarkable fact that more than fifteen years after I introduced the starting ideas for crystalline cohomology, and more than ten years after Berthelot's thesis established that the theory was indeed "the right one" for clean, smooth schemes, we still haven't reached what I call a situation of "mastery" of crystalline cohomology, comparable to that developed for stellar cohomology in the SGA 4 and 5 seminar. By "mastery" (in the first degree) of a cohomological formalism including duality phenomena, I mean no more and no less than full possession of a six-operation formalism. While I'm not "in the know" enough to be able to appreciate the difficulties specific to the crystalline context, I wouldn't be surprised if the main reason for this relative stagnation lies in the disaffection of Berthelot and others for the very idea of this formalism, which makes them neglect (just like

p. 391

Deligne's Hodge theory, which remained in its infancy) the first essential "level" to be reached in order to have a fully "adult" cohomological formalism. These are  $\square$  the same kind of dispositions

which have surely led him to overlook the relevance of Mebkhout's point of view to his own research. NB When I speak here of "crystalline cohomology" in a context where one abandons assumptions of cleanliness (as is necessary for a "fully grown-up" formalism), it is understood that one is working with a crystalline site whose objects are (power-divided) "thickenings" that are not purely infinitesimal, but are "proper" (power-divided) topological algebras. The need for such an extension of the primitive crystal site (which for me was only a first approximation for the "right" crystal theory) was clear to me from the start, and Berthelot learned it (along with the initial ideas) by null other than myself. A written allusion to this link can be found in *Esquisse Thématique*, 5 e.

**Note 91<sub>2</sub>** It's quite extraordinary that nobody but me seems to have realized that Mebkhout's unnamed theory was an essential new part of a crystalline theory. As someone who has been completely "out of cohomology" for nearly fifteen years, I realized this as soon as Mebkhout took the trouble to explain to me what he had done last year. In any case, when I mentioned the matter (as a matter of course) to Illusie, he seemed to see it as a rather "kooky" combination of things (*D-Modules* and crystals) that really had nothing to do with each other. Yet I know first-hand that he has a mathematician's flair, and so do my other students (cohomologists in this case, starting with Deligne) - but I can see that in certain situations, he's no longer any use to them... ... The more I think about it, the more I find it extraordinary that in such an atmosphere, Mebkhout still managed to do his job, without letting his own mathematical flair be defused by the total incomprehension of his elders, so far above him. . .

**Note 91<sub>3</sub>** It was especially since my lectures at the Séminaire Cartan on the foundations of the theory of complex analytic spaces, and on the precise geometrical interpretation of "level modular varieties" à la Teichmüller, towards the end of the fifties, that I understood the importance of a double generalization of the common notions of "variety" we've been working with so far (algebraic, real or complex analytic, differentiable - or  $\square$  subsequently, their "moderate topology" variants). One is to broaden-

p. 392

gir the definition so as to admit arbitrary "singularities", and nilpotent elements in the structural bundle of "scalar functions" - along the lines of my foundational work with the notion of schema.

The other extension is towards a "relativization" above suitable locally annelated topoi ("absolute" notions being obtained by taking a punctual topos as a base). This conceptual work, matured for over twenty-five years and initiated in Monique Hakim's thesis, is still waiting to be taken up. A particularly interesting case is that of the notion of relative rigid-analytic space, which allows us to consider ordinary complex analytic spaces and rigid-analytic spaces over local bodies with variable residual characteristics, as "fibers" of the same relative rigid-analytic space; just as the notion of relative scheme (which has finally become commonplace) allows us to link together algebraic varieties defined over bodies of different characteristics.

**Note 91<sub>4</sub>** While Demazure's thesis work, like Raynaud's, makes essential use of a consummate schematic technique they learned from me, the essential ideas in their respective works are not part of the "Grothendieckian" panoply, which distinguishes their work from that of my other students of the first period. It's possible that this circumstance resulted in a continuity in their work, free from a rupture due to the effect of the "master's burial syndrome". This doesn't necessarily mean that this syndrome didn't affect one or the other in another way. Three years ago, I was struck by Raynaud's attitude towards Contou-Carrère's work on local relative Jacobians. The results announced are profound, difficult and beautiful, and go far beyond a simple generalization of "well-known" things. There's an unexpected link with Cartier's theory of typical curves, some wonderful explicit formulas - all entirely within Raynaud's (and my) grasp. The freshness of his welcome must have weighed decisively in Contou-Carrère's strategic retreat, abandoning for profit and loss a subject in which he had invested himself wholeheartedly and which, it may have seemed, was only going to get him into trouble. ... <sup>132</sup>(\*). My letter to him, in which I expressed my (pained) surprise at his insensitivity to the beauty of these results, went unanswered.

### 11.3.10. . . and the chainsaw

**Note 92** □ When I moved to the area nearly four years ago, there were not far from p . 393 me a beautiful cherry orchard. Often, when I went for a walk, I'd go and have a look. It was a pleasure to see these thick cherry trees in the prime of their lives, with their powerful trunks, which seemed to have always been one with this piece of land, where wild grasses proliferate freely. They must not have known about fertilizers or pesticides, and in cherry season, that's where I'd go to pick tasty ones. There must have been twenty or thirty trees.

One day, when I went back there, I saw all the trunks cut down to man-height, the crowns slumped on the ground next to the trunk, stumps in the air - a vision of carnage. With a good chainsaw, it must have been done in an hour or so. I'd never seen anything like it - when you cut a tree, you usually take the trouble to bend down and cut it flush with the ground. There's a shortage of cherries, of course, and this cherry orchard wasn't going to produce tons, that's for sure - but these stumps of trunks said something other than shortage and yields... .

Yesterday I had that feeling again, of a vigorous trunk, with powerful roots and generous sap, with strong, multiple branches extending its momentum - cut clean off, at man's height, as if for pleasure. It was taking the trouble to look at the main branches one by one, and seeing each one cut off, that finally made me see what had happened. What was made to unfold, in the continuity of a momentum,

---

<sup>132</sup>(\*) For further details, see sub-note no. ° 95<sub>1</sub> to note "Cercueil 3 - ou les jacobiniennes un peu trop relatives", no. ° 95.

2. A walk through a work or the Child and Mother

p. 394

of a deep-rooted inner necessity, has been sliced clean through, with a clean slice, to see itself designated for all to see as an object of derision.

This reminds me of the "misunderstanding" Zoghman referred to, which supposedly took place between me and my students (except Deligne). What's clear, in fact, is that neither impetus nor vision were communicated from me to any of my students (apart from Deligne, who is decidedly "apart" indeed!). Each of them assimilated a technical baggage, useful (and even indispensable) for doing a well-done job on the subject they had chosen, and which could even be of use to them later on. I can't say whether there was any hint of something else, going beyond that. If there was had, it didn't stand a chance against the chainsaw, which quickly trimmed it... ..

I'm well aware that if there are still people doing maths -□and unless they give up completely the kind of maths we've been doing for over two millennia - they can't help but one day or other breathe new life into each of these branches that I see lying inert. Some of them have already been taken over by my friend-with-the-saw, and it's quite possible, if God gives him life, that he'll do the same with some or all of them. Most of them, however, are no longer in his style. But perhaps he'll also eventually tire of constantly substituting himself for someone else, something that's surely very tiring and, what's more, not at all profitable, so that he'll be content to be himself (which isn't bad at all).

## 15.1. VII The Colloquium - or Mebkhout and Perversity bundles

### 15.1.1. Iniquity or the meaning of a return

□

p. 285 **Note 75** (May 2) I'm definitely not done learning! I've just read two

texts, which shed unforeseen light (for me at least) on the "escamotage" (of Meb- khout's work) already mentioned ("L'inconnu de service et le théorème du bon Dieu", note (48)). It concerns the role played by the two illustrious colleagues and former students whose disdainful indifference to Zoghman Mebkhout I noted, without however questioning their professional bona fides. Both texts are part of the Proceedings of the **Luminy Colloquium** (July 6-11, 1981) entitled **Analyse et topologie sur les espaces singuliers**, published in Astérisque n° 100 (1982).

The first of these texts is the introduction to the Colloquium, signed by **B. Teissier** and **J.L. Verdier** (the same man who acted as Z. Mebkhout's official thesis supervisor). This one-and-a-half-page text begins with an explanation of a certain "Riemann-Hilbert correspondence", which is clearly destined to play a leading role in the Colloquium (and which is none other than the "theorem of the good Lord" alias Mebkhout). In this correspondence (and this is what gives it its charm and depth, and necessitates the introduction of derived categories), a regular holonomic **module** (i.e., a regular holonomic complex reduced to degree zero) is associated with a constructible complex of **C-vector** bundles, which can be characterized (it is said) by purely topological properties that make sense for constructible complexes of sheaves over a not necessarily smooth variety defined over any body.

This, it is explained, is the starting point for the Colloquium's "main theme", "**perversity, intersection complex, purity**"-the (complex  $\square$  of) so-called "**perverse**" beams<sup>1</sup> (\*) being none other than those which, "morally", correspond ("à la Mebkhout") to the simplest complexes of regular holonomic differential operators, expressed using a single D-Module. . 286

The second text is part<sup>2</sup> (\*\*) of the long article by **A.A. Beilinson, J. Bernstein and P. Deligne** on perverse bundles, referred to in the introduction as the central work of the Colloquium. As can be seen from the table of contents and the other pages at my disposal, this paper marks the sudden re-entry of derived and triangulated categories into the public arena, in the wake of Mebkhout's obscure work and the famous "Riemann-Hilbert" theorem.

Incredibly, in both texts, Z. Mebkhout's name is absent. Mebkhout is absent, just as he is absent from the bibliography. I should point out that not only was J.L. Verdier perfectly aware of Mebkhout's work (and with good reason!), but so was Deligne (and it would be difficult even to conceive that it could be otherwise, for someone so well informed about current mathematical events, and when it's about the subject that touches him most closely<sup>3</sup> (\*\*\*)).

I don't know what happened to B. Teissier<sup>4</sup> (\*\*\*\*) and the other participants in the Colloque de Luminy, notably the two co-authors with Deligne of the article cited<sup>5</sup> (\*\*\*\*). It seems that none of the participants was so curious to know the authorship of the ideas and the key theorem that had had the virtue of mobilizing them.

<sup>1</sup>(\*) (May 4) See note n° 76, "Perversity", on this strange application.

<sup>2</sup>(\*\*) (May 4) I've since received the full article, which confirms what the part I had already shown me.

<sup>3</sup>(\*\*\*) In particular, Mebkhout's work and his "theorem of the good God" represent a decisive advance on Deligne's earlier work (from 1969), which he refrained from publishing. On this subject, see note n° 48' already quoted.

<sup>4</sup>(\*\*\*\*) (June 12) B. Teissier had long taken an interest in Mebkhout's work, and had been one of the very few to have an encouraging attitude towards him. He was therefore perfectly aware of the fraud, to which he knowingly lent his support. He justified himself to Mebkhout by assuring him that, in any case, he "couldn't have done anything about it".

<sup>5</sup>(\*\*\*\*\*) (May 28) I have since learned that A.A. Beilinson and J. Bernstein were informed of Mebkhout's results by P. Deligne (in October 1980) and by Mebkhout (in detail in November 1980, at a conference in Moscow). These two authors made essential use of the God's theorem in their demonstration of a famous conjecture known as the Kazhdan-Lusztig conjecture even before the Colloque de Luminy in June 1981. Compare the quotation from Zoghman Mebkhout's letter in the note "Un sentiment d'injustice et d'impuissance" (note n° 44").

(June 3) For further details about the solidarity of all Colloquium participants, see the following note "The Colloquium", n° 75'.

I assume that it was taken for granted, a little (a lot) like in the volume of the lecture Notes LN 900 which, the following year, was to consecrate the re-entry of motifs on this same "public square"<sup>6</sup> (\*\*\*\*\*); that paternity belonged to the brightest among the brilliant mathematicians who had taken the initiative of the Colloquium and

p. 287 had animated it. What everyone knew for sure was that it was neither Riemann nor Hilbert, otherwise the brilliant Colloquium  $\square$  would have taken place in 1900 and not in 1981, two years after the pupil's thesis defense.

Unknown by Jean-Louis Verdier.

The kind of operation I've witnessed here is perhaps now commonplace<sup>7</sup> (\*) and perfectly acceptable, as long as it's carried out by mathematicians who are at the top of their game, and the one who pays the price is a vague unknown (even though he's been kindly invited to join in the fun). The fact that one of these men is a great mathematician, both in terms of his means and his work (which puts him above suspicion from the outset), doesn't change the nature of the matter. Surely I'm old-fashioned - in my day, this kind of operation was called a **swindle**, and this one strikes me as a **disgrace** to the generation of mathematicians who tolerate it.

p. 288 The brilliance of genius takes nothing away from such a disgrace. It adds an unprecedented dimension, perhaps unique in  $\square$  the history of our science<sup>8</sup> (\*\*). Behind the apparent absurdity and gratuitousness of the act (carried out by someone whose lot has been fulfilled beyond measure, yet who delights in plundering. . . ), we can glimpse the action of forces other than the mere desire to shine, or the gratuitous desire to humiliate or despair those who feel defenceless and voiceless. ), the action of forces other than the mere desire to shine, or the gratuitous desire to humiliate or despair those who feel defenseless and voiceless.

As I'm definitely in the middle of a "tableau de mœurs", I'd like to point out (almost as a matter of course) that my name is equally absent from the quoted texts. Yet I was pleased to note that there is not a single page of the quoted article (among those in my possession<sup>9</sup> (\*)) that is not deeply rooted in my work and bears its mark, right down to the notations I introduced, and the names used for the notions that come into play at every step - which are the names I gave them when I first became acquainted with them before they were named. There are, of course, some minor adjustments - for example, the biduality theorem that I had worked out in the fifties<sup>10</sup> (\*\*) has been renamed "Verdier duality" for the occasion, still the same Verdier, there's no mistake. ...<sup>11</sup> (\*\*\*). However, it has not been possible for my name not to appear at least implicitly, through occasional references to texts that are still irreplaceable (despite SGA 4<sup>1</sup>, which is not quite sufficient<sub>2</sub> for its purpose), namely EGA and SGA. (In the explanation of the acronym SGA = Séminaire de Géométrie Algébrique du Bois Marie, my name of course does not appear, but in EGA, honest or not, the full designation is given, with the names of the authors including mine... . ) Another detail that struck me, and which testifies to the obsessive strength of the burial syndrome (in someone who, however, has no obsessive "profile" whatsoever): the two references I saw to SGA make a point of explaining each time especially "Mr. Artin's theorem in SGA 4. ... .", lest the misguided reader get the idea that said theorem might be due to the carefully non

<sup>6</sup>(\*\*\*\*\*) See notes n°s 51,52,59.

<sup>7</sup>(\*) I'm thinking of two other "operations" along the same lines, which took shape with the publication of LN 900 (see previous b. de p.) and APG 4<sup>1</sup> five years earlier (see notes n°s 67, 67', 68, 68').

(May 9) For a third such operation, closely related to the previous ones, see the "Good references" note (n° 82). on another "memorable article", this time by J.L. Verdier.

<sup>8</sup>(\*\*) Nor have I ever heard of such a thing in the history of any other science or art than mathematics.

<sup>9</sup>(\*) (May 4) And the others too, of which I have since become aware.

<sup>10</sup>(\*\*) The same goes for the theory of dualité étale, which becomes "dualité de Verdier" under the pen of his generous friend Deligne!

<sup>11</sup>(\*\*\*) (May 5) Compare notes n°s 48', 63" . Throughout this long Burial, which has been going on for nearly fifteen years, and throughout the discovery that the principal "anticipated deceased" has just made over the past month,

J s friend, who lavishes him with the wreaths of flowers that are de rigueur on this mournful occasion.

named, when it is quite clear that the presentation was indeed made, thank God, by a named author! (77)

□ All of this, it seems, is fair game in the "beau monde" today. Without indulging myself (and it's not meant for that. ... ) this guéguère is not really detrimental to the anticipated deceased, whose symbolic remains are thus left to the vagaries of this fairground, which I have been discovering with wonder for barely two weeks. It doesn't gnaw at my life with the feeling of **iniquity** suffered in impotence. It hasn't broken the joy and impetus that carry me to the encounter with mathematical things and those of the world around me, nor has it burned the delicate beauty of these things in me. I can consider myself happy, and I am... .

p. 289

And I'm happy too about my unexpected "return", the meaning of which had escaped me. If it were to teach me only what I have learned in these past days, this return will not have been in vain, as it has already fulfilled me ( $\Rightarrow$  76).

## 15.1.2. The symposium

**Note 75'** (June 3) I have received details of the other participants in the colloquium, which dispel all doubts. Although no talk by Mebkhout had been scheduled in the Colloquium's official program, Verdier was obliged to ask him on the spot and in extremis to give a talk, to make up for the shortcomings of one of the official talks (which had been entrusted to Brylinsk'i, who knew little about D-Module theory). Mebkhout was thus able to set out his ideas and results, and in particular the Good God Theorem, in such a way as to leave no doubt as to the authorship of this theorem, and of the philosophy that goes with it, which had led to the spectacular revival of the cohomology of algebraic varieties, culminating in this Colloque. So, **all the participants in the colloquium were made aware of this paternity**, through this presentation. I also assume that all of them, without exception, have since been acquainted with the Colloquium Proceedings, and in particular with the Introduction and the cited article by Beilinson, Bernstein and Deligne. Not a single one, apparently, found anything wrong with it - or if they did, they didn't let on. Zoghman Mebkhout received no such feedback. So, all the Colloquium's participants can justifiably be considered to be in solidarity with the mystification that took place during the Colloquium.

This collective mystification was already clear at the Colloquium, since no one found anything wrong with the fact that, in Deligne's oral presentation on "perverse" beams, the name of Mebkhout is not pronounced. The speaker confined himself to stating the good Lord's theorem, saying □ that he wasn't going to demonstrate this in his talk. He made it clear, moreover (with the modesty with which he

p. 290

is accustomed to) that "there was no merit" in guessing the extraordinary and a priori unpredictable properties of the beams he calls "perverse", obviously suggested by the "Riemann-Hilbert correspondence" he had just mentioned<sup>12</sup> (\*). Everyone found it normal that he should refrain from naming the person who had had the "merit" of discovering this providential correspondence, and that he should give the appearance that the author was none other than himself, even though they had just learned, or would learn in the following days, that this was not the case. It must have been some sort of inadmissible misunderstanding that a vague participant in the Colloquium should be the author of such a remarkable theorem, and everyone did their utmost to rectify the situation and establish a consensus which attributed authorship to the one who was clearly the right person for the job - the one who **should have** been the author<sup>13</sup> (\*\*).

<sup>12</sup>(\*) Compare with pages 10 and 11 of the article quoted.

(June 7) For details on the art of escamotage, see the following note "Le Prestidigitateur", n° 75".

<sup>13</sup>(\*\*) (June 5) everything fits together! The reflection that continued in the "l'Elève" procession (following on from the "Le Colloque" procession), and a certain tone too (notably again in a recent and brief exchange of letters with Deligne, see first footnote to the note "Les obsèques", n° 70), show me that for Deligne and my other cohomologist students, it's clear

Characteristically, **Mebkhout's paper does not appear in the Colloquium proceedings**. Verdier had asked Mebkhout not to write his paper, saying that the Colloquium was intended to present new results, whereas Mebkhout's had already been published for over two years.

When you don't get bogged down in a technical discourse, and look at what's actually been done, you'll see that it's not just a question of the technical.

p. 291 the forces and appetites that animated uni 'and the others, you'd think you were watching a film about mafia rule in the underworld of some far-off ☐Megapolis, It's

The actors are among the noblest jewels of French and international science. The Grand Chef, who runs the operation with his finger on the pulse, is none other than the man who once looked to me like a modest, smiling spiritual son, or at least a (no less modest and smiling) legitimate heir. As for the one who can be drilled and cut, the "soft" one in a world of "hard" ones who don't give quarter, by a strange "coincidence" whose meaning I still don't fully grasp, he too is closely linked to me. He's my "pupil" as is the Great Chief (and like him, "pupil" with quotation marks... ) - the one who took me on when I'd already been declared dead and buried years ago... .

### 15.1.3. The conjurer

**Note!** 75" (June 7) The "memorable article" (referred to in the previous two notes) displays a consummate art of casual evasion. The equivalence of categories that has been the essential motivation of the whole work is introduced for the first time in a sentence in the fourth rage of the Introduction (page 10, lines 9 to 15), without giving it a name, only to be followed immediately by the kyrielle of consequences for the notion of the so-called "perverse" bundle (pages 10 and 11). No further mention is made until the end of page 16, when we read<sup>14</sup> (\*):

"We would like to point out that on the following points, **which would have found their place in these notes**, we have failed in our task.

- The relationship between perverse beams and holonomic modules. As mentioned in this introduction, it has played an important heuristic role. The essential statement is 4.1.9 (**not proved here**). . . "  
(To continue with other "points that would have found their place. . . ")

I hasten to find out what this "essential statement" is that the authors haven't found the leisure to include in their work, or at least not to demonstrate. Let's look for it:° 4.1.9. ... I'm looking for an "essential statement", a theorem in the form of a scholia, with a reference **where** the authors have proved it or will prove it, since they don't prove it **here**. . .

p. 292 But no matter how hard I look, there's no trace of a "theorem 4.1.9" - there's only one passage that answers the number 4.1.9- So I start reading the "remark" at random (without conviction☐- there must be a mistake of numbering. ... ), I read that "the analogue of 4.1.1 in complex cohomology is true... . "Unfortunately, I'll have to go back to 4.1.1 to find out what it's all about. I skipped over it and skimmed through the text that followed - and lo and behold, I couldn't believe it, eleven lines later, a sentence that starts with "We know that... . ." and ends with "induces an equivalence of the category . . with that of perverse beams".

Phew - so that was it after all! But no matter how hard I looked, I couldn't find the slightest hint to clarify that cryptic "We know that... . ". Readers who didn't already "know" it must be feeling pretty silly, not to the

---

it's been a long time since Deligne should have been the one to discover and master staggered cohomology; and at a certain level (that which commands behavior and attitudes), they're convinced that it's really him, next to whom I'd be a sort of clumsy, clumsy auxiliary who would be more detrimental than anything else to the harmonious unfolding of a theory (leading to Deligne's theorem-ex-Weil's conjectures) and to a distribution of roles satisfactory to all concerned. . .

<sup>14</sup>(\*)Emphasis added.

the situation. What's clear to him in any case (apart from the fact that he's not up to it), is that this result "which would have found its place in his notes", which is "recalled" here in the course of a technical remark - something the reader should know anyway - is obviously due to the authors of the "notes" in question, or to one of them; the most prestigious perhaps and who wrote the article (there's an unmistakable "house style" . ), or the one who gave the oral presentation, whose well-known modesty prevents him from saying "it's me! - but everyone understood without having to say it...

It immediately brings back memories of my reflections over the last few weeks. The very first is Deligne's first work in 1968, which I finally (sixteen years later) took the trouble to look at a little more closely in the note "L'éviction" (n° 63) of April 22 (three days after the discovery of the pot-aux-roses LN 900). Here I find the same style, with variations no doubt due to the intervening thirteen years of "breaking-in". In the 1968 article, whose main inspiration came from me, he names me in passing and in a sibylline way towards the end of the article, just to be "in order". Here, he no longer takes such care - experience has long since shown him that there's absolutely no point! On the other hand, in the article of his young age, since he felt obliged to name me, he compensated by entirely retracting the initial motivation for his work (and the yoga of the weights with it, only to release it under an alternate paternity six years later, while awaiting the exhumation of the motives eight years later still... .). In any case, even hiding (and keeping for his own benefit. ... ) the article's essential arithmetical motivation, it "stood up," this article was perfectly understandable, living up to the author's reputation for doing things ☐ perfectly .

p. 293

Here, the theory he develops would be incomprehensible without the heuristic motivation. So he points to the latter, referring to it as "the essential statement", while treating it from under the leg - without honouring it with a name, or a formal statement baptized theorem or proposition, there isn't even a "correspondence" (known as Riemann-Hilbert) - he left that to his friends Verdier and Teissier. He doesn't have to give it a name (given the few<sup>15</sup> (\*) - surely he'd demonstrate it in five minutes!) or name anyone - others will take care of that for him and to his complete satisfaction. There is clearly a yoga, a philosophy, that the author handles with perfect mastery and authority, without having to name anything - this "little" that he pretends to disdain ("which would have found its place in these notes"), he knows full well he'll get more of, as long as he knows how to keep quiet and wait. The first time he played this game successfully, the "few" were "weight considerations" alluded to in a sibylline remark (waiting to bring out the philosophy of weights with great fanfare, six years later). The second time, as far as I know, was when I left in 1970 - the "little" was the "dream of motives", which for twelve years didn't deserve to be honored with a word (just think - a dream, and a dead man's dream at that, not to mention unpublished!), while we wait to discover the real motifs this time (and what we can do with them) and to claim, as modestly as ever, undisputed authorship<sup>16</sup> (\*\*\*).

#### 15.1.4. Perversity

**Note 76** (May 4) I well remember the first time I heard the name "faisceaux pervers", must be two or three years ago, that it struck me unpleasantly, arousing in me a feeling of unease. This feeling reappeared the two or three times I heard this unusual name again. There was a sort of inner "recoil", which remained close to the surface of my consciousness, and which would undoubtedly have been expressed (if I had stopped to examine it) on the other occasions.

<sup>15</sup>(\*) (June 14) To put this "little" in context, I'd like to remind you that Deligne devoted a seminar at the IHES to trying to develop a translation of constructible discrete coefficients in terms of continuous coefficients, without arriving at a satisfactory result.

On this subject, see the note "L'inconnu de service et le théorème du bon Dieu", n° 48'.

<sup>16</sup>(\*\*)For further comments on this technique of "appropriation through contempt", see the following day's note, n° 59'.

then) by something like: what an idea to give such a name to a mathematical thing! Or even

p. 294

□ any other thing or living being, except in a pinch a person - for it is obvious that of all "things" of the universe, we humans are the only ones to whom this term can sometimes be applied. ...

It seems to me (although I'm not entirely sure) that it was none other than Deligne himself who first spoke to me about so-called "perverse" beams, when he dropped by my place after the Colloque de Luminy<sup>17</sup> (\*). It must even have been one of the last mathematical conversations between us - there were no others after his visit. It was during this very visit that this "sign" appeared, which led me a few weeks or months later (while this sign was being comforted in the exchange of mathematical letters that followed this encounter) to put an end to a communication on the mathematical level<sup>18</sup> (\*\*). (For this episode, see the note "Two turning points", n° 66. )

Coming back to the so-called (wrongly i) "perverse" beams, it's obvious that "normally", these beams should have been called "Mebkhout beams", which would only have been fair. (On more than one occasion, I've named mathematical notions I've worked out and studied after predecessors or colleagues who were much less closely associated with them than Mebkhout was with this beautiful notion - which, incidentally, would seem to me to be more "sublime" than perverse!) The circumstances in which Deligne found himself at the time he was discovering and naming this notion derived from Mebkhout's work, preparing to rob him when he himself was already "fulfilled beyond measure" - these circumstances can rightly be called "perverse". Surely my friend himself must have felt it in his innermost being, at a certain level where one is not fooled by the facades one likes to flaunt. I sense in the attribution of this name (which seems aberrant at first sight) an act of **bravado**, a kind of drunkenness in a power so total, that it can even allow itself to display (symbolically, by the display of a provocative name whose true meaning no **one** will allow themselves to read!) its true nature of "perverse" spoliation of others.

p. 295

□ It seems by no means impossible that at some deep level, I perceived the tone of these dispositions in my friend, and that this contributed to the unease I mentioned<sup>19</sup> (\*). This uneasiness was expressed in particular by my inattention to the explanations he had to give me, although I don't think there had been an occasion before this meeting when I hadn't followed what he was telling me with sustained attention, and especially when it concerned mathematics. There was a kind of blockage in me with regard to this notion called (God knows why) "perverse" - I didn't really want to hear about it, even though it was very closely linked to issues I was (and still am to some extent) very close to.

In fact, the whole article by Deligne et al. was typical "**grothendieckery**" and all

---

<sup>17</sup>(\*) If this is indeed the case (as I'm now convinced it is) I must give credit to my friend's modesty, for I had no idea (on a conscious level at least) that it was none other than he who had introduced and named them. I had to read the "memorable article" to realize this.

(May 28) To tell the truth, the article doesn't say this any more than it says that Deligne is the father of the Riemann-Hilbert correspondence. However, I had no doubts about his authorship of the term "faisceaux pervers", which was subsequently confirmed to me.

<sup>18</sup>(\*\*) On a purely personal level, this relationship continued in the same tone of affectionate friendship as before, with no apparent change. My friend used to come every other year or so to visit me, usually on some kind of hike. I did have a visit again last summer, which was a welcome opportunity to get to know his wife Lena and their infant daughter Natacha. I think it was on the way back from yet another Colloque de Luminy, about which I've heard very little (apart from a few vague, morose allusions from Mebkhout, who had been given the honor of being invited again, and who could think of nothing better to do than to get back into the game... .). They stayed at my place for two or three days, and the contact was excellent all round.

<sup>19</sup>(\*) I would even be inclined to think that this is indeed the case. On more than one occasion, I've been able to see for myself the extent to which the deepest perception of things is of a finesse and acuity that have no comparison with what skims the surface at the conscious level. The fully "awakened" man is undoubtedly the one in whom these perceptions are constantly integrated into conscious vision and conscious experience - the one who lives fully according to his true means, and not just on a paltry portion of those means.

that could just as easily have come from my pen (with the sole exception of the name of the main concept)! It's something I've already expressed in the second part of the previous note (n° (75)), and something I've also sensed from the moment I read the article quoted - but without this diffuse feeling yet being embodied in the striking observation I've just made. It makes me aware once again, in a striking way, of this profound contradiction of the person who cannot help (in a certain

sense) to reproduce and assimilate the very one it is a question of denying, of handing over to disdain - the one it is a question of burying, and who is also at the same time  $\square$  the one one **wants to be** and that (in a certain sense) one **is**.

p. 296

The day before yesterday, as I was writing the previous note ("l'Iniquité - ou le sens d'un retour"), I had already been struck by the coincidence that this turning point in the relationship between my friend and me, suddenly impoverished of a communion in a common passion, which had been its raison d'être and most powerful mainspring, took place on my friend's return from that memorable Colloque, the meaning of which had just revealed itself to me. What had puzzled me at our meeting in July '81, which on one level was as friendly and affectionate as on the other occasions we met, was this "sign", discreet in tone and air, yet brutally obvious, of a deliberate gesture of disdain. It was like a sort of **down payment** that my friend was making, this time at the level of a personal relationship, on the implicit and equally "discreet" (and just as "brutally obvious") disdain that he had just publicly expressed towards me, as a public figure, at the Colloque de Luminy, in the context of a brilliant display of technical virtuosity between the stars of the day. It was the same "disdain" that had just been expressed (but this time with an altogether different "perverse" brutality) towards the man who had dared (even a little) to claim to be me, and who had thereby condemned himself to be, for my friend Pierre (at a certain level at least), nothing more than "another Grothendieck"<sup>20</sup> (\*) who had to be crushed at all costs. . .

### 15.1.5. Pouce!

**Note** 77 (May 5) I was struck by another detail while reading this memorable paper<sup>21</sup> (\*\*), which dominated (so they say) the no less memorable Colloque de Luminy in June 1981. The last chapter, under the suggestive title "From F to C", describes at length a remarkable principle I had introduced into geometry twenty years ago - it must have been even before the birth of the notion of motif (which in gives the <sup>most  $\square$  deep</sup> illustrations, via Weil's ex-conjectures). This principle ensures that for some p . 297

In the case of statements concerning schemes of finite type over a body, it suffices to prove them over a finite base body (i.e., in a situation "of an arithmetical nature") to deduce their validity over any body, and in particular over the body of complexes - in which case sometimes the algebraic-geometric result envisaged can be reformulated by transcendental means (e.g., in terms of integer or rational cohomology, or in terms of Hodge structures etc.)<sup>22</sup> (\*). My friend learned this from none other than me and from me, on numerous examples over the years<sup>23</sup> (\*\*). The authorship of this principle (which in an elementary form is even spelled out in EGA IV - don't ask me which paragraph and which number... .) is well known<sup>24</sup> (\*\*\*). So much so that

<sup>20</sup>(\*) In our personal relationship, my friend calls me by the affectionate diminutive (of Russian origin) of my first name, Alexander, which is also what my family and closest friends have called me since childhood.

<sup>21</sup>(\*\*) See note n° 75 about the "memorable article".

<sup>22</sup>(\*) (May 6) It seems to me that the first example of the use of such a principle is to be found in Lazard's theorem on the nilpotence of algebraic group laws on the affine space  $\underline{E}$  (over any body). I was struck by its demonstration, and drew inspiration from it for a number of other statements, as well as for a "philosophy" that has dominated my thinking on pattern theory.

<sup>23</sup>(\*\*) See the note "Eviction" (n° 63) for one such example.

<sup>24</sup>(\*\*\*) (June 5) It is perhaps abusive for me to claim to be the "father" of a principle whose first known application is due to Lazard (see previous note (\*)). My role, as on other occasions, has been to sense the generality of someone else's idea,

When my brilliant friend was awarded the Fields Medal at the Helsinki Congress in 1978, N. Katz couldn't resist mentioning it in passing in his speech in honor of P. Deligne, thus rectifying a somewhat embarrassing systematic "oversight" on the part of his illustrious laureate. I read this speech just a few days ago, along with the "memorable article" itself.

p. 298 In any case, in this article, the philosophy behind the transition from "arithmetic" to "geometry" is presented in such terms that there can be no doubt in the mind of an uninformed reader that the brilliant lead author (excuse me, I impair. . . ) has only just discovered this wonderful principle of such far-reaching significance.

It's true that I haven't patented the method, and nowhere does my brilliant friend say that he's the brilliant inventor; nor does he claim in plain English that he's the father of that famous "correspondence" (admire the term, which smacks of his nineteenth century!) modestly attributed to Riemann and Hilbert (men worthy of sponsoring the children of such a prestigious successor) - nor does he specify in the "memorable volume" (LH 900) that it was indeed he who invented motives, motivic Galois groups and the whole philosophy that goes with them (and of which he has still only released a fragment). There's nothing to say either for this famous SGA 4<sup>1</sup>, where I've even been honored to be listed as a "contributor" to this volume, which so brilliantly develops ab ovo étale cohomology, deigning to call on (despite their regrettable gangue of superfluous details etc.) the two satellite volumes SGA 4 and SGA 3.) to the two satellite volumes SGA 4 and SGA 5, which have been consigned to oblivion, but to which I am generously credited with providing a few technical additions and digressions (some of them even "very interesting")<sup>25</sup> (\*).

In all these cases, and in many other micro-cases that I've witnessed over the last five or six years, without the idea ever occurring to me to **pinpoint my discomfort** and give a name to what I witnessed or co-acted<sup>26</sup> (\*\*) - in all these cases, I recognize the same **style**. My friend is always and totally "**thumbed**" - he can help himself at ease, with the complete good conscience that comes from admiring his peers and his blunders (with all due respect), guaranteeing total impunity.

### 15.1.6. The Chinese emperor's robe

p. 299 **Note 77** (May 7) Of course, those who see what my friend Deligne is doing and are in the know at all for the ins and outs, I mean those who haven't just learned about the maths "being done" from the publications of the person concerned himself, or other brilliant (though not always golden) stars of his generation - these colleagues (and they're not that rare after all!) are well aware, at **some level**, of what's going on. They must have sensed, in the "big" cases, that particular uneasiness that I myself have felt on more than one occasion in the face of these "micro-cases" a hundred times less serious than the "big" ones.

---

and systematize it to the point of making it a "reflex" or "second nature". In the context of the yoga of weights and patterns, it's likely that the first to use this principle was Serre (not me), with his idea of virtual Betti numbers, which set me on the path to just such a general yoga of weights and patterns. (See note no. 46<sub>9</sub> for Serre's idea in question.) It's also true that it's common practice to attribute the authorship of a "principle" of reasoning that has become commonplace, not to the author where we first find a trace of it, but to the person who first perceived its general scope, systematized and popularized it. In this sense, N. Katz's correction (referred to in the following sentence), attributing the paternity of this principle to me, is justified.

<sup>25</sup>(\*) For details of the "SGA AT operation", see the four notes "La table rase", "L'être part see the four notes "La table rase", "L'être à part", "Le Feu vert", "Le renvers- ment" (notes n°s 67, 67', 68, 68').

<sup>26</sup>(\*\*) The first step towards precisely "pinpointing my malaise" in a specific case was taken in Harvest and Sowing less than three months ago, in the reflection (which turned out to be quite laborious - and for good reason) "The note, or the new ethic" (section 33). This reflection was taken up again in a note to that reflection, "Le snobisme des jeunes, ou les défenseurs de la pureté" (note n° 27), then again less than two weeks ago (under the impact of the discovery (the day before) of the "memorable volume" (LN 900)) with note n° 59: "La nouvelle éthique (2) - ou la foire d'empoigne". As I was writing this, there remained in me a tinge of hesitation about using the rather blunt term "jumble sale". The discoveries I've made since then have shown me that there's no need for hesitation.

bigger than these. But what they sensed was so **enormous**, so **incredible** that it must never have surfaced - as it finally began to surface with me, in the course of a **work**, which expressed itself in these two texts around a micro-case referred to in the previous b. de p. note. Indeed, I've never heard of anything like it in the history of our science or any other. Instead of "surfacing", for some people "it" must have **become the norm**, or at least been considered **normal** - as long as an obviously brilliant man, admired by all, practised it with the greatest naturalness in the world, in full view of everyone and without the thing ever (as far as I know) eliciting the slightest comment.

Over the past few days, I've been reminded many times of the tale "The Dress of the Emperor of China", in which the aforementioned emperor, deceived by unscrupulous swindlers and his own vanity, announces that he will appear in a solemn procession wearing the most sumptuous garments the world has ever seen, prepared for him at great expense by so-called tailor artists. And when he appears in the procession, surrounded by the pomp and circumstance of his Court in full regalia, the "artists" bowing and scraping, and the entire imperial family, no one in the procession or among the people gathered to contemplate the seventh wonder dares to believe the testimony of his eyes, and everyone makes a point of admiring and raving about the unsurpassable splendor of the garments with which he is now adorned. Until a small child who had strayed into the crowd exclaimed, "But the emperor is naked!" - and then all of a sudden the whole crowd, as if with one voice, cried out with the little child: "But the emperor is naked!"

And I feel like the little child who believes the testimony of his eyes, even though what he sees is quite unheard of, never seen before and ignored and denied by all.

□ Whether the child's voice will be enough to bring some back to the humble testimony of their healthy faculties, that's another story. A tale is a tale, it tells us something about reality - but it's not reality<sup>27</sup> (\*).

p. 300

### 15.1.7. Encounters from beyond the grave

**Note 78** (May 6) It's only been five days since I received this generous package of documents from my friend Zoghman Mebkhout, including above all the two texts already examined from the "memorable Colloquium" - that Colloquium built around a monumental **mystification**! The note "l'Iniquité - ou le sens d'un retour", in which I try to assimilate the quite incredible meaning of this new "event", was written on the very day (the day after May 1st) that I received these documents, still in the emotion of discovery<sup>28</sup> (\*\*).

Since April 19, when I finally became aware of the "memorable volume" of the Notes readings (LN 900 - see notes (51) (52)), this has been the third great discovery on the subject of the solemnities of the Great Burial, and the one that seems to me to be of the greatest significance, both in terms of the light it sheds on the actions of the "Great Burial".

<sup>27</sup>(\*) (June 14) After writing this note, the name "The robe of the Chinese Emperor" struck me as a natural sub-title for the Burial, expressing a particularly striking aspect of it. Later, as the focus shifted to my students as a whole, and even to "the entire congregation" of the Mathematical Establishment, this subtitle seemed less appropriate. However, I've come to realize that the parable that first came to mind when thinking of my friend Deligne, applies equally to all aspects and adventures of the Burial, which at every step reach the Ubuesque in the unbelievable (which everyone makes a point of modestly ignoring) that is nonetheless true. For reflections along these lines, see in particular the notes "On n'arrête pas le progrès!", "Le Colloque", "La Victime - ou les deux silences", "La plaisanterie - ou les complexes poids", "La mystification", "Le Fossoyeur - ou la Congrégation toute entière" (n°s 50, 75', 83, 85', 97), none of which specifically concern my friend Pierre.

<sup>28</sup>(\*\*) Along with the section "The note - or the new ethic (1)", this note is the only note or section I've had to rewrite several times, because what "came out" in the first version (and even in the next one) was still burdened by the inertia of my usual vision of things, which fell far short of the reality I was examining.

of people to whom I have been closely linked, than by its implications as a "tableau de mœurs" of an era, apparently unique (but it is true that I am ignorant of history. . . ).

p. 301

The second discovery had closely followed the first - that of the exhumation of the "motifs", for twelve years buried. After the "memorable volume", I was treated to the "memorable seminar" - that "seminar" that never took place, given a bogus name (both SGA and number 4 1/2), and enriched with the "State 0" of a phantom thesis, not to mention a central presentation from the (real) SGA 5 seminar (which appears later, even though it predates it by twelve years); a presentation "borrowed" for the purposes of the operation without further ado. This brilliant operation, and the role it played in the strange vicissitudes that befell this poor SGA 5 seminar (dismantled from the head, the tail and the middle!) were gradually revealed in the course of a reflection that continued between April 24 and 30. (See the five notes "Le compère", "La table rase", "L' Etre à part", "Le signal", "Le renversement", n°s 63", 67, 67', 68, 68'.)

As soon as I had digested this discovery, and as my retrospective reflection on "Mon ami Pierre" drew to a close, and on April 30 I had proudly put the final and definitive mark (that was a sure thing!) on my life, I decided to take the plunge.

- this time I was finally there i) under this interminable Burial, with the "final note" with the doubly euphoric name "Epilogue - ou l'Accord Unanime" - that I receive this package of misfortune, which calls into question final point, epilogue, page layouts and numbering... . A quick glance at the documentation and the accompanying annotations and letters made it clear that my period was gone, as were the beautiful arrangements for a first-class Funeral, the final details of which I was about to polish - I was ready to take up the master of ceremonies' harness. . .

God knows my friend Zoghman had plenty of time to inform me of the situation! It must have been going on for ten years in latent form, and three years at least in "acute form" (and that's putting it mildly) - ever since the Colloquium in question, where he must have sensed the wind without having to wait for the publication the following year of the highly official "Proceedings" under the patronage of his illustrious ex-patron and protector.

p. 302

A few months after he had defended his thesis (in February 1979), he had come to bring me a copy to the village where I had lived for six years. Unluckily, I had just left (never to return).  
return, except in passing... ) a few days before, to retire in solitude. He only met my daughter, who later handed me the thesis. It was the following year, I think that we finally got to know each other, in college. in Montpellier, where we chatted for an hour or two. I wasn't really into math at the time, and couldn't remember much about the thesis I'd flipped through in a few minutes, or the name of its author. That didn't stop the contact from being warm. I remember an immediate current of mutual sympathy. We didn't talk so much about maths (not that I can remember), but mostly about more or less personal things. Zoghman told me afterwards (something I'd forgotten) that he'd been able to explain the D-Modules "philosophy" to me a little, and that he'd been pleased with the meeting, to have felt me "vibrate" if at all by learning new things from him, and yet also (in a way) "expected". What I remember most of all was the impression he made on me - an impression of stubborn, calm strength, that of a "go-getter". At the time, much more than when we met last year or during the correspondence that followed, I had the impression of a strong affinity of temperaments - this "go-getter" side in particular. But the two or three years that have elapsed between the two encounters seem to have dented it quite a bit. ...

I don't remember Zoghman telling me at our first, brief meeting about the isolation in which he had worked, the lack of any encouragement from the "luminaries" who had been my students. If he hinted at it, he must not have insisted. Even then, the whole thing didn't appeal to me.

surprise<sup>29</sup> (\*). I couldn't say whether this was before or after the Colloque de Luminy in June 1981<sup>30</sup> (\*\*). If it was afterwards, he would still have had some hot stuff on his stomach - and he really didn't give the impression of it. Rather that of a man who knows what he wants to do and what he wants, and who follows his instincts.

quietly, without seeking trouble and without being sought out.

□ We didn't continue then to write to each other. But I remembered him well, and early last year I wrote to him I wrote him a note, at random, to ask if he might be in a position to tackle a magnificent work on the foundations of a "moderate topology" which (it seemed to me) was just waiting for someone of his calibre to take it up. Although Zoghman didn't make it clear to me at first, it turned out that he wasn't really interested in this prospect - on the other hand, he seemed happy to seize the opportunity of a new encounter. At the time, I was too out of the loop to fully appreciate the situation, and imagined that D-Module theory was now a done deal, as is, say, coherent duality theory (78<sub>1</sub>), and that Mebkhout had perhaps run out of "big tasks". It was only when we met last summer that I realized that in the very theory he had started, there was no shortage of "big tasks" - and some of them had not even been started, because they had not even been seen!

p. 303

In any case, it was a perfect opportunity for a second meeting, and this time not as casual as the first. Zoghman must have stayed at my place for maybe a week last summer, in June I think. Mathematically speaking, our meeting served mainly to bring me up to speed as best we could on D-Module yoga. I've been slow to "thaw out", having lost touch with my old cohomological loves, and being mostly embroiled in the writing of "Poursuite des Champs", which is set in rather different registers. Zoghman wasn't discouraged to see me listening with a slightly distracted ear, and returned to the charge without tiring, with a touching patience. I was finally triggered, I think, when I realized that these famous D-Modules were nothing other than what I had long ago called **module crystals**, and that as such they still made sense in singular spaces. All of a sudden, I saw a whole network of intuitions from my crystalline-differential past rising up from forgotten depths, and slightly rusty reflexes from my "six operations" past being reactivated...

Perhaps it was Zoghman who was a bit of a loose cannon, or maybe it was more that he decided afterwards that he wasn't going to risk his fingers in that particular gear (any more than my friend Pierre wanted to put his - although he'd been all fire and brimstone while I'd been around... ). (⇒ 78)

**Note 78** □ There are, however, a number of "fine" results of consistent duality, notably on the structure of "dualizing differential modules", their relation to "naive" differential modules, and trace and residue applications in the non-smooth flat case, which I had developed in the late fifties which, to my knowledge, have never been published. Nevertheless, for the most part, the theory of coherent duality (in the schematic framework at least), just like that of stellar duality (and its variant for the discrete cohomology of locally compact spaces, developed by Verdier on the stellar model), or linear algebra or general topology, appear as theories that have essentially **been completed**<sup>31</sup> (\*), in the nature of **tools that are perfectly perfected and ready for use, and not so much of a substance**.

. 304

<sup>29</sup>(\*) (May 30) That's not quite true - I'm reprojecting more recent disillusioned dispositions onto the past. When I met Zoghman just last summer, I remember being surprised that none of my cohomology students (Deligne, Verdier, Berthelot, Illusie in particular) had supported Zoghman in his work. This surprise was repeated when Deligne came to see me ten days later (I must have said something to him about Zoghman, but I got no response), and later in a telephone conversation with Illusie (see the note "La mystification", n° 85').

<sup>30</sup>(\*\*) (June 3) That was back in February 1980, a year after he defended his thesis.

<sup>31</sup>(\*) (June 12) This is not quite true for stable duality, until the purity conjectures and the "biduality theorem" are proved in all generality.

that would have to be penetrated and assimilated.

### 15.1.8. The victim - or the two silences

**Note** 78 We met in an atmosphere of friendly trust and affection. This atmosphere, however, did not live up to its promise. I realize now that from that moment on, my friend's trust was far from complete. It was two years after the famous Colloque, and a year after the publication of the "Actes" in *Astérisque*<sup>32</sup> (\*\*)-at a time when he was the victim of a scandalous spoliation.

p. 305 But he didn't bother to inform me until just four days ago! When he came last year, he was returning from another Colloque de Luminy<sup>33</sup> ('\*\*\*') (this time squarely on the theme of D-Modules)'□où<sup>ou</sup> on which he had again generously invited and rushed to attend. He spoke of it in terms both bitter and vague, suggesting that now that he'd pulled the chestnuts out of the fire, it was "the others who had done it all". I could imagine the picture indeed - especially Verdier suddenly remembering the paternity of the triangulated categories (and derived ones too, while we're at it!) he had left to one side for ten or fifteen years, barely tolerating his "pupil" Mebkhout's use of them in his work... (81).

Although he didn't want to explain himself clearly at the time, Zoghman seemed to have his heart set on Verdier, which was understandable given his ex-boss's less-than-encouraging behavior. And yet, my other cohomology students - Deligne, Berthelot, Illusie - hadn't bothered to take an interest in what he was doing or to support him in any way. But it almost seemed as if Zoghman took this for granted, having never (or so it seemed) experienced anything other than this attitude among his elders. If he held a grudge against any of my former students, it was solely and exclusively against Verdier.

From Zoghman's hints (which he obviously didn't want to spell out), I understood that "they" were systematically putting the scope of what he'd done - period. This is, after all, the most common thing in the world. Since judging the importance of a thing is largely subjective, it's commonplace and almost universal to attribute more merit and importance to one's own work, to that of one's buddies and allies, than to that of others, and especially to those one feels like minimizing for one reason or another. (And the "reason" in this case wasn't exactly a mystery to me!) Nothing could have made me suspect that, far beyond such common attitudes, there was here an operation of pure and simple swindling, where there was no question whatsoever of "minimizing", but rather of **swindling** Mebkhout's authorship of the ideas and results that were breathing life back into where there had been stagnation... .

p. 306 And yet, if there was one person in the world to whom it was natural for my friend to open up, it was me. whose work had inspired him during those years of obstinate work, sometimes bitterly, against the fashion of the day - I who received him affectionately in my home, making myself a bit□his pupil at my learning as best I could what he took pleasure in teaching me<sup>34</sup> (\*).

<sup>32</sup>(\*\*) (October 9) Zoghman tells me that these "Actes" were not published until early 1984.

<sup>33</sup>(\*\*\*) (May 7) There's a slight memory lapse here - I think he was getting ready to go to the Colloquium. At the time, of course, there was no shortage of reasons for those "bitter terms" (and vague ones) I remembered. But this bitterness was further heightened by his visit to Luminy after his stay with me. I had echoes of it in a phone call he gave me on his return from Luminy. From that moment on, I had the distinct feeling that he had come to Luminy for the pleasure of being mistreated by "the people" (without really asking me which ones) who had generously invited him, for the pleasure of being able to treat him as a negligible quantity. I must have told him so, or let it be understood, which couldn't have improved my friend's attitude towards me.

<sup>34</sup>(\*) Zoghman didn't tell me about mine, and he didn't tell me about his own funeral either, even though he'd had a front-row seat to the proceedings for nearly ten years! To tell the truth, his "protectors" (a little reluctant on the edges) had even agreed to let him carry with his hands a small corner of the coffin carrying my remains - but they couldn't forgive him for being the only one among the guests who sometimes took the liberty of uttering the name that all the others kept quiet!

So my friend must have felt at odds in his relationship with me, and he couldn't find it in himself to take on the responsibility.

After my friend had passed through an atmosphere of warm affection, there was an immediate "backlash". I had the impression that he had decided to transfer onto me the mistrust and bitterness that had built up in him over the past eight or ten years, under the sting of the indifference and disdain he had encountered in some of my former students. In the months that followed, the correspondence between us never left the *aigredoux* register - it finally stopped with a New Year's greetings card, which never received a reply.

It was only at the end of March that I contacted Zoghman again, to send him "Le poids d'un passé" and the notes I had then added to this section (n° s 45, 46, 47, 50). It was to ask him if he would agree to my including him, as I had done, in the short reflection on my work (in the note "My orphans", n° 46), when it would be clear to all that I was using information he had given me, and which he might consider confidential. I was by no means sure that my friend would not prefer (like others before him) to "crush rather than displease". It would have hurt my feelings if he had.

It took me a long time to get her reply, which I received only ten days later. I was somewhat expecting her to would still be half-flesh, half-fish - but □ this time she was downright warm. He'd give me his p . 307 I agreed wholeheartedly, even emotionally, with the terms in which I spoke of him.

It's on page 6 of his long (eight-page) letter that he points out, as if in passing and with reference to the "impressive number" of applications of his theorem ("both in the framework of stale topology and in the transcendental framework") that it still appears in the literature under the name of the "Riemann-Hilbert correspondence"<sup>35</sup> (\*). He says it in such an almost incidental way, and with such a delightfully illegible handwriting, that it almost went completely unnoticed! But then I remembered, it really was a strange thing. So strange, in fact, that it hardly seemed believable, and then perhaps my friend was exaggerating, obviously he was angry with everyone, including me, even though I only wanted good things for him. So I added a note (holy Zoghman, I thought I'd finished!) called "L'inconnu de service et le théorème du bon Dieu", in addition to two others "L'instinct et la mode - ou la loi du plus fort" (I'd also thought a lot about him, among others, when writing it) and "Poids en conserve et douze ans de secret". This note on "L'inconnu de service", I wrote at first without total conviction; Zoghman seemed to me so knotted up and full of contradictions that I wondered what I was getting myself into by simply echoing him, without knowing the facts for myself. The thought hadn't occurred to me that there might be a scam, let alone that Verdier or Deligne themselves were involved. There was nothing in what Zoghman had told me to suggest this... .

Yet both of them were so closely linked to this theorem of the good Lord, that its authorship could hardly be concealed without at least their tacit agreement. It must have worked on me in the days that followed. I remembered that Deligne had given it a lot of thought, this problem solved (ten years later) by Zoghman - and then Verdier, after all, acted as research director; even if he didn't go out of his way for his pupil and would rather have beaten him cold and discouraged him than anything else, he must at least have known what the two main theorems in this work were - Zoghman surely explained them to him, during those famous "interviews" that Verdier □ was kind enough to grant him! I have therefore added to the note on p . 308 a commentary on the relationship of Mebkhout's work to an earlier attempt by Deligne, and a b. de p. note on the role of Verdier. At the same time, it was also a sounding board for my friend

---

a past fraught (as mine was) with ambiguity, and speak to me plainly and clearly. Talking about his funeral also meant talking about mine and the role he himself had played in it ... . In any case, if I ended up discovering this famous funeral in all its splendor, it was against a kind of "conspiracy of silence" that encompassed both my friend Zoghman and my friend Pierre - and no doubt most of the friends I had in the "great mathematical world".

(June 3) For further details, see note n° !78" below.

<sup>35</sup>(\*) See the quotation from his letter in the note "A feeling of injustice and powerlessness", n° 44.

Zoghman...

You'd think that Zoghman would jump at the chance to finally, finally reveal his batteries, hidden for three years, which will finally bring out the clear truth and triumph the cause of the oppressed! But not at all! Fifteen days of silence, followed by a letter about everything (in maths) except God's theorem - or rather, he confined himself to giving me the precise reference in his thesis, which I had asked for. (I still wanted to know where this famous theorem, to which I was so firmly committed, had been proved!)

In my reply to this letter, I had to say a few words to him about the "vast swindle with regard to my work" I had just discovered (with the "memorable volume" LN 900, and moreover "promising me much pleasure" in the days to come in making the acquaintance of SGA 4<sup>1</sup> in the college library) - so<sub>2</sub> that after another ten days' silence, my friend finally got in touch!

This time, at last, he "pulled out all the stops" - a **great deal**, in fact, of judiciously-chosen documents, enabling me (who hardly ever haunts libraries, or even the piles of separate prints piling up in my office at university... ) to give me a well-balanced idea of an "atmosphere", in which many of those who didn't take part in my long and solemn funeral still remain<sup>36</sup> (\*). Alongside the main "piece of evidence" (the two articles from the famous Colloquium, exposing the incredible mystification), and another "memorable article" (this time from the pen of Verdier<sup>37</sup> (\*\*)). there was the speech by

p. 309 N. Katz on the "Fields Laureate" Deligne, plus a presentation by Langlands and another by Manin at the same Helsinki Congress 1978; then Deligne's "Théorie de Hodge I" at the Nice Congress 1970 (where he is made another allusion in line 3 to a "conjectural theory of Grothendieck's motives" (78<sub>1</sub> ), and "Weight in the Cohomology of Algebraic Varieties" by the same Deligne, Vancouver Congress 1974 (where my name is not mentioned (78<sub>2</sub> )); plus finally a correspondence with A. Borel (yet another old friend, whom I learn at the same time is back in Zurich. . . ), and two notes to Mebkhout's CRAS, one of which from 1980 is a summary of Chap. V of his thesis (passed the previous year), giving a little more emphasis to the theorem of the good Lord<sup>38</sup> (\*). Not to mention another document - shhh! communicated under the seal of secrecy, and of which I won't say another word here. ...

Two letters accompany this substantial dispatch (letters of April 27 and 29), one very long and both substantial. Now that he's finally let the cat out of the bag (the real one, this time!), Zoghman continues to urge me to exercise extreme caution, as he had been doing ever since I contacted him again. If I listened to him, I'd be careful not to make public my reflective notes, which would remain a matter of absolute secrecy between him and me - at least not the part that implicates anyone, given that "they" have "all the power" and "everyone is with them"<sup>39</sup> (\*\*)! And yet, I had warned Zoghman that these notes, from which I sent him the extracts concerning him, were destined to be made public, and as soon as possible.

All the elements seem at last to be in place for the just cause of the oppressed to triumph, but the "victim" seems to be doing everything in his power to continue muddying the waters as if by magic.

---

<sup>36</sup>(\*) (June 12) Katz, Manin, Langlands don't seem to be among them. . .

(March 1985) For a different take on Katz, see "Dotting the I's", n° 164 (II5), and "Maneuvers" (n° 169), "Episode 2".

(April 1985) Similarly for Langlands, see note "Pre-exhumation (2)", n° 175 . . . 1

<sup>37</sup>(\*\*) For more on this article, see "Les bonnes références", n° 82.

<sup>38</sup>(\*) For a precise reference for this note, Mebkhout's thesis and the theorem of the good Lord, see the note "Le pavé et le beau monde - ou vessies et lanternes", n° 80.

<sup>39</sup>(\*\*) (May 30) Carried away by my impetus, I'm exaggerating a little here. At no time has Zoghman suggested that I refrain from publishing any part of my notes. Lately, he's even been insisting that these notes should indeed appear in book form, for the benefit of "posterity", whereas a limited edition like a preprint seems to him a bit "like a sword in the water".

secret regret (one would say) at having sold that famous "fuse" of which Zoghman must have been (until the fateful May 2) the one and only holder. This ambiguity is apparent in every line (I'm hardly exaggerating), right down to the latest letters I've just received - including the very last one, in which he sends me, with an air of sombre triumph, the "memorable article" in its entirety (whereas, with the "big package" he first sent me, he had only managed to part with the first twenty pages of this masterpiece<sup>40</sup> (\*\*\*)).

□ As for the friend Pierre I mean Deligne (who is neither Pierre nor "friend" to everyone. . . ), it's p. 310  
it's just that he doesn't sing its emotional praises - it seems that it's no longer he, Zoghman, who's the "victim", but no, it's Deligne, poor fellow, who's been so badly influenced by those around him - the only villain, and the one who surrounded him so badly, is Verdier (and yet. . . follow my gaze instead, . . .): it's clear that I "must have done something" to Verdier for him to be such a coward for the sheer pleasure of doing harm, not to mention the fact that I was also his boss and I was also the one who awarded him the title of doctor and the glory and all the rest - the means, in short, of "absolute power"!<sup>41</sup> (\*)

Clearly, if my friend has a grudge against anyone, it's not really against his illustrious ex-boss, whom he's only had the honor of meeting for an "interview" three times in ten years in all (if I've understood correctly what he wrote to me most recently) - a vertiginously distant man, entirely out of reach - but it's the one he can come and see whenever he pleases, and share both his bread and his lodgings...<sup>42</sup> (\*\*).

Each time Zoghman takes a new step to divulge some new element, making me a little more aware of a situation of despoilment in which he is the victim (and can help a little to unravel it), I feel that it's like a **wrench**, the culmination of an exhausting inner struggle. I

has a **role** with which he seems to have identified body and soul, clinging to it as if it were his most precious possession - a role with which he seems to have identified body and soul, clinging to it as if it were his most precious possession.

this role of <sup>victim</sup>□ which he can only maintain by keeping around this role and the situation that justifies it, p. 311  
absolute secrecy<sup>43</sup> (\*). And he may indeed be torn, and resent me more than ever, at this moment when, with his reluctant collaboration (snatched away, as it were, by the logic of a situation created by none other than me, with those unfortunate reflections on an uneventful Funeral. . . ), this secret will come to an end, and with it, perhaps, this role in which it has pleased him to maintain himself, for how long I cannot say.

This "burial" of my friend Zoghman was achieved by the combined care of **two silences**, each responding to the other and provoking it in turn, in a seamless round in which the role of one closely matches the role of the other - the despoilers and the despoiled. If on more than one occasion I was struck by the fact that the "burier" was at the same time, and more profoundly, his own "buried", I was equally struck by the fact that in the person of another friend, the "buried" was at the same time, and more profoundly, his own "burier" - in close connivance with him.

<sup>40</sup>(\*\*\*) (October 9) Zoghman told me that, in fact, he didn't have a Xerox of the complete article in his possession at first, which he pulled out only later.

<sup>41</sup>(\*) It's not the first time I've heard this "absolute power" claptrap, with which one would like to convince oneself of one's own powerlessness and justify it. If anyone has invested anyone with "absolute power" over himself, Zoghman, it's none other than Zoghman himself!

<sup>42</sup>(\*\*) (May 8) It's surely no coincidence that the unequivocal signs of conflict in my friend's relationship with me appeared in the very aftermath of this stay, when he "shared my hand and my bed" in an atmosphere of unreserved affection, abolishing a feeling of "distance" that our first brief encounter probably couldn't entirely erase. Here I encounter a situation with which I have long been familiar, and which I discuss (in relatively general terms) in the two notes "Le Père ennemi (I), (2)" (sections n°s 29, 30). Little did I suspect, when I wrote them as a commentary on the reflections that had preceded them, the extent to which the archetypal situation I describe there would constantly find itself at the center of a long reflection yet to come, just as I thought I was nearing the end of this journey!

<sup>43</sup>(\*) (May 30) Since these lines were written (May 6), my friend's attitude has changed dramatically, and lately I've seen no signs of attachment to a victim role. It goes without saying that the lines which follow (like those which preceded) concern certain episodes in my friend's life, and in no way claim to define a temperament or describe a permanent bias.

with the very people whose willing victim he delights in being.

And I can see that the person primarily responsible for his own spoliation is none other than my friend Zoghman himself, who for three years has acquiesced by his silence to his humiliation by those who take their ease with him. He had everything in his hands to fight for - and for three years he chose to forget he even had hands, and to be defeated without having fought<sup>44</sup> (\*\*).

p. 312 **Note 78<sub>1</sub>** I had never held this short preliminary communication in my hands, but only the more circumstantial "Hodge Theory II, III" publications that appeared in Publications Mathématiques. This is why I had been under the impression that Deligne had not seen fit to ever allude to a role motive theory in the genesis of his ideas on Hodge theory. I thought that if he had wanted to mention any role I might have played with him<sup>45</sup> (\*), he would probably have done so with "Hodge Theory II", his thesis work, which was the perfect opportunity to mention such things<sup>46</sup> (\*\*). I've just seen that he's fulfilled the formality of mentioning me once and for all, with this lapidary line<sup>47</sup> (\*\*\*) alluding to "Grothendieck's conjectural theory of motives", with even a reference at the key (to Demazure's talk at the Bourbaki seminar).

Once again, nothing to say! The idea never occurred to him to specify that he had learned this theory (all conjectural, let's not forget!) from **another source** than this meagre text by Demazure, which can give no image of a theory of great richness (all conjectural!), which runs like a thread through all Deligne's subsequent work on weight yoga - pending the escalation of the "pirate volume" LN 900, where the motivic Galois groups are finally exhumed (fifteen years later) (this time without even a laconic reference line containing the name of the deceased. . . ).

p. 313 On reflection, in this laconic quote, I recognize the same "thumb!" style. - a quote from pure form, to be fair, with a reference that is in no way likely to enlighten the reader (in this case, on obvious and deep-rooted relationships with ideas that it is precisely to hide<sup>48</sup> (\*) - and which have remained hidden during the twelve years that followed), but **of a nature to deceive him**.

**Note 78<sub>2</sub>** I didn't have to hold this<sup>49</sup> (\*\*) text in my hands (which I learned about a few years ago). weeks) to know that my name wasn't on it. Nor was Serre's, who was the first to glimpse a "philosophy of weights", which I later worked out in great detail.

<sup>44</sup>(\*\*) (May 30; This is an admittedly subjective view of someone with the temperament of a fighter, someone in whom this fibre might have seemed absent. It would seem, however, that since these lines were written, my friend's fighting spirit has been reawakened, and he is determined to fight back against an iniquity of which he has been the victim.

(April 18, 1985) For a different, less "harsh" take on my friend's provisions, see also the "Roots" note (n° 171 ).<sub>3</sub>

<sup>45</sup>(\*) (May 30) Until a few weeks ago, I systematically downplayed this role. See note

"Being apart" n° 67' of May 27, where I first became aware of this attitude in myself and perceived its meaning.

<sup>46</sup>(\*\*) (May 30) Nor do I remember being asked to sit on the thesis jury. The funeral was already well under way...

<sup>47</sup>(\*\*\*) Serre is also implied in the same line by the cross-reference sign [3] - the curious reader will find his name in the bibliography at Hodge I. This expeditious reference line is the only one between 1968 and the present day where there is any allusion (however cryptic) to the "sources" it mentions in a single breath: Serre (alias [3]), motifs, Grothendieck. ...

(May 28) However, I have since come across another such allusion, very interesting in view of the very special occasion. On this subject, see the note "L'Eloge Funèbre (1) - ou les compliments" n° 104 , and the end of the note that precedes it ("Le Fossoyeur - ou la Congrégation toute entière" n° 97), situating this "particular occasion".

<sup>48</sup>(\*) As I write these lines, I am reminded of a revealing incident involving "weights" two years earlier, mentioned at the start of the note "Canned weights and twelve years of secrecy" (n° 49), and in more detail at the start of the note "The eviction" (n° 63). For the "pouce! style" in general, see the reflection in the note "Pouce!" (n° 76). It's a style with which I'm becoming quite familiar!

<sup>49</sup>(\*\*) "Weights in the Cohomology of Algebraic Varieties", by P. Deligne, Vancouver Congress 1974, Proceedings, pp. 78-85.

### 15.1.9. The Boss

**Note!** 78" (June 3) Zoghman explained to me that he only gradually became aware, and confused at first, of the "swindle" that was going on around my work. The manuscript Verdier had given him in 1975 (see "Les bonnes références" note n° 82) had been providential for him, notably in introducing him & to the notion of constructibility and its essential properties, as well as to the biduality theorem, from which he had drawn inspiration for the biduality theorem (or "local duality") in the context of D-Modules. It was only years later, while reading SGA 5 (a massacre edition, admittedly, but not so massacred as to give an attentive reader like him the slip) that he began to realize something. For a long time, he had been filled with admiration and gratitude for his distant elder, convinced that the ideas he drew on were his own. In fact, it would seem that for years he was convinced that the theory of duality known as "de Verdier" was indeed due to Verdier, or at least to "Serre-Verdier", and that the idea of duality he calls "de Poincaré-Verdier" was also due to Verdier. It was only around 1979 (the year he defended his thesis) that he began to realize that there was something wrong - but I presume he had to be careful not to let anything show about it to his prestigious "boss", nor to me, when we met in February 1980 and June 1983.

It was only with the Colloque Pervers, in June 1981'□then that he began to sense the escamotage that was p . 314 that he also began to realize more clearly the world he had strayed into<sup>50</sup> (\*)! Surely, for him, I had to be part of that world, where my former students (or at least some of them) had the upper hand and plundered the posthumous pupil with the same casualness as the departed master. The only difference, as it turned out, was that I was dead and they were alive and kicking. ...

I can imagine that even after the Colloque Pervers, Zoghman still found it hard to believe the testimony of his healthy faculties, which told him quite clearly what had happened. He only received the famous Introduction to the Colloquium Proceedings, signed by B. Teissier and his "patron-sic" Verdier, in January 1984. Having denied the evidence for nearly three years, the shock was all the greater, I understand. It was two months later that I contacted him again, sending him the notes "Mes orphelins" and "Refus d'un héritage - ou le prix d'une contradiction" at the end of March, and it was another month later that he finally decided to "let me in on the joke" and tell me about the "Mystification du Colloque Pervers".

### 15.1.10. My friends

**Note** 79 And here I am about to finish and make public this reflection which will put an end to the secrecy that Zoghman himself has maintained around the spoliation of which he is the victim, and from which he also reaps the obscure benefits<sup>51</sup> (\*\*). Perhaps it will be unwelcome to him, just as it may be unwelcome to my friend...

Pierre, to whom I'll hand-deliver it as soon as it's finished and the text cleaned up and printed<sup>52</sup> (\*\*\*).

The □best thing I have to offer my friend Zoghman as well as my friend Pierre, perhaps both the p . 315

---

<sup>50</sup>(\*) Zoghman ended up having such a low opinion of his ex-boss, that he was convinced that everything Verdier had done in the sixties (which I review in a b. de p. note to note no.° 81 "Thesis on credit and comprehensive insurance") had been more or less dictated or at least blown by me.

<sup>51</sup>(\*\*) (May 30) I would remind you that this reflection was inspired by a disposition in my friend that now seems outdated. (Compare two b. de p. notes of May 30 with note n° 78'.)

<sup>52</sup>(\*\*\*) I didn't think I'd ever have the opportunity, in my remaining years, to return to the capital for a few days. But my friend Pierre has travelled often enough, over more than ten years, to meet me deep in the remote countryside, for me to travel on this exceptional occasion, following up on an often-repeated invitation that has never yet been put to good use.

Will they receive it as the worst: as a calamity, or as an outrage. All the worse, since my testimony is public - just as the silences of both have been rites of public acts, and which commit one as they commit the other.

Whether they reject or accept my testimony is their choice, and the same goes for Jean-Louis, whom I counted among my friends, just as Zoghman and Pierre do today. These choices affect me closely, and they are not mine. I have no temptation to predict what they will be. It won't be long before I know, and I await what the weeks and months ahead will bring with intense interest, suspense - and without a shadow of anxiety. My only concern and responsibility is that what I offer is the best I have to offer - that is, to be true.

Some may be surprised that I speak so bluntly of people I call "friends", and see in this name a stylistic clause, or even an intonation of irony that is absent. When I refer to Zoghman Mebkhout or Pierre Deligne as "friends", it's a reminder of the feelings of sympathy, affection and respect that are within me as I write. Respect tells me that I don't have to "spare" a friend, any more than I have to "spare" myself - like me, he is worthy of encountering the humble truth, and no more than me, he needs sparing.

If I don't refer to Jean-Louis Verdier as a "friend", it's in no way because I consider him less "good", or less "deserving", than my friends Zoghman and Pierre, or myself, but because life has distanced us from each other. The feelings of sympathy and affection that bound me to him fifteen or more years ago have more or less faded with time, and have not had the opportunity to be revived by any kind of personal contact. The few attempts I have made to re-establish such contact have met with no response, and I don't know whether reading these reflections will revive a relationship that had frozen. But even though he's no longer a "friend" to me, I don't think I'm showing him any disrespect by not treating him any more kindly than I treat myself or my friends, and I'm well aware that to do otherwise would be to do him or anyone else a disservice. Not to mention that both he and my friend Pierre, if any

that they insist on "defending" themselves (or attacking) rather than taking the risk of looking at themselves, are not lacking in means or support. And not to mention that where they have had the opportunity to □discourage

or to crush, more than once both have done so, ruthlessly and mercilessly.

p. 316

### **15.1.11. The pavement and the beautiful world (or: bladders and lanterns. . . )**

**Note 80** (May 9) It's about time I finally gave a reference for this famous Riemann-Hilbert-(Deligne qui ne dit pas son nom) theorem - Adam and Eve - bon Dieu - (and especially not Mebkhout), which everyone quotes at length (including myself), and for which apparently nobody has yet thought to ask where it is demonstrated. Having been led to believe by my friend Zoghman that the "me- morable theorem" was to be found in his thesis, I did indeed find it in the table of contents, under the name (admittedly down-to-earth and worthy of a cad) "Une équivalence de catégories", Chap. III, par. 3, p..

75. To make matters worse, it's not even entitled to the name "theorem" but is called "Proposition 3.3" (and what's worse, my name appears, underlined again, on the same page). I'll even admit that, having failed to read the previous 75 pages to recognize myself, I wasn't entirely sure whether this was it - Zoghman confirmed that it was, and I trust him<sup>53</sup>. The demonstration (it would seem) is the subject of Chap V of the same thesis - which was passed at the University of Paris VII on February 15, 1979, before a Jury comprising D. Bertrand,

---

<sup>53</sup>(\*) (April 17, 1985) It would appear that the generally used form of the "God's theorem" is not that of the theorem quoted here, but a related form demonstrable by the same methods. See the note "Ecllosion d'une vision - ou l'intrus" (n° 171<sub>1</sub> , and in particular today's b. de p. note therein.

R. Godement, G. Houzel, Le Dung Trang, J.L. Verdier. Interested parties who have not yet received a copy from the author (who sent his thesis to all those he could suspect, rightly or wrongly, might be interested) need only ask him, and he will be pleased to do so... ... Of course, he sent a copy to each of my former cohomology students, none of whom has been heard from since. They must have changed subject in the meantime, unluckily. ...

It has to be said that Zoghman definitely doesn't have the knack of selling his merchandise, of presenting it in a clear and appealing way - these are things that have to be learned, and he wasn't as lucky as my former students to learn the ropes from a virtuoso of the trade who didn't skimp on his time. But he can't complain, he's had his "three interviews", and perhaps one of the "luminaries" will one day have the idea of even acknowledging his indigestible pamphlet. He must have realized himself that the paving stone was not easy to read (even if it wasn't lost on Riemann or Hilbert. . . ): he wrote a note to the CRAS, which is still shorter, to draw attention to his famous theorem, the title of which I'll give you in a thousand:

"On the Hilbert-Riemann problem"! I knew my friend Pierre Deligne wasn't any better at history than I was, so all he had to do was restore the chronological order, <sup>□</sup>and contribute the pretty folklop designation "correspondence" and that was it, Zoghman had it coming. ... This note is dated 3.3.1980, Series A, p. 415-417. . 317

Verdier must have learned of the theorem in one of the "three interviews" he gave to his pupil - sic (or at the time of the defense), but he must not have realized it. As for Deligne, he finally realized something, I can't say when, but what's certain is that he knew about it in October 1980, and so did Bernstein and Beilinson, according to what he himself says. Mebkhout himself went to Moscow to explain his results (at length) to Beilinson and Bernstein (in case they had trouble reading him). I don't know if they or Deligne ever read the thesis or the subsequent note to the CRAS, but they must have figured out what was in it, since next year's "memorable Colloque" at Luminy was, coincidentally, all about it.

To sum up, and according to the latest information from my intelligence service, there were at least five people perfectly aware of the situation, who took part in the mystification known as the "Colloque Pervers", namely (in alphabetical order of the actors) A.A. Beilinson, J.Bernstein, p. Deligne, J.L. Verdier and Z. Mebkhout - plus a whole Colloque acultees, surely brilliant mathematicians to boot, who apparently wanted nothing better than to be mystified and take bladders. Mebkhout - plus a whole Colloquium of aculturous people, surely brilliant mathematicians to boot, who apparently wanted nothing better than to be mystified and to take bladders for lanterns<sup>54</sup> (\*). Which proves once again that we mathematicians, from the illustrious Medalist to the obscure unknown student, are not a hair smarter or wiser than the average person.

## 15.2. VIII L' Elève - alias le Patron

### 15.2.1. Credit thesis and comprehensive insurance

**Note 81** <sup>□</sup>(May 8) It seems time to express myself more circumstantially on the "thesis-" affair. phantom", which I had only mentioned "in the aftermath" in two previous notes (notes (48) and (63<sup>'''</sup>)). An inattentive or ill-disposed reader might say that I'm simultaneously reproaching my ex-student J.L. Verdier for two contradictory things - for having "buried" the derived categories, and for having "published" them

<sup>54</sup>(\*) (June 3) In fact, it appears that all Colloquium participants, without exception, had been made aware of the situation on the spot. On this subject, see the note "Le Colloque", n° 75', written today.

(in SGA 4<sup>1</sup>) and claim authorship; just as the same reader would say that I reproached P. Deligne for both "burying" the motifs, and exhuming them (in LN 900). So it may not be superfluous to give a retrospective of the situation, from 1960 to the present day.

Around 1960 or 1961, I proposed to Verdier, as a possible thesis project, the development of new foundations for homological algebra, based on the formalism of derived categories that I had developed and used in previous years for the purposes of a coherent duality formalism in the context of schemes. It was understood that in the program I was proposing to him, there were no serious technical difficulties in prospect, but above all a conceptual work whose starting point was acquired, and which would probably require considerable developments, of dimensions comparable to those of the Cartan-Eilenberg book of foundations. Verdier accepted the proposed subject. His foundations work continued satisfactorily, materializing in 1963 in a "Etat 0" on derived and triangulated categories, multigraphied by the IHES. This 50-page text is reproduced as an Appendix to SGA 4<sup>1</sup> in 1977.

2

(as stated in note (63' "))\*<sup>55</sup> (\*).

p. 320

□ If the defense didn't take place in 1963, but in 1967, it's because it was unthinkable that this 50-page text, the embryo of a foundational work yet to come, could constitute a state doctorate thesis - and the question of course didn't even arise. For the same reason, when he defended his thesis on June 14, 1967 (before a Jury including C. Chevalley, R. Godement and myself, who presided), there was no question of presenting this work as a thesis. The text submitted to the jury, 17 pages long (+ bibliography), is presented as an **introduction** to a major work in progress. It outlines the main ideas behind this work, placing them in the context of their many uses. Pages 10, 11 give a detailed description of the chapters and paragraphs planned for this seminal work.

If the title of Doctor of Science was awarded to J.L. Verdier on the strength of this 17-page text, outlining ideas which he himself says are not his own<sup>56</sup> (\*), it was clearly a contract of good faith.

p. 321

□ between the jury and himself: that he was committed to completing and making available to the public this work of which he

<sup>55</sup>(\*) This text alone may seem a meagre result for two or three years' work by a gifted young researcher. But most of Verdier's energy was then devoted to acquiring the indispensable basics of homological algebra and algebraic geometry, by attending my seminars in particular, and by working one-on-one. His contributions to the duality formalism (see below) came later, once Artin and I had developed the stale duality formalism in detail in SGA (1963/64), when I suggested (in parallel with his work on the foundations of derived categories) that he develop the same formalism in the context of "ordinary" topological spaces and smooth morphisms of such spaces.

It was around the time I began my "Séminaires de Géométrie Algébrique" series with SGA 1 (in 1960) that I was contacted by Verdier, along with Jean Giraud and Michel Demazure, asking if I had any work for them - and they were knocking at the right door! Coincidentally, from the moment I wrote the note "Mes Orphelins" (n° 46) when the three of them contacted me, they had just formed a small seminar called "Séminaire des orphelins" (on the theme of automorphic functions, approaching calculations with a zinc strand), as their boss (or sponsor at the CNRS?) had just left for a year without warning, leaving them hungry and a little empty. That emptiness was soon filled... .

<sup>56</sup>(\*) The beginning of the thesis reads:

"This thesis was written under the supervision of A. Grothendieck. The essential ideas it contains are due to him. Without his initial inspiration, his constant help, his fruitful criticism, I could not have completed it. I would like to express my deep gratitude to him.

I would like to thank Claude Chevalley for chairing my thesis jury and for his patience in reading this text. My thanks to R. Godement and N. Bourbaki for introducing me to mathematics.

"The term "this thesis" can hardly refer to anything other than the body of foundational work undertaken, of which the text submitted constitutes the introduction - work which was therefore not, strictly speaking, "completed" at the time of the defense.

(May 30) This inconsistency reflects the ambiguity of a situation for which I was primarily responsible, as thesis director and (if the cover of the copy of the thesis in my possession is to be believed) as president of the Jury. There was a lack of "rigor" on my part towards a brilliant student, a complacency that goes in the same direction as that which I had shown towards Deligne (see the note "L'être à part", n° 67'), and which contributed its share to make bear the same fruits.

presented a brilliant introduction. This contract was not kept by the candidate<sup>57</sup> (\*): the text he announced, a text on the foundations of homological algebra from a new, proven point of view, was never published.

Clearly, if Verdier's work between 1961 and 1967 had been limited to writing the skeletal "Etat 0" of 1963, the jury would not have considered accepting this "thesis on credit". The writing of his work had to be sufficiently advanced to allow completion within a year or two, and for practical reasons it seemed appropriate that Verdier should have the title without waiting for the work on which it was based to be completed.

It should be added that between 1964 and 1967, Verdier had made some interesting contributions to duality formalism (81<sub>1</sub>), which, together with the foundational work he was supposed to be pursuing, could justify the credit given to him. His contributions to duality as a whole could, in a pinch, have constituted a reasonable doctoral thesis. Such a thesis, however, would by no means have been in the style of the work I am accustomed to proposing, all of which consists in the systematic development to completion of a theory whose need and urgency I sense (82<sub>2</sub>). I don't recall Verdier ever raising the question of presenting such a "thesis on titles", and I doubt I would have accepted, since such a thesis would have in no way corresponded to the "contract" that was signed between him and me, when I entrusted him with the beautiful subject of derived categories, with the task of developing foundations on a vast scale.

As J.L. Verdier's thesis supervisor and president of the jury, I accept full responsibility for my carelessness in awarding him (jointly with C. Chevalley and R. Godement, trusting the title of doctor on work that had not yet been done<sup>58</sup> (\*\*)).

□ I am not justified in complaining if I now see some of the fruits of my levity. But this p. 322 does not prevent me from stating this publicly, and that the actions of my ex-student J.L. Verdier are his responsibility alone, and that of no one else.

Not to keep the contract he had made with me and with the Jury who had placed their trust in him, was a way of burying the point of view of derived categories that I had introduced and that he had taken on the task of founding through a major work. This work may have been done, but it was never made available to the user. It was a way of "writing off" a set of ideas that he himself had helped to develop.

The revival of the notion of derived category in Mebkhout's work met with no encouragement from Verdier (nor, for that matter, from any of my other cohomological "luminaries"). The de facto boycott of derived categories seems to me to have been total until about 1981<sup>59</sup> (\*), when they made their comeback in force at the "memorable Colloque" at Luminy (see note (75)), under a sudden surge of demand.

However, State 0 of Verdier's "thesis" had already appeared four years earlier, in 1977, as an appendix to the

<sup>57</sup>(\*) It is all the more remarkable that J.L. Verdier refused my proposal to sit on Contou-Carrère's thesis jury in December 1983, with J. Giraud, and myself acting as research director, believing that the thesis (though entirely written and carefully read by J. Giraud) and the jury would not offer sufficient guarantees of seriousness, without referring to the control of a Commission des Thèses des Universités **Parisiennes** (Sic).

<sup>58</sup>(\*\*) To this responsibility I should add that of not having ensured, during the two years that followed (before my departure from the mathematical scene), that Verdier actually kept to the contract he had signed. It has to be said that my energies were so focused on pursuing the foundational work I had taken on myself, not to mention motivational reflections and the like, that I didn't have to think too much about the unpleasant task of reminding others of their obligations. I had to learn of Verdier's decision to abandon the publication of the planned work in the early '70s, at a time when I was absolutely no longer into maths, and when the idea would not have occurred to me to "react".

<sup>59</sup>(\*) (May 30) These somewhat dubious forms of style are in fact out of place. As Zoghman Mebkhout confirmed me (who paid to find out), what I dubiously put forward about the status that was given to homological algebra "Grothendieck style" corresponds well to reality.

volume SGA 4<sup>1</sup> (see note n° 63<sup>1</sup>) - so ten years after the defense of his thesis, and at a time when (to my knowledge(\*))  $\frac{1}{2}$  Mebkhout was the only one to make use of derived categories in his work, against the fashion of the seven years that had preceded. Unless I'm mistaken(\*) , he remained the only one to do so, right up to the time of the great "rush" around the famous "Riemann-Hilbert correspondence" at the Colloquium already mentioned, where Deligne alias Riemann-Hilbert appeared as the father of this "correspondence" - sic, and Verdier (with his providential Etat 0 abundantly quoted by his generous friend) appeared as the father of derived categories and algebra.

p. 323 homological style 2000, with no mention of my humble self and even less of Mebkhout<sup>60</sup> (\*\*).

□ In the light of these events, I believe I understand the reason for the unexpected publication of this State 0 which (as it says in the introduction to SGA<sub>2</sub> 4<sup>1</sup> by the same friend) "had become unobtainable" and that nobody cared about "finding", except (perhaps) Zoghman Mebkhout<sup>61</sup> (\*). So there was just this one unfortunate fellow who, in his own corner and against all odds, persisted in using these notions of a bygone age, without anyone really knowing what he was getting at - so stubborn, in fact, that we began to doubt whether he wouldn't one day come up with something that would do the trick, you never knew... . After all, the man to whom he sometimes imprudently referred as one of his sources of inspiration (alongside the Master's works) had, in the past, proved or found things with all that, things that couldn't be ignored even if the author - and the Master himself - were forgotten, Jean-Louis Verdier himself, had he not made his start to stardom with this "Lefschetz-Verdier" formula, which he would have been hard-pressed even to write down, let alone prove, without all these notions fit for the dustbin. . .

While my influential ex-student of almost ten years (since he had rid himself of a certain annoying formality. . . ) **was betting against** derived categories and would continue to bet against them until time X (of the famous Colloquium), he must have thought it prudent (you never knew. . . ) to pre-empt events that might occur. . . ) to anticipate events that might occur, in short, to take out "all-risk insurance", by publishing (not the large-scale work that was one day supposed to constitute a thesis, but) a "text-witness", a sort of exhibit "just in case. . . ."; a text that would "attest to his claim to paternity over an **orphan** whom he] had taken a liking to, and whom he continued, pending events, to disown<sup>62</sup> (\*\*).

p. 324 **Note 81<sub>1</sub>** □ The contributions in question are: 1) Foundations of a duality formalism in the context of locally compact spaces and 2) that of Galoisian modules (in collaboration with J. Tate); 3) the Leschetz-Verdier **fixed-point** formula; 4) duality in locally compact spaces.

Contributions 2) and 3) are "unforeseen" compared with what was known. The most important contribution seems to me to be 3). Its demonstration follows easily from the duality formalism (both for "discrete" and "continuous" coefficients), which does not prevent it from being an important ingredient in the arsenal of "all-purpose" formulas available to us in cohomology. The existence of this formula was discovered by Verdier, and came as a (pleasant!) surprise to me<sup>63</sup> .

<sup>60</sup>(\*\*) Compare with the comments in the notes "Le compère" and "L'Iniquité - ou le sens d'un retour" (n° s 63<sup>1</sup> and 75).

<sup>61</sup>(\*) In any case, it was while perusing the bibliography of a work by Z. Mebkhout that I had just received, towards the end of April, that I learned of the publication of this "Etat 0", when I had even forgotten the existence of this text from another age. ...

<sup>62</sup>(\*\*) If J.L. Verdier had really wanted to make known the yoga of derived categories, which has been buried for seven years, he would have chosen to publish the introductory text which constitutes his thesis, rather than a technical text which nobody cared about and which only acquires interest in the background of yoga and its many uses. But it's understandable that he had no desire to append to the 50-page text the 17 pages of his thesis, containing now embarrassing statements about the role of the one who must not be named. ...

<sup>63</sup>(\*) (April 19, 1985) I return to this beautiful formula, its role and its strange vicissitudes during the Burial, in the three notes "Les vraies maths. . . .", "... and "nonsense", "Tricks and creation" (n° 169, 169, 169), in the fourth part of Récoltes et Semailles.

The formalism of duality in the context of locally compact spaces is essentially the "necessary" adaptation of what I had done in the context of scalar cohomology of schemes (and without the difficulties inherent in this situation where everything was still to be done). He did, however, contribute an interesting new idea, that of the direct construction of the functor  $f^!$  (without prior lissification of  $f$ ) as a right-hand adjoint of  $Rf_!$ , with an existence theorem to boot. This procedure was taken up by Deligne in étale cohomology, enabling him to define  $f^!$  in this framework, without any lissification hypothesis.

These comments make it clear, I think, that by 1967 Verdier had demonstrated his capacity for original mathematical work, which of course; was the determining factor in the credit he received.

**Note 81<sub>2</sub>** As another example, I would point to the detailed development of the duality formalism in the context of locally compact spaces, in the spirit of the "all-purpose" formalism of the six operations and derived categories, of which Verdier's presentation at the Bourbaki Seminar would constitute an embryo. Even in the context of topological **varieties** alone, there is still, to my knowledge, no satisfactory reference text for Poincaré's duality formalism.

□(June 5) There are two other directions in which I note with regret that Verdier did not see fit to go all the way.

p. 325

the end of work that he had started off strongly enough to **take credit for** (I mean, by starting up a duality formalism in the context of discrete coefficients and locally compact topological spaces), whereas the essential ideas are not due to him and he doesn't care (any more than for the derived categories) to make himself the **servant of a task** and put at the user's disposal a complete formalism (as I tried to do in the three seminars SGA 4, SGA 5, SGA 7).

The duality program I was planning and suggested he develop was set in the framework of general topological spaces (not necessarily locally compact) and applications between such that are "separated" and locally "lissifiable" (i.e. locally the source is immersed in a  $Y \times \mathbb{R}^n$ , where  $Y$  is the goal space). This was clearly suggested by the analogy with the framework of the stale cohomology of **arbitrary** schemes. Verdier was able to see, in the context of locally compact spaces, that the assumption of local smoothness of applications was unnecessary (which came as a surprise). Nevertheless, the context of locally compact spaces (which excludes "parameter spaces" that are not locally compact) is visibly short-sighted. A more satisfactory context would be the one that would cover both the one chosen by Verdier, and the one I was planning, i.e. the one where topological (or even topos?) spaces are (more or less?) arbitrary, and where applications  $f: X \rightarrow Y$  are subject to the restriction of being 1) separate and 2) "locally compactifiable", i.e.  $X$  plunges locally into a compact  $Y \times K$ ,  $K$ .

In this context, the fibers of an "admitted" application would be locally compact quel- conical spaces. Another step would be to admit that  $X$  and  $Y$ , instead of being topological spaces, are "topological multiplicities" (i.e. topos that are "locally like a topological space"), or even topos of any kind, by restricting the applications in a suitable way (to be made explicit), so as to find fibers that are **locally compact multiplicities**, subject if need be to additional conditions (close perhaps to the point of view of Satake's  $G$ -varieties), for example (and lastly, to the point of view of Satake's  $G$ -varieties). rigorously!) to be locally of the form  $(X, G)$ , where  $X$  is a compact space with **finite** operator group  $G$ .

To my knowledge, even the "ordinary" de Poincaré duality has not been developed in the case of multi-smooth compact topological cities (smooth: which are locally like a topological variety). The case of a classifying space of a finite group seems to show that we can hardly hope to have a duality theorem (absolute global) other than module torsion, more precisely, by working with a ring of coefficients that is

p. 326

a Q-algebra. With this restriction, I wouldn't be surprised if Poincaré's duality ("six operations" style) worked as is in this context. No wonder nobody ever looked at it (except unrepentant differential geometers, pretending to look at the cohomology of the "leaf space" of a foliage), given the general boycott on the very notion of multiplicity, instituted by my cohomology students, Deligne and Verdier in the lead.

To put it bluntly, what's missing is a fundamental reflection of the following type: describe (if you can) in the context of any topos and bundles of "discrete" coefficients on them, notions of "cleanliness", "smoothness", "local cleanliness", "separation" for a morphism of topos, enabling us to derive a notion of "admissible morphism" of topos  $f : X \rightarrow Y$ , for which the two operations  $Rf_!$  and  $Lf^!$  make sense (one adjoint of the other) so as to obtain the usual properties of the six-operation formalism. Here, topos are considered as non-ringed, or perhaps as provided with Rings (which are assumed if necessary to be constant or locally constant), assuming (initially at least) which ringed topos morphisms  $f : (X, A) \rightarrow (Y, B)$  are such that  $f^*(B) \rightarrow A$  **is an isomorphism** (81<sub>3</sub>). The foregoing reflections suggest that when we restrict ourselves to Rings of coefficients of zero characteristics (i.e. which are Q-Algebras), we can be considerably broader in the notion of "admissible morphism", so as to encompass "fibers" which are e.g. (topological or schematic) multiplicities, rather than ordinary (topological or schematic) "spaces".

p. 327

A first step in this direction (apart from the cases treated by me, then by Verdier on the same model) is due to Tate and Verdier, in the context of discrete or profinite groups. The memory of this first step encouraged me to pursue a reflection along these lines last year, in the context of small categories (generalizing discrete groups) serving as homotopic models. Without going very far, this reflection was nevertheless enough to convince me that there must be a complete formalism of the six operations in the context (Cat) of the category of small categories. (See on this subject the □ "Pursuit of Fields", Chap.VII, par.136, 137.) The development of such a theory in (Cat), or even in Pro(Cat), just like a theory of this type in the context of topological or schematic spaces and multiplicities, would for me have as its main interest to be a step towards a better understanding of "discrete duality" in the context of general topos.

Illusie told me last year that he had struggled with duality perplexities in the case of semisimplicial spaces (or schemes). It seemed to me to be the same old tobacco - to be able to detect the existence of a six-operation formalism in a particular case, and to understand it. But it would seem that the mere prospect of a fundamental reflection has the gift of freezing each and every one of my former students - at least among my cohomology students. If I went to any trouble with them, it was with the conviction that they would not stop right where they had left off (in terms of conceptual work) with me, and remain wringing their hands every time a new situation showed that the work they and their buddies had done with me was insufficient. The conceptual work we do is **always** insufficient in the long run, and it's by taking it up again and going beyond it, and not otherwise, that mathematics progresses. Between 1955 and 1970, each year again I found that what I had done in previous years was not sufficient to the task, and I went back to the drawing board, at least when someone else (e.g. Mike Artin) with the point of view of "algebraic varieties" in his sense) hadn't already done so. But it would seem that my students have also buried the example I set them, along with myself and my work.

**Note 81<sub>3</sub>** I seem to recall that in the formalism of the six variances in (say) staggered cohomology, the assumption that the ring bundles serving as coefficients are locally constant is unnecessary - the essential assumption is that they are prime torsion bundles with residual characteristics, **and** that  $f^1(B) \rightarrow A$  is an isomorphism. When we abandon this last assumption, we have to enter a theory (never yet made explicit, to my knowledge) that "mixes" the "discrete space" duality, and the "coherent" duality (relative to the rings of coefficients and their homomorphisms). As a result, we envisage replace, on the diagrams (or more general topos)  $X, Y$ , the Rings with coefficients  $A, B$  by relative (not necessarily affine) schemes  $X', Y'$  on  $X, Y$ , and ringed topos morphisms  $\square$  p. 328  $(X, A) \rightarrow (Y, B)$  by commutative diagrams of the type

$$\begin{array}{ccc} X' & \xrightarrow{\quad} & X \\ \downarrow & & \downarrow \\ Y' & \xrightarrow{\quad} & Y \end{array}$$

with a "six operations" formalism in such a context. When  $X, Y$ , etc. . . are the ponc- tual topos, we should find the usual coherent duality.

## 15.2.2. The right references

**Note 82** (May 8) This is J.L. Verdier's article "Classe d'homologie associée à un cycle", published in Astérisque n° 36 (SMF), p.101-151 in 1976. In a way, this rather unbelievable article (although nothing should surprise me any more. . . ) is a counterpart to the "perverse article" by Deligne et al. With one reservation: it practically consists in **copying** over fifty pages, in a slightly different context, notions, constructions and reasoning that I had developed at length ten or fifteen years earlier - terminology, notations, everything is there verbatim! I'd have thought I'd returned to a session of the APG 5 seminar held in 1965/66, where these things were spelled out (apparently to the satiation of the participants<sup>64</sup> (\*) for an entire year. After this seminar, at least, all these things became part of the "well-known" for people in the know<sup>65</sup> (\*\*). Verdier had attended, of course, as had Deligne (the only one who was never left behind, even though it was the first time he'd set foot' at my  $\square$  séminaire<sup>66</sup> (\*) - it took p. 329 do it... ). It's true, well, well, that in 1976 it had been ten years since the "writing-sic" of this famous seminar by "volunteers-sic" who were fed up with it was dragging on - I see now that one of these "volunteers" took charge of the "writing-sic" in his own way, even before the publication of SGA 5 in

<sup>64</sup>(\*)For comments along these lines, see notes n° s 68, 68' "Le signal" and "Le renversement", in which I examine the strange vicissitudes of the writing of this seminar, and the relationship between these and Deligne's "SGA 4 operation<sup>1</sup>". The following reflection reveals to me another unforeseen aspect of these vicissitudes and of the dismemberment of the mother seminar by the combined care of Verdier and Deligne. Verdier's and Deligne's publications on this dismemberment date from 1976 and 1977 - they constitute the "green light" given to Illusie to prepare (eleven years later. . . ) the publication of  $\square$ SGA 5 (which, as Deligne says in SGA 4<sup>1</sup>, "may be seen as a series of digressions, some of them very interesting").

<sup>65</sup>(\*\*) For a reflection on this "hasty" impression, see the note on "Silence" (n° 84).

<sup>66</sup>(\*) The year of this seminar was (I think) the year I met Deligne, who must have been nineteen at the time. He "got into the swing of things" very quickly, and even took on the task of writing my lectures on étale duality from the previous year (which he must have known from my explanations and notes), and also the lecture on the cohomology class associated with a cycle, which was discussed in the note quoted n° 68' ("Le renversement"), and which will be discussed a little more in this one. The fact that with the means at his disposal, and a complete mastery of the subject, he waited eleven years to write the essay, to then include it in his  $\square$ SGA 4<sup>1</sup> without informing me, now shows me, in retrospect, that as early as 1966 (and not just 1968 as I may have assumed - see note n° 63, "L'éviction") - i.e. from the very first year of our meeting, there was a profound ambiguity in my friend's relationship with me, expressed from that moment onwards in a perfectly clear way, which I have refrained from learning about to this day!

1977 ! It would appear that the vicissitudes of this unfortunate seminar were not only to Deligne's advantage, as he took advantage of a situation of debandade in his own way. But at the time, Deligne still took care to mention in his essay (on the cohomology class associated with a cycle) "d'après un exposé de Grothendieck" (after a paper by Grothendieck), while dismantling SGA 5 from one of his key lectures and attaching it to his SGA 4<sup>1</sup> as a matter of course. (It's true that this compensated him for being able to present me as his "collaborator"! - see note "Le renversement", n° 68').

Coming back to the **homology** class (not to be confused!) associated with a cycle (which, according to the title, is the subject of Verdier's article), I had developed this formalism in great detail, over several presentations, during the oral seminar, before an audience that, incidentally, begged for mercy (except always the only Deligne, always dashing and fresh... ). It was one of the innumerable "long exercises" I developed that year on the formalism of duality in the étale frame, feeling the need to arrive at a complete mastery of all the points I felt needed to be thoroughly understood. The interest here was to have a valid formalism on an ambient scheme that is not necessarily regular - the passage to the **cohomology** class in the case of

p. 330

regular, and the link with my old construction using cohomology with supports and immediately giving compatibility with cups-products, being immediate. I also found that □ this part of the seminar does part of the lot that didn't make it into the published version - no doubt Illusie (on whom all the hard work of preparing a releasable (hmm) edition eventually fell) must have been quite happy that Verdier took care of it, mutatis mutandis (i.e. here: without changing a thing!).

As the saying goes, "it hardly needs saying" that my name does not appear in either the text or the bibliography (except implicitly by the ever-present reference SGA 4, which we'd still have to find a replacement for... ). There's no allusion to a "Seminar on Algebraic Geometry" under the acronym SGA 5, which the author might have heard of - although I seem to remember seeing him busy taking notes (like everyone else, except Deligne of course. . . ).

Incidentally, I've exaggerated just a little by saying that my name is absent from the text - it makes a single, mysterious and lapidary appearance on page 38, section 3.5, "Fundamental cohomology class, intersection" (here we come, the crux of the matter!). The reference consists of a cryptic sentence whose meaning escapes me, I confess: "The idea of systematically using weight complexes (??? those damn weights again!) is due to Grothendieck and was put into shape by Deligne" - without any further explanation of these mysterious "weight complexes" whose idea I had and of which I hear mention here for the first time. There will be no further mention of them in the rest of this article (nor was there any mention of them in the 37 pages before). Understand who can! As for the content of the said section, it is copied without further ado from the SGA 5 seminar which had taken place ten years earlier (and by which time this construction was already five or six years old, see note n° 68'), a seminar which he is careful not to quote. The reference to Deligne (who is said to have "perfected" an idea that had already been perfected when my friend was still in high school!) is a "flower", the idea of which no doubt came to the author because the young and newcomer Deligne had indeed taken on the task of writing my paper on this subject (and refrained from doing so for eleven years, for the benefits we know, see note cited). This "flower" is part of the exchange of courtesies between inseparable friends.

p. 331

There is, however, one (undoubtedly) new and very interesting result in the article (th.3.3.1., page 9) on stability of discrete bundles analytically constructible by direct higher images through an analytic and proper morphism. Verdier had learned about all-round constructibility from me one day, fifteen years earlier, as well as □ the stability conjecture, which I had asked myself (and told who would listen) in the late fifties, before I'd had the pleasure of making his acquaintance. Reading the article, the idea wouldn't occur to an uninformed reader (but those are becoming rare. . . ). I

I'm still repeating myself, I'm afraid) that the author isn't serving up hot-off-the-press notions and statements he's only just discovered. He doesn't have to say it's him - because it's self-evident. It's the famous "thumb" style that's so obviously catching on.

Apart from this detail (which, I feel, is in line with the new canons of the trade), there must still be around ten pages (out of fifty), around this interesting result, that present the author's personal work. All things considered, what strikes me most about Verdier, as with Deligne, is that he's perfectly capable of doing beautiful mathematics. Even in this sad article, there's a hint of it in the theorem quoted. But by keeping himself (like his friend) in a gravedigger's mood, he operates, like his prestigious friend, on a paltry fraction of his means. A sign (which astounded me) of apparent mediocrity, in a mathematician who nevertheless gave proof of astute and flair, was the total lack of instinct to feel the scope of the work of his "pupil-sic" Mebkhout, whom he took pleasure in treating from the height of his greatness, without ever having been able to do himself a work of comparable depth and originality<sup>67</sup> (\*). Not that he isn't just as capable as Mebkhout or me. But he has never given himself the chance to do great things, that is, to let go of a passion - rather than **using** mathematics and its gifts **to** dazzle, dominate or crush. Up until now, he's been content to take up as is the fruitful notions and points of view that have already been baked in. Indeed, he seems to have totally lost touch with the meaning of **mathematical creation**.

Yet I seem to remember that when he worked with me, that sense was still there. Nothing external about him prevents that sense from resurfacing. Just as in his friend, in whom I often felt this same eclipse of something delicate and lively, obturated by the same fatuity. .332

This incredible 50-page article, which appeared in a standing magazine, sheds new light on the "The note - or the new ethic" incident (s.33). where a note to the CRAS of **a few pages**, summarizing a solid and **original** work, on an important subject (in my humble opinion), the fruit of **two years' work** by a highly gifted young mathematician, was rejected by two eminences as "devoid of interest"<sup>68</sup> (\*). One of these eminences was none other than Pierre Deligne - the same Deligne who did not disdain to copy in toto and in person the humble doctoral thesis of one of my students (whom he made a point of quoting). (This duplicate, enhanced by a prestigious signature, makes the largest article in the "memorable volume" LN 900 of a no less prestigious collection! See end of notes (52), (67)).

The "tableau de mœurs" is growing by the day, without my having to come out of retirement and hit the streets to mingle with the "big world". A few hours spent here and there leafing through a few well-chosen "great texts" were enough to edify me...

### 15.2.3. The joke or the weight complex

**Note 83** ( May 8-9) I've been thinking about this "weight complex" referred to in the "reference - thumb" in Verdier's memorable article<sup>69</sup> (\*\*) - a reference that's sheer nonsense. As soon as I saw this ludicrous reference, an association came to mind that kept running through my head. This isn't the first time, far from it, that I've found myself faced with something

<sup>67</sup>(\*) The same astonishing lack of flair was evident on this same occasion in Deligne, who didn't "feel the wind" (the importance of Mebkhout's ideas) until 1980, it seems, even though Mebkhout had been working in this direction since 1974. On more than one occasion, I've had occasion to observe my friend's natural flair obturated by sufficiency, especially since 1977 (or 78), which seems to have been a first "turning point" (see notes "Two turning points" and "Les obsèques", n°s 66,70).

<sup>68</sup>(\*) For details, see the note "Casket 4 - or topos without flowers or wreaths", n° 96.

<sup>69</sup>(\*\*) See previous note "Good references".

that seem to defy rational explanation - even though the meaning is clear and unmistakable and clearly perceived, but at a different level from that of conventional logic. This was the only one on which I had functioned at a conscious level for most of my life - with the result that I was constantly overwhelmed by "bizarre", incomprehensible events - distressing in their irreducible saugrenousness! My life changed a lot from the moment (less than ten years ago) when I started

p. 333 to live on a wider register of my faculties. I've come to understand that every absurdity, every so-called "nonsense" has a **meaning** - and the mere fact of <sup>□</sup>knowing this, and from then on being curious about the meaning behind the nonsense, often opens me up to its obvious meaning.

In this nonsense about "weight complexes", I think I sense an act of **bravado** of the same nature as in the appellation "faisceaux pervers"<sup>70</sup> (\*) - the pleasure, in this case, of proving to oneself that one **can afford**, in a journal of standing and in a text that claims to be a standard reference text<sup>71</sup> (\*\*), to say a related nonsense, and that **nobody** will dare to even ask a question! And I'm convinced that the wager contained in this bravado, in the eight years since the article appeared, has **been won to this** very day: that I was the first today to put the naive question to the author.

Of course, the time (or place) at which a saugrenuité appears, in this case at the precise moment of the one and only reference to my person, is by no means coincidental; nor is the form it takes, here by allusion to a type of notion, "weight", entirely foreign to the theme of the entire article, and by the improvisation of a composite notion "weight complex" that never existed! The association that immediately presented itself to me could well provide the key to the more precise meaning of the saugrenuité, beyond the bravado, the demonstration of power. It's the association with an allusion just as sibylline and just as purely formal (but without yet having the added dimension of saugrenuité!) in Deligne's article quoted at the beginning of note (49)<sup>72</sup> (\*\*\*). It was an obscure allusion, in an article where the word "weight" was rigorously absent and where nobody but Serre or I would have been able to see them, to "weight considerations" which had led me to conjecture (in a less general form, it is clearly stated) the main result of the work. As I explain in the more detailed note "The eviction" (n° 63), behind this rhetorical allusion lies the intention to **conceal** both my role, and the ideas (concerning "weights" and "weights") that I'd been working on.

p. 334 their relationship to cohomology in general, and Hodge's in particular) which he intended to reserve for himself alone. This intention must have been all the more clearly perceived by Verdier as he himself <sup>□</sup>me "operates" on the same diapason (in his relationship with me, at least, which seems to me to be the main cement between the two inseparable friends). In either case, an honest presentation would have consisted in starting the article by clearly indicating the source(s) for the main ideas, or for the question(s) that motivated the article.

Having said this, here's the meaning I see behind the symbolic language of apparent nonsense: I can allow myself, without the slightest embarrassment, to display patent **nonsense** in front of everyone, and at the same time express through this nonsense my true intention, with this absurd allusion-reference to the "weight complex": that is, I have no more intention of revealing anything about the role of Gr. in this work, any more than Deligne had such an intention with his empty allusion to "**weight** considerations"-which allusion made no more sense to the reader then than it does now with the imaginary "**weight-complexes**" I've just described.

---

<sup>70</sup>(\*) See "Perversity", n° 76.

<sup>71</sup>(\*\*) And it seems that this text is indeed a standard reference today - at any rate, for years it was one of Zoghman's bedside texts (he recently sent it to me). It was there that he learned about the notion of constructibility (which plays an essential role in his theorem), and for a long time he was convinced that Verdier was the brilliant inventor of this crucial notion for him.

<sup>72</sup>(\*\*\*) This is the note "Poids en conserve - et douze ans de secret". For a more detailed examination of this Deligne article from the point of view that interests us here, see "L'éviction", note no. 63, quoted below.

to invent right now, for the sake of the cause and my own pleasure!

I've just posted this note, written yesterday - I was interrupted earlier by a phone call from Verdier, whom I'd tried to reach during the day, to ask him just that question. I explained that I was trying to learn a bit about cohomology, which he knew I'd never understood, and that Mebkhout had passed on to me for my instruction an old article by him, Verdier, a work that had long served as his bedside text. I was now trying my best to read it, but there was this cryptic reference - it was nice of him to quote me, of course - but I had no idea what he was talking about.

He was quite happy, even a little flattered, but yes, with a broad smile that protruded behind an air of paternal joviality, that I'd end up like this in my old age, learning cohomology on this old paper of his. I didn't expect him to contradict me when I said that he knew I'd never understood anything about cohomology - obviously that had been agreed long ago. ... As for those famous "weight complexes", I could feel his broad smile again at the end of the line (you'll say I'm making it up!), delighted that someone (and the addressee himself, no less) had finally picked up on his point.

something that had gone by the wayside for so long. At the same time, there was also a hint of embarrassment - more the embarrassment (I think) of not having been able to hide from a  $\square$  pleasure (like the pleasure one would take in ap . 335

slightly salacious story... ), than not knowing what to answer. Dumped as I was, he really didn't have to worry about that! Without a moment's hesitation, he turned to Deligne (whose name I hadn't mentioned), who had given a demonstration in one of his articles, in which he also quoted me (he couldn't quite remember where) - in any case, it was a question of weights, but yes, he'd forgotten a little, of course - but not arithmetical weights, because I was quite right, it wasn't the same....

His tone was jovial and unapologetic, and he made it clear that he'd already given me quite a bit of his time - with a slightly hurried air, but without losing his debonair, slightly protective tone. I apologized for bothering him like that, with a rather stupid question, and thanked him for his explanation. My apologies were sincere and so were my thanks - he had indeed taught me everything I wanted to know.

<sup>73</sup>(\*) .

## 15.3. IX My students

### 15.3.1. The silence

**Note** 84  $\square$  (May 9) I was perhaps a little brisk yesterday, writing that in "the correct reference" (see note (82)) p. 337 what the author and ex-student shamelessly recopied as "part of the realm of the 'well known' for those in the know". I tried to explain who these "people in the know" were - with the conclusion that **they were no more, no less, than the dear listeners of this SGA 5 seminar** in 1965/66 - listeners, as I've had occasion to say, and judging by the vicissitudes of the writing of this seminar in the hands of volunteers whose lack of conviction I didn't want to sense, it was often rather "more" than "less" (always with the exception of the same Deligne ; of course). Indeed, there was no risk of other people "getting involved" as long as SGA 5 had not been written and published, precisely to enable people to "get involved" by reading it! This seminar was in fact published (as fate would have it) after the two "memorable

<sup>73</sup>(\*) Even with my droopy airs, I didn't really feel like I was putting on an act (I don't have the gifts for it), it was perfectly natural - in truth, I'm a bit droopy in all this stuff I haven't handled in nearly fifteen years! But I think that even when I'm old and ripe for the hearse, I'll still be able to feel the difference between an empty walnut and a full one. .

publications" by two of my dearest students and comrades-in-arms, namely the article in question by Verdier in 1976 (in which he says nothing about the origin of the ideas he develops, published there under his pen and for the first time), and Deligne with SGA 4<sup>1</sup>, which has already been discussed at length<sup>74</sup> (\*). After that, we cordially invite Illusie to take care of publishing the rest!

I can't remember in detail who took part in this seminar - whether Artin was there or not, for example. I think that more or less all my students from the first period must have been there in any case.

- with the exception of Mrs. Sinh and Saavedra (whom I hadn't met at the time) and perhaps Mrs. Hakim. There was also Bucur (since deceased). Houzel, Ferrand - I'm not counting Serre - who never had a taste for big cohomological fuss, and who came to put his feet up cautiously from time to time. While no one except Deligne perhaps had a good sense of where all this was leading,

it seems to me that there must have been ten or twelve listeners (not very involved) who were at least

p. 338 following enough to be considered "in the loop" ☐ <sup>the</sup> thought that ran through my head since yesterday, it's that among all these people "in the know", thus representing cohomological expertise (if not all "luminaries" like Illusie and Berthelot, with their "cohomological" theses that were decidedly weighty), and even apart from Verdier and Deligne - there must be quite a few who've had Verdier's article in their hands! A certain air in Verdier gives me the conviction that nobody ever suggested to him that something might be wrong. And I also know that nobody ever drew my attention to it - I learned of the existence of this article on May 2. exactly a week ago today, thanks to Mebkhout, who had of course known about the scam for years.

This gives concrete meaning to the euphoric observation of the "Unanimous Agreement" (to bury my modest self) made ten days ago (note (74))! This agreement encompasses many (if not all) of my "pre-1970" students, i.e. many of those who today set the tone in the mathematical world; and it includes (or has included) my friend Zoghman himself, treated as a Cinderella by the beau monde and clinging against all odds to a kind of "fidelity to my work" (to use his own expression<sup>75</sup> (\*)), which he has had the temerity and obstinacy to claim for himself at times, with the consequences that we know. Go figure!

In short, I was wrong to suggest that such and such a standing journal published a sort of "boilerplate" article that merely copied what was "well known". What the author was copying in full view (if not of everyone, but) of many witnesses was neither published nor "well known" (except for the cohomology class of a cycle in the coherent framework, where I had published it ages ago); and these were additional ideas that I would be remiss to play down, given that I didn't consider it a waste of my time to spend a year developing these and other ideas in a seminar, in front of a large audience. Verdier's article is probably a useful and well-done "digest" of a small part of the ideas and techniques I had developed: precisely so that they can be passed on to a wider audience.

the realm of the "well-known", the daily bread of those who use cohomology (or homology) for objects that

p. 339 more or less deserve the name "varieties" ☐ From this point of view, then, Verdier has done what was useful to do<sup>76</sup> (\*), and in the end I have no reason to be unhappy. However, from what I sensed from my ex-student

<sup>74</sup>(\*) See notes n° s 67, 67', 58, 68'.

<sup>75</sup>(\*) (June 7) Reading all the notes on L'Enterrement during a recent visit. Zoghman pointed out to me that the expression he had used of "reliability in my work" did not really capture his thoughts. Rather, he had in mind a ~~confidence~~ <sup>confidence</sup> in his own powers of judgment and mathematical instinct, which told him that my work provided him with some of the ideas he needed. It's all about **self-confidence, which is** essential if you want to do something truly innovative.

<sup>76</sup>(\*) He did so, it's true, at the expense of the "dismantling" of the original SGA 5 seminar, of which he and Deligne were the main players and "beneficiaries".

(June 7) The reflection of May 12, three days later (see note "The massacre" n° 87) made it clear that Illusie was even more directly associated than Verdier with what appears to be more a "massacre" indeed than a dismantling - even if he

and friend even today, on the phone, and through many other things I've sensed from him (the "biggest" of which, or at least the most "spectacular", is the mystification of the Pervers Colloquium) - I can feel that **something is amiss**. That memorable Colloquium was certainly brilliant, mathematically speaking, in many respects. What's "wrong" is at a completely different level. I could try to define it in words, but I'm afraid that wouldn't make much sense. Anyone who doesn't feel what's wrong with this Colloquium - and I'm sure with many other Colloquia too, without mystification or anything - won't feel it a hair more, once I've made this attempt to "pin it down" and even succeeded in doing so to my complete satisfaction... ..

The question that remains open for me is whether this "sign" represented by what is undoubtedly a relatively common occurrence today (of an author presenting as his own the unpublished ideas of others) - whether this sign is that of a general degradation of morals, So, is it just a typical sign of a "spirit of the times" in today's mathematical world, or does it have more to teach me about myself - about the person I once was, and who is now coming back to me, through the attitudes towards me of those who were my students?

The two possible meanings are by no means mutually exclusive. My ex-students' relationship with me could not have found this way of expressing itself, if a certain state of morality didn't encourage them to do so. In fact, even before this "sign", I saw many others that seem to me to be even more eloquent in terms of a "picture of morals". What struck me about this sign is the particularity that sets it apart from all the others: it seems to **involve most of my former pupils at the same time**.

Such a circumstance cannot be fortuitous. To simply put it down to a "deterioration of the mores" (all that's real) would be a way of evading its more personal meaning, which implies me as a it involves each and every one of my ex-students. If I say "each", which seems to go beyond the actual amplitude of this

p. 340

sign, I'm weighing my words carefully. For this sign is a timely reminder that it is scarcely conceivable that one of my former students has not at least been confronted with situations of this kind. For years now, I've felt a certain "wind" about me, blowing through the world of mathematicians I've left behind (a wind whose origin and reasons I can now clearly see, it seems). There is no way that any of them could have failed to feel the breath of this wind, whether on the occasion of an "incident" such as the publication of this gravedigger-article, or on any other occasion. Whether he wanted to or not, such an encounter inevitably raised (or raised again) the question of his relationship with me, who had taught him his trade. And the sign I've noticed, beyond the one that just brought me to this point, is that **I haven't heard a word on the subject from any of my students**<sup>77</sup> (\*). This is a "coincidence" the meaning of which still escapes me - but which cannot fail to make sense (84 ).<sub>1</sub>

p. 340

The day is dawning - I feel it's time to stop. I'm not sure that this is the time and place, in Harvest and Sowing, to pursue the meaning of this striking coincidence. It's a harvest perhaps reserved for other tomorrows, if my reflections of this night meet with an echo in one or other of those who were my students.  
⇒ 85

**Note 84<sub>1</sub>** (May 16) This perfect agreement between my former students, in this complete silence towards me, goes in the same direction as other signs. One is the complete silence that also greeted the episode "Les étrangers" (see section 24) - a silence I have already pondered somewhat in note n° 23v.

---

was not the "beneficiary" and that he acted on behalf of others.

<sup>77</sup>(\*) (May 31) Interestingly, the one and only person who ever hinted at the existence of a funeral was an African friend of mine who had passed a 3° cycle thesis with me some ten years ago (so "post-1970 student", and of modest status), with whom I have remained on friendly terms. The letter in which he implied this must have been written two or three years ago, at a time when I was not at all surprised. I did not then ask for details of his impressions, which he has only recently returned to.

On the other hand, with the exception of Berthelot, who sent me numerous separate prints, and Deligne, who sent me four (out of some fifty publications) and one from Illusie, I haven't received separate prints from any of my former students. That says a lot about the ambivalence in their relationship with me. Send prints to

p. 341 part, even though it was doubtful whether I would ever make use of it in my work<sup>78</sup> (\*), would have been the way to

p. 341 to let the person who had taught them their trade know that this trade in their hands did not remain inert, that it was alive and active. But it is also true that for at least some of them, their publications also testify to their participation in a tacit burial of which it was better not to inform the anticipated deceased, trade or no trade... . On the other hand, I have received numerous offprints from several authors working in crystalline cohomology<sup>79</sup> (\*\*), and even a good number of offprints from fellow analysts whom I hardly know by name, when their work takes up (and sometimes solves) questions I asked thirty or more years ago, when it was obvious that I would not return to the subject I had left, and that from a "utilitarian" point of view, they were wasted offprints. But these colleagues must have sensed something that my students didn't want to sense. - Of course, in the sixties, my students were the first to be served for all my publications, both my articles and the great EGA and SGA series, and every one of them (except Mrs. Sinh and maybe Saavedra) must be in possession of my complete work published between 1955 and 1970 (in the ten thousand pages I presume).

It's true that my ex-students are in good company: none of my former close friends in the mathematical "big world", including those whose work is closely related to mine or who played a role in the development of my work program in the sixties, have seen fit to conti-

continue to send me separate prints after my departure from<sup>80</sup> (\*\*\*). Only recently, among

p. 342 the fifteen or twenty friends of yesteryear (including a few students) to whom I sent the Esquisse d'un Programme

p. 342 (which, among other things, announced the resumption of intense research activity, after a hiatus of fourteen years and on research themes closely related to those we used to pursue together), only two (Malgrange and Demazure) took the trouble to send me a few lines of thanks. The few more detailed (and, what's more, warm) echoes I've received have come from young mathematicians I've only recently met, and from my old friend Nico Kuiper, who is in no way connected to the kind of things I do. He found out about the text via intermediaries, and was delighted with my unexpected "homecoming"<sup>81</sup> (\*).

<sup>78</sup>(\*) (May 31) This may even have seemed out of the question until 1976, when I made it quite clear in the early '70s that I had no intention of ever returning to mathematics. The lecture I gave at the IHES in 1976, on De Rham complexes with divided powers, showed quite clearly that I was still interested in mathematics.

<sup>79</sup>(\*\*) (May 31) These are young authors whom I don't know personally, and I presume they've followed Berthelot's example, who for them must be a figurehead. The strange thing here is that, for at least the last two years (since the Colloque de Luminy, September 6-10, 1982), Berthelot has been actively trying to bury me (see the b. de p. note of May 22 to the note "les cohéritiers. . .", n° 91) - could this be a recent turning point in his relationship with me? I don't remember receiving the reprint of the Survey article on crystalline cohomology and consorts, in which he passes my name over in silence - he must have been careful not to send it to me!

<sup>80</sup>(\*\*\*) (May 31) Of course, the psychological reasons that might have prompted them to send me some were far less strong than in the case of my students - but, one might naively think, far stronger than among my fellow analysts, or even among the many algebraic geometers whose prints I received separately, and whom I know little or nothing about personally. Clearly, after my departure from the common milieu, the fact of having been friends created or reinforced, among my former friends in the mathematical world, the automatisms of rejection that I have had occasion to observe. (On the subject of these attitudes, alluded to in passing here and there in Récoltes et Semailles, see the note "Le Fossoyeur ou la Congrégation toute entière" of May 24, n° 97.)

<sup>81</sup>(\*) (May 31) This is almost the only echo from one of my old friends (or one of my former students) in the sense of an acquiescence to my "re-entry". This is hardly surprising, given that the appearance of the deceased unseemly interrupts the normal course of a funeral ceremony... ..

(June 17) However, I recently had the pleasure of receiving a warm letter from Mumford, who says he is "thrilled" and "very excited" by the ideas sketched in the Esquisse, and who confirms that the key technical result I needed was

## 15.3.2. solidarity

**Note 85** (May 11) This story of the ill-fated SGA 5 seminar keeps running through my head. The "good reference"<sup>82</sup> (\*\*) definitely sheds new light on this story, and at the same time gives new meaning to the brilliant "SGA 4 operation".<sup>1</sup><sub>2</sub>

The more I think about it, the **bigger** the SGA 5 story seems. My first impression, when I "disembarked" just a few weeks ago (see notes n°s 68, 68'), was that a situation of debandade among the poor ex-auditors of this seminar in 65/66 had been put to good use in his own way by my friend Pierre, for his famous operation, and that no one else had anything to do with it. And as for the misfortunes of SGA 5, this was neither he nor anyone else, but rather "ut other than myself, who had not, alas, known how to enthuse my volunteer-editor listeners, nor do for them the □work they stubbornly refused to do while saying they p. 343 were about to get down to business. Then it turned out over the last few days that there was one, after all, whose enthusiasm was reawakened ten years later, to publish (without reference to the seminar) what he liked to take from it, thus creating a good reference for his own account, at a time when the other "volunteers" still hadn't decided to get going.

What's become increasingly clear to me since yesterday is that it's not just two "villains", but **every single one of my "cohomologist" students** who are directly involved in the cover-up that took place at this seminar. Unless I'm mistaken, every single one of them attended this seminar - namely (in chronological order of appearance of my "cohomologist" students): Verdier, Berthelot, Illusie, Deligne, Jouanolou. (I'm not counting Jean Giraud, who operated on quite different registers from those mostly discussed in SGA 5 or its predecessor SGA 4).

This seminar, which I did **for the benefit of my students** in the first place, and even though they sometimes asked, grace - **I consider that it wasn't crap**. Every one of them, during that year, learned a good deal about his job as a "cohomology user mathematician"! The things I was doing to them, taking up in the spread-out framework and in a much more circumstantial way ideas I'd first developed in the coherent framework - these things they couldn't find anywhere else but in that one seminar made for their benefit, given that nobody before me had ever bothered to do them - and that nobody but me even felt what there was to do, and why. (Except always Deligne, who learned it over the months in this very seminar, being quicker on the uptake than the others). It was having taken this seminar (and the previous one) and having worked on it at home as best they could, and nothing else, that meant they were now "in the know" about duality formalism, and they were **the only ones** to be. This **privilege**, it seems to me, created an **obligation** for them: to ensure that this privilege did not remain in their hands alone, and that what they had learned from me, and which has been indispensable baggage in all their subsequent work up to the present day, was made available to all, and this within reasonable and customary deadlines - of the order of a year at most, or even two at a pinch.

□We'll say, not without some reason, that it was up to me above all others to see to that. But if I accepted in good faith when students and other listeners offered to help with the writing (which, for those who took it seriously, could only be good for them) - not for the benefit of being able to twiddle my thumbs while they did a job that fell to me. I've

p. 344

---

for my combinatorial description of Teichmüller's tower is well and truly proven. This is the first time since 1978 that an old friend of mine has latched on to my "Anabelian" ideas, whose exceptional scope (comparable to that of pattern yoga) has been obvious to me since the very beginning. ...

(March 28, 1985) Since these lines were written, I have also received a very warm letter from I.M. Gelfand (dated Sept. 3, 1984), in response to the Esquisse.

<sup>82</sup>(\*\*) See note n° 82.

continued, with the help of Dieudonné and others (including, incidentally, Berthelot and Illusie in 1966/67) to develop' basic texts that seemed equally urgent to me, and that no one else would have done in my place or without my assistance<sup>83</sup> (\*). These texts have themselves become indispensable references, including for my "cohomology students", who are just as happy as everyone else to find them ready when they need them.

With the mastery of cohomological ideas and techniques they had acquired through their work with me and the seminars they had attended or participated in, writing this seminar through their joint efforts represented a task of derisory dimensions, if we compare it with the service that was being rendered to the famous "mathematical community", or perhaps also, later on, with an obligation of loyalty they might feel towards me. I've already said that for me (the one with the helping hand), it must have been a job of the order of a few months to write the entire seminar. By dividing the work between the five of them, with the writing experience they had each acquired in those years, and with my detailed manuscript notes at their disposal, the investment for each of them was of the order of a month or two at the very least. They were much better equipped to do this than other editors, such as Bucur, who would have liked nothing better than to entrust a task, which was clearly beyond him, to younger, more directly motivated hands.

As long as I was around (so in the three years that followed), I can see how a "leave it to me" reflex might have come into play - I was supposed to coordinate everything and deal with the "volunteers". It's likely that if I'd asked each of them to give two or three presentations

within a short space of time, it was up to me to do the same, and finally get it over with, they wouldn't have recused themselves. It was from the moment I withdrew from the mathematical world that the situation changed completely. They

p. 345

found themselves **the sole trustees of a certain inheritance**, both implicit (in the absence of a will) and very concrete. It's true that, from a practical point of view, my departure was tantamount to a **disappearance** - I was indeed "deceased", in the sense that there was no one outside them to know about the inheritance, to be able to use it and to be concerned (for better or for worse. . . ) about its fate.

If, for the seven years following my departure, this heritage remained hidden (apart from "the good reference" in 1976!), it's because **my students didn't want it to become public during that time**. All things considered, the situation doesn't seem very different to me from that of the "yoga of motives", which was thoroughly known only by Deligne (apart from myself), and which he saw fit to keep secret for his own benefit. If there is a difference at first sight, it is that in this case there is only one "beneficiary" instead of five, and that there is no common measure between the depth of what was, concealed by one, and what was jointly concealed by the five.

I certainly don't know everyone's deeper motivations - even in Deligne's case I have an apprehension that remains hazy and no doubt will remain so. But on a "practical" level, Deligne's game (with the SGA 4 "s operation - and all the rest) is quite clear. And what's also clear is that these operations couldn't have been carried out **without everyone's solidarity**. It seems to me that Jouanolou isn't too much in the picture - he doesn't strike me as a "luminary", I have the impression that he has long since left the cohomological quagmires (85<sub>1</sub>). But I can't imagine Illusie and Berthelot not having had their hands on both SGA<sub>2</sub> 4<sup>1</sup> and "la

good reference", and they can read as well as me and are no stupider than I am.

If Illusie suddenly became involved in the publication of SGA 5, at the precise moment when Verdier used, where

where Deligne needs a logistical base for his famous SGA 4<sup>1</sup> (by unpacking it) the two seminars from which this text and all his work derive), whereas Illusie had

2

<sup>83</sup>(\*) Between the 1960s and 1970s, I had to work at an average rate of a thousand pages a year of texts (EGA, SGA, articles), almost all of which were to become standard references (something that was quite clear to me when I wrote them, or when I encouraged a collaborator to do so with my assistance).

had ten years to do it, it's surely no coincidence. If the closing presentation on open problems and conjectures that I gave made in 1966 "has unfortunately not been written, any more over [sic] than p. 346 his very fine introductory talk, which reviewed the formulas of Euler-Poincaré and Lefschetz in various contexts (topological, complex analytic, algebraic)", it's surely no coincidence either - but that's a funeral I don't know anything about. And it's no coincidence either that it seemed as natural to Illusie as it did to Deligne (and just worthy of a mention in passing among the "changes of detail") to amputate the seminar from one of its key presentations, which passes into SGA 4<sup>1</sup> without further ado<sup>84</sup> (\*).

I don't know what were the intentions (conscious or unconscious) of Luc Illusie, whom I like like Pierre Deligne, and who (like him) has always shown me great kindness<sup>85</sup> (\*\*). But I've noticed that, alongside Deligne, he's become the co-actor of a **shameless mystification**: that which passes off the SGA 5 mother seminar of 1965/66 (the very one in which Deligne first heard of schemas, stale cohomology, duality and other "digressions") as a kind of shapeless, vaguely ridiculous appendix to a collection of texts with the misleading name SGA 4<sup>1</sup> written eight years later, which pretends to present itself as anterior (both by the number in its title, and by the number of publication in the Notes readings, and finally by the author's unusual comment "Its existence (of SGA 4<sup>1</sup>) will soon allow us to publish SGA 5 as it stands"<sub>2</sub> - emphasis added) - and which, moreover, affects to treat with undisguised disdain the works from which this meagre collection is entirely derived.

Without these works, treated with this beautiful casualness, **none** of Deligne's great works, which are the foundation of his career, would have been possible. its well-deserved prestige, would not be written now, nor in a hundred years (and the same without doubt for Illusie and my other cohomology students). There is in the esprit of this "SGA 4 V operation a p. 347 **impudence**, of which Illusie is the guarantor (without even realizing it, no doubt), and which could only have been displayed with the tacit approval of a **consensus**. The first people involved in this consensus, apart from Deligne himself, are the very people who were my students and the main beneficiaries of a certain heritage, handed over before their very eyes to the vagaries of the jockeying for position and disdain.

And those airs of peremptory smugness, those paternal, protective airs that I was able to appreciate in my ex-student as recently as the day before yesterday in our telephone conversation<sup>86</sup> (\*), and also those more discreet airs of condescension that I was able to appreciate in my friend Pierre in the aftermath of the brilliant double operation "SGA 4<sup>1</sup> - SGA 5" (of which I was far from having the slightest suspicion at the time and for another seven years) - these airs are **not the** products of solitude, but the signs of a consensus that has **never been called into question**. These tunes tell me something not only about Verdier and Deligne, but also about all those who were my students, and before all others, about those who were (by virtue of their work themes and the tools they wielded every day) the first to be concerned.

The term "mystification", which came to me without having sought it out, opportunely reminds me of that other mystification, in which the same cynicism is on display - that of the so-called "Pervers" Colloquium. The two now seem **intimately, indissolubly linked - it's the same spirit that made both possible**. With the possible exception of Jouanolou, who is no longer so much a part of the "big world", I consider these same ex-students to be the same.

<sup>84</sup>(\*) (May 16) In fact, as I discovered the very next day (see note n° 87), there had been a veritable "massacre" of the mother seminary (or father!) SGA 5, at the hands of Verdier, Deligne and Illusie.

<sup>85</sup>(\*\*) Even after I left in 1970, Illusie showed me a lot of kindness - for a long time he sent me beautiful Christmas cards at the end of the year. I'm afraid I didn't have to write back very often to thank him and give him some sign of life - these signs of a faithful friendship came to me like messengers from a past that seemed so infinitely distant, and with which I'd lost touch.

(May 16) On the other hand, there has been no inclination on Illusie's part to continue or resume contact on a mathematical level, and even last year (when I contacted him about mathematical questions) I sensed his reluctance. In the fourteen years since I left, I have received one and only one offprint from him, dated 1979.

<sup>86</sup>(\*) For this conversation, see the note "Jokes - or 'weight complexes'" (n° 83).

p. 348

cohomologists jointly and severally responsible for this disgrace. As far as Berthelot and Illusie are concerned, nothing allows me to prejudge malice or bad faith (which cannot be doubted in the case of Verdier as in that of Deligne). But at the very least, I note a blindness, a blockage in the use of healthy faculties, the underlying reason for which, of course, escapes me. If it weren't for a deliberate intention of indifference and disdain, surely Zoghman Mebkhout, as the only person in the '70s to openly claim to be an admirer of my work, and on subjects that were close to both of them (without that they deign to notice it), would have had the benefit of the minimum "favorable prejudice" so that they would at least be aware so  $\square$  so it little of what he does, and hence realize the interest of the direction in which he had been engaged since 1974, an interest that was **obvious**! Neither of them bothered to notice anything, coming from a vague stranger who still pretends to be a Grothendieck. I don't know if they've opened it, or if they've gone through the shorter, more digestible texts that explain what it's all about - in any case, they haven't deigned to acknowledge receipt of it (nor has Deligne, who obviously sets the tone).

That didn't stop them and the other participants in the memorable Colloque<sup>87</sup> (\*) from learning about the remarkable "Riemann-Hilbert correspondence", without the slightest thought of questioning its origin or authorship, or at least (as solid mathematicians) where it was demonstrated (85 ). But here I trust that Deligne was happy to explain this demonstration, which is surely quite obvious to people like them - precisely the kind of demonstration, using Hironaka-style resolution of singularities, that they learned a long time ago from none other than me (85<sub>2</sub> ). Riemann-Hilbert, Hironaka abracadabra - that was it!

Clearly, like Verdier and Deligne, they've completely forgotten what **mathematical creation** is all about: a vision that gradually unravels over months and years, bringing to light the "obvious" thing that no-one had seen, taking shape in an "obvious" statement that no-one had thought of (even though, in this case, Deligne had been trying in vain for a whole year. . . ). ) - and which anyone can then demonstrate in five minutes, using the ready-made techniques he had the advantage of learning sitting on the benches of a distant seminar he doesn't deign (or hasn't kept) to remember. ...

If I've spoken bluntly of Berthelot and Illusie, it's not because I particularly want to smear them (after an initial settling of scores with their two friends). I know they're no "worse" or dumber than most of their dear colleagues or me, and that the lack of flair and sound judgment that

I see in them in this instance (and sometimes also, that of the necessary respect for others. . . ) is by no means inveterate, but the effect of a **choice**. This choice undoubtedly offered **them**  $\square$  **returns** that pleased them - and may have done so.

p. 349

Perhaps this other "return" that comes with my reflection will be unwelcome to one or the other. If it were, it would simply be that he's still reproducing the same choice, which is also that of operating on a tiny part of his faculties, even if it means mistaking bladders for lanterns and vice versa, and hopelessly confusing empty nuts (from the boyfriend) and full nuts (from a vague stranger). To each his own! ( $\Rightarrow$  86, 87)

**Note** 85<sub>1</sub> Jouanolou is the only one of my students, along with Verdier, who did not publish his thesis. This seems to me to be a sign of disaffection with the foundational work he had developed, namely that of  $\chi$  - *adique* cohomology from the point of view of derived categories. Since most of his work on this theme took place **after** my departure, i.e. at a time when my students, Deligne and Verdier in particular, were in the process of completing their studies, I'd like to take this opportunity to thank him.

<sup>87</sup>(\*) (June 12) I have since learned that neither of them took part in this Colloque (Luminy, June 1981). See, however, the note "La mystification", n° 85'.

head, had signaled a general disaffection with the ideas I had introduced into homological algebra, particularly that of the derived category, the context hardly encouraged Jouanolou to identify with his work and do him the (well-deserved) honor of publishing it. As these same Deligne and Verdier, in the wake of the work of Zoghman Mebkhout (aka Elève Inconnu (de Verdier) aka élève posthume (de Grothendieck)), have come to discover (with great fanfare and mutual publicity) the importance of derived categories (see notes n°s 75,77,81), Jouanolou's scorned thesis has, since the Colloque Pervers, regained all its topicality ; a relevance it would never have ceased to have, had the development of the cohomological theory of schemas continued as normal after my departure in 1970. A striking detail that illustrates a certain drastic "turn" in Deligne's options after my departure: it was Deligne himself (who had clearly understood the importance of developing the formalism of  $\chi$ -adic cohomology in the context of triangulated categories) who provided Jouanolou with a key technical idea for a formal definition of the triangulated  $\chi$ -adic categories he was studying, an idea that is developed in the thesis. (See my 1969 "Report" on Deligne's work, par.8.)

(May 30) See also, on the subject of Jouanolou's work, the note "Les cohéritiers. . . ", n° 91.

**Note 85<sub>2</sub>** Significantly, it was in this same SGA 5 seminar that everyone learned this demonstration principle, used to prove the biduality theorem in cohomology.

(in cases where the resolution of singularities is available), that the  $\square$ -finitude theorems for the  $Rf_*$  without any cleanliness assumption on  $f$ , and similarly for  $RHom$ ,  $Lf^!$ . (These finiteness theorems were also omitted from the published version of SGA 5, to be appended to SGA 4 $\frac{1}{2}$ , without Illusie even seeing fit to point this out in his introduction - I only realize this as I write these lines!) Zoghman, who didn't have the advantage of attending the seminar (he got the "right reference" instead), learned the procedure in another place where I had used it (for De Rham's theorem for smooth schemes on  $\mathbb{C}$ ).

p. 350

He could also learn it from "the good reference", where my demonstrations are copied into the analytical framework, to establish what my students and listeners at SGA 5 have since liked to call the "Verdier duality" (which was known to me before I had the pleasure of making his acquaintance). It all adds up! **The same demonstration** (copied from me at the same time as the statement) is used by Verdier as a title of authorship for a duality he learned nowhere else than in that dislocated and scorned SGA 5 seminar - and it is used **against** Mebkhout, becoming (by its very "obviousness") a (tacit) pretext and means for shamelessly robbing him of the credit for an important discovery.

(May 30) It seems to me that the first time I used singularity resolution à la Hironaka, and understood the extraordinary power of resolution as a demonstration tool, was for a "three spoonfuls" demonstration of the Grauert-Remmert theorem, describing a complex analytic structure on certain finite coverings of a complex analytic space, and the analogous statement in the case of finite-type schemes on  $\mathbb{C}$ . (It's not impossible that the principle was blown to me, on this very occasion, by Serre). This last result is the main ingredient in the proof of the comparison theorem between étale cohomology and ordinary cohomology (the rest being reduced to unscrewing, thanks to the formalism of  $Rf_!$ , plus a bit of solving to go from  $Rf_!$  to  $Rf_*$  . . . )

### 15.3.3. The mystification

**Note! 85'** (June 3) In fact, I'm learning that they didn't have to wonder about this paternity, since both Berthelot and Illusie learned the theorem from the mouth of Mebkhout, the first...

p. 351

in February 1982, the second as early as 1979 (the year Mebkhout defended his thesis). Although neither of them took part in the Colloquium in question, they are nonetheless in solidarity with the mystification that took place at the Colloquium.

place at this Colloquium, because it is impossible that they were unaware of the cover-up that took place of Mebkhout's authorship of the *theoreme du bon Dieu*. I can imagine that, along with all the other Colloque participants, they were the first to be fooled by the collective mystification organized by their friends Verdier and Deligne (a mystification in which four of my five cohomology students appear to be involved). As far as Illusie is concerned, at least, I was struck, during a telephone conversation with him after Mebkhout's visit to my home last summer, by how little he obviously thought of him - he was quite astonished (almost pained on the part of his old master, in whom he would surely have expected better judgment... ) to see me give Mebkhout a leading role in restarting the cohomological theory of algebraic varieties. Consensus of considerable force had decided to rank Mebkhout among the vague unknowns, and my friend Illusie blithely lived with this triple contradiction, without asking himself any questions: the leading role played by the theorem of the good God and the philosophy that goes with it; the evasion surrounding the authorship of these things (an evasion in which he himself participates in the company of many); and the low esteem he has for the format and role of Mebkhout (who he knows perfectly well is the unnamed author of these things, which have renewed a field of mathematics in which he, Illusie, is a figure of eminence).

I find here again the complete blockage of common sense and sound judgment, even in something as seemingly impersonal as judgment on scientific matters, a blockage to which I have had occasion to allude more than once already, and which each time again baffles me. And this contradiction I see here in Illusie's (and surely many others') relationship with Mebkhout, my "posthumous pupil", is surely no more than one of the many effects of a more crucial contradiction to be found in his relationship with me. It is this contradiction, in him more particularly and in my other pupils too, that becomes increasingly clear in the reflection pursued in the notes of the present procession to the Funeral, formed by my pupils of yesteryear...

#### 15.3.4. The deceased

**Note 86** ( May 11) As is so often the case, it was with some reluctance that I set about this task.

new reflection, on the theme "SGA 5 - SGA 4<sup>1</sup> - Perversity", which might have seemed to have been examined and

re-examined over and over again: "It's going to make a deplorable impression on a reader who's probably had enough of it ever since he heard about it; It doesn't look elegant at all to go into details again, SGA 5 this SGA 4<sup>1</sup> that, it's and doesn't deserve any more toast... .".

p. 352

□ I'm glad I didn't let myself be intimidated by that well-known refrain, which would like to prevent myself from getting to the bottom of something (at least as far as I'm able to go at the time), on the pretext that it's decidedly "not worth it", that there's nothing to do but let it run its course... . If there have been times when I've discovered things that I consider useful and important, it's always been in moments when I've known not to listen to what presents itself as the voice of "reason", or even "decency", and follow this indecent urge inside me to go and see even what is supposed to be "uninteresting" or of poor appearance, or even messed up or indecent. I can't remember a single time in my life when I've regretted having looked at something a little more closely, against inveterate reflexes that would have prevented me from doing so. These inhibition reflexes were even stronger in *Récoltes et Semailles* than on other occasions, because this reflection is destined to be made public, which immediately imposes certain

finally, that these constraints never prevented me from either tackling something I wanted to tackle, or going as far into it as I felt I wanted to. In the cases that may at one time have seemed like borderline cases, I forged ahead with the assurance that, should the need arise, I would always have the resource of not including in Harvest and Sowing anything that would "escape" my indiscreet reflection. These "borderline cases" arose exclusively when I hesitated to involve others, and never when it came to involving myself. But even in the first case, as it happens (and this came as a surprise to me), I never had to make use of this "resource": the text of Récoltes et Semailles represents the complete version of my reflection - at least of the part of this reflection that found its way into writing to express itself.

I feel that with the brief reflection of the previous note<sup>88</sup> (\*), the situation has become considerably clearer. I mean that a certain essential aspect of a situation which had been confusing to pleasure, and which I have just evoked by the triple name of a "theme" (SGA 5 -  $\text{SGA } 4^1$  - Perversity), has appeared to me in full light: that of a "solidarity", a "connivance" which had only been confusedly perceived until then. This doesn't mean that I believe I've fathomed and understood all the ins and outs of a "solidarity", a "connivance" that had only been dimly perceived until then.

complex situation, directly and particularly obviously involving at least seven people: Zoghman Mebkhou (acting in a sense as a "revealer" of a certain situation), my five ex-students cohomologists, and myself. I don't even flatter myself to have perceived all the springs and motivations that have been at play in my own person, in relation to the "SGA 5 etc. ... .", in the nearly twenty years since that "unfortunate seminar" took place! But I feel in a much better position than I was yesterday (or even just this morning), to understand and situate the echoes that I hope will reach me on this subject from at least one or other of the main parties involved.

The main question that arises for me (it seems to me that it was already present at another stage of reflection, and now reappears with new vigour) is (it seems to me) this: is what happened with this Burial by my students, (more or less) in their entirety, something completely **atypical**, linked to certain particularities of my person and my singular destiny (such as my departure from the mathematical scene nearly fifteen years ago, the circumstances surrounding it, etc. ) ? Or is it, on the contrary, something "quite natural", due to a simple combination of circumstances - following the principle that "opportunity makes the thief"? I hesitate to think so, though I can't at the moment discern, or even glimpse, what particular aspect of myself has had the virtue of creating such perfect and unanimous **agreement** among my former students, to bury both the "master", and those who claim to be his followers or whose work clearly bears his mark (without, however, being "theirs"). Is it this sort of "aura" of Father that surrounds me, and which I've had occasion to mention? Or is it the challenge posed to each of them by the mere fact of my departure? At the moment, I wouldn't be able to say, for lack of eyes that can see... . Perhaps the coming months will teach me something on this subject<sup>89</sup> (\*).

More than once in the last three weeks, I've thought of this other strange "coincidence": it's that the discovery of the Burial "in all its splendour" (with the four-stroke LN 900 -  $\text{SGA } 4^1$  -  $\text{SGA } 5$  - Colloque Pervers, then back to  $\text{SGA } 5$  and  $\text{SGA } 4^1$ ) - that this discovery came at a time when I had just completed an in-depth reflection on my past as a mathematician and my relationship with my students. It was a time, therefore, when I had just come "to terms with myself" on the subject of my students.

of this past, to the best of my ability, and as far as the facts then known to me allowed, as they were often hazy memories. Or to put it another way: it was lep

rendered by

<sup>88</sup>(\*) This refers to the note "La solidarité" n° 85, dated the same day.

<sup>89</sup>(\*) (May 30) For a reflection along these lines, see the note "Le Fossoyeur - ou la Congrégation toute entière", n° 97.

the exact moment when I was finally **ready** to learn and profit from it.

Chance" did things so well that there wasn't even a break in the meditation. The reflection that had begun with this short retrospective on the fate of the most important notions (in my opinion) that I had introduced<sup>90</sup> (\*) (a reflection that remained in a certain vagueness, where only a certain basic tone emerged insistently... ) - this reflection continued quite naturally on Thursday April 19. It was, it's true, still in the throes of the emotion aroused by that impression of "impudence" (to use the term from earlier, which also aptly describes something I felt at the time), on reading the "memorable volume" LN 900.

In this new departure from "the same" thinking, the main driving force was "the boss" - my self-esteem and sense of decency were affected, and by writing down my emotions I freed myself from them to a certain extent. It was indeed "me", "the boss", who visibly led the dance in the ten days that followed - days marked by the absence of smiles and laughter, by unfailing seriousness. I had to go through this ten-day detour before the reflection returned to the center it had left - to myself. I still remember the relief of that return - like coming out of a tunnel when daylight appears again! It was then that I found myself laughing and smiling again, as if we'd never left each other. It was April 29th. The next day, the 30th, the last day of the month, I was happy to put the finishing touches to this ultimate stage of reflection.

It was also the moment, surely, when I was ready to receive the next "package", this time sent by my friend Zoghman - the "Colloque" package received the day after tomorrow. Today is the tenth day I've been working on assimilating the substance of this package. But at this stage, while I've been gnawing at the bit to get to the bottom of this rebound that just kept on rebounding, the smile hasn't faded for a single day. And today, I truly believe (for the thirtieth time, it's true!), is finally the day of closure.

Five days ago I'd already had that same feeling that I'd reached the end of my rope, that there was nothing left but work to be done.

of stewardship: adding a few footnotes here and there, retyping pages too overloaded with ratures (each time a sign of a thought that had remained somewhat confused, and which needs to be put into This seemingly mechanical work, from which the text always emerges with a new face. ... ). . . This was when I had just written what is now the note "Mes amis" (n° 79), which spontaneously flowed into "final chords". However, I ended up separating these chords from the beginning of the note. In fact, it turned out that this famous stewardship work had broken down: the "footnotes", typed without line spacing, became real notes (**not** footnotes) of nice dimensions, which had to be retyped with line spacing, and then tried as best I could to fit in here and there. It took days before I realized that another procession, after the one called "The Colloquium", was forming to join the procession - and that the last of the processions would not (as I had decided in my head) be the said Colloquium, but would be led by **the Student**. And just today, as the first procession, reduced to a single note, was enriched by a second ("A feeling of injustice and powerlessness"), I also knew who would lead it: it was "**L'élève posthume**". So the procession, opened by a Pupil (posthumous and lower-case, as befits his humble state) and closed by yet another Pupil (by no means humble this time), seems to me to be complete at last!

It's also time, it seems to me, after a first "false arrival", to return to the chords of a final De Profundis, which are more appropriate today than they were five days ago. Here they are, as I wrote them down then, and which also express my feelings at the moment.

---

<sup>90</sup>(\*) See notes "My orphans" and "Refusal of an inheritance - or the price of a contradiction" of March 31 (n° s 46,47).

(May 31) Finally, it was another "false arrival" - the "final agreements" were premature this time too! Twenty days went by, during which the "housekeeping work" continually broke down into rethinking this and that aspect that had been neglected. Six more notes joined the "L' Elève" procession, which was supposed to close the parade. The Fourgon Funèbre appeared in the wake of the Elève, carrying four coffins accompanied by the Fossoyeur. He was definitely lacking to give body and meaning to a funeral convoy that didn't seem to be conveying anyone.

Having become cautious through experience, I'm waiting for events to unfold and won't take any chances for the time being.

to predict whether the procession is finally complete, or whether a forgotten procession will sneak in again at the last minute, so as not to miss the ultimate Ceremony<sup>91</sup> (\*).

p. 356

### 15.3.5. The massacre

**Note** 87 (May 12)<sup>92</sup> (\*\*) For the edification of the somewhat cohomologist reader, and above all for my own, I would like to review the details of this plundering of a splendid seminary, in the hands of two of my former cohomologist students and under the benevolent eye of the others<sup>93</sup> (\*\*\*) - of the same seminary where they learned, twelve years before anyone else and from the hand of the workman himself, the basics and finesses of the trade that made their reputation.

Two of my oral presentations have never been made available to the public in any form. One is the closing lecture on open problems and conjectures, which "unfortunately was not written up", given how little - and indeed, the author of the introduction to the murder-edition deemed it unnecessary even to mention **what** open problems and conjectures it was. And why should he have taken the trouble, when they were merely problems (which everyone is free to pose as they please!) and conjectures (not even demonstrated!) (87<sub>1</sub>). The other was the lecture that opened the seminar, placing it right from the start in a broader context (topological, complex analytic, algebraic) and reviewing formulas of the Euler-Poincaré, Lefschetz, Nielsen-Wecken type, some of which constituted one of the seminar's main applications. The ". . . any more than. . . ." with which the author of the introduction follows up to signal, in the nick of time, the disappearance of this presentation, says a lot about the **casual attitude** that was clearly self-evident at the time, even though the author of the seminar had been out of circulation for seven years.

There's a whole series of talks I gave on the formalism of homology and cohomology classes. logie associated with a cycle (regular ambient pattern in the cohomological case)<sup>94</sup> (\*\*\*\*). They have been equally divided: cohomology for Deligne, homology for Verdier - who nevertheless overflows a little on cohomology, even if it means making the small reference to Deligne with the famous "complexes". p. 357 weight"<sup>95</sup> (\*). (Not to mention the finiteness theorem for RHom and the biduality theorem, copied verbatim from the seminar - the lion's share of which will go to Deligne, which is to be expected. ... ) The author of the introduction does not see fit to mention the homology lectures alone. Indeed, there was no need, since the previous year his friend Verdier had taken on the task of providing the missing "good reference" (without alluding to a seminar, or to me).

<sup>91</sup>(\*) (June 12) Caution was the order of the day, as a new "Mes élèves" procession separated from the one originally called "L'Elève", which became "L'Elève - alias le Patron".

<sup>92</sup>(\*\*) This note follows on from the previous day's reflection on "Solidarity" (n° 85).

<sup>93</sup>(\*\*\*) Further reflection reveals that one of these "others" lent a hand efficiently to this operation on behalf of others.

<sup>94</sup>(\*\*\*\*) For details, see note no. 82 "Good references".

<sup>95</sup>(\*) See note (83) "The joke - or weight-complexes".

There were oral presentations on finiteness theorems for the operations  $Rf^!\wedge$  ( $f$  not proper), and as a corollary, for the operations  $RHom_*$  ; and  $Lf^!$  . The key theorem was proved using a Hironaka-style singularity resolution technique (valid only in cases where the resolution is available).

These arguments, which I used, have come into common use since the seminar (see note (85<sub>2</sub>)). Deligne has managed to prove these finitude theorems, as well as the biduality theorem, under other, more helpful hypotheses, which have already been verified in most applications. It might have been expected that he would ask to include these refinements in the seminar where he had the privilege of learning étale cohomology, and the ideas and techniques at the basis of all his subsequent work. But this circumstance is used as a "reason" for amputating this part of the seminar. As for the biduality theorem, under Illusie's pen (and within the framework of the diagrams) it became "Deligne's biduality theorem" (introduction to Lecture I). This was only fair, since in the analytical case, Verdier had already claimed it as his own the previous year (without even having to go to the trouble of finding another demonstration).

Then there's Illusie's paper developing a "generic Kûnneth formula". No one before had thought of developing this kind of statement, inspired by the intuition that "generically" i.e. in the vicinity of the generic point of the basis, a relative scheme behaves like a "locally trivial fiber" in the topological context. In an elegant demonstration similar to the one mentioned above, Deligne manages to eliminate the singularity-resolving hypothesis I had made. It's awarded - presentation deleted and "replaced" by a reference to a presentation by the same Illusie in the so-called "earlier" seminar.  
SGA 4<sup>1</sup>.

p. 358

□ There is a series of lectures on the formalism of non-commutative traces, developed as a means of explicating the local terms of the Lefschetz-Verdier formula in cases that had never been treated. These lectures were eventually written, it seems, by Bucur, whose manuscript "got lost in a providential move" - it's turning into a vaudeville!<sup>96</sup> (\*) In the introduction to SGA 5, written by Illusie, these lectures become "Grothendieck's theory of **commutative** traces, generalizing [brilliantly] Stallings'" (which were non-commutative!). The slip of the tongue<sup>97</sup> (\*\*) can only be due to a badly (or too well. . . ) inspired secretary, who must have been involved with my friend Ionel Bucur's movers. (The word "brilliantly" is an interpolation of my pen, to better render the thought infallibly suggested by this slip of the tongue, also providential ).

I can't complain, since Illusie has taken on the job of redoing the work (and even, he tells us, a "more sophisticated" version, given that it's put in the Beamtique sauce - I seem to remember, though, Illusie, that you made more "sophisticated" innovations than this in my day... ). It must have taken a long time even, if I remember that I spent weeks putting the machine together; my manuscript also got lost in the same providential move, and God knows if one of the dear listeners, overwhelmed by my oral faconde, was at least able to take comprehensible notes... .

Remarkably, and this is something I hadn't noticed before, he doesn't insert this talk in the place in Lecture XI where it was intended (which no doubt also corresponds to the place it had in the oral seminar), preferring to leave a gaping hole there and make his talk an apocryphal one, called "Calculs de termes locaux" ("Calculations of local terms"). The title does, however, seem to correspond to what I seem to remember him doing in the oral seminar.

<sup>96</sup>(\*) It was this circumstance, no doubt, that inspired Deligne's unexpectedly brilliant criticism of SGA 5, in which the local terms of Lefschetz Verdier's formula (which "remained conjectural", remember!!!) were not even calculated! (See note "la table rase", n° 67, about the absurdity of this criticism, which for an informed reader is similar to that of Verdier's famous "weight complex" the previous year (see note n° 83). So it was Verdier who became the schoolmaster! )

<sup>97</sup>(\*\*) This is the slip of the tongue attributing to me the authorship of a theory of "commutative" traces (for which I had not been expected) instead of "non-commutative" ones. That it survived into the published edition is all the more remarkable given that Illusie was perhaps the most meticulous of my students, down to the last detail.

strange. But right from line 1 of his introduction to this talk, the author is quick to <sup>□</sup>detrompt us: "Cetp . 359 exposé, written in January 1977, **does not correspond to any oral presentation in the seminar**". And he continues with Lefschetz-Verdier formulas (that name rings a bell, though, and I thought I'd actually developed a theory of non-commutative traces, in order to calculate "local terms" in certain cases. . . ), then on a formula by Langlands and on a demonstration by Artin-Verdier in 1967 (this was a year after the final agreements of the oral seminar, which must have influenced these authors, at least one if not both of whom followed him). Towards the end of the page, we learn as if in passing, contrary to what was announced at the beginning, that there is also a "second part of this talk, of a much more technical nature" (I've read this language somewhere. . . ) which is (admire the nuance) "**inspired by the method used by Grothendieck** to establish the Lefschetz formula for certain cohomological correspondences on curves", with a reference to Lecture XII of the same seminar and above all to the indispensable SGA 4<sup>1</sup>; Obviously, there was no reason, for so little, to include this lecture in place of the gaping hole - the "more sophisticated version" of earlier will have done things right. It was even nice of Illusie and Deligne to cite me as a source of "inspiration", when the example of their friend Verdier the previous year had clearly shown that there was absolutely no need for such scruples.

I return to Illusie's introduction to the volume that goes by the name of SGA 5. In it, we learn once again - as Deligne had already announced in his introduction to SGA 4<sup>1</sup> - that it was indeed **thanks to his friend** that the seminar has finally been published:

"I would like to thank P. Deligne for having convinced me to write, in a new version of Lecture III, a demonstration of the Lefschetz-Verdier formula, **thus removing one of the obstacles to the publication of this seminar**".

Once again, we're in the middle of a farce - repeated as is by the docile Illusie in the introduction to SGA 4<sup>1</sup> ! If the seminar remained unpublished for more than ten years, it's because no one (until Deligne saved the day in 1977) had yet considered the possibility of publishing it.

good idea to write a demonstration of the so-called (and rightly so) "Lefschetz-Verdier formula", of which none other than <sup>□</sup> his inseparable friend and my ex-student Verdier himself has proudly borne the paternity **since aup** . 360 **minus** 1964 (87<sub>2</sub>), i.e. for at least two years by the time my seminar ended, and was just waiting to be made available to everyone!

Finally, as another and last (?) mutilation of the seminar, there was the disappearance of the fine talk Serre had given on the "(Serre-) Swan module" - a talk entitled "Introduction à la théorie de Brauer". It's fortunate that Serre, seeing the turn events were taking, had the good sense to include his talk in his book "Représentations linéaires des groupes finis" (Hermann, 1971), and make it available to the mathematical public.(87)<sub>3</sub>

This time, I think, I've come full circle. The picture of the fate of a seminar in which I had put the best of myself (88)<sup>98</sup> (\*), and which I find twenty years later unrecognizable, butchered by the very people who had been its exclusive beneficiaries - or at least by three of them, and with the assent of all the other participants.

I don't regret having taken the trouble, once again, to follow through on what had gradually come to my attention. This "return of things"<sup>99</sup> (\*\*) that I noticed, at the end of a long retros-

<sup>98</sup>(\*) For the meaning of this expression "of the best of myself", see the following notes "La dépouille. . . ", ". . . and the body", n° 88, 89. The first of these situates the SGA 5 seminar, with SGA 4 inseparable from it, as the masterpiece of the part of my work "entirely completed".

<sup>99</sup>(\*\*) See note of this name (n° 73) dated April 30.

pective about my relationship with one of my former students, sensing even then that he wasn't the only one to "bury me with gusto" - I've only now become aware of his breath, his "smell" (to use an expression that then appeared in one of my dreams) - the breath of **violence**. This breath is concealed and revealed at the same time by the speech<sup>100</sup> (\*\*\*) (seemingly detached and impassive) presenting a highly technical substance. What this violence is aimed at, through a "corpse" delivered at mercy,

is the very person of the one who was the "master", the "Father" - at a time when the "pupils" have long since taken his envied place, without encountering any resistance; and that □ also long ago they have elected from among themselves the new "Father", called to replace the old and reign over them.

I feel this breath, and yet it remains for me a foreign thing, misunderstood. To "understand" it, this breath would have to live in me, or have lived in me. But four years ago, for the first time, I felt and measured the significance of something in my life that I had never thought about, that had always seemed self-evident: that my identification with my father as a child **was not** marked by conflict - that at no time in my childhood **did I fear or envy my father**, while at the same time devoting unreserved love to him. This relationship, perhaps the most profound that has marked my life (without my even realizing it before this meditation four years ago), which in my childhood was like a relationship with an other self both strong and benevolent - this relationship was not marked by division and conflict. If, through all my often-torn life, the knowledge of the strength that lies within me has remained alive; and if, in my life by no means free of fear, I have not known fear either of a person or of an event - it is to this humble circumstance that I owe it, ignored until well into my fifties. This circumstance has been a priceless privilege, for it is the intimate knowledge of the creative force within one's own person that **is** also that force, which enables it to express itself freely according to its nature, through creation - through a creative life.

And this privilege, which has exempted me from one of the deepest marks of conflict, is at the moment also like a hindrance, like a "void" in my experience of life. A void that's hard to fill, where many others have a rich web of emotions, images and associations, offering them the path (provided they're curious enough to take it) to a profound understanding of others as well as of themselves, in situations that I manage (by dint of repetition and cross-checking) to apprehend as best I can, but in the face of which I remain like a stranger - with the desire for knowledge within me still hungry.

**Note 87<sub>1</sub>** (87<sub>1</sub>) (May 31) This closing presentation, surely one of the most interesting and substantial with the opening talk, was obviously not lost on everyone, as I see from reading Mac Pherson's paper "Chern classes for singular algebraic varieties" (Chern classes □ for singular algebraic varieties, *Annals of Math.* (2) 100, 1974, pp. 423-432) (received April 1973)-In this paper, under the name of "Deligne-Grothendieck conjecture", I repeat one of the main conjectures I had introduced in this paper in the schematic framework. It is taken up by Mac Pherson in the transcendental framework of algebraic varieties over the field of complexes, the Chow ring being replaced by the homology group. Deligne had learned this conjecture<sup>101</sup> (\*) in my talk in 1966, the same year he had appeared in the seminar where he began to familiarize himself with the language of diagrams and cohomological techniques (see the note "L'être à part" n° 67)-It's nice of you to have done me the honor of including me.

<sup>100</sup>(\*\*\*) These are mainly the introductory texts accompanying SGA 5 (written by Illusie) and SGA 4. <sup>1</sup>  
(written by Deligne).

<sup>101</sup>(\*) (June 6) In a slightly different form, see the rest of today's note.

(March 1985) For further details, given by Deligne himself, see the note "Les points sur les i", n° 164 (II 1).

in the name of conjecture - a few years later it would no longer have been appropriate... .

(June 6) I'd like to take this opportunity to explain the conjecture I'd put forward in the seminar in the schematic framework, while surely pointing out the obvious variant in the complex analytic (or even rigid-analytic) framework. I conceived it as a "Riemann-Roch" theorem, but with discrete coefficients instead of coherent coefficients. (Zoghman Mebkhout told me, incidentally, that his view of D-Modules should make it possible to consider the two Riemann-Roch theorems as contained in a single crystalline Riemann-Roch theorem, which would thus represent in zero characteristic the natural synthesis of the two Riemann-Roch theorems I introduced into mathematics, one in 1957, the other in 1966). We fix a ring of coefficients  $\Lambda$  (not necessarily commutative, but noetherian for simplicity and moreover of prime torsion to the characteristics of the schemes under consideration, for the purposes of stable cohomology... ). For a scheme  $X$  we denote by

$$K(X, \Lambda)$$

the Grothendieck group formed by constructible étale bundles of  $\Lambda$ -modules. Using the functors  $Rf_!$ , this group depends functorially on  $X$ , for  $X$  noetherian and morphisms of schemes that are separated and of finite type. For regular  $X$ , I postulated the existence of a homomorphism of groups canonical, playing the role of the "Chern character" in the consistent RR theorem,

p. 363

$$ch_X : K(X, \Lambda) \rightarrow A(X) \otimes_{\mathbb{Z}} K(\Lambda), \quad (15.1)$$

where  $A(X)$  is the Chow ring of  $X$  and  $K(\Lambda)$  the Grothendieck group formed with  $\Lambda$ -modules of finite type. This homomorphism was to be determined solely by the validity of the "discrete Riemann-Roch formula", for a **proper** morphism  $f : X \rightarrow Y$  of regular schemes, which formula is written as the consistent Riemann-Roch formula, with Todd's "multiplier" replaced by the total relative Chern class :

$$ch_Y(f_!(x)) = f_*(ch_X(x) c(f)), \quad (15.2)$$

where  $c(f) \in A(X)$  is the total Chern class of  $f$ . It's not hard to see that in a context where we have the resolution of singularities in Hironaka's strong form, RR's formula does indeed determine the  $ch_X$  uniquely.

Of course, we assume that we're in a context where the Chow ring is defined (I'm not aware of anyone having even attempted to write a theory of Chow rings for regular schemes of finite type over a body). Alternatively, we can also work in the graduated ring associated with the usual "Grothendieck" ring  $K^0(X)$  in the coherent context, filtered in the usual way (see SGA 6). Alternatively, we can replace  $A(X)$  by the even  $l$ -adic cohomology ring, the direct sum of  $H^{2i}(X, \mathbb{Z}_l(i))$ . This has the disadvantage of introducing an artificial parameter  $l$ , and giving formulas that are less "purely numerical" fines, while the Chow ring has the charm of having a continuous structure, destroyed by switching to cohomology.

Already in the case where  $X$  is a smooth algebraic curve over an algebraically closed field, the calculation of  $ch_X$  involves delicate local invariants of the Artin-Serre-Swan type. In other words, the general conjecture is a profound one, the pursuit of which is linked to an understanding of the higher-dimensional analogues of these invariants.

Remark. Designating in the same way by  $K(X, \Lambda)$  "the Grothendieck ring" formed with the construc-

of finite tor-dimensional  $\Lambda$ -spreads (which ring operates on  $K(X, \Lambda)$  when  $\Lambda$  is commutative. . . ), we must likewise have a homomorphism

$$ch_X : K(X, \Lambda) \rightarrow A(X) \otimes_{\Lambda} K(\Lambda)$$

again giving rise (mutatis mutandis) to the same Riemann-Roch (RR) formula.

p. 364

□ Let  $cons(X)$  now be the ring of constructible integer functions on  $X$ . We define less tautological canonical homomorphisms

$$K(X, \Lambda) \rightarrow Cons(X) \otimes_{\Lambda} K(\Lambda),$$

$$K^*(X, \Lambda) \rightarrow Cons(X) \otimes_{\Lambda} K^*(\Lambda),$$

If we now restrict ourselves to schemes **of zero characteristic**, then (by using Euler-Poincaré characteristics with proper supports) we see that the group  $Cons(X)$  is a covariant functor with respect to finite-type morphisms of noetherian schemes (in addition to being contravariant as a ring functor, which is independent of characteristics), and the preceding tautological morphisms are functorial. (This corresponds to the "well-known" fact, which I believe was not proved in the SGA 5 oral seminar, that in **zero characteristic**, for a locally constant bundle of  $\Lambda$ -modules  $F$  on an algebraic scheme  $X$ , its image by

$$f_! : K(X, \Lambda) \rightarrow K(e, \Lambda) \rightarrow K(\Lambda)$$

is equal to  $d\chi(X)$ , where  $d$  is the rank of  $F$ ,  $e = Spec(k)$ ,  $k$  the base field assumed to be algebraically closed. . . ). This immediately suggests that the Chern homomorphisms (1. ) and (1' ) must be derivable from the tautological homomorphisms (2. ), (2' ) by composing with a "universal" Chern homomorphism (independent of any ring of coefficients  $\Lambda$ )

$$ch_X : Cons(X) \rightarrow A(X),$$

so that the two " $\Lambda$ -coefficient" versions of the RR formula appear to be formally contained in an RR formula at the level of constructible functions, which is always written in the same form.

When working with schemes on a fixed basic body (again, of any characteristic), or more generally on a fixed **regular** basic scheme  $S$  (for example  $S = Spec(\mathbb{Z})$ ), the form of the Riemann-Roch formula most in line with the usual writing (in the coherent framework familiar since 1957) is obtained by introducing the products

$$ch_X(x)c(X/S) = c_{X/S}(x)$$

p. 365

(where  $X$  is in a  $K(X, \Lambda)$  or  $K^*(X, \Lambda)$  indifferently), which we might call **the Chern class of  $X$  relative to the basis  $S$** . When  $x$  is the unit element of  $K^*(X, \Lambda)$  i.e. the class of the constant bundle of value  $\Lambda$ , we find the image of the total relative Chern class of  $X$  with respect to  $S$ , by 1 "canonical homomorphism of  $A(X)$  into  $A(X) \otimes K^*(\Lambda)$ . This being the case, RR 's formula is equivalent to the fact that the formation of these relative Chern classes

$$c_{X/S} : K^*(X, \Lambda) \rightarrow A(X) \otimes K^*(\Lambda),$$

for a regular variable scheme  $X$  over  $S$  (of finite type over  $S$ ), with  $S$  fixed, is functorial by

with respect to eigenmorphisms, and similarly for the variant (5'). In null characteristic, this reduces to the functoriality (for eigenmorphisms) of the corresponding application

$$c_{X/S} : \text{Cons}(X) \rightarrow A(X) .$$

It is in this form of the existence and uniqueness of an absolute "Chern class" application (6), in the case where  $S = \text{Spec}(\mathbb{C})$ , that the conjecture in Mac Pherson's work is presented, the relevant conditions (here as in the general zero characteristic case) being a) the functoriality of (6) for proper morphisms and b) we have  $c_{X/S}(1) = c(X/S)$  (in this case, the total "absolute" Chern class). Compared with my initial conjecture, however, the form presented and proved by Mac Pherson differs in two ways. One is a "minus", in that it is placed, not in the Chow ring, but in the whole cohomology ring, or more precisely the whole homology group, defined by transcendental means. The other is a "plus" - and it is here perhaps that Deligne has made a contribution to my initial conjecture (unless this contribution is due to Mac Pherson himself<sup>102</sup> (\*)). It's that for the existence and uniqueness of an application (6), we don't need to restrict ourselves to regular schemes  $X$ , provided we replace  $A(X)$  by the entire homology group. The same is likely to be true in the general case, where we denote by  $A(X)$  (or better, by  $A_*(X)$ ) the **Chow group** (which is no longer a ring in general) of the noetherian scheme  $X$ . Or to put it another way: while the heuristic definition of *ch-invariants* <sub>$X$</sub>  ( $x$ ) (for  $x$  in  $K_*(X, A)$  or  $K^*(X, A)$ ) makes essential use of the assumption that the ambient scheme is regular, as soon as we multiply it by the "multiplier"  $c(X/S)$  (when the scheme  $X$  is of finite type over a fixed regular scheme  $S$ ), the product obtained (4) seems to retain a meaning without any assumption of regularity<sup>about</sup>□, as an element of a tensor product

p. 366

$$A_*(X) \otimes K_*(\Lambda) \text{ or } A^*(X) \otimes K^*(\Lambda) ,$$

where  $A_*(X)$  denotes the Chow group of  $X$ . The spirit of Mac Pherson's demonstration (which does not use singularity resolution) would suggest the possibility of an explicit "computational" construction of the homomorphism (5'), by "making do" with the singularities of  $X$  as they are, as well as with the singularities of the coefficient bundle  $F$  (whose class is  $x$ ), to "collect" a cycle on  $X$  with coefficients in  $K_*(\Lambda)$ . This would also be in the spirit of the ideas I had introduced in 1957 with the coherent Riemann-Roch theorem, where I did self-intersection calculations in particular, taking care not to "move" the cycle under consideration. A first obvious reduction (obtained by immersing  $X$  in an  $S$ -scheme) would be to the case where  $X$  is a firm subscheme of the regular  $S$ -scheme. . .

The idea that it should be possible to develop a **singular** (coherent) Riemann-Roch theorem was familiar to me, I can't say how long ago, but I never tried to test it seriously. It was more or less this idea (apart from the analogy with the "cohomology, homology, cap-product" formalism) that led me in SGA 6 (in 1966/67) to systematically introduce the  $K_*(X)$  and  $K^*(X)$  and the  $A_*(X)$ ,  $A^*(X)$ , instead of just working with the  $K^*(X)$ . I don't remember whether I also thought of something like this in the SGA 5 seminar in 1966, and whether I hinted at it in the oral presentation. As my handwritten notes have disappeared (in a removal perhaps?) I'll probably never know... .

(June 7) Looking through Mac Pherson's article, I was struck by the fact that the word "Riemann-Roch" is not mentioned - which is why I didn't immediately recognize the conjecture I made in the SGA 5 seminar in 1966, which was for me (and still is) a "Riemann-Roch" theorem. It seems that when Mac Pherson wrote his article, he didn't even realize that it was a "Riemann-Roch" theorem.

<sup>102</sup>(\*) (March 1985) This is indeed the case, cf. note no. ° 164 cited in the previous footnote.

of this obvious kinship. I presume that the reason for this is that Deligne, who after my departure put this conjecture into circulation in the form he liked, took care as far as possible to "erase" it.

p. 367 the obvious kinship with the Riemann-Roch-Grothendieck theorem. I think I sense his motivation for doing so. On the one hand, it weakens the link between this conjecture and myself, and makes it more plausible to call-

the "Deligne-Grothendieck conjecture" under which it is currently circulating. (NB I don't know if it's in circulation in the schematic case, and if so, I'd be very curious to know under what name). But the deeper reason seems to me to lie in his obsessive desire to deny and destroy, as far as possible, the fundamental unity of my work and my mathematical vision<sup>103</sup> (\*). This is a striking example of how, in a mathematician of exceptional means, a fixed idea entirely unrelated to any mathematical motivation, can obscure (or even completely block out) what I have called the "healthy mathematical instinct". This instinct cannot fail to perceive the analogy between the two "continuous" and "discrete" statements of the "same" Riemann-Roch theorem, which I had of course emphasized in the oral presentation. As I indicated yesterday, this kinship will no doubt soon be confirmed by a statement in form (conjectured by Zoghman Mebkhout), at least in the complex analytic case, allowing both to be deduced from a common statement. Clearly, given Deligne's "gravedigging" attitude towards the Riemann-Roch theorem<sup>104</sup> (\*\*), he was not likely to discover the unique statement that links them in the analytic framework, and even less likely to raise the question of an analogous statement in the general schematic framework. Nor was he able, in such circumstances, to identify the fruitful point of view of D-Modules in the cohomological theory of algebraic varieties, arising all too naturally from ideas that had to be buried - or even to recognize, for years, the fruitful work of Mebkhout, succeeding where he himself had failed.

**Note** 87<sub>2</sub> (May 31) This is the year of my Bourbaki lecture on the rationality of *L-functions*, in which I heuristically use Verdier's result (???) (and especially the expected form of local terms in the case of d'espèce), without waiting for Illusie to demonstrate it thirteen years later, at Deligne's invitation. It seemed to me, moreover, when Verdier showed me his ultra-general formula that came as a surprise, that he demonstrated it with a few lines of "six operations" formalism - this is the kind of formula where (almost) to write it is to demonstrate it! If there was any "difficulty", it could only be at the level of verifying one or two compatibilities<sup>105</sup> (\*). What's more, both Illusie and Deligne knew perfectly well that the demonstrations I had given in the seminar for various explicit trace formulas **were complete**, and in no way depended on Verdier's general formula, which had simply acted as a "trigger" to encourage us to make explicit and prove trace formulas in as general a range of cases as possible. The bad faith of both is obvious here. As far as Deligne is concerned, it was already clear to me when I wrote the note "La table rase" (n° 67) - but probably not to an uninformed reader, nor of course to an informed reader who renounces the use of his healthy faculties.

p. 368

<sup>103</sup>(\*) Compare with the commentary in the note "La dépouille" (n° 88) on the deeper meaning of the SGA 4 operation<sup>1</sup>, similarly aimed at shattering into an amorphous set of "technical digressions" the deeper unity of my work around staggered cohomology, through the "violent insertion" of the foreign text SGA 4<sup>1</sup> between the two indissoluble parts SGA 4 and SGA 5 which develop this work.

<sup>104</sup>(\*\*) These dispositions, with regard precisely to the Riemann-Roch-Grothendieck theorem, are particularly clear in the "Funeral Eulogy"; see the note "Funeral Eulogy (1) - or compliments", n° 104.

<sup>105</sup>(\*) (June 6) It would also appear that, via the biduality theorem (in the meantime promoted to "Deligne's theorem"), the initial demonstration of the Lefschetz-Verdier formula depended on a singularity resolution hypothesis, which Deligne manages to dispense with in the case of *fi ni* type schemes over a body. This is a good opportunity to fish in troubled waters and give the impression that SGA 5 is subordinate to the "seminar-sic" SGA 4<sup>1</sup> which "precedes" it (and which was published well and truly before...). him!).

(June 6) As for Illusie, he played right into his friend's hands, trying to muddy the waters to give the appearance of an ultra-technical oral seminar that didn't even give complete demonstrations of all the results, especially the trace formulas. These were, however, demonstrated there (and for the first time) in 65/66, and it was there that both he and Deligne had the privilege of learning them, and the delicate technique that goes with it<sup>106</sup> (\*\*).

□ This reminds me that, of course, I had taken the trouble to demonstrate Lefschetz-'s formula.

p. 369

Verdier in the seminar - it was the least I could do, and a particularly striking application of the formalism of local and global duality that I set out to develop. The question came to me these days: why on earth, when there were ten or so papers still being written by my dear students, so that Deligne and Illusie were spoilt for choice when it came to naming their technical "obstacle" to the publication of SGA 5, they chose the theorem of their good buddy Verdier, who at the time was taking credit for it as his own, just as he had never bothered to write (or at least make available to the public) the theorem of derived and triangulated categories. There's a kind of **defiance** in the absurdity (or in a kind of collective cynicism in the group of my ex-cohomology students, whom I consider to be in solidarity in this operation-massacre), which reminds me of the "weight-complexes" brilliantly invented by Verdier the previous year (see the note of that name, n° 83), or (in the iniquitous register) with the "perverse" name given by Deligne to bundles that should be called "Mebkhout bundles" (see the note "La Perversité", n° 76). I sense such inventions as acts of domination and contempt towards the entire mathematical community.

- and at the same time a **gamble**, which was clearly won until the unexpected appearance of the deceased, who appears almost as the only one awake in a community of sleepers...

**note** 87<sub>3</sub> (June 5) After this assessment of a massacre, we will appreciate the value of Illusie's statement in line 2 of his introduction to the volume entitled SGA 5:

"Compared with the original version, the only significant changes concern Lecture II [generic K nneth for- mules], which has not been reproduced, and Lecture III [Lefschetz- formula], which has been reproduced.

Verdier], which has been completely rewritten and expanded with an appendix numbered III B<sup>107</sup> (\*). A part some changes of □ detail and additions of footnotes, the other presentations have been left **as they are**" (emphasis added).

p. 370

Here again, Illusie complacently echoes another well-sent joke from his inenarrable friend, namely that the existence of SGA 4<sup>1</sup> "will soon make it possible to publish SGA 5 **as is**" (see the "Clean slate" note n° 67) - and Illusie does his utmost in his talks and introductions to lend credence to this.

<sup>106</sup>(\*\*) In the second paragraph of the Introduction to the volume published as SGA 5, Illusie presents as "the heart of the seminar" the three lectures III, III B, XII on Lefschetz's formula in stale cohomology, whereas we have seen that in the introduction to lecture III B., he takes care to specify (contrary to reality) that "this lecture corresponds to no oral lecture of the seminar" and that in the introductions to lectures III and III B., he does his utmost to give the impression that these are "the heart of the seminar", he is careful to specify (contrary to reality) that "this lecture does not correspond to any oral lecture of the seminar" and that in the introductions to lectures III and III B, he does his utmost to give the impression that these are subordinate to SGA 4<sup>1</sup>, and that lecture III is presented as "conjectural"! ! In fact, the entire SGA 5 seminar was technically independent of Lecture III (Lefschetz-Verdier formula), which played the role of a heuristic motivator, and Lecture III B is no more than the "hole" (Lecture XI) created by the move to Bucur, which was the welcome pretext for this further dismemberment.

To lend credence to the version of a seminar of "technical digressions" (blown up by his friend Deligne), Illusie was careful to skip the introductory presentation, in which I had painted a preliminary picture of the main themes that were to be developed in this seminar, a picture in which the trace formulas form only a small part (taking on particular importance because of their arithmetical implications, in the direction of Weil's conjectures). For an overview of these "major themes", see sub-note n° 87 .5

<sup>107</sup>(\*) Which is presented as part of the "heart of the seminar"! (See previous b. de p. note.)

imposture (that SGA 5, where he and his friend learned their trade, would depend on the pirate-volume SGA 4<sup>1</sup>, made of bries and bracs gleaned or plundered over the following twelve years), by a luxury of cross-references to SGA 4<sup>1</sup> every page turn...

The final word goes (as it should) to Deligne, who wrote to me a month ago (May 3), in response to a laconic request for information (see the beginning of the note "Les Obsèques", n° 70):

"In short, if it had been seven years since you were doing maths [?!] when this SGA 4 text<sup>1</sup> appeared, this simply corresponds [?] to the long delay in editing SGA 5, **which was too incomplete to be usefully published as it stood.**

I hope these explanations please you."

If they haven't "approved" me, at least they've edified me. . .

**Note 87<sub>4</sub>** (June 6) Perhaps it's time to indicate what the main themes were that were developed in the oral seminar, and of which the published text gives an idea only by cross-checking.

I) Local aspects of duality theory, whose essential technical ingredient is (as in the coherent case) the biduality theorem (supplemented by a "cohomological purity" theorem). I have the impression that the geometrical meaning of the latter theorem, as a local Poincaré duality theorem, which I had explained so well in the oral seminar, has since been entirely forgotten by my former students<sup>108</sup> (\*).

II) Trace formulas, including "non-commutative" trace formulas more subtle than the formula of the usual traces (where both members are integers, or more generally elements of the ring of coefficients, such as  $\mathbb{Z}/n\mathbb{Z}$  or an  $\ell$ -adic ring  $\mathbb{Z}$ , or even  $\mathbb{Q}$ ), placing ourselves in the algebra of a  $\square$  finite operating group on the considered scheme, with coefficients in a suitable ring (such as those considered in the previous parenthesis). This generalization came very naturally, since even in the case of Lefschetz formulas of the usual type, but for "twisted" bundles of coefficients, we were led to replace the initial scheme by a Galois coating (usually branched) serving to "untwist" the coefficients, with the Galois group operating on it. Nielsen-Wecken" type formulas are thus naturally introduced into the schematic context.

III) Euler-Poincaré formulas. On the one hand, there was a detailed study of an "absolute" formula for algebraic curves, using Serre-Swan modules (generalizing the case of moderately branched coefficients, giving rise to the more naive Ogg-Chafarévitch-Grothendieck formula). On the other hand, there were novel and profound conjectures of the "discrete" Riemann-Roch type, one of which reappeared seven years later, in a hybrid version, under the name of the "Deligne-Grothendieck conjecture", proved by Mac Pherson by transcendental means (see note n° 87 ).<sup>1</sup>

The comments I couldn't fail to make on the profound relationships between these two themes (Lefschetz formulas, Euler-Poincaré formulas) were also lost without trace. (As was my habit, I left all my handwritten notes to the volunteer-writers, and no written trace remains of the oral seminar, of which I did, of course, have a complete set of handwritten notes, even if some of them were succinct).

IV) Detailed formalism for homology and cohomology classes associated with a cycle, derived naturally from the general duality formalism and the key idea of working with the cohomology "with supports" in the cycle under consideration, using cohomological purity theorems.

<sup>108</sup>(\*) This geometrical interpretation has at least been preserved in Illusie's writing.

V) Finiteness theorems (including generic finiteness theorems) and generic K nneth theorems for cohomology with any support.

The seminar also developed a technique for passing from torsion coefficients to l-adic coefficients (lectures V and VI). This was the most technical part of the seminar, which as a rule worked with torsion coefficients, and then "go to the limit" to deduce the corresponding l-adic results.

dants. This point of view was a <sup>provisory</sup> pis-aller, pending Jouanolou's thesis (still unpublished at p. 37)

(at present) giving the formalism that was needed directly in the l-adic framework.

I don't include among the main "themes" the calculations of some classical schemes and the cohomological theory of Chern classes, which Illusie highlights in his introduction as "one of the most interesting" of the seminar. As the program was full, I hadn't felt it necessary to dwell on these calculations and this construction in the oral seminar, as it was sufficient to repeat, virtually verbatim, the reasoning I had given ten years earlier in the context of Chow rings, on the occasion of the Riemann-Roch theorem. On the other hand, it was obvious that it had to be included in the written seminar, to provide a useful reference for the user of étale cohomology. Jouanolou took on this task (Lecture VIII), which he had to regard not as a service to the mathematical community, while learning basic techniques essential for his own use, but as a chore, since its writing dragged on for years<sup>109</sup> (\*). It was no different, it seems, for his thesis, which remains a ghostly reference just like Verdier's. ... The "passage à la limite" section shouldn't be counted as one of the seminar's "main themes" either, in the sense that it isn't associated with any particular geometrical idea. Rather, it reflects a technical complication peculiar to the context of étale cohomology (distinguishing it from transcendental contexts), namely that the main theorems on étale cohomology concern in the first place **torsion** coefficients (prime to residual characteristics), and that in order to have a theory that corresponds to rings of coefficients of zero characteristic (as is necessary for Weil's conjectures), we need to go to the limit on rings of coefficients  $Z/t^n Z$  to obtain "*l-adic*" results.

All this said, the only one of the five main themes of the oral seminar that appears in complete form in the published text is theme I. Themes IV and V have simply disappeared, absorbed by SGA 4. Themes IV and V have disappeared altogether, absorbed by SGA 4<sup>1</sup>, with the advantage of being able to refer to them extensively and give the impression that SGA 5 depends on a text by Deligne that appears to predate it. Themes II and III appear in the published volume in mutilated form, still maintaining the same imposture of dependence on the SGA 4 text<sup>1</sup> (which in reality emerged entirely from the mother seminar SGA 4, SGA 5).

### 15.3.6. The skinning

**Note 88** □(May 16) The set of two consecutive seminars SGA 4 and SGA 5 (which for me are like p. 373 a single "seminar") develops from nothingness both the powerful instrument of synthesis and discovery represented by the **language of** topos, and the perfectly perfected, perfectly effective **tool of** stale cohomology - better understood in its essential formal properties, from that moment on, than even the cohomological theory of ordinary spaces<sup>110</sup> (\*). This whole represents the most profound and innovative contribution I have made to mathematics, at the level of a fully completed work. At the same time, and without wishing to be, while at every moment everything unfolds with the naturalness of

<sup>109</sup>(\*) (June 12) Going through the presentation in question, I was convinced of Jouanolou's perfect connivance with my other cohomology students.

<sup>110</sup>(\*) Even if we restrict ourselves to the spaces closest to "varieties", such as triangulable spaces.

Obviously, this work represents the most far-reaching technical "tour de force" I've accomplished in my work as a mathematician<sup>111</sup> (\*\*). For me, these two seminars are indissolubly linked. They represent, in their unity, both the **vision** and the **tool** - the topos, and a complete formalism of scalar cohomology.

While the vision is still rejected today, the tool has, over the last twenty years or so, profoundly re-imagined algebraic geometry in its most fascinating aspect for me - the "arithmetic" aspect, apprehended by an intuition, and by a conceptual and technical baggage, of a "geometric" nature.

It was certainly not only the intention of suggesting that his cohomological "digest" **had anteriority** over the SGA 5 part that motivated Deligne to give it the misleading name SGA 4<sup>1</sup> - nothing prevented him from doing so.

after all, while we're at it, to call it SGA 3<sup>1</sup> ! In "Operation SGA 4<sup>1</sup>" I sense the intention to present the work from which all his own work stems (this work from which he cannot detach himself!) - a work of obvious and profound unity, clearly apparent in the two seminars, SGA 4 and (the real) SGA 5, as thing **divided** (as itself is divided. . . ), **cut in two** by this violent insertion of a foreign and disdainful text; of a text that would like to present itself as the living heart, the quintessence of a thought, of a vision in which he had no part<sup>112</sup> (\*), and the two "quarters" that surround it as a sort of vaguely grotesque appendix, like a collection of "digressions" and "technical complements" to the work that Deligne claims to be central and essential, and in which my humble self is graciously admitted (before total burial) to the number of "collaborators"<sup>113</sup> (\*\*).

Chance" had done it right. This "corpse left to mercy - this "unfortunate seminar" always left behind by the "editors", and at the time of my departure in the hands and at the discretion of my cohomology students - this was not **just any** part of the master's work! It wasn't SGA 1 and SGA 2 (where I was developing, in my own corner and without even realizing it, the tools that were to be the two essential technical aids for the "take-off" of the main work to come), nor SGA 3 (where my contribution consisted mainly of incessant - and sometimes arduous - scales and arpeggios to hone the "all-out" technique of schematics), nor SGA 6 (systematically developing my ten-year-old ideas on the Riemann-Roch theorem and the intersection formalism), or even SGA 7 (which, through the inner logic of reflection, stems from the possession of the central tool, mastery of cohomology). It is indeed the **main part of** my work, the writing of which had remained unfinished (and by their care. . . ), that I have left, at least in part, in the hands of my cohomology students. It was this main part of the work that they chose to massacre and appropriate as their own, forgetting the unity that is their meaning and beauty, and their creative virtue (90).

And it's no coincidence either that, equipped with heterogeneous tools and denying the spirit and vision that had brought them into being from nothing, none were able to discern the innovative work where it was being reborn, against their indifference and disdain. Nor that after six years, when at the end of the line the new tool was finally

apprehended by Deligne, they unanimously buried the one who had created it in solitude - Zoghman Mebkhout, <sup>□</sup>the disowned master's posthumous pupil! And it's no more a coincidence that, after the momentum had died down

Deligne's initial work (which in just a few years had led him to launch a new theory of

<sup>111</sup>(\*\*) Some difficult or unforeseen results were obtained by others (Artin, Verdier, Giraud, Deligne), and some parts of the work were done in collaboration with others. This in no way detracts (in my mind at least) from the strength of my appreciation of the place of this work in my body of work. I intend to come back to this point in more detail, in an appendix to the Thematic Outline, and to dot the i's and cross the t's where it's obviously become necessary.

<sup>112</sup>(\*) This line of thought had reached full maturity, in terms of both key ideas and essential results, even before the young man Deligne appeared on the scene to learn algebraic geometry and cohomological techniques from me, between 1965 and 1969.

(May 30) On this subject, see the note "L'être à part", n° 67'.

<sup>113</sup>(\*\*) See notes "Le feu vert", "Le renversement", n° s 68, 68'.

Hodge, and towards the demonstration of Weil's conjectures), and despite its prodigious means and the brilliant means of my cohomology students, I note today this "morose stagnation" in a field of prodigious richness where everything still seems to be to be done. This should come as no surprise, when for nearly fifteen years the main source of inspiration and some of the "big problems"<sup>114</sup> (\*), even though they are present and confronting us at every step, remain carefully bypassed and concealed, like the messengers of the one whom for fifteen years it has been our constant aim to bury.

### 15.3.7. . . and the body

**Note** 89 (May 17) The thought, the vision of things that lived within me and that I had thought I was communicating, I see as a living body, healthy and harmonious, animated by the power of renewal of living things, the power to conceive and engender. And now this living body has become a **corpse**, shared between some and others - this limb or quarter, duly stuffed, serving as a trophy for one, another, butchered, as a puzzle or boomerang for another, and yet another, who knows, as it is, for the family kitchen (we're not that far from it!) - and all the rest is good for rotting in the dump... .

That's the picture I've come to see, in terms that may be colorful but seem to express a certain reality of things. The puzzle may well fracture a skull here and there<sup>115</sup> (\*\*)  
- but never will these scattered pieces, neither trophy nor puzzle nor family soup, have the power so simple and obvious in the living body: that of the loving embrace that creates a new being. ...

(May 18) This image of the living body, and of the "remains" with its pieces scattered to the four winds, must have been forming in me throughout the past week. □ The comical form in which it presented itself under my pen-p

typewriter in no way means that this image is in the least an **invention**, a tad macabre, a burlesque improvisation on the spur of the moment. The image expresses a **reality**, felt pro- fondly at the moment it took material form through a written formulation. I must have been aware of this reality in bits and pieces, here and there, over the fourteen years since my "departure", and perhaps even before. Bits and pieces of information recorded at first on a superficial level by a distracted attention, absorbed elsewhere - but which all pointed in the same direction, and which must have assembled, on a deeper level, into a certain image - an unformulated image that I didn't bother to take note of, when I had other things to worry about. This image has been considerably enriched and clarified in the course of reflection since the end of March, six or seven weeks ago. More precisely, scattered pieces of information, finally examined by the care of a fully present conscious attention, have been gradually assembled into **another** image, at the more superficial level of the thought that examines and probes, through work that might seem independent of the presence, in deeper layers, of the first. This conscious work culminated six days ago in the sudden vision of the "massacre" that took place - when I felt the "breath", the "smell" of **violence**, for the first time I believe in the whole<sup>116</sup> (\*) reflection. It was also the moment when, in the layers already close to the surface, this

<sup>114</sup>(\*) This "main source of inspiration" is, of course, the "yoga of motives". It has been active in Deligne alone, who has kept it to himself for his own "benefit", and in a narrow form deprived of much of its force, denying some of the essential aspects of this yoga. Among the "great problems" inspired by this one, which have been ignored or discreetly discredited, I see right now (outsider that I am) the standard conjectures, and the development of the formalism of the "six operations" for all the usual types of coefficients, more or less close to the "motifs" themselves (which play in their respect the role of "universal" coefficients - those which give rise to all the others). Compare with the comments on this subject in the note "My orphans", n° 46.

<sup>115</sup>(\*\*) (May 31) And it will even be used to prove a theorem "of proverbial difficulty"!

<sup>116</sup>(\*) (June 12) In recent years, I've sensed violent intent on the part of some of my ex-students towards some of my "co-students", but never a violence that could be felt as coming from a collective will (grouping five of them here).

the feeling of a living, harmonious body, which is well and truly "massacred" - and also the one in which the deeper, diffuse image must have begun to surface, perhaps bringing to the image-in-form a carnal dimension, a "smell" that thought alone is powerless to give.

This "carnal" aspect came to the fore again in a dream last night - it's under the impulse of this dream that I now return to the lines I wrote yesterday. In this dream, I was cut quite deeply in several places on my body. First of all, there were cuts on my lips and in my mouth itself, bleeding profusely as I rinsed out my mouth with copious amounts of water (heavily reddened by blood) in front of my face. an ice pack. Then wounds in the belly, also bleeding profusely, especially one from which blood was coming out.

p. 377

□ by jerks, as if it were an artery (the Dreamer didn't care about anatomical realism). The thought I pressed my hand in front of the wound and curled up to stop the blood - it did indeed stop flowing, eventually forming a clot and a very large scab. Later, when I carefully lifted the scab, delicate healing had already begun. I was also cut on one finger, and it was surrounded by an impressive dressing doll... ...

I have no intention of embarking on a more delicate and detailed description of this dream, nor of probing it in depth here (or elsewhere). What this dream "as is" already reveals to me with startling force is that this "body" of which I spoke yesterday, and which as I was writing I saw as detached from me, like a child perhaps that I had conceived and procreated and which had gone out into the world to follow its own path - this body remains today an intimate part of my person: that it is **my** body, made of flesh and blood and a life force that enables it to survive deep wounds and regenerate itself. And my body is also, without doubt, the thing in the world to which I am most deeply, most indissolubly linked. ...

The Dreamer did not follow me in the image of the "massacre" and the sharing of the remains. This image was meant to convey the reality of intentions, of dispositions in **others** that I had strongly perceived, and not the way in which I myself experienced this aggression, this mutilation of which I was the object through something to which I remain closely linked. The Dreamer has just given me a glimpse of the extent to which I remain linked to it. This ties in with what I perceived (albeit less forcefully) in the reflection in the note "Le retour des choses - ou un pied dans le plat" (n° 73), where I try to pinpoint the feeling of this "deep link between the one who conceived a thing, and this thing", which appeared in the course of the reflection that day. Before that reflection on April 30 (barely three weeks ago), and for the rest of my life, I have pretended to ignore this link, or at least to minimize it, following the well-trodden path of current clichés. Worrying about the fate of a work of art that has left our hands, and of course worrying about whether our name remains attached to it in any way, is felt to be petty and mean-spirited - whereas it seems natural to us all that we should be deeply touched when a child of the flesh whom we have raised (and whom we believe we have loved) chooses to repudiate the name he was given at birth.

### 15.3.8. The heir

□

p. 378

**Note 90** (May 18) I don't know if any student in the sixties (apart from Deligne) was able to sense this essential unity, beyond the limited work he was doing with me. Some may have sensed this in a confused way, and that this perception was lost without return in the years following my departure. What is certain, however, is that from our first contact in 1965, Deligne sensed this living unity. It was this fine perception of a unity of purpose in a vast design that was surely the main stimulus for his intense interest in everything I had to communicate and pass on. This interest

---

people) and directed against me, through my work.

demonstrated, without ever wavering, throughout the four years of constant mathematical contact between 1965 and 1969<sup>117</sup> (\*). He gave mathematical communication between us that exceptional quality I've already mentioned, and which I've experienced with other mathematician friends only in rare moments. It was this perception of the essential, and the passionate interest it stimulated in him, that enabled him to learn as if by playing everything I could teach him: both the technical means (zinc strand diagram technique, Riemann-Roch yoga and intersections, cohomological formalism, étale cohomology, topos language) and the overall **vision** that unites them, and finally the **yoga of patterns** that was then the main fruit of this vision, and the most powerful source of inspiration I had yet discovered.

What's clear is that Deligne was the only one of my students, right up to the present day, who at a certain point (as early as 1968, I believe) had fully assimilated and made his own the totality of what I had to transmit, in its essential unity as well as in the diversity of its means<sup>118</sup> (\*\*). It was, of course, this circumstance, felt by all, that made him the designated "legitimate heir" to my work.

work. Clearly, this heritage neither encumbered nor limited him - it was not a burden, but gave him a sense of identity.

wings; I mean: he nourished with his vigor these "wings" <sup>"□which</sup> he had from birth, like other visions and p . 379 other heritages (less personal of course...) would nourish it...

The heritage he had nurtured in those crucial years of growth and development, and the unity that makes up its beauty and creative virtue, which he had sensed so well and which had become like a part of himself - my friend subsequently<sup>119</sup> (\*) denied them, striving relentlessly to hide the heritage, and to deny and destroy the creative unity that was its soul. He was the first among my students to set an example by appropriating tools, "pieces", while striving to dislocate the unity, the living body from which they came. His own creative impulse was slowed down, absorbed and finally dislocated by this deep division within him, driving him to deny and destroy the very thing that made him strong, that nourished his impulse.

I see this division expressed in three interrelated effects. One is the dissipation of energy, scattered in the effort to deny, dislocate, supplant, hide. The other lies in the rejection of certain ideas and means, essential to the subject's "natural" development.

which he has chosen as his central theme<sup>120</sup> (\*\*). The third is the attachment to this theme, of all themes, which is about

to supplant, to oust a master who is present every step of the way and who must be constantly erased - the very theme p . 380

who is most intensely invested with the fundamental contradiction that dominated his life as a mathematician.

What I know at first hand, and a basic instinct or flair that has never deceived me, make

<sup>117</sup>(\*) This period comprises five years, of which my friend spent one (1966) in Belgium doing his military service.

<sup>118</sup>(\*\*) When I say "totality", I mean everything that was essential, both in vision and in means. This doesn't mean, of course, that there weren't unpublished ideas and results that I never thought of telling him about. On the other hand, I don't think there was any mathematical reflection from the years 1965-69 that I didn't talk about "on the spot" to my friend, always with pleasure and profit.

<sup>119</sup>(\*) Strangely enough, this division must have been present as early as the first year of our meeting (already expressed in an ambiguous attitude towards the SGA 5 seminar, which was his first contact with schemes, Grothendieck-style cohomological techniques, and staggered cohomology), and at the latest and in unequivocal form as early as 1968 (see note "L'éviction", n° 63). - at a time, therefore, when mathematical communication was perfect, and when the development of his mathematical thinking seems to me not yet to have been marked by conflict. At the time, he made many interesting contributions (which I take great pleasure in highlighting in the Introduction to SGA 4) on topics that he did his utmost, immediately after my departure, to bury.

<sup>120</sup>(\*\*) This refusal manifested itself in the burial of derived and triangulated categories (until 1981), of the formalism of the six variances (until today), of the language of topos (also), and by a sort of "blocking by disdain" of the vast program of foundations for homological and hoinotopic algebra, which I'm now trying (twenty years later) to sketch out with La Poursuite des Champs, and which he had of course also felt the need for. However, even though it was inspired by the yoga of motifs (buried until 1982), this yoga remained mutilated of part of its force, being detached from the formalism of the six variances which constitutes an essential formal aspect of it. It seems to me that this aspect has also been rigorously banished from

Hodge-Deligne's theory.

it's quite clear to me that if Deligne hadn't been torn by this profound contradiction in his own work, mathematics today wouldn't look like it does<sup>121</sup> (\*) - that it would have undergone, in several of its essential parts, far-reaching renewals like the one I myself had been the main instrument of - the very one that this same Deligne was bent on countering and diverting!<sup>122</sup> (\*\* )

There's also no doubt that he was ideally suited to be the driving force behind a powerful school of geometry, a continuation of the one that had formed around me - a school nourished by the vigor of the one from which it had sprung, and the creative power of the one who was taking over from me. But this school that had formed around me, this nurturing matrix that had surrounded intense years of training - it broke up the day after my death.

p. 381 of my departure. If this was the case, it was precisely because I couldn't find, in the person who was obviously taking over from me<sup>123</sup> (\*\*\*), the person who would also be the soul of a group united by a common adventure, for a common task.

whose dimensions are beyond anyone's means.

I have the impression that, after my departure, each of my students found themselves in their own corner, with a wealth of work to do - there's no shortage of that anywhere in maths - but without this "corner" fitting into a whole, and without this "work" being carried along by a current, by a wider purpose. Surely, as soon as I left, if not even before, the eyes of most of my students or ex-students were focused on the designated "successor", the most brilliant among them and also the closest to me. At this sensitive moment, my friend must have felt, perhaps for the first time in his life, the power over others that was suddenly in his hands, the power of life or death that he had over the fate of a certain school from which he had come, and whose friends he had rubbed shoulders with for four years were no doubt expecting him to ensure its continuity. The situation was entirely in his hands, and it was he who would set the tone... He did indeed set the tone, by destroying the legacy, and first and foremost that confidence and expectation<sup>124</sup> (\*) which those who, with him, had been pupils of the same master, could not fail to bring him. ...

I'm sure many people are impressed by Deligne's work, and not without reason. But I'm also well aware that this work, beyond the impressive initial impetus (ending with the demonstration of Weil's conjectures), is far from "living up to its potential". It certainly demonstrates an uncommon technical mastery and ease, placing him among the "best". But it lacks the humble virtue that

<sup>121</sup>(\*) When I wrote these lines about "mathematics today", I wasn't just thinking about the more or less profound knowledge we have of mathematical things today. I was also thinking, in the background, of a certain **spirit** in the world of mathematicians, and more particularly in what might be called (without sarcastic or mocking intonation) "the big mathematical world": the one that "sets the tone" for deciding what is "important", even "licit", and what is not, and the one that also controls the means of information and, to a large extent, careers. Perhaps I'm exaggerating the importance that a single person, in the position of figure de proue, can have on the "spirit of the times" in a given milieu at a given time. Deligne's career seems to me to be comparable (for better or for worse) to Weil's in the milieu that had welcomed me twenty years earlier, and with which I had identified myself for twenty years.

(May 31) Compare with the (complementary) reflections in the note "Le Fossoyeur - ou la Congrégation toute entière", n° 97.<sup>122</sup> (\*\*) (June 16) I'm convinced that the very fact that the key ideas I've introduced into mathematics are already developing normally, on the momentum gained in the sixties (cut short by the "chainsaw effect" to be discussed in the following two notes. ... ), mathematics today, fifteen years after my departure, would have been different from what it is, in some of its essential parts. ...

<sup>123</sup>(\*\*\*) This **de facto succession** was expressed by unequivocal concrete signs: he took over from me at the IHES (from which I left the year after he joined - see note "L'éviction", n° 63), and he took over, with the means I had developed at this final for some fifteen years (from 1955 to 1970), the central theme of the cohomology of algebraic varieties.

<sup>124</sup>(\*) (May 26) In the course of further reflection, I detected yet another "expectation" regarding my tacit heir, this time coming not from my students alone, but from "the whole Congregation" - see the end of the note "The Gravedigger - or the whole Congregation" (n° 97). I have little doubt that these two opposing expectations, one linked to a very particular moment, the other continuing throughout the fourteen years of the Burial, are both real. What's more, I'd be inclined to think that for many of my former students, the two expectations must have been present simultaneously: that of finding in the most brilliant among them the one who would ensure the continuity of a School and a work in which they had their place and their part - and that of seeing erased (if that were possible) all trace of the one whose departure suddenly called out to them with such force, in the quietude of the well-trodden paths. ...

I perceived in him in his early years - the virtue of renewal. This virtue he carried within him, this freshness or innocence of the little child, has long since been deeply buried, denied. I was about to write that by this "virtue" and by his not very <sup>common</sup> gifts, as well as by the exceptional circumstances of which he benefited from the deployment of his gifts, Deligne was called upon to "dominate" the mathematics of our time, just as a Riemann, or a Hilbert, had each "dominated" the mathematics of their time. Inveterate habits of thought, rooted in common parlance, have suggested to me this image of "domination", which nevertheless gives a distorted apprehension of reality. These great men undoubtedly fully "grasped", "assimilated", "made their own" the mathematics known in their time, which undoubtedly also gave them an exceptional mastery of technical means. But if they rightly seem "great" to us, it's not through their technical prowess, "wresting" difficult demonstrations from surly substance. It's by the renewal each of them brought to several important parts of mathematics, by simple and fruitful "ideas", that is to say: for having turned their gaze on simple and essential things, to which no one before them had deigned to pay attention. This childlike ability to **see** simple, essential things, however humble and disdained by all - **this is the** power of renewal, the creative power in everyone. This power was present to a rare degree in the young man I knew, unknown to all, a modest and passionate lover of mathematics. Over the years, this humble "power" has seemed to disappear from the person of the admired and feared mathematician, enjoying unfettered his prestige, and the (sometimes discretionary) power it gives him over others.

This **stifling** in my friend of something very delicate and very vivid, neglected by all and which has creative power, I've felt it many times since I left, and more and more in recent years. But it took the discoveries of the last few weeks, and the reflection I've been pursuing since the end of March (following on from Récoltes et Semailles), to begin to feel the full extent of the devastating effect of this suffocation in the life of my friend, and among many others I've known closely. Not only on some of my "later" (and assimilated) students, who were subjected to his malevolence (perhaps unconscious in some cases), which was exercised against everyone and weighed heavily on three of them; but also, it seems to me glimpse it now, among my students "before", by the destruction of a **continuity** in the subject, and that of a sense of a whole, a unity, giving a deeper and broader meaning to their work than ce <sup>lui</sup> p. 383 an accumulation of separate prints bearing their names (91)<sup>125</sup> (\*).

More than once in the last seven years, and more than once again in the last few weeks and days, I've felt a sadness, at what feels, on some level, like an immense **waste** - when what is most precious in oneself and in others is squandered or smothered as if for pleasure. Yet I've also come to learn that such "waste" is a staple of the human condition, to be found in one form or another everywhere, in the lives of individuals, from the humblest to the most illustrious, as well as in the lives of peoples and nations. This very "mess", which is nothing other than the action of conflict and division in everyone's life, is a substance of a richness and depth that I have barely begun to fathom, a nourishment that it is up to me to "eat" and assimilate. So this mess, and every other mess I encounter at every step, and every other thing that happens to me at the turn of the road and is so often unwelcome - this mess and other unwelcome things carry within them a  **blessing**. If meditation has meaning, if it has the power of renewal, it's insofar as it allows me to receive

<sup>125</sup>(\*) (June 16) This second aspect only came to my attention in the course of my reflection on L'Enterrement. If ever I saw a prestigious mathematician make use of the "power to discourage", it was the very man who once seemed to me to be my heir apparent. When I wrote the section "The power to discourage", I had thought a lot about him (before the thought came back to me), but without yet having the slightest inkling (at least not on a conscious level) of the extent to which this power had found occasion to be exercised among the very people for whom he must have been (as he was for me) the model of the perfect mathematician. ...

the benefit of that which (through my inveterate reflexes) presents itself as "evil", where it allows me to **nourish** what seems designed to destroy.

Nourishing yourself with your experience, letting it renew you instead of constantly evading it - that's what it means to take full responsibility for your life. I have this power within me, and it's up to me at any given moment to make use of it, or to let it go to waste. It's the same for my friend Pierre, and for each of my students - free, like me, to feed on the "mess" I'm finishing reviewing in these last days of a long meditation. And the same goes for the reader who reads these lines, intended for him or her.

### 15.3.9. The co-heirs

p. 384

**Note** 91 (May 19) The echoes that have reached me here and there about my former pupils have been more than sparse.

Hardly any of them gave me any sign of life after my departure, if only by sending me prints<sup>126</sup> (\*). However, by gathering together the few that have reached me, I can form an idea, admittedly very approximate. Perhaps it will become clearer in the months to come, if this reflection prompts some of them to come forward.

I've already had occasion to note the profound rupture in Deligne's work after my departure, even though in some respects he appears, unwillingly, as a successor, and therefore as part of a certain continuity. And I had the feeling that this rupture must have had profound repercussions on the work of all my other students. It's this impression that I'd like to explore a little more closely.

The only one of these students whose work seems to be an obvious (at least at first sight) extension of the work he had done with me, seems to be Berthelot<sup>127</sup> (\*\*). He's also the only one who, for a long time, sent me numerous separate prints - perhaps even all his separate prints. They are all on the difficult subject of crystalline cohomology, the systematic start-up of which is the subject of his thesis. Yet it seems to me that, as with my other (commutative) "cohomology" students, his work is marked by the disaffection of some of the main ideas I had introduced: derived categories (and triangulated categories, cleared by Verdier), six-operation formalism, topos (91<sub>1</sub>). As Zoghman Mebkhout himself says, his own work, so close in theme to Berthelot's (91<sub>2</sub>), is in line with these ideas, combined with those of the Sato school. If they hadn't been repudiated by my cohomology students, led by Deligne and Verdier, there's a good chance that from the very beginning of the seventies,

p. 385

Mebkhout's crystalline theory (which he began to develop only from 1975, against the disinterest of these same students) would already have reached the full maturity of a formalism of <sup>six</sup>□operations, which it still hasn't reached today<sup>128</sup> (\*).

Incidentally, I remember talking to Verdier about the question, which intrigued me, of the link between constructible discrete coefficients and continuous coefficients, without it seeming to catch his eye. It must have caught on later

<sup>126</sup>(\*) (May 31) On this subject, see note no. 84, following the note on "Silence" (no. 84).

<sup>127</sup>(\*\*) According to the duality theme that Verdier pursued for a few years after my departure, in the context of analytic spaces close to the one in which I had developed it, there is an impression of continuity as in Berthelot's case. But it seems to me that this has been a bit of a "routine continuity", whereas the one whose signs (or absence of signs) I'm looking for above all is a creative continuity, continuing an initial impulse into the unknown. ...

<sup>128</sup>(\*) (June 7) I hesitated to hazard this assessment, which could be interpreted as minimizing the originality of Mebkhout's theory. This would not be at all in line with my thinking, and all the more so as I have an excellent opinion of the abilities of each of my cohomology students (when they are not blocked by prejudices alien to mathematical common sense). My friend Zoghman himself dispelled any scruples I might have had, saying that he was convinced that "normally", it was my students who should have been developing his theory from the very beginning in the 70s. At a certain level, they're surely the first to be convinced: it's they, or Deligne, who **should have** developed it - and with the general degradation of morals, that's all it takes to behave as if they (or Deligne) really were! On this subject, see the notes "Le Colloque" and "La mystification", n°s 75' and 85'.

(See note "L'inconnu de service et le théorème du bon Dieu", n° '48.) In fact, he was so "blocked" by his burial syndrome that, until October 1980, he failed to perceive the importance of Mebkhout's work - and when he finally did, it was in the grave-digging mood we all know (see notes n° s 75 to 76).

As far as I'm aware, Verdier's work since his thesis defense has essentially been limited to redoing in the analytical context (which sometimes presents additional technical difficulties) what I had done in the coherent schematic framework, without introducing any new ideas. It's even rather extraordinary, with the reflexes he was supposed to have developed, and well-informed as he was, that he didn't come across Mebkhout's theory himself, by dint of turning his crank - and that he didn't at least recognize that his "pupil" was doing some interesting things, which had escaped him (as they had escaped Deligne).

To tell the truth, while intrigued by the question of the relationship between discrete coefficients and coefficients continuous, I hadn't really had any inkling of Mebkhout's crystalline theory, which would blossom in the decade following my departure. On the other hand, there was a vast theme, arising from my <sup>reflexions</sup> of cohomology both commutative and non-commutative of the fifties (1955-1960), and which was just beginning (in the "commutative" context i.e. in terms of additive categories) in Verdier's work, started in the early sixties and left behind after his defense (see note n° 81). The non-commutative aspect was initiated later in Giraud's thesis, which developed a geometric language, in terms of 1-fields over a topos, for non-commutative cohomology in dimension  $\leq 2$ . By the second half of the sixties, the inadequacy of these two primers was quite obvious: both in terms of the inadequacy of the notion of "triangulated category" (teased out by Verdier) to account for the richness of structure associated with a derived category (a notion destined to be replaced by the considerably richer notion of **derivator**), and in terms of the need to develop a geometric language for non-commutative cohomology in any dimension, in terms of n-fields and  $\infty$ -**fields** over a topos. One sensed (or I sensed) the need for a synthesis of these two approaches, which would serve as a common conceptual foundation for homological algebra and homotopic algebra. Such a work was also in direct continuity with Illusie's thesis work, in which both aspects are represented.

Bousfield-Kan's seminal work on homotopic limits (Lecture Notes n° 304), published in 1972, was also in line with this diffuse program, which since at least 1967 had been just begging to be developed. In January of last year, without yet suspecting that I would be embarking on the Pursuit of Fields a month later, I submitted to Illusie some thoughts on the "integration" of homotopy types (familiar to homotopists as "homotopic (inductive) limits"), at a time when I was still completely unaware of the existence of Bousfield and Kan's work, and that this type of operation had already been examined by others than myself. It turned out that Illusie was equally unaware of it, despite the fact that he was supposed to have remained in homologous-homotopic waters for all the time since my "death" in 1970! This just goes to show how far he seems to have lost touch with certain realities that are part and parcel of the fundamental thinking he himself had been pursuing in the sixties<sup>129</sup> (\*). He must have made his own little hole, from which he hardly ever emerges. ...

□ With the disdain that has befallen the very notion of topos and all the "categorical nonsense", it is not surprising

p. 387

<sup>129</sup>(\*) This notion of "integrating" homotopy types had come to me again, in the context of unscrewing stratified structures, which I took up at the end of 1981.

that Giraud now has a total disaffection for what had been his first major theme of work. It's true that Deligne, with the exhumation of motives two years ago, pretended to have suddenly discovered the interest of the arsenal of non-commutative cohomology, sheaves, links and consorts, as if he himself had just introduced them, along with motives and motivic Galois groups<sup>130</sup> (\*). It's doubtful that this kind of circus will rekindle a flame that he himself has worked so hard to extinguish. ... In February last year, I sent Giraud a copy of the twenty-page letter that became Chapter 1 of the opening chapter of *La Poursuite des Champs*. It's a non-technical reflection, in the course of which I managed to "jump with both feet" over the "purgatory" that had once stopped Giraud (and many others) from handling the notion of "non-strict"  $n$ -category (which I now call " $n$ -field"), which remained heuristic and yet was visibly fundamental. This was the start of the *Poursuite des Champs*. When we met (on friendly terms) last December for Contou-Carrère's thesis defense, I learned from Giraud that he hadn't even had the curiosity to read the letter! I got the impression that he'd drawn a long line under such things. The idea that there might be some rich substance, in a direction he had long since abandoned, didn't even seem to occur to him. I tried, unsuccessfully I'm afraid, to get him to understand that there was a juicy and vast work here that had been waiting for nearly twenty years to be done, and which I finally got round to in my old age, to at least give a broad outline, under the dictation of things themselves, of a rich substance that the "deceased" me continues to feel strongly about, while my students have long since forgotten about it.

Jouanolou also abandoned a research direction he had just begun with his thesis. This direction had become the object of the disdain of a fashion established by the very person who had provided him with a master technical idea for the theme he had chosen. With the "rush" on triangulated categories with the Colloque Pervers three years ago, this same Deligne suddenly pretended (without laughing) to discover the big job of foundations in perspective, the lack of which is suddenly felt at all ends, and which he had  $\square$ été the first to discourage for ten years - The need for such a job was quite obvious to me as early as 1963/64 with the beginnings of étale cohomology; and for Deligne just as much, from the moment he started hearing about  $l$ -adic cohomology and triangulated categories, i.e. when he arrived at my seminar the following year. Beyond the construction of "constructible triangulated categories" on the ring  $\mathbb{Z}_l$  (above a basic scheme, let's say), and the development of the formalism of the "six operations" within this framework (something accomplished, it seems to me, in Jouanolou's thesis), to make analogous work by replacing the base ring  $\mathbb{Z}_l$  by an arbitrary (more or less?) Noetherian  $\mathbb{Z}_l$ -algebra, e.g.  $Q_l$  or an (algebraic?) extension of  $Q_l$ . This is one of the things for which time has been ripe for some twenty years, and which are still waiting to be done, when the wind of contempt that has blown over them has died down... .

The natural continuation of Ms. Raynaud's work (weak Lefschetz theorems in staggered cohomology, in terms of 1-fields) would have been placed in a context of strictly taboo  $\infty$ -fields, let's not talk about it! The same goes for Ms. Sinh's work, begun in 1968 and completed only in 1975 - a natural continuation would have been the notion of an enveloping  $\infty$ -category of Picard of a so-called "monomial" category, or of triangulated variants of such a category<sup>131</sup> (\*) - let's not! Another was to transpose her work in terms of fields onto a topos - what a horror! As for Monique Hakim, she too had the misfortune to write her thesis on a subject which, in the times since my untimely departure, looks a bit ridiculous on

<sup>130</sup>(\*) See "Souvenir d'un rêve. . . - or the birth of motifs", note n° 51.

<sup>131</sup>(\*) See "Souvenir d'un rêve. . . - or the birth of motifs", note n° 51.

edges - relative diagrams on a locally ringed topos, I ask you! His little book on the subject, published in Grundlehren (Springer), must sell three or four copies a year - no wonder I've got bad press there, and they're not too keen to accept any text I might recommend. For me, it was a first test-step towards a "relativization" of all "absolute" notions of "varieties" (algebraic, analytic, etc. . . ) on general "bases", the need for which is obvious to me (91<sub>3</sub> ). It's true that we've done just fine without them until now. But it's also true that we've done without maths for the two million years we've been around.

The fact remains that Monique Hakim, who was not motivated to write her thesis in the same way as I was to offered it to him, surely had no desire to keep any contact with a theme which (detached from p . 389

In the context of a favorable consensus, or stubborn thought pursuing a tenacious and sure vision against all odds, it can no longer make the slightest sense.

As for Neantro Saavedra Rivano, he seems to have disappeared entirely from circulation - I can find no trace of his name even in the official world directory of mathematicians. What is certain is that his rather categorical thesis subject could hardly have been in good press with the gentlemen who decide what is serious and what is not. The most natural continuation of this thesis, in my opinion, would have been neither more nor less than this "vaste tableau des motifs", a theme decidedly a little broad for this student's more modest aims. Yet he ended up having the unexpected honor of having his thesis redone ab ovo et in toto by one of these great gentlemen himself, barely two years ago. (On this subject, see the notes "L' Enterrement - ou le Nouveau Père" and "La table rase", n° s 52 and 67.)

Finally, the only ones among my twelve "pre-1970" students for whom it's not too clear to me whether or not there was a more or less drastic or profound **break in** their work, compared to the one they had to follow in my contact, are Michel Demazure and Michel Raynaud (91<sub>4</sub> ). All I know is that they've continued to do maths, and that they're part (as you'd expect, given their brilliant means) of what I called earlier "the great mathematical world".

The foregoing brief reflection, based on what is sometimes very little data, is of course largely hypothetical and very approximate. I hope that those mentioned here will forgive me for any perhaps gross errors of assessment, which I'll be happy to rectify if they'd be so kind as to let me know. Here again, I realize that everyone's case is surely different from everyone else's, and represents a much more complex reality than someone as distant as me can reasonably apprehend, let alone express in a few lines. All these reservations aside, I have the impression that this reflection has not been in vain, for me at least, to identify by a few concrete facts, a still vague impression that had emerged yesterday (and which was undoubtedly present at an informal level for many years): that of a **break** that was made p . 390

in many of my students in the aftermath of my departure, reflecting on a personal level the sudden disappearance, overnight, of a "school" to which they must have felt a part during crucial formative years in their mathematical profession.

**Note** 91<sub>1</sub> (May 22) I've just come across an article-survey from the Colloque "Analyse *p*-adique et ses applications" at CIRM, Luminy (September 6-10, 1982), by P. Berthelot, entitled "Géométrie rigide et cohomologie des variétés algébriques de car. *p*" (24 pages), which outlines the main ideas for a synthesis of Dwork-Monsky-Washnitzer cohomology and crystalline cohomology. The initial ideas (and the very name) of crystalline cohomology (inspired by Monsky-Washnitzer cohomology), and the idea of complementing these with the introduction of sites formed by rigid-analytic spaces, ideas that I had introduced in the

In the sixties, they became the daily bread for all those working on the subject, starting with Berthelot, whose thesis developed and fleshed out some of these initial ideas. Nevertheless, my name is conspicuously absent from both the text itself and the bibliography. Here we have a fourth clearly identified pupil-croquemort. Who's next?

(June 7) It's a remarkable fact that more than fifteen years after I introduced the starting ideas of crystalline cohomology, and more than ten years after Berthelot's thesis established that the theory was indeed "the right one" for clean and smooth schemes, we still haven't reached what I call a situation of "mastery" of crystalline cohomology, comparable to that developed for stellar cohomology in the SGA 4 and 5 seminar. By "mastery" (in the first degree) of a cohomological formalism including duality phenomena, I mean no more and no less than full possession of a six-operation formalism. While I'm not "in the know" enough to be able to appreciate the difficulties specific to the crystalline context, I wouldn't be surprised if the main reason for this relative stagnation lies in the disaffection of Berthelot and others for the very idea of this formalism, which makes them neglect (just like

p. 391

Deligne's Hodge theory, which remained in its infancy) the first essential "level" to be reached in order to have a fully "adult" cohomological formalism. These are  $\square$  the same kind of dispositions

which have surely led him to overlook the relevance of Mebkhout's point of view to his own research. NB When I speak here of "crystalline cohomology" in a context where one abandons assumptions of cleanliness (as is necessary for a "fully grown-up" formalism), it is understood that one is working with a crystalline site whose objects are (power-divided) "thickenings" that are not purely infinitesimal, but are "proper" (power-divided) topological algebras. The need for such an extension of the primitive crystal site (which for me was only a first approximation for the "right" crystal theory) was clear to me from the start, and Berthelot learned it (along with the initial ideas) by null other than myself. A written allusion to this link can be found in *Esquisse Thématique*, 5 e.

**Note 91<sub>2</sub>** It's quite extraordinary that nobody but me seems to have realized that Mebkhout's unnamed theory was an essential new part of a crystalline theory. As someone who has been completely "out of cohomology" for nearly fifteen years, I realized this as soon as Mebkhout took the trouble to explain to me what he had done last year. In any case, when I mentioned the matter (as a matter of course) to Illusie, he seemed to see it as a rather "kooky" combination of things (*D-Modules* and crystals) that really had nothing to do with each other. Yet I know first-hand that he has a mathematician's flair, and so do my other students (cohomologists in this case, starting with Deligne) - but I can see that in certain situations, he's no longer any use to them... ... The more I think about it, the more I find it extraordinary that in such an atmosphere, Mebkhout still managed to do his job, without letting his own mathematical flair be defused by the total incomprehension of his elders, so far above him. . .

**Note 91<sub>3</sub>** It was especially since my lectures at the Séminaire Cartan on the foundations of the theory of complex analytic spaces, and on the precise geometrical interpretation of "level modular varieties" à la Teichmüller, towards the end of the fifties, that I understood the importance of a double generalization of the common notions of "variety" we've been working with so far (algebraic, real or complex analytic, differentiable - or  $\square$  subsequently, their "moderate topology" variants). One is to broaden-

p. 392

the definition so as to admit arbitrary "singularities", and nilpotent elements in the structural bundle of "scalar functions" - along the lines of my foundational work with the notion of schema.

The other extension is towards a "relativization" above suitable locally annelated topos ("absolute" notions being obtained by taking a punctual topos as a base). This conceptual work, matured for over twenty-five years and initiated in Monique Hakim's thesis, is still waiting to be taken up. A particularly interesting case is that of the notion of relative rigid-analytic space, which allows us to consider ordinary complex analytic spaces and rigid-analytic spaces over local bodies with variable residual characteristics, as "fibers" of the same relative rigid-analytic space; just as the notion of relative scheme (which has finally become commonplace) allows us to link together algebraic varieties defined over bodies of different characteristics.

**Note 91<sub>4</sub>** While Demazure's thesis work, like Raynaud's, makes essential use of a consummate schematic technique they learned from me, the essential ideas in their respective works are not part of the "Grothendieckian" panoply, which distinguishes their work from that of my other students of the first period. It's possible that this circumstance resulted in a continuity in their work, free from a rupture due to the effect of the "master's burial syndrome". This doesn't necessarily mean that this syndrome didn't affect one or the other in another way. Three years ago, I was struck by Raynaud's attitude towards Contou-Carrère's work on local relative Jacobians. The results announced are profound, difficult and beautiful, and go far beyond a simple generalization of "well-known" things. There's an unexpected link with Cartier's theory of typical curves, some wonderful explicit formulas - all entirely within Raynaud's (and my) grasp. The freshness of his welcome must have weighed decisively in Contou-Carrère's strategic retreat, abandoning for profit and loss a subject in which he had invested himself wholeheartedly and which, it may have seemed, was only going to get him into trouble. ... <sup>132</sup>(\*). My letter to him, in which I expressed my (pained) surprise at his insensitivity to the beauty of these results, went unanswered.

### 15.3.10. . . and the chainsaw

**Note 92** □ When I moved to the area nearly four years ago, there were not far from p . 393

me a beautiful cherry orchard. Often, when I went for a walk, I'd go and have a look. It was a pleasure to see these thick cherry trees, in their prime, with their powerful trunks, which seemed to have always been one with this piece of land, where wild grasses proliferate freely. They must not have known about fertilizers or pesticides, and in cherry season, that's where I'd go to pick the tasty ones. There must have been twenty or thirty trees.

One day, when I went back there, I saw all the trunks cut down to man-height, the crowns slumped on the ground next to the trunk, stumps in the air - a vision of carnage. With a good chainsaw, it must have been done in an hour or so. I'd never seen anything like it - when you cut a tree, you usually take the trouble to bend down and cut it flush with the ground. There's a shortage of cherries, of course, and this cherry orchard wasn't going to produce tons, that's for sure - but these stumps of trunks said something other than shortages and yields... .

Yesterday I had that feeling again, of a vigorous trunk, with powerful roots and generous sap, with strong, multiple branches extending its momentum - cut clean off, at man's height, as if for pleasure. It was taking the trouble to look at the main branches one by one, and seeing each one cut off, that finally made me see what had happened. What was made to unfold, in the continuity of a momentum,

---

<sup>132</sup>(\*) For further details, see sub-note no. ° 95<sub>1</sub> to note "Cercueil 3 - ou les jacobiniennes un peu trop relatives", no. ° 95.

of a deep-rooted inner necessity, has been sliced clean through, with a clean slice, to see itself designated for all to see as an object of derision.

This reminds me of the "misunderstanding" Zoghman referred to, which supposedly took place between me and my students (except Deligne). What's clear, in fact, is that neither impetus nor vision were communicated from me to any of my students (apart from Deligne, who is decidedly "apart" indeed!). Each of them assimilated a technical baggage, useful (and even indispensable) for doing a well-done job on the subject they had chosen, and which could even be of use to them later on. I can't say whether there was any hint of something else, going beyond that. If there was

p. 394 had, it didn't stand a chance against the chainsaw, which quickly trimmed it... ..

I'm well aware that if there are still people doing maths - and unless they give up completely the kind of maths we've been doing for over two millennia - they won't be able to resist reviving each and every one of the branches I see lying inert. Some of them have already been taken over by my friend-with-the-saw, and it's quite possible, if God gives him life, that he'll do the same with some or all of them. Most of them, however, are no longer in his style. But perhaps he'll also eventually tire of constantly substituting himself for someone else, which is surely very tiring and not at all profitable, and just be himself (which isn't bad at all).

## 16.1. X Le Fourgon Funeral

### 16.1.1. Coffin 1 - or the grateful D-Modules

**Note 93** □ (May 21) It's been a couple of weeks now that my thoughts have been lingering on my "bon teint" students, those

"before". Each day, the reflection appeared as a "final addition", as a matter of conscience, to a reflection that seemed (practically) finished. More than once, it was an innocuous footnote, carelessly branching off from the previous day's or the day before's reflection, that grew and grew to the dimensions of an autonomous "note". Each time, it quickly found its name, distinguishing it from all the others, and inserting itself into its funeral procession, just in the right place, as if it had always been there! Every other day, I was there to redo (each time with pleasure) at least the end of the table of contents, which seemed to be closed and which was then lengthened by two or three new participants in the Procession, when it wasn't a whole new procession...

...

This Procession ends up taking on worrying dimensions - no one's ever going to want to read all that! But if it grows so long, it's not, to be honest, for the dubious benefit of a hypothetical reader, but first and foremost for my own benefit - just like when I do maths. I've never had any regrets about having embarked on these "last complements", which I embark on each time as if against my will. By dint of these last supplements, I've learned many things that I wouldn't have been able to learn otherwise, by doing without a

"piecemeal" reflection. And one by one, these things came together to form a vividly colored, vastly proportioned and multi-faceted picture. Even now, I can see that it's not entirely finished - there are still two places that seem to need a final brushstroke.

I think it's time, after my "good-natured students", to talk a little about the **buried**.

p. 396 -of those who "with me are entitled to the honors of this funeral through silence and disdain". No more than I or those who bury with gusto, these buried are not saints and have no vocation for martyrdom. I don't think there's one of them who didn't resent me□for the trouble I was quite unwittingly getting him into (simply because of

that he'd been unwise enough to bet on me, on a certain approach to mathematics and on a certain style. . . ) - or that he had at least tried to distance himself from me, once he'd recognized that the bet was definitely a loser<sup>1</sup> (\*). As I've seen, this is a wasted effort - once spotted, it's all over, and to stand out is to fuel contempt, to provide tacit justification, instead of disarming it. More than once, too, and in many ways, I've seen the roles of burier and buried rubbed together and confused<sup>2</sup> (\*\*). These aspects of ambiguity are undoubtedly the cause of a long-standing reluctance on my part to talk about the "buried" in any more detailed way than the allusions I've already made to them in passing. It's possible that, with the possible exception of Zoghman, none of the other three I know would be grateful to me for giving him "publicity" here, as if I hadn't given him enough trouble as it is.

Like so many times in the course of Harvesting and Sowing, I'm finally overcoming such reluctance in myself. I tell myself that even when it comes to people who have had to suffer because of me (because of a choice they made at a given time and where, for one reason or another, they were happy with it, although they had no more idea than I did of the disadvantages attached to their choice) - even towards them my role is not to help them evade a very real situation, in which they are involved whether they like it or not, and which surely makes sense even if it has serious disadvantages.

Before I embark on the black series of the four coffins of my late co-deceased and co-buried, I should perhaps cheer up the reader with a less funereal note. First of all, in my dealings at the "local" level of my University's Institute of Mathematics, I have by no means had the experience that the good I might say about a candidate for a post, or the fact that a candidate was one of my students (after 1970, needless to say), or that his work was influenced by mine, necessarily worked against him. A

p. 397 such an attitude of systematic boycott uniquely characterizes the relationship of the mathematical "big world" to my person, and by extension, to those who □appear to be linked to me "after 1970". This boycott has been

As far as I've been able to ascertain, his service has been virtually faultless in the fourteen years since I left, albeit with two modest exceptions. One concerns a student who, after a promising start, was supposed to be working with me on a state doctorate thesis on a most tantalizing subject, and whose application for a position as assistant professor at USTL had been rejected by my University's Commission of Specialists. He was "drafted" to the national level, with the help of Demazure, to whom I had written about this student's work<sup>3</sup> (\*). In addition, on two occasions, the journal **Topology** accepted articles by students of mine: an article "Factorisations de Stein et découpes" by Jean Malgoire and Christine Voisin, and a forthcoming article by Yves Ladegaillerie, containing the central result of his 1976 thesis (See note n° 94).

I've already had occasion to talk about Zoghman Mebkhout in particular, and I'll mention him again here "for the record"<sup>4</sup> (\*\*). Mebkhout began to draw inspiration from my work in 1974, I believe, and has continued to do so ever since.

---

<sup>1</sup>(\*) (February 1985) I am aware of a total of seven or eight (short) publications, outside my University, presenting (in summary form) work done with me and inspired by me, since I have been in Montpellier. My name is absent from all of them.

<sup>2</sup>(\*\*) (September 2) In different ways from one to the next, each of them has at some point internalized and taken on board the disdain for their work, acquiescing to the consensus that dismisses this work or classifies it as "uninteresting".

<sup>3</sup>(\*) At the "practical" level of promotion or accession to a position and status, the record of my teaching activity since 1970 boils down, in all, to two accessions to a position with status at stake, once as a maître-assistant and another time as an assistant. By a strange irony, on both occasions, these accessions signalled a sudden and radical halt to all research activity on the part of the person concerned.

<sup>4</sup>(\*\*) Apart from Introduction (6) (L'Enterrement), Mebkhout is mentioned in the notes "Mes orphelins", "L'inconnu de service

to this day. I am not aware of any of my "official" students having produced a work of comparable scope - although Mebkhout's work is necessarily affected by the conditions of adversity in which it had to be pursued. As I said in the Introduction (6), for the past four years, Mebkhout's ideas and results have been used by everyone, while his name has been carefully withheld<sup>5</sup> (\*\*\*). It's a mystery to me how my friend was able to continue doing maths, while at the same time

suffering disdain, then iniquity as a kind of inescapable fate - a fate that came to him through people he must have (and still must) felt vertiginously  $\square$  above him<sup>6</sup> (\*), people he p . 398

must have first heard them referred to as the "gods of the stadium", at a time when he (like myself) was a modest emigrant student with precarious resources. When he defended his thesis in 1979, he had an assistant's post in Orléans. He then did everything he could to get into the CNRS, coming back three times - on the third occasion (in October 1982) he was finally given a position as a research fellow (equivalent to that of assistant or maître-assistant at the University). This gave him, if not a statutory guarantee, at least a degree of relative security.

Of the four "co-buried" mathematicians of whom I am aware, Mebkhout is the only one who has continued to pursue his work against all odds, trusting his mathematical instincts without letting himself be stopped by considerations of prudence and expediency that might have inspired a merciless fashion. There was in him, who was not of a combative nature, an elementary **faith** in his own judgment, which is also a **generosity**, and which (much more than cerebral "means") is the primary condition for doing innovative and profound work. My idea of his work is surely incomplete. From what I know of the main part of his work, it seems to me that with the brilliant means at his disposal, placed in an atmosphere of warm and active sympathy, he could have accomplished it, and brought it to greater maturity, in three or four years instead of ten, and in joy and not in bitterness. But three years or ten, and "maturity" or not, the remarkable thing is that the innovative work appeared, and that it could have appeared in many such conditions.

### 16.1.2. Coffin 2 - or cut to size

**Note** 94 Yves Ladegaillerie began working with me in 1974. It was "just by chance", in a hollow moment at his place - I submitted to him some naive reflections on the plunging of topological 1-complexes into surfaces, at a time when I knew nothing about surfaces (except the notion of and he even less so. It was a bit grothendieckery (where I come from, anyway, it always starts-days like that. ... ), and it clicked  $\square$  with him more or less, until one day it finally "clicked", I don't know p . 399 when and why. Perhaps it was when an obviously juicy question was emerging, a certain key conjecture about determining the isotopy classes of a compact 1-complex in a compact oriented-edge surface. True - false? That was the suspense, which lasted a good six months,

---

et le théorème du bon Dieu", "L'Iniquité - ou le sens d'un retour", "La Perversité", "Rencontres d'outre-tombe", "La Victime - ou les deux silences", "Le Pavé et le beau monde", "Thèse à crédit et assurance tous risques" (notes n°s 46, 48', 75, 76, 78, 78', 80, 81).

<sup>5</sup>(\*\*\*) Legion of people acted as gravediggers at this funeral, in which practically the entire Colloque de Luminy (June 1981) took part. Apart from my cohomology students (see note "Mes élèves (2) : la solidarité", n° 85), those whose professional good faith is directly and gravely in question here and of whom I am aware are J.L. Verdier, B. Teissier, P. Deligne, A.A. Beilinson, J. Bernstein.

<sup>6</sup>(\*) Of course, Zoghman Mebkhout is no more of an idiot than I am, and he's sufficiently in the know to have a precise idea of the work of each of my cohomologist students, and to realize its scope as well as its limits, without any propensity to idealize it. Nevertheless, inhibitions of considerable power have held him back from even the idea of publicly questioning any of them, even where malice is patent.

a year, during which Yves brought himself (and me) up to speed on the key theorems of surface theory, while pushing on with the "foundation" parts of his work. The known results made the conjecture rather plausible, but were obviously far from the mark - whereas the conjecture implied cow results from Baer and Epstein, and other things that had unusual, even suspicious, aspects. He finally managed to prove the key conjecture in the summer of 1975. Essentially, it is equivalent to a complete algebraic description, in terms of fundamental groups, of the set of isotopy classes of plungers of a triangular compact space (say) in an oriented compact-edge surface<sup>7</sup> (\*).

From the moment Yves had "hooked", he did his thesis in a year, a year and a half, results, writing, everything, and on top of it all. It was a brilliant thesis, not as thick as most of those done with me, but as substantial as any of those eleven theses. I defended it in May 1976.

The thesis is still unpublished today. It may not have been thick, but apparently it was still too thick to be publishable, among many other excellent reasons I've been given. I mention some of them in the note "On n'arrête pas le progrès" (n° 50). The story of my efforts to "place" this unfortunate thesis, one of the best I've ever had the pleasure of inspiring, would make a small book, which would surely be instructive but which I've given up writing. Among the close friends of yesteryear who had such good reasons for forgetting to read the results and burying the whole thing with their eyes closed, there is

are (in order of appearance on stage) Norbert A. Campo, Barry Mazur, Valentin Poenaru, Pierre Deligne

p. 400 -□not counting B. Eckmann via Springer<sup>8</sup> (\*). The central result will finally appear,

nine or ten years later and reduced to the bone, in a short article in Topology (shhh - I have an accomplice on the Editorial Board of this esteemed journal. . . ). The rest of the work, on the one hand, demonstrated things that everyone has always used without demonstration (and we certainly did well without it!), and on the other hand, developed typical grothendieckeries, completely contrary to usage and good morals. I'm well aware that if my friend Deligne doesn't take it upon himself to "discover" them in the next ten years, others won't be able to resist repeating them in thirty or fifty years' time, since my healthy instinct tells me that these are fundamental things. They have been a precious thread in my Anabelian cogitations, and if God lends me life, I'll have ample opportunity to refer to them in the part of Mathematical Reflections developing the yoga of Anabelian algebraic geometry.

This adventure was a revelation for me, the first of its kind - the revelation of something I didn't become fully aware of until the reflection of l'Enterrement. I've tended to forget it ever since, my mind being absorbed elsewhere. Yves Ladegaillerie, one of the most brilliant students I've ever had, understood right from the start that to be accepted in today's mathematical world, it's not enough to put in the hard work and meet all the requirements of excellence. Having more than one string to his bow, for seven years he devoted himself to more down-to-earth tasks and to the

<sup>7</sup>(\*) The "analogous" statement in the non-oriented case is false - decidedly a tricky result, carefully "sliced" into a set of equally "plausible" but nonetheless false hypothesis-conclusions! For further comments on Ladegaillerie's work, see Esquisse d'un Programme, especially the beginning of par.3.

<sup>8</sup>(\*) I don't know Eckmann personally, and my correspondence to have Yves' thesis published by Lecture Notes was with Dr. Peters, in charge of LN at Springer. I believe that through the fifteen or so volumes of LN that were published by me (SGA in particular) or by students (theses) in the sixties, I was among those who contributed by their endorsement to the credit and unprecedented success of this series, still in its infancy. The reason given for rejecting the work I recommended (that they didn't publish theses) was a joke.

My first experience of the New Look in correspondence also dates from this episode: with a truly impressive ensemble, A. Campo, B. Mazur, V. Poenaru and Dr. Peters refrained from honouring me with a reply to a second letter, when naively (I have a slow comprehension. . . ) I returned the charge, after their reticent reply which showed that they hadn't bothered to acquaint themselves with the results set out in the introduction to Ladegaillerie's work.

less problematic returns. He is fortunate to have held a position as assistant professor

eve

n before his unfortunate encounter with me, □ providing him with security that his misadventure did not jeopardize. L'anp

. 401

last a mathematical spark seems to have awakened again, on a theme very close to those I've been interested in over the last few years - hyperbolic geometry à la Thurston and its relationship to the Teichmüller group. It's even possible that we'll go a little way together again, or that he'll take his own personal walk, just for the fun of it, and without expecting any return other than that which mathematics itself can give. He knows that if he expects any more, it's in his interest to change his interlocutor or fellow traveller (and even his past. . . ).

### 16.1.3. Coffin 3 - or jacobiennes a little too relative

**Note** 95 My first encounters with Carlos Contou-Carrère were in the corridors of the Institut de Math, shortly after my arrival in Montpellier in 1973. He'd corner me in some obscure corner and pour a torrent of mathematical explanations on me, before I'd even had time to apologize politely and duck out of the way. What he was pouring out at an impressive rate went right over my head, without him even pretending to notice, or being the least bit bothered when I timidly let him hear. He was in desperate need of someone to talk to, and I wasn't his only "unwilling interlocutor". This was at a time when I was absolutely not into maths. For a year or two, I would run away as soon as I saw his (easily repaired) silhouette appear at the end of a corridor. It was like that until Lyndon, who had been at Montpellier for a year as an associate professor, let me know that Contou-Carrère had some unusual resources and was about to be shipwrecked for lack of knowing how to use them. Until then, the question of whether or not what Contou-Carrère was spouting at me held water, and whether or not he had the means, hadn't even crossed my mind, so far away was all that. Perhaps Lyndon's suggestion came at a time when I was beginning to take an interest in mathematical questions again. In any case, I took the bit by the teeth and asked Contou-Carrère if he would explain something he had done, so that I could understand him. I suspect I was the first to ask him such a thing, at least in the many years he'd already been in France. It wasn't easy to get him to explain something, but it wasn't easy.

by no means impossible, and it was well worth the effort. I soon realized that Lyndon □ hadn't been wrong - that Contou-Carrère was full of ideas that just needed to be carefully worked out and developed, and he had an immediate and very sure intuition in practically any mathematical situation that could be put before him. This rapidity and certainty of intuition, even in things with which he was completely unfamiliar, was beyond me and impressed me - the only other pupil where I experienced it to a comparable degree was Deligne<sup>9</sup> (\*). On the other hand, he had an almost total block against writing! Incredibly, he could do maths **without writing** - God knows how he managed to do even that little, not to mention communicating with others, where he was a total "shipwreck" (see above).

p. 402

If I had something urgent and useful to teach Contou-Carrère, it was the art of writing, or more frus- tely, just making him understand that maths is done by **writing** it. I must have tried for two years, maybe three, until 76 or 77<sup>10</sup> (\*\*), without being quite sure whether I really succeeded entirely. His first major work written entirely in black and white was his thesis on the cycles of

<sup>9</sup>(\*) I'm not sure I've come across it in any other mathematicians, except Pierre Cartier (who impressed me in his youth with this remarkable ability) and Olivier Leroy, mentioned in the following note.

<sup>10</sup>(\*\*) (June 7) Checked, it was until February 1978.

p. 403 Schubert, defended only last December (1983)<sup>11</sup> (\*\*\*). Between 1978 and the present day, our relations have been very episodic, my role being practically confined to supporting him as best I can in the nom- many occasions when he had found himself trapped in one way or another in his professional life, constantly suspended on the most precarious assistant-delegate positions.

For two or three years, I had been trying to provide Contou-Carrère with the foundations of a precise and flexible mathematical language and some principles of systematics. With this background, and his resources and wealth of ideas, he was spoilt for choice as to what to branch out into. Rather than start with ideas of his own, he branched off into the theory of relative local and global Jacobians, which I had mentioned to him as a possible thesis topic. Once I'd left him to his own devices, in the space of barely a year he produced some very fine work, part of which is announced in a note to CRAS (95<sub>1</sub>). Going all the way would have meant a few years of exciting, highly motivating work, while at the same time learning all the finer points of schematic technique. I had no doubts at the time - it was obvious to me that Cartier, Deligne and Raynaud would all give a warm welcome to the work already done, which was profound, difficult and unexpected in many ways. Cartier was delighted to see some of his old ideas take on new relevance. Raynaud, on the other hand, was indifferent, as was Deligne, who kept the complete manuscript in his drawers for six months, without deigning to give any sign of life<sup>12</sup> (\*).

It was two against one - enough to feel the wind. The slightly too relative Jacobians are sine die written off. The chainsaw did its job...

That didn't mean we didn't have a few mishaps at Contou-Carrère, a detailed account of which would be useful.

well another little book, which I willingly give up writing. It's around this time, I think, that for the first and only time since I left (in 1970) the institution I'd been the only one to work in for four years (1958- ), I decided to write another little book.

p. 404 62) to represent and make credible "in the field", during the years when it still had no roof over its head to her - it's the only time I've ever taken it upon myself to recommend someone for an invitation (for a year, in this case), at a time when Contou-Carrère was in danger of finding himself out of a job and on the street. I knew that the person I was recommending, just as unknown as Hironaka, Artin or Deligne had been when I warmly welcomed them to the IHES, would do as much honor as they had to the institution that welcomed him. Of course, I didn't fail to say so. Fortunately for Contou-Carrère, his position as assistant delegate (admittedly unworthy of the honor of an invitation to such a select institution) was finally renewed<sup>13</sup> (\*).

I wasn't that surprised by this episode, knowing Deligne's disposition even then, and given that

<sup>11</sup>(\*\*\*) It's a long piece of work (which I haven't read) in which he carefully develops ideas in which I have no part, giving, among other things, an explicit resolution of the singularities of all "Schubert"-type cycles - something nobody has been able to do before him. For once, when he did write a formal essay, he was criticized for it being too detailed (not to mention that his statements were too general. . . )! For my part, if I have a criticism to make, it would be in the opposite direction: while Contou-Carrère asserts that his methods should apply to all types of semisimple groups and Schubert cycles, he has only done the work in the case of the general linear group - so he hasn't gone all the way with the work that needs to be done on the precise question: description of the resolutions of equivariant singularities of universal Schubert cycles, **and** of the singular loci of said Schubert cycles. This lacuna seems to me to be a legacy of this "block" against piecework and writing, which had long been his main handicap.

<sup>12</sup>(\*) Contou-Carrère had been ahead of the game, however, and didn't breathe a word in his note about me, who had provided him with the initial program. It was all in vain - no matter how much he put into it, there's an unmistakable "style" attached, whether you like it or not, to certain themes, which it's best to avoid if you want to make a career in maths today. (June 7) After checking with the person concerned, I note that I am confusing here two different episodes concerning Contou-Carrère's work on Jacobians. See the following note (n° 95) for further details and precise references.

<sup>13</sup>(\*) I can't complain, since five or six years later, on the occasion of IHES's twenty-fifth jubilee last year, I was indeed honored with an invitation, and even given the choice between the solemn reception with the minister's speech, or a subsequent week's stay at IHES, again all expenses paid (I was assured). I told my old friend Nico Kuiper that it was very kind of him to have thought of me like that, but that I didn't travel anymore at my age... ..

Nico Kuiper had warned me that everything depended on him in this particular case. (It didn't even occur to me to suggest to him that this might also apply to the other members of the Scientific Council, given the case in point... .) The episode that touched me the most, however, of all Contou-Carrère's misadventures (my "protégé", as Verdier had taken it for granted to call him in a letter....), takes place in October 1981, in connection with his application for a teaching post in Perpignan. Colleagues in Perpignan (where he had his position as assistant delegate) surely appreciated the presence among them of someone who was at ease and could be consulted in virtually all branches of mathematics. When a teaching post became vacant, they put him forward as the sole candidate for the position. - a rare move, which made it clear that they wanted him and no one else in the job. C.C. had relatively few publications apart from his doctoral thesis in Argentina with Santalo, mostly notes to CRAS, announcing results (some of them profound), but without demonstration. No one had ever suggested to him that, in these times of unprecedented competition, it's better to have articles with complete demonstrations as "exhibits".

which I'd preached to him enough myself, but from a less utilitarian point of view<sup>14</sup> (\*\*). Still that Contou-Carrère's candidature was deemed inadmissible by the Comité Consultatif des Universités and the p. 405 case referred. The thing that struck me at the time was that neither the President of the CCU (the national body that made the decision), on behalf of the Committee, nor any of the members in a personal capacity, had the minimum respect to write, either to the main interested party Contou-Carrère himself, or at least to the Director of the Institut de Mathématiques de Perpignan, to give a few words of explanation on the meaning of this vote, which in the absence of any explanation could only be received as a stinging disavowal of the choice of the Perpignan colleagues, and as a disavowal of their only candidate as suitable to honorably fill the post for which he was proposed. The Council included three of my former students, two of whom knew Contou-Carrère personally. Of course, they knew that he had been a pupil of mine as well as theirs, especially as the dossier included a particularly glowing report by me on the candidate's work. None of them, nor any of the other members of the Council, thought about the affront represented by this vote-couperet without any other form of trial, and the torpedoing of a mathematician just as honorable as any of them.

It was this incident that, for the first time in my life as a mathematician, made me feel that "breath" I've spoken of more than once in the course of my reflections. I had already felt it four years earlier, with the episode of the<sup>15</sup> (\*) strangers. But it wasn't within the world that had been mine, blowing on **one of the theirs** - on someone who unreservedly identified with this world. It made me feel sick, for weeks; perhaps months. To free myself from an anguish that then embraced me without that I cared p. 406 to read it<sup>16</sup> (\*), I became restless, writing letters left and right, and a thirty-page text "Le Cerveau et le Mépris" (The Brain and Contempt), in a darkly humorous vein, which I finally decided not to publish<sup>17</sup> (\*\*). With hindsight, I realize that it was the perfect time to **meditate** on the meaning of this

<sup>14</sup>(\*\*) The year before, Contou-Carrère had applied for a professorship in Rennes, where he knew Berthelot and Larry Breen. His application was considered admissible by the CCU, but the position was awarded to another candidate. No one bothered to warn him that if he was to have any chance of a position, he would have to publish detailed demonstrations of the results he was announcing. The following year's disavowal by the CCU came as a complete surprise to Contou-Carrère, his Perpignan colleagues and myself. With hindsight and in the light of the present reflection, I doubt whether the situation will really change with the writing of his thesis (already declared "unpublishable" as it stands) and its defense, and whether he will have any chance of finding a teaching post in France.

<sup>15</sup>(\*) See "My farewells - or strangers", s.24. - 406

<sup>16</sup>(\*) I became aware of this anguish only during a long period of meditation the following year, when I discovered the role of anguish in my life, whose presence (chronic until 1976, and occasional after 1976) had been "the world's best-kept secret" all my life. There were highly effective mechanisms in place, which concealed all the generally recognized signs of anguish, which remained ignored by myself and those close to me.

<sup>17</sup>(\*\*) I was discouraged from publishing it by the very people for whom I was about to go to war, to whom I had the good sense to say: "We're going to war!"

that was happening. The funny thing is that what was "preventing" me from even realizing the need for in-depth meditation, was a long meditation I was engaged in at the time<sup>18</sup> (\*\*\*) and about which I've had occasion to speak) - and a meditation, what's more, on my relationship to mathematics (if not on my past as a mathematician)! She was troubled by an episode in which life was calling out to me forcefully - and I evaded the challenge by getting agitated, then diving back into "meditation". Looking back, I realize that this "meditation" didn't fully deserve the name, that it lacked an essential dimension of true meditation: attention to myself at the **very moment**. I was "meditating" on the meaning of certain more or less remote events, while ignoring a repressed anguish (perfectly controlled, it's true, as a result of a long habit of such control), a sign of my refusal to take cognizance of the message this rejected "breath" was bringing me.

But I'm getting away from my point. The torpedoing, of course, had the effect it was bound to have. The Perpignan colleagues were called to order once, and that was enough. Apparently, they don't even have an assistant delegate position any more, at least not for Contou-Carrère. He has found a replacement at short notice in Montpellier, for the current year, whose incumbent will return next year.

I'm not too worried about his future, though, as it's been a while since Contou-Carrère had the wisdom to get ahead of the curve, and plugged into IT. With the means

p. 407

his brilliance, he must have been dominating the subject from on high for a long time now, while doing the math he's been

loves in his spare time. He's a father with two children, and maths in these times, with the past hanging over him, is decidedly hazardous, not to say violent. It's in his interest to have a brilliant career as a computer scientist, where no one will hold it against him that he was even the slightest bit my pupil.

**Note 95<sub>1</sub>** (June 7) It was towards the end of '77 that I submitted to Contou-Carrère a detailed work plan for a theory of local and global relative Jacobians, including, in the local case, the suggestion of "screwing back" Cartier's Jacobian and ind-group, in order to find a "complete" Jacobian with a more beautiful universal property, and which would be "autodual". I had no idea of a demonstration to propose, and didn't bother with his work after February '78, having realized that my presence inhibited rather than stimulated his abilities. He managed to "get going" within a year, and his first note "The generalized Jacobian of a relative curve, construction and universal factorization property" (concerning the global case) appeared on 16.7.1979 (CRAS t.289, Série A - 203).

The following month he found the decisive results for the local Jacobian, but didn't publish anything on the subject for a year and a half, when he published "half" (the universal property of the ordinary local relative Jacobian, unrevised with the Cartier group), in a note to CRAS dated March 2, 1981, under the name (not very convincing at first sight) "Corps de classes local géométrique relatif" (CRAS t.292, Série I - 481). As for the theory of the complete local Jacobian, even more interesting in my opinion, there is a draft note to the CRAS, which was never published, under the title: "Local Jacobian, universal Witt bivector group and tame symbol". Of course, I was informed of his results as early as 1979, i.e. a complete realization of the provisional program I had proposed to him, for which it had been necessary to overcome considerable technical difficulties, requiring a great deal of imagination and technical power. I was aware (unless I was mistaken) only of the first note, and was astonished that he didn't publish the rest, i.e. the local part, without ever giving a clear explanation for it - but he was obviously disappointed by the reception given to this work.

p. 408

first note. After his unsuccessful application to Rennes in 1980, and given that my letter of support attached to his application file reported remarkable results on global and local relative Jacobians,

---

show my text before attempting to make it public.

<sup>18</sup>(\*\*\*) See "The troublemaker boss - or the pressure cooker", s.43.

he must still have considered it prudent (in preparation for his candidacy the following year in Perpignan) to publish at least one more note on the local Jacobians, or else empty his entire bag. It was only two months later, in May '81, that he sent the draft of his third note to Deligne and Raynaud (no doubt Cartier had known about it for a long time), presumably to test the waters. (I don't think he would have had the slightest difficulty in getting Cartan to present this third note, at any time since August 1979 when he had the results in hand). Neither Raynaud nor Deligne gave him any sign of life - but in March 1982 Deligne sent him the manuscript of an article "A remark on tame symbols", dedicated to Deligne, by Kazuya Kato, which makes Contou-Carrère's theory in the case of a basic body, and conjectures its validity on any basic ring. Contou-Carrère told me about it, saying he was convinced that Deligne had communicated his results (without naming him, or giving any indication of a demonstration) to K. Kato. At the time, the thing seemed so incredible that I didn't take Contou-Carrère seriously - although now I realize that it would be quite in the usual "thumbs up!" style of my brilliant friend Deligne. Contou-Carrère seemed genuinely outraged that anyone would "presume to conjecture" about something he seemed to regard as a kind of private property. Yet Contou-Carrère himself took his conjectures from me, without even thinking it necessary to allude to me in any of the three notes<sup>19</sup> (\*)! From him to me, it must have seemed self-evident, whereas the mere presumption that Deligne would do the same to him outraged him, but he didn't dare breathe a word of it to the interested party. (I had urged him to explain himself to Deligne, which he did not. . . )

In a way, I imagine he's had to do violence to himself over the years not to publish some very fine results, in which he's had to invest his heart and soul in making them. If he's done himself such violence, it's out of concern for an economic climate that's clearly not conducive to this kind of grothendieckery. In the last few days, he was astonished to receive a letter from the same Deligne, expressing surprise that he had not published

his note on "total" Jacobians, and asking him for everything he possessed on the subject and even on others. Zoghman Mebkhout had already told me a few days before that Deligne was using these things etp that he had even named Contou-Carrère in this context. It would seem that the time is ripe for Contou-Carrère to finally recognize a child of his own, whom he has been careful to bury for nearly five years. Perhaps, who knows, the time has even come for a reconciliation between the two "pupil-enemies"; these two most brilliant of my pupils, one a medal-winning academician and the other a delegated assistant, and yet (whether they reconcile or not) for a long time two **brothers**.

. 409

#### 16.1.4. Casket 4 - or topos without flowers or wreaths

**Note** 96 (May 22) I'd hardly be exaggerating if I said I'd never met Olivier Leroy. What is certain is that from the moment he heard about me, he decided to avoid me like the plague. His reasons, I confess, escape me. Perhaps an instinct told him that I was only going to get him into trouble, or maybe Contou-Carrère (who was very friendly with him for a long time) told him so - I may never know. All the same, I had the honor and pleasure of two substantial conversations with Leroy, which I remember very well.

The first time must have been in '76, '77, when Contou-Carrère and I went to see him at his place, out of the blue, just to talk math a bit - I don't know if we had any ulterior motives. But perhaps it was understood that Olivier was thinking of embarking on a 3° cycle doctorate, and I certainly had plenty of subjects up my sleeves. Having seen him once or twice at Contou-Carrère's, and from what Contou-

<sup>19</sup>(\*) On the subject of a certain conniving role I've often played in this kind of situation with some of my students, see the note "Ambiguity", n° 63".

As Carrère himself suggested, I had a feeling that Olivier must be a quick study, and not just in maths. It was a memorable evening for the three of us. I soon had to tell Olivier about a program for a fundamental group theory of a topos and van Kampen theorems in the toposic framework, and he seemed interested. He must have had some toposic background from Contou-Carrère's algebraic geometry seminar, and he seemed interested in having an opportunity to "get his teeth into" the language of topos on an example of concrete theory. For a good two or three hours, I had to pour over him a detailed masterpiece of the theory I had in mind to develop, which was fleshing out

p. 410

as I talked about it, and as a host of concrete situations in algebraic geometry and topology came up in my mind - situations that had to be expressed in the  $\square$ cadre toposique, and that with each times I first had to "remind" someone who was hearing about it for the first time. More than once in the course of the evening, Contou-Carrère (who has read almost everything and has a strong stomach) looked vague and disoriented, and even for him it was a lot to take in - and more than once I thought it prudent to ask Olivier if it wouldn't be better to stop for today and start again another day. I could have saved myself the trouble - Olivier was visibly fresh, bright-eyed and perfectly at ease, and I even laughed, because I couldn't believe he wasn't cracking up, but he wasn't! He was a young guy, maybe twenty years old, who must have had just a tincture of schematics, a bit of topology and topos, and he'd worked quite a bit with infinite discrete groups, I think... . It was three times nothing, to tell the truth, and with that he still managed to fill in all the blanks and "feel" effortlessly what I, an old veteran, was telling him at top speed in two or three hours on the basis of a fifteen-year familiarity with the subject. I'd never come across anything like it, or at most with Deligne, and perhaps Cartier, who had also been quite extraordinary in this line in his younger days.

Olivier was going to write his 3<sup>o</sup> cycle thesis on the subject in question. Little did he know what was waiting for him at the end. In any case, I never saw him again during the two years he worked on the project and beyond. His official boss was Contou-Carrère, but it would have been a pleasure to chat with such a hip guy. In fact, I wasn't even notified of the defense, and don't think I ever received a copy of this thesis - but I remember

p. 411

having held a copy in my hands, from someone who had been entitled to it<sup>20</sup> (\*). I couldn't say whether the defense was  $\square$ done before or after the "pouring" of the note to the CRASs where Olivier summarized his work. I discusses this casting, in some detail but without naming anyone, in the section "La note - ou la nouvelle éthique (1)" (s.33). The two mathematicians who took care of this casting were Pierre Cartier (the same one whose incredible speed of intuition had come back to me when talking about that of his young non-colleague, whom Cartier was casting so kindly and with all the regret in the world), and the other was Pierre Deligne,

<sup>20</sup>(\*) All this secrecy is all the more unusual in that I was surely, along with Contou-Carrère, the only person in the whole Languedoc region who could understand anything of Olivier Leroy's work. Needless to say, I never got my hands on Leroy's draft note to the CRAS either. Perhaps I'm deluding myself, but it seems to me that if I hadn't been so drastically sidelined that it was practically impossible for me to intervene, I would have found a way to get this unfortunate note published, through Cartan or Serre if need be, who aren't connected, but who would have trusted me if I had guaranteed the seriousness of the work. (June 7) I must have learned long afterwards that Leroy had passed his thesis, and was too busy on my side to think of asking myself then how it was that I hadn't even been informed. It didn't "click" until after Contou-Carrère's own thesis defense, for which I'm supposed to have been the thesis supervisor (x). He found a way to ensure that, as the only member of the jury, I was not entitled to the definitive, official copy of his thesis! I finally just received a copy today - he had thought (he wrote) that I "wasn't interested" in having one. . .

(x) More precisely, for a year or two, C.C. had cautiously played on two "directors" at once (you never knew. . . ), each of them unaware of the existence of a "parallel" director. I was informed of Verdier's role as director in extremis, when C.C. finally fell back on me in the spring of 1983, when it became clear that Verdier decidedly wanted his hide anyway!

with his historic remark that mathematics "didn't amuse him", (although it did "amuse" him at a young age. . . ) I should add Contou-Carrère himself, who didn't lift a finger to defend his pupil.

- This exposed him to the risk of upsetting powerful men. He must have suggested to Olivier Leroy that it would be better to forget the episode of his unfortunate thesis. What is clear, however, is that Leroy has indeed drawn a line under this episode - even if the opportunity arose to publish not just a note to the CRAS, but his entire work, I doubt he would make use of it<sup>21</sup> (\*). This time again, the chainsaw has done its job<sup>22</sup> (\*\*).

□

p. 412

Despite this misadventure, I still had the pleasure of seeing Leroy regularly for several months in early 1981. It was at a micro-seminar I was giving on the algebraic-arithmetical theory of Teichmüller's tower (discussed at some length in *Esquisse d'un Programme*). The only literal listeners were Contou-Carrère and Leroy. Even for an ultra-selective Parisian audience (and I know what I'm talking about), there wouldn't have been three or four of them in a whole room, so as not to be left out. To tell the truth, the reason I was doing this seminar, at a time when Contou-Carrère was entirely taken up with fine-tuning his ideas on Schubert's cycles, was for Leroy, thinking that maybe he'd catch on to such a splendid subject. He obviously "sensed" what I was doing, but had decided in advance (I think) that he wouldn't "catch on". Strange that he even bothered to come - something must have fascinated him, just as it did me, and he wasn't too clear himself about what he really wanted. When I realized he wasn't going to go for it, I called it a day. I wasn't interested in continuing a monologue in front of two spectators, no matter how brilliant they were. It was at this point that I had my second and last conversation with Leroy. I don't think I've seen him since.

There's been no real mathematical discussion between Leroy and me, apart from the one seven years ago. - which explains why I know virtually nothing about the work he did, apart from his unfortunate topological work. His misadventure must not have increased his confidence in people like me, or even Contou-Carrère or other people from the beau monde □ mathématique. I heard he was doing a seminar

p. 413

at the Faculté des Lettres, where there's a group of sympathetic mathematicians who get on well with each other. There are

<sup>21</sup>(\*) An eloquent sign of this "gros trait": in Olivier Leroy's application for an assistant's position at Montpellier; submitted during a vacancy two years ago, Leroy mentions neither the title of his post-graduate thesis, nor the name of Contou-Carrère who had been his boss, nor does he mention any personal work whatsoever. Clearly, he hadn't decided whether he wanted the job or not - which is why, despite his impressive credentials, it was awarded to another candidate with a solid track record and for whom there was no doubt as to his intentions.

<sup>22</sup>(\*\*) By an interesting coincidence, I recently heard that Cartier had dedicated one of his Bourbaki lectures to me (the first time such a thing has happened to me, I believe), and that the lecture was devoted to the theory of topos - the very topos that Cartier had deemed unworthy of inclusion in a note to the CRAS. Sign of a change in the fashion winds of recent years? Certainly not, and it all ties together again: the presentation in question concerned the use of topos in logic! My friend Cartier's touching dedication seems to me to be in the same vein as the Funeral Eulogy delivered on a special occasion last year (see the note "L'Eloge Funèbre - ou les compliments", n° 104), in which the word "topos" is pronounced (among other well-sent compliments), only to add (as a unique and eloquent comment) that they are "used today in logic" - and nowhere else, need I say, at least as long as my friends who are lavish with compliments can prevent it, by the power in their hands. . .

(Reference to Cartier's talk: *Catégories, logiques et faisceaux, modèles de la théorie des ensembles*, Séminaire Bour- baki n° 513, Feb. 1978).

I sense in the condescending (and boycotting. . . ) attitude of some (such as Deligne, Cartier, Quillen, among those who set the tone. . . ), towards innovative and profound notions such as that of topos in geometry, a phenomenal **haughtiness**. Even supposing that just one of them had the stuff (or the innocence. . . ) to draw out of nothing, as I have done with the introduction of étales and crystalline topos, a new topological vision of algebraic varieties (and from there, the means for a profound renewal of algebraic geometry and arithmetic, while awaiting topology) - there's no doubt that the very attitude of contempt that he likes to cultivate in himself and arouse in others, defuses this power of vision and renewal, for the sole benefit of a fatuity.

would expound ideas of combinatorial topology - a subject that's been right up my alley for nearly ten years. As I'm by nature a discreet person (but yes, yes!), I didn't ask any questions about what he was talking about, and I don't know whether he intended it for publication. As far as his situation is concerned, he leads a most illegal existence (although he's neither a foreigner nor in an illegal situation), doing tutorial work right and left, paid for (shhh. . . ) by I don't know what slush funds and under the noses of the treasurer-payer and the Cour des Comptes. I don't think he's made up his mind whether or not he's finally going to pursue a career in mathematics, and it must be an uncomfortable situation in the long run, Cour des Comptes or not. I'd be delighted if my edifying painting of a Funeral, in which he appears as the fourth assistant coffin, could help him dispel his perplexities, this time with full knowledge of the facts.

### 16.1.5. The Gravedigger - or the entire congregation

**Note** 97 (May 24) It was against a certain reluctance on my part that I finally decided to mention by name some of my close friends and colleagues in the mathematical world of yesteryear, whom I have seen act as "gravediggers" (or "chainsaws"), cutting short, from the outset, the attempts made by certain mathematicians of modest or precarious status, to take up some of my ideas and develop them according to their own logic, or only (as in the case of Yves Ladegaillerie) to follow in their footsteps.

p. 414 an approach and style that bears the stamp of my influence. As I've said over and over again, such reluctance to involve others, or only to name them<sup>23</sup> (\*) without <sup>a□voir</sup> consulting them, was not uncommon during Récoltes

and Semailles. In each case, I eventually examined the reticence and realized that it was unfounded, that its source was not delicacy but confusion, not to say pusillanimity. In all the cases (it seems to me) where I mentioned by name the acts or attitudes of others, these were in no way of a "confidential" nature. They concerned the professional life of the person concerned, with all the repercussions that implies in the professional lives (and by extension, in the lives of all) of other colleagues, including myself. Each of those I involve is just as responsible for his or her actions and attitudes, and for the full range of their implications (whether or not he or she likes to ignore them), as I am for mine. He has no right to take offence if some of the consequences of his actions come back to him in one form or another, for example that of a public "mise en cause", in this case through me. If at times my language is colourful and harsh, my intention is in no way polemical, nor to offend or outrage anyone, but rather to describe the facts and the way I feel about them, as an incentive for everyone (and first and foremost for those I imply) to examine them on their own, rather than dismissing them one way or another (as I often did myself before the Harvest and Sow reflection). If the person being questioned chooses to be offended, that's his or her choice. This choice may pain me, coming from people I hold in esteem or even affection, but it doesn't weigh on me. The reluctance I mentioned, a sign of a certain confusion in my vision of things, vanished without a trace as soon as it was

<sup>23</sup>(\*) I was reluctant, for example, to include a note (note n° 19) in which mention would be made by name of all the students who had prepared and completed a state doctorate thesis with me. This hesitation in me must have stemmed from the reluctance of many of my students to see themselves associated with me, a reluctance I must have perceived at an informal level for some years already. The only ones among my former students (with or without quotation marks) where the desire to distance themselves from my person had been clearly perceived by me at the time, were Contou-Carrère (with whom I had only just discovered it), and Deligne (where the thing had already been quite clear since 1968, without my suspecting however how far this desire would lead him). In Deligne's case, I was particularly reluctant to name him as having been "more or less" a pupil, as I didn't want to seem like I was taking advantage of such a brilliant "pupil", when he himself didn't want to reveal the link that bound him to me and my work. My reflection made me realize, moreover, that this link had taken on an infinitely greater significance in the life and work of my young friend than I had ever suspected.

(June 1) See the note dated March 27 (three days later) "L'être à part" (n° 67').

understood and, by the same token, surpassed.

At no time during the reflection on l'Enterrement did I feel that some vast "conspiracy" had been hatched against my work and against those who had the temerity to draw inspiration from it (rather than simply borrowing tools, keeping quiet about the name of the worker who had fashioned them and placed them in their hands). There is no conspiracy, but there is a **consensus** which, in what I have called "the great mathematical world",

has so far appeared to me to be without fault. This consensus, except at most in rare exceptions, is in no way fueled by any conscious "malice" toward my person or my work. In p. 415

Only in exceptional cases did it express itself in unequivocal malevolence towards one or other of the four "co-sitters" mentioned in the previous notes<sup>24</sup> (\*). But surely such malevolence could not have proliferated in any of my former pupils, and could only have been expressed unhindered by the encouragement of general consensus.

In most, if not all, of my former friends and students, this consensus manifests itself not in "malicious" attitudes, but in (I believe) entirely unconscious mechanisms of unrolling uniformity and flawless efficiency, sweeping aside like chaff common sense and healthy mathematical instinct, to make way for purely automatic **attitudes of rejection**<sup>25</sup> (\*\*). Such automatic attitudes, I suspect, are not only aroused by me and those whose mathematical "smell" recalls it in some way - but also by any mathematician who does not present himself as already invested with the **tacit endorsement** of a certain "establishment"; either he himself is already part of it, or

that he appears as the "protégé" (to use an expression from Verdier's pen) of one of these.

It seemed to me □ that in almost all mathematicians, dispositions of a minimum "openness p. 416

mathematical instinct" (necessary for this "common sense" and "healthy mathematical instinct" to come into play) **can only be triggered in relation to someone who has already been granted such a guarantee.**

This kind of mechanism must be practically universal, not only in the mathematical world, but in all sectors of society without exception. It goes far beyond any individual case. If (as it seems to me) there is an exceptional situation in the case of my person, and of those who in the eyes of the establishment are "my protégés", it is because in the past I was invested with the status of "one of theirs", with the usual effect of a "minimum of openness" towards me and "mine". This status was taken away from me when I left in 1970. Or more precisely, by my own choice, clearly expressed on more than one occasion in the years following my departure, and by my way of life to this very day, I have indeed ceased to be one of "them". In fact, I myself no longer felt "one of them", and I left a world that was common to us with no spirit of return. Even today, my "return to maths" is by no means a return "among them", to the establishment, but a return to mathematics itself; more

---

<sup>24</sup>(\*) Only in the cases of Deligne and Verdier did I learn of what I consider to be unequivocal acts of malice.

<sup>25</sup>(\*\*) These attitudes of rejection, of course, never present themselves as such, even in extreme cases like those of my friend Deligne, or Verdier. They are almost invisible in terms of conscious attitudes towards me, which (as I've already had occasion to say) are almost always (perhaps even always), in the case of my friends and pupils of yesteryear, attitudes of sympathy (from which some of them sometimes try as best they can to defend themselves) and respect. Such dispositions of sympathy and respect are present, not only at the superficial level of conscious "opinions", but even at the deeper level of real attraction (or repulsion), and of real knowledge of others (independently of the images in which we strive to enclose them).

Here we find ourselves in a typical situation **of ambivalence** (collective, I'd almost be tempted to say) where, as far as the eye can see, we "see" nothing! (Compare with the reflection in "The Enemy Father (1), (2)" (sections 29, 30), where for the first time in Harvest and Sowing I address this ambivalent aspect that has marked many relationships in my life, and not only in the mathematical milieu). And yet, at the level of concrete manifestations (examined at length in Burial), the "resultant" of these ambivalent forces no longer has anything ambivalent about it, it seemed to me, but it does present itself, with "baffling uniformity and unfailing efficacy", as the "attitude of automatic rejection" that I'm about to examine more closely.

precisely, a "return" to a continuous mathematical investment, and to an activity of publishing my mathematical reflections.

I'm only just beginning to realize how much my departure was felt as a kind of "desertion", even as an "outrage" by my former friends and pupils<sup>26</sup> (\*). It must have been the easiest way to evacuate the meaning of my departure, the questioning it could arouse in them, by such a diffuse feeling of a **wrong received**, and the automatic reaction of a grudge, expressing itself in an act of **retaliation** (which rarely had to be perceived as such, or even as an act, on a conscious level) : since he has cut himself off from us, we cut ourselves off from him - we cease to grant him and "his kind" the benefit of the "automatism of attention" reserved for "ours" - he and his kind will be entitled, like the first-timers, to the rigours automatic rejection!

p. 417     □The situation is further complicated (for my former friends and students) by the fact that not only was I doing

part of the establishment, but that moreover it is impossible for any of them to do their job as mathematicians without using at every step notions, ideas, tools and results of which I am the author. I don't know if there has ever been, in the history of our science or any other science, an example of such an embarrassing paradox! Seen in this light, the chainsaw effects (by no means limited to my friend Deligne) to cut off any velocity of development for ideas that bear my imprint (when such development could only increase this perplexity) now present themselves to me as driven by an implacable inner logic, as a **necessity** from a certain choice already made - the choice of rejection. And the same is true of the efforts I see being made just about everywhere to sweep under the carpet the origins of those notions, ideas, tools and results that have become part of our common heritage, and which we can no longer do without, whether we like it or not. This "indifference" that I've noticed in the face of Deligne's very large "operations", pretending to claim, one by one, the paternity of a certain number of my main contributions to mathematics (or, for the crumbs, generously attributing them to some inseparable friend) - this is by no means indifference, but **tacit approval**. Deligne is simply doing what the establishment's collective unconscious expects him to do: **erasing** the name of the man who cut himself off from everyone else, and thus resolving the intolerable paradox **by replacing a real but unacceptable paternity with a tolerable fake paternity**.

Seen in this light, the main Deligne officiant appears, no longer as the one who would have shaped a fashion in the image of the profound forces that determine his own life and actions, but rather as the designated **instrument** (by virtue of his role as "legitimate heir") of a **collective will** of flawless consistency, committed to the impossible task of erasing both my name and my personal style from contemporary mathematics.

p. 418     I have little doubt that this vision of things essentially expresses the reality of things: everything at least on a collective level. Surely my "return," which unexpectedly ends a funeral that was going on so satisfactorily for all, or (if it doesn't end it) at least disrupts so unseemly and inadmissible the unfolding of a ceremony that seemed to have been settled in advance - this return is going to inconvenience and displease not only this or that among the principal officiants, but also embarrass the entire congregation assembled for this funereal occasion! And I have no idea, of course, what "parade" this famous collective unconscious will come up with, to clear up the mess created by the untimely return of the deceased, suddenly (and unacceptably scandalously) stepping out of the cozy coffin intended for him, and pretending to officiate his own funeral in his own way. I trust, however, that the congregation will find

---

<sup>26</sup>(\*) My friend Zoghman Mebkhout expressed this way of seeing and feeling things particularly eloquently. It's because of this desertion that I'm responsible for his difficulties with the mathematical world, since he alone has been deprived of the "protection" and support that those who now treat him like a troll once found with me.

a good way of evacuating this little additional contradiction in the mathematical edifice!

I seem to see quite clearly now, at the level of the images and attitudes of each individual, the reflection and general form taken by the collective consensus, and the collective will to erase, to bury. It's the universally used system of "two mutually contradictory tables" on which we operate simultaneously, and which I first had occasion to discuss in Harvest and Sowing in the case of my own person. (See the section "Merit and contempt", s. 12.) I doubt there's anyone who would say flatly and plainly: "Grothendieck has done nothing but bogus mathematics, let's not talk about it any more and get down to business". As it stands, this would be too explicitly contrary to the axioms of the establishment, for the time being at least. In the foreseeable future, in twenty or thirty years' time, the question won't even arise, as the name will no longer even be mentioned. The common tactic, both individually and collectively, is that of silence: we don't think of the deceased, not as a mathematician at least, we don't talk about him, and we don't mention him (except, when we can't do otherwise, by the providential acronym SGA or EGA, until these references are replaced by others from which all trace of the deceased is absent).

Yet there are occasions, exceptional no doubt, when complete silence becomes impracticable. One such occasion, I imagine, was my application for admission to the CNRS, which must have embarrassed more than a few of my colleagues.

from a<sup>27</sup> (\*). An autre will be the preliminary distribution of Récoltes et Semailles<sup>28</sup> (\*), pending its publication

p. 419

in volume 1 of *Réflexions Mathématiques* (if my publisher doesn't crack and refuse to blame the entire scientific establishment). These are opportunities created by the inadmissible deviations of the deceased himself, unhappily stepping out of the role assigned to him. Another occasion (perhaps more instructive for an understanding of the Burial, before its disruption by an unruly deceased) is the twenty-fifth anniversary jubilee of the IHES, which was celebrated last year "with great pomp". As "the first of the four Fields medals of the IHES", it would have been difficult to pass over me entirely in silence on this solemn occasion - even if my role in giving the IHES a real existence in the four heroic years of its existence was overlooked. The eulogy concocted in my honor, in the brochure published to mark this jubilee (to which I have already referred twice), seems to me to be a model of its kind - as an elegant and discreet way of resolving, to everyone's satisfaction, this "little contradiction" in contemporary mathematics... .

And suddenly I'm all revived - like the horse that's starting to smell the stable! Almost two weeks ago, I began to reflect on this instructive episode, in a note that immediately took the name "L'Eloge Funèbre - ou les compliments". After some hesitation as to where to place this note (taken from a late footnote to the first of the notes written for the Funeral), it appeared that the most natural place to insert it was (not the "chronological" place, but) in the "Funeral Ceremony" which is to complete the Funeral. And so, without having looked for it, the "thread" I've been following for the last three weeks, through the last three processions "The Colloquium", "The Student" and finally "The Funeral Van", which has only just joined the convoy, connects with the final part of the Burial, namely the Funeral Ceremony;

---

<sup>27</sup>(\*) (May 26) I've just learned that my colleagues on the Comité National at the CNRS have made an effort on my behalf, by offering me a two-year "position d'accueil". I don't know whether they did so enthusiastically - but none of my friends on the Committee went out of their way to give me a call or a note to tell me the good news (dated May 15).

(September) I was informed of this in a letter from the CNRS dated August 16 - it was a one-year (not two-year) appointment to a research associate post.

<sup>28</sup>This is a limited edition (150 copies) produced by my university for distribution among my closest colleagues and friends.

this ceremony marked above all, precisely, by this □chef d'oeuvre Funeral Eulogy which I began to examine on May 12, and which now constitutes the note following quite naturally from this one<sup>29</sup> (\*).

I'm finally (again?) on target! And at the same time, this beginning of reflection on a eulogy suddenly takes on a new dimension. It's no longer just the ingenious invention of a powerful brain at the service of a fixed idea, expending itself before the indifference or commanding attention of the distinguished guests at an official "grand occasion" - but it's above all the perfect, deftly served response, made on this delicate occasion of all, to a collective expectation, about the attitude that should be taken towards my person. If anyone of his generation has earned the unreserved gratitude of the entire congregation, it's my friend Pierre Deligne, who fulfilled the role expected of him with his unmistakable perfection.

---

<sup>29</sup>(\*) (November 1984) Following an unforeseen episode of illness, the note in question (n° 104) is separated from "this one" by a new procession - "The deceased - still not deceased" (n° s 98-103).

## 17.1. The incident - or the body and the mind

**Note 98** □(September 22) The latest notes for the Burial (apart from a few footnotes page) is dated May 24 - that's four months ago. The two weeks that followed, until June 10, were mainly spent re-reading and completing or reworking the notes already written, not to mention a visit of a day or two from Zoghman Mebkhout, who came to read all the notes for L'Enterrement before I entrusted it to the typesetter, and to give me his comments. I was confident that the final manuscript would be ready by early June, and that it would be typeset and printed (that was optimistic, after all. . . ) before the university vacations. I really wanted to send my "five-hundred-page letter" to everyone before the vacation rush!

p. 421

In fact, the text of L'Enterrement is still unfinished as I write: as it was four months ago, it still lacks the final two or three notes - plus a<sup>1</sup> that has been added in the meantime: the one I've just started with the lines I'm writing, as a quick account of what's happened in the meantime. On June 10, a new contingency burst upon the writing of Récoltes et Semailles, which is rich in unforeseen events: i got sick! A stitch in my side, which appeared suddenly (when the minute before I'd suspected nothing), pushed me onto my bed with a peremptory force, without reply. Standing or even sitting up suddenly became very painful for me, only lying down seemed to suit me. It was really silly, especially at a time when I was just about to finish an urgent job, and I didn't want to talk about it anymore! Typing while lying down was out of the question, and even handwriting in this position is no picnic...

<sup>1</sup>(September 23) In fact, it appears that this planned "note" was split into three separate notes (n° s 99-101)

It took me almost two more weeks, during which I tried as best I could to carry on with my work against all odds, to realize the obvious: my body was exhausted and insisting, without me even pretending to hear, on complete rest.

I'd had such a hard time hearing it, because my mind had remained fresh and alert, wriggling to keep up its momentum, as if it had an autonomous life, totally separate from that of the body. It was even so fresh and wriggly that it had the greatest difficulty in taking into account the body's need for sleep, constantly refusing, to the point of exhaustion, the deadline for sleep, that impediment to going round in circles!

Throughout my life, and up until three or four years ago, the unlimited capacity to recuperate through deep, prolonged sleep had been the solid, salutary counterpart to sometimes inordinate investments of energy: when sleep is secure, you can no longer fear anything, and you can afford (without it being madness) to throw yourself headlong and to the point of exhaustion into orgies of work - even if it means making up for it with orgies of restorative sleep! This ability, which all my life had seemed as much a matter of course as the ability to work, the ability to discover (and surely the two are intimately linked. . . ), has in recent years ended up being eliminated, and sometimes even disappearing, for reasons that I can't quite discern at present, and that I haven't really made the effort to fathom yet. More and more, when, after a long day spent at my typewriter (or on handwritten notes) and obeying the injunctions of my body, which refuses to go on, I resolve to go to bed, the reclining position (and the partial relief it provides from the tension of sitting) immediately revives my thoughts. The thinking starts all over again, for hours or even the whole night (or rather, what's left of it. . . ). I realize that the system is unprofitable (assuming it's **sustainable** in the long run), given that (for me at least) prolonged reflection without the support of writing ends up going round in circles, often becoming a kind of rehashing - the bad bent is well taken, and tends to get worse. It had become, it seems to me, the great focus of energy dispersal in my life in recent years, while other dispersal mechanisms have been eliminated one by one, gradually, over the years.

If this mechanism has taken root in my life with such tenacity, if I've been willing to pay such a price for the last few years, it's surely because something in me has found its reward, and would find its reward when the time came. It would be no luxury for me to examine the situation closely - more than once in the past four months I've been on the verge of doing so.

p. 423

□ This was undoubtedly an urgent task. Eventually, however, I realized that there was something even more urgent. He

The first thing I had to do was to deal with the most pressing problem: to re-establish contact with my body, to help it recover from the state of exhaustion I had come to feel and admit, and to regain the vigour it had lost. I realized that to do this, I'd have to give up all intellectual activity for an indefinite period - even meditating on the meaning of what was happening to me. Today's notes bring to an end this long and salutary "parenthesis" in my major investments, which for a time (since February of this year) had come together in the writing of "**Récoltes et Semailles**". The present note is a first reflection, or at least a kind of summary report, on this four-month "parenthesis".

By the time I understood, at the end of the ends, the need for complete rest, great fatigue had become profound exhaustion. Having failed to listen to the peremptory language of my body, the derisory few pages of comments and retouching in *l'Enterrement*, snatched from a state of physical exhaustion in those first two weeks, were done at the cost of an outlay of energy which, with hindsight, seems to me demented! In any case, after these feats, I had to lie in bed for weeks on end, getting up only a few hours a day for the indispensable practical tasks.

Remarkably, once I finally **understood** the need for complete rest, I didn't experience the slightest

I found it difficult to give up intellectual activity altogether, without any desire to "cheat". I didn't even have to make a decision per se - just by understanding, I'd already quit. The tasks that only the day before had kept me on my toes suddenly seemed very distant, as if they belonged to a very distant past... .

The present, however, was not empty. While for weeks and months sleep remained reluctant to come, and I lay for long hours, seemingly in total inactivity, I don't remember a single time when I found time long. I was reacquainting myself with my body, and also with my most immediate surroundings - my bedroom, or sometimes the patch of grass or dry grass bathed in sunlight right before my eyes, wherever I happened to lie down, near the house or during a short (and cautious. . . ) walk. I'd spend long moments following the dance of a fly

in a ray of sunlight, or the peregrinations of an ant or tiny green translucent bugs

or pink along endless strands of <sup>her</sup>□<sup>be</sup>, in inextricable forests of such strands tangling beneath

p. 424

my eyes. These are also the moments when, in silence and in a state of great fatigue, we follow with solicitude the hesitant wanderings of the slightest wind through our guts - the moments when we get back in touch with the elementary and essential things; the moments when we can fully appreciate all the benefits of a restful sleep, and even the marvel of simply pissing without any problem! The humble workings of the body are an extraordinary marvel, and we only become aware of them (sometimes reluctantly) when they are disturbed in one way or another.

It was quite clear that, "technically", the root of my "health problem" was sleep disturbance. The deeper reasons for this disruption eluded me and still do. By trial and error, I tried first and foremost to get back to sleep, the good old sleep I'd known, which mysteriously slipped away just when I needed it most! I've only recently found it again. Needless to say, the idea of relying on pills would never have occurred to me, and if I tried herbal teas or orange blossom water (which I was introduced to on this occasion), I knew deep down that they were expé- dients. More seriously, I took the opportunity to make some major changes to my diet: a reduction in starchy foods in favor of green vegetables and fruit (both raw and cooked), a (moderate) reintroduction of meat as a regular ingredient in my diet, and above all, a drastic reduction in the consumption of fats and sugars, where I (and many others in affluent countries) had been systematically unbalanced since at least the end of the war. My son-in-law Ahmed, who practises Chinese medicine and has a very good "feeling" for these things, helped me a great deal in realizing the importance of such a change of diet in restoring a disturbed life balance. He was also the one who insisted, without tiring, on the importance of significant bodily activity, on the order of a few hours a day, to keep up with intense intellectual activity. Intellectual activity otherwise tends to exhaust the body, drawing available vital energy towards the head and creating a strong yang imbalance.

Ahmed didn't content himself with lavishing me with good advice, accompanied by a yin-yang dialectic to which I'm quite sensitive, in the four or five years I've had ample opportunity to familiarize myself.

with this delicate dynamic of things. As soon as I was well enough to garden, □and seeing myself

p. 425

Ahmed took it upon himself to get the shabby mini-garden up and running again, by clearing new strips of land, bringing in soil, transplanting and sowing, building terraces and retaining walls, rearranging the compost heap and so on. As the days and weeks went by, I saw unfolding before me, under the impetus of my indefatigable friend, landscaping tasks sufficient to keep me busy for years, if not for the rest of my life.

for the rest of my life!

That's exactly what I needed, and what I'll need in the long term to counterbalance my over-enthusiastic intellectual activity. In this respect, the daily walks I could take myself, as suggested to me a long time ago, wouldn't be much help: my head continues to grind during the walks as it does in bed, undisturbed by the beauties of the landscape, which I cross without seeing much of anything! On the other hand, when I'm watering the garden - I'm responsible for making sure it's doing well - and even better, when I'm hoeing a bed of vegetables, I can't help but pay attention and get into it a little - to see the texture of the soil, how it's affected by the hoeing, by the vegetable plants and by the "weeds" that grow in it, by the compost and by the mulch.

- and also, as time goes by, become aware of the state of the plants I'm supposed to be caring for, a state which reflects to a large extent the greater or lesser attention I've been able to give them. This gardening activity, and all that revolves around it, responds to two strong aspirations or dispositions within me: the one that pushes me towards an action where I see **something coming out of my hands** on a daily basis (which is by no means the case for walking, and even less so for the weights suggested to me by a colleague and friend. . . ); and the one that also pushes me towards an action where I see something coming out of my hands on a daily basis (which is by no means the case for walking, and even less so for the weights suggested to me by a colleague and friend. . . ). ); and the one that pushes me towards an action where, at every moment, I have the opportunity to **learn from** contact with things. It would seem that I'm best disposed to learn in situations where I'm actually "doing" something - "something" that takes shape and transforms itself under my hands... .

p. 426 Once I'd got over the state of exhaustion itself, my convalescence was, it seems to me, aided by two types of activity, or rather, two types of important and beneficial factors in my day-to-day activities, both at home and in the garden. On the one hand, there was **physical effort**.

that I often felt tired and listless before setting to work - the "harder" the job, involving me wielding a heavy pickaxe or large stones, let's say, the fitter, heavier I felt afterwards

a good dose of fatigue. And then there was the contact with **living things**: the plants that had to be cared for; the soil that had to be prepared for them, then mulched or hoeed; the food that had to be prepared and that I ate with as much pleasure as I had had in preparing the meal; the cat demanding its pittance, and its share of affection; the various utensils and tools too, and right down to the rough and often badly licked stones that had to be turned and turned in all directions, in order to assemble them into low walls that would stand upright. . .

Physical effort and contact with living things - these are precisely the two aspects that are lacking in intellectual work, and which mean that such work is by nature incomplete, piecemeal, and ultimately, if not supplemented and compensated for by something else, dangerous or even harmful. This is the third time in just over three years that I've had the opportunity to realize this. It's even become quite clear now that I'm facing a drastic deadline: to change a certain lifestyle, to find a balance where the yin pole of my being, my body, is not constantly neglected in favour of the yang pole, the mind or (to put it better) the head - or else lose my skin in the very next few years. That's what my body has been telling me, as clearly as it can be told! I've now reached a point in my life where the need for a certain elementary "wisdom" has become a matter of **survival**, in the literal sense of the word. This is surely a good thing - otherwise "wisdom" would be perpetually postponed, in favor of the kind of bulimic intellectual activity that has been one of the dominant forces in my entire adult life.

Faced with such a clear deadline: "change or die! - I didn't have to probe myself to find out what my choice was. That's why, for almost four months, I was able to abstain from all intellectual activity, maths or no maths, without ever feeling like I was doing myself any violence. I knew, without having to tell myself

In other words, a living gardener is even better than a dead mathematician (or a dead "philosopher" or "writer", for that matter! ). With a little malice, we could add: even better than a living mathematician! (But that's another story... )

I don't think I'll ever find myself in such a "borderline" situation, where I'll have to give up all intellectual activity, whether mathematical or meditative, in the long term. Rather, the task practice □ the most immediate, the most urgent in the years to come, seems to me to be precisely that of achieving

p. 427

a balanced life in which the two types of activity coexist on a daily basis, that of the body and that of the mind, without either becoming all-consuming and crowding out the other. I make no secret of the fact that my most powerful investments since childhood have been in the "spirit", and that the two main passions which have continued to dominate my life in recent years still lead me in this direction today. Of these two passions, the passion for mathematics and the passion for meditation, it seems to me that it is the first named above all, if not exclusively, that acts as a factor of imbalance in my life - as something that still has an unfortunate tendency to "devour" everything else for its own sake. It's no coincidence, surely, that the three "episodes of illness" in my life that have marked a situation of imbalance, since June 1981, have occurred precisely at times when it's the mathematical passion that has taken centre stage.

It could be said that this is not quite the case for this latest episode, which occurred during the writing of *Récoltes et Semailles*, a period of self-reflection, not to say meditation. But it's also true that this reflection on my mathematical past was constantly fuelled by my mathematical passion. This was particularly the case in the second part, *l'Enterrement*, where the egotic component of this passion was particularly strong and constant. Yet, even in retrospect, I don't feel that at any point this reflection took on an all-consuming, even demented, rhythm and pitch, as on the two previous occasions when my body was finally forced to let out an unanswered "ras le bol! Seen separately from the context of an entire life, my intellectual activity over the last year and a half (since "resuming" with the writing of *La Poursuite des Champs*, followed by *Récoltes et Semailles*) appears to have continued at a most reasonable pace, without forgetting to eat or drink (but sometimes, just a tad, to sleep. . . ). If it finally led to a third "health episode" (to use a euphemism), it was undoubtedly the result of a whole life marked by the eternal imbalance of a head that is too strong, imposing its rhythm and its law on a robust body that has long endured without flinching<sup>2</sup> (\*).

□ In the past two months, I've had ample opportunity to realize the irreplaceable benefit of bodywork, in intimate contact with humble living things, speaking to me in silence about the simple, essential things that books or reflection alone are powerless to teach. Thanks to this work, I found sleep again, that even more precious companion than eating and drinking - and with it, a renewed vigor, a robustness that had suddenly seemed to have vanished. And I've come to realize that, in my season of life, if I want to continue this new mathematical adventure I've been on since last year for a few more years, I can't do it without endangering my health and my life, except with my two feet firmly planted in the soil of my garden.

p. 428

The coming months will be those in which a new way of life will have to be put in place, in which the work of the body and that of the mind find their place and are reconciled on a daily basis. There's plenty to do!

---

<sup>2</sup>(\*) I should make an exception here for the five years from 1974 to 1978, which were not dominated by any major task, and where manual occupations absorbed a not inconsiderable proportion of my time and energy.

## 17.2. The trap - or ease and exhaustion

**Note** 99 (September 23) Last night, I had to cut myself short, lest I keep going until two or three o'clock in the morning and get caught up in a spiral I know only too well. I was feeling refreshed, and if I'd followed my natural inclination, I'd have gone on into the wee hours! The trap of intellectual work - at least that which you pursue with passion, in a subject where you end up feeling like a fish in water, following a long familiarity - is that it's so incredibly **easy**. You just pull and pull, and it always comes, you just have to pull; it's only sometimes that you have the feeling of an effort, of friction, a sign that it's resisting just a little. . .

I remember, however, from my early years as a mathematician, a persistent feeling of heaviness that had to be overcome by stubborn effort, leaving a feeling of fatigue in its wake. This corresponded above all to a period in my life when I was working with insufficient or even inadequate tools; or to a later period, when I had to acquire tools more or less painstakingly, under the pressure of a milieu (essentially, that of the Bourbaki group) that used them routinely, without their *raison d'être* becoming apparent to me as I went along, or even sometimes for years. I've already had occasion to talk about these sometimes rather painful years (see "L'étranger bienvenu" s.9, and

"cent fers dans le feu, ou: rien ne sert de sécher!", note n° 10), in the first part of *Récoltes et Semailles*. It was mainly the period from 1945 to 1955, which coincides with my period of functional analysis. (He

p. 429

It seems to me that in the students I had later, between 1960 and 1970, this resistance to learning without sufficient motivation, where notions and techniques are swallowed up on the faith of the authority of elders, was much less strong than it was in me - to tell the truth, I didn't perceive any at all).

To return to my subject, it was from 1955 onwards that I often had the impression of "flying" - of doing maths by playing with myself, without any feeling of effort - just like some of my elders whom I had once envied so much for such almost miraculous ease, which had seemed well beyond the reach of my modest, ponderous self! Today, it seems to me that such "facility" is not the privilege of some exceptional gift (as I've encountered in others, at a time when such a "gift" seemed entirely absent in me), but that it appears of its own accord as the fruit of the union of a passionate interest in a given subject (like mathematics, say), and a more or less long-standing familiarity with it. If "gift" does indeed play a part in the emergence of such ease, it is undoubtedly through the factor of time, more or less long from one person to the next (and sometimes from one occasion to the next in the same person, it's true.... ), to arrive at a perfect ease in working on this or that subject<sup>3</sup> (\*).

Still, the more things go - as the years go by - the more I get this impression of "ease" when I do maths - that things are just waiting to reveal themselves to us, if only we take the trouble to look, to scrutinize them just a little. It's not a question of technical virtuosity - it's quite clear that from this point of view, I'm in much worse shape than I was in 1970, when I "quit maths": since then, I've had the opportunity above all to unlearn what I'd learned, "doing maths" only sporadically, in my own corner, and in a spirit and on themes quite different (at first sight at least) from those of yesteryear. Nor do I mean that it would be enough for me to get to grips with some famous problem (Fermat's, Riemann's or Poincaré's, let's say), to make my way in a straight line to its solution, in a year or two.

---

<sup>3</sup>(\*) Yet I know several mathematicians, each of whom has produced a profound body of work, who have never seemed to give me the impression of ease, of "facility" referred to here - they seem to grapple with an omnipresent heaviness, which they have to overcome with effort, at every step. For one reason or another, the "natural fruit" just mentioned didn't "appear of its own accord" in these eminent men, as it was supposed to. Which goes to show that not all unions bear the fruit one might expect...

even<sup>4</sup> □trois! The ease I'm talking about is not the ease that sets out and achieves such and such a **goal**, fixed in advance :

p. 430

proving such and such a conjecture or giving it a counterexample... . Rather, it is that which allows us to dart into the unknown, in such and such a direction that an obscure instinct tells us is fruitful, with the intimate assurance, never to be denied, that every day and every hour of our journey cannot fail to bring us...

its harvest of new knowledge. Exactly **what** knowledge the next day, or even the next hour on this very day, holds in store for us, we certainly sense - and it's this "presentiment", constantly caught short, and the suspense with which it's bound up, that constantly launches us forward, while the very things we're investigating seem to draw us into themselves. What becomes known always surpasses what was foretold, in precision, flavor and richness - and what is known in turn immediately becomes the starting point and material for a renewed foreknowledge, dashing forward in pursuit of a new unknown eager to be known. In this game of discovering things, the **direction** we're taking at any given moment is known to us, while the **goal is** forgotten - assuming we started out with a goal, in fact, that we set out to achieve. This "goal" was in fact a **starting point**, the product of an ambition, or of ignorance; it played its part in motivating "the boss", setting an initial direction, and triggering this game, in which the goal has no real part. As long as the journey undertaken does not last a day or two, but is a long one, what it will reveal to us as the days and months go by, and where it will lead us at the end of a long cascade of unknown adventures, is for the traveller a total mystery; a mystery so remote, so out of reach in fact, that he hardly cares! If he happens to scan the horizon, it's not for the impossible task of predicting a point of arrival, and even less to decide on one as he sees fit, but to take stock of where he is at the moment, and from among the directions open to him for continuing his journey, choose the one he feels from then on to be the most burning. ...

Such is the "incredible facility" I mentioned earlier, in connection with the work of discovery in a wholly intellectual direction, such as mathematics. It is not **held back** by inner **resistance**<sup>5</sup> (\*)

(as is so often the case in meditation work such □as I practice it), nor by **physical effort** to

p. 431

The result is fatigue, which eventually gives an unequivocal signal to stop. As for **intel- lectual** effort (assuming we can even speak of "effort", having reached a point where the only "resistance" left is the time factor... . ), it doesn't seem to generate either intellectual or physical fatigue. More precisely, if there is any physical "fatigue", it is not really felt as such, apart from occasional aches and pains caused by sitting too long in a fixed position, and other similar incidental problems. These are easily eliminated by a simple change of position. Lying down has the unfortunate virtue of making them fade away, and thus encouraging a revival of intellectual work, instead of much-needed sleep!

I've come to realize, however, that there's a physical "fatigue" that's more subtle and insidious than muscular or nervous fatigue, which manifests itself as such in an unmistakable need for rest and sleep. The term "exhaustion" here (rather than "fatigued") would be more accurate, although it's understood that this state is not perceived as such, in the common sense of the term, which designates extreme fatigue, manifesting itself as

<sup>4</sup>(\*) Yet I know several mathematicians, each of whom has produced a profound work, who have never given me the impression of ease, of "facility" referred to here - they seem to grapple with an omnipresent heaviness, which they have to overcome with effort, at every step. For one reason or another, the "natural fruit" just mentioned didn't "appear of its own accord" in these eminent men, as it was supposed to. Which goes to show that not all unions bear the fruit one might expect... .

<sup>5</sup>(\*) Yet I know a remarkably gifted mathematician whose relationship to mathematics is typically conflictual, hampered at every step by powerful resistances, such as the fear that a certain expectation (in the form of a conjecture, say) might turn out to be false. Such resistance can sometimes lead to a state of genuine intellectual paralysis. Compare this with the previous footnote.

in particular by the great effort required just to stand up, walk a few steps, etc. It's more a question of "exhaustion" of the body's energy for the benefit of the brain, manifested by a gradual lowering of the body's general "tonus", its vital energy level. It seems that this exhaustion by excessive intellectual activity (by which I mean: not compensated by sufficient bodily activity, generating physical fatigue and the need for rest) - this exhaustion is gradual and **cumulative**. These effects depend on both the **intensity** and **duration** of intellectual activity over a given period. At the level of intensity at which I pursue intellectual work, and with my age and constitution, it would seem that the cumulative exhaustion in question reaches a critical, dangerous threshold in my case, after a year or two of uninterrupted activity, without compensation through regular bodily activity.

In a way, the "ease" I'm talking about is only apparent. Clearly, intense intellectual activity involves considerable energy: energy is taken from somewhere and "spent" on work. It would seem that the "somewhere" is in the body, which "takes in" (or rather, **disburses**) as best it can the (sometimes dizzying) expenses that the head spends without counting the cost. The normal route to recovery

p. 432

of the energy supplied by the body, is sleep. It's when the head becomes bulimic that it ends up encroaching on sleep, which amounts to eating up energy capital without renewing it. The trap and the danger

of the "ease" of intellectual work, is that it relentlessly encourages us to cross this threshold, or to remain beyond it once crossed, and that moreover this crossing is not signalled to our attention by the usual, unmistakable signs of fatigue, or even exhaustion. It takes great vigilance, I realize, to detect the approach and crossing of the threshold in question, when we're fully engaged in the pursuit of an exciting adventure. To perceive this emptiness of energy at the level of the body requires a state of listening to the body, which I have often lacked and which few people have. Indeed, I doubt that such a state of communion of conscious attention with the body could flourish in anyone at a time of life dominated by purely intellectual activity, to the exclusion of all physical activity.

Many intellectual workers instinctively feel the need for such physical activity, and arrange their lives accordingly: gardening, DIY, mountains, boating, sports... . Those who, like me, have neglected this healthy instinct in favor of an over-invasive passion (or too much lethargy), sooner or later pay the price. That's three times in three years that I've paid the bill, and I've done it without complaint I might add, or better still, with gratitude, realizing with each new episode of illness that I was merely reaping the rewards of my own negligence, and what's more, that it was also teaching me a lesson that no doubt only he could give me. Perhaps the most important lesson I learned from the last of these episodes, which has just come to an end, is that it's high time I took the initiative and made such reminders unnecessary - or, more concretely, that it's high time I cultivated my garden!

## 17.3. A farewell to Claude Chevalley

**Note 97** In my reflections yesterday and today, I have deliberately left out an event that took place right in the middle of the illness-episode, in the early days of July, at a time when I was still bedridden. This was the death of Claude Chevalley.

I found out about it from a vague article in *Libération*, more or less devoted to the event, which a friend had passed on to me on the off-chance that it might interest me. There was almost nothing about Chevalley, but a bit about Bourbaki, of which he was a founding member. I felt quite stupid when I found out about the news. For months I'd been picturing myself about to finish with *Récoltes et Semailles*, mint paperback and all - and go up to Paris dare dare to bring him a still-warm copy! If there were

p. 433

one person in the world I was sure would read my pamphlet with real interest, and often with pleasure, was him - and I wasn't at all sure there'd be anyone else but him!

Right from the start of my reflection, I realized that Chevalley had brought me something, at a crucial moment in my itinerary, something sown in effervescence, and which had germinated in silence. What I felt connected to him wasn't so much a **feeling of** gratitude, let's say, or sympathy, or affection. These feelings were surely present, as they are also present towards this or that other "elder" who had welcomed me as one of their own, more than twenty years earlier. What made my relationship with Chevalley different from my relationship with any of them and with most, if not all, of my friends, was something else. It's the feeling, I think, or better said, the perception, of an essential **kinship**, over and above the cultural differences and conditioning of all kinds that marked us from an early age. I don't know if there's anything of this "kinship" in the lines of my reflection where it's mentioned<sup>6</sup> (\*). In the period of my life to which these lines refer, Chevalley appears perhaps more as an "elder", this time on the level of an understanding of certain elementary things in life, than as a "parent". It's a distance, however, that my subsequent maturation must have reduced and perhaps abolished, as had been the case for a long time at the mathematical level, in my relationship with him as with my other elders. If I now try to put into words the meaning of this kinship, or at least one of its signs, it comes to me as follows: both of us are "cavaliers seuls" - travelers, both of us, on our own "solitary adventure". I write about mine in the last "chapter" (of the same name) of "Fatuité et Renouvellement"<sup>7</sup> (\*\*). Perhaps, for those who knew Chevalley well (and even for others), this part of the reflection is more apt to suggest what I'd like to express, than that which concerns him by name.

Meeting him and talking with him would surely have given me a better understanding of this friend than I had in the past, and a better grasp of both this essential kinship and our differences. If there were, apart from Pierre

Deligne<sup>a</sup> person for whom I felt an eagerness to be able to hand-deliver the text of Récoltes et Semailles was Claude Chevalley. If there was one person whose comments, whether mischievous or sarcastic, would carry particular weight with me, it was him again. On that day in the first week of July, I knew I wouldn't have the pleasure of bringing him the best I had to offer, nor the pleasure of still hearing the sound of his voice.

p. 434

The strange thing - and which no doubt contributed to making me feel so **stupid** on the spur of the moment - is that more than once over the past few months, as I talked about an upcoming meeting with Chevalley, I remembered that he was struggling with health problems - and there was a worry in me, constantly brushed aside, that this meeting might not take place, that my friend might perhaps disappear before I came to see him. The idea of course occurred to me to write or telephone him, if only to ask about his health and how he was, and to say a few words about the work I was engaged in, and my intention to go and see him about it. The fact that I brushed it off as silly and unwelcome (that there was really no reason why. . . etc.), as one so often does in situations of this kind, illustrates just how much I, like many others, continue to live "below my means" - brushing off the obscure foreknowledge of things that blows me knowledge that I'm too busy and lazy to hear. . .

<sup>6</sup>(\*) See "Rencontre avec Claude Chevalley - ou : liberté et bons sentiments" (section 11 ), and the last paragraph of the following section, "Le mérite et le mépris".

<sup>7</sup>(\*\*) See especially, in this sense, the two sections "The forbidden fruit" and "The solitary adventure", n° s 46, 47.

## 17.4. Surface and depth

**Note** 101 (September 24) After the digression of the previous two days around the "illness episode" of the past few months, it's time to pick up where I left off in June. I foresaw that there would be two final notes yet to be written: a "Funeral Eulogy (2)" (which would follow on from and complete the note "Funeral Eulogy (1) - or compliments" of May 12), and a final "De Profundis", in which I intended to sketch out an overview of my thoughts on the Burial.

The planned substance of these two notes was still very much alive when I fell ill - I was just about to throw it all down on paper, just long enough to finish putting the finishing touches to all the previous notes, so as to feel that I was working on solid, tidy "backsides". ... During the three full months (since June 23rd to be exact) that I've practically stopped all work on Burial, apart from the occasional typing correction, it has, alas, slipped my mind a little. I feel

p. 435 even a little foolish, embarrassed in any case, to wisely set about filling in the blank pages waiting behind titles-pensums, on the pretext that these figures went in a provisional table of contents, and that I had the imprudence of alluding to it here and there in a certain text intended for publication. This is especially the case for "L' Eloge Funèbre (2)", and even rereading the first juice of "L' Eloge Funèbre (1)" (aka "les compliments") wasn't enough to warm up for me a substance that for months had had the leisure to chill in its corner!

And yet, from the day after May 12, when I wrote this note, and throughout the month that followed, my hands were tingling with the desire to delve deeper into this new mine I'd stumbled upon, without even suspecting it. When Nico Kuiper was kind enough to send me the jubilee brochure celebrating the twenty-fifth anniversary of the IHES last year, I must have spent half an hour going through it (including the two half-page articles on Deligne and me), without finding anything in particular. The only thing that struck me was the absence of any allusion to the difficult early years of the IHES, when its reputation was established in a makeshift room, myself (with the first Algebraic Geometry Seminars) being the only one to represent it "in the field". I reflected on this months later, when writing the note

"L'arrachement salutaire" (n° 14), in March 84. Not being sure of my memory, I have, as a matter of conscience asked Nico to send me another copy of the booklet (as I couldn't get my hands on the first one again). This was a second opportunity to go through the two topos again, perhaps with a less hasty eye. And yet, this time I'm definitely not hip. I note in passing, with some surprise, that the topo on Deligne states that "The main thrust of his work is to 'understand the cohomology of algebraic varieties'" - who would have thought! I forgot about it for a month or two (until I was reminded of it while writing the note "Refusal of an inheritance").

- or the price of a contradiction", n° 47). On the other hand, I don't notice that the word The word "cohomology" is not mentioned, nor is the word "schema". In my inattentive state at the time, there's still nothing to make me suspect that this anodyne text, a little overloaded with hyperbolic epithets, functions as a Funeral Eulogy, "served" (moreover) "with perfect fingering"! A fingering so perfect, in fact, that I wonder if any of the readers of this booklet (a little dull around the edges, by dint of deliberate pomposity on all sides, as the occasion demanded, it would seem. . ) noticed it more than I did, on my first and second readings.

p. 436 This immediately ties in with an observation that keeps coming back to me, whenever, for one reason or another, I am led to look at something with a □ somewhat intense and sustained attention that I had previously been content to look at "in passing" with the "usual", routine attention I pay to the big and small things and events that go on in my life from day to day. Such a situation

is a frequent occurrence during meditation, which often leads me (more often than not "one thing leading to another" and without deliberate intent) to examine more closely certain events of the day or night (including dreams), which had passed more or less unnoticed in my customary state of attention, or whose meaning (often clear and obvious) had entirely escaped my conscious attention at first.

When I speak here of "somewhat intense, sustained attention", what I really mean is an **alert**, fresh look, a look that is not weighed down by habitual thinking or the "knowledge" that serves as a facade for it. If, for one reason or another, we are led to take an alert, attentive look at things, they seem to transform before our very eyes. Behind the apparent flatness of the dull, smooth surface of things presented to us by our everyday "attention", we suddenly see an unsuspected **depth** open up and come to life. This profound life of things didn't wait for us to take the trouble to get to know them - it's always been there, part of their intimate nature, whether we're talking about mathematical objects, a garden lawn, or all the psychic forces at work in such and such a person at such and such a time.

**Thought** is just one of the instruments we use to reveal and fathom the depth behind the surface, the secret life of things, which is only "secret" because we're too lazy to look, too inhibited to see. It's an instrument that has its advantages, just as it has its drawbacks and limitations. But in any case, thought is rarely used as an instrument of discovery. Its most common function is not to discover the secret life in ourselves and in things, but rather to mask and freeze it. It is a multi-purpose tool at the disposal of both the child-worker and the boss. In the hands of the former, it becomes a sail, capable of capturing the forces of our desire and carrying us far into the unknown. In the hands of the other, it becomes an immovable anchor, which neither turbulence nor storms can shake... .

The thought process was getting a bit lost, and now it's back to a starting point - which is the observation I **was** ☐ **arresting** on yesterday: to what extent, through habits and conditioning p. 437

I live below my means! (In which, moreover, I find myself in very good company... ). It was through a gradual discovery of L'Enterrement, based on facts as large as the LN 900 volume<sup>8</sup> (\*), that my lazy attention was finally awakened. A reading of the note "Refus d'un héritage

- ou le prix d'une contradiction" (n° 47) led me on May 12 to reread for a third time (!) the two famous "topo". This time, however, I noticed a rather unusual detail: there was no mention whatsoever of "cohomology" (or algebraic varieties or diagrams), in the little text in dithyrambic style devoted to me in the jubilee brochure! The whole thing struck me as funny enough to merit a footnote, which I set about writing as quickly as possible. Along the way, I became aware of one or two other "funny" details that hadn't yet caught my attention: even though this was a third reading, it too had remained superficial and mechanical - I'd pretty much just **repeated** and **reproduced** the readings I'd done previously. It was only when I wrote what was supposed to be a footnote, and which became the note "L'Eloge Funèbre (1)", that I gradually became hooked on the game, that a **curiosity** was awakened, which led me to return to these texts once again, this time looking at them a little more closely. It was only then that the transformation I mentioned earlier took place - that a "depth" opened up, an intense life behind the flat façade of a dithyrambic discourse, served up in the florets of a grand occasion! It was this curiosity that transformed a mechanical, repetitive, distracted gaze into an "awakened" one. . .

---

<sup>8</sup>(\*) See the note "Souvenir d'un rêve - ou la naissance des motifs", n° 51, and the following note "L'Enterrement - ou les Nouveaux Pères".

The "awakening" in question wasn't instantaneous, moreover; it came gradually, with the progress of the reflection pursued in this note-de-bas-de-page-sic. To tell the truth, it wasn't complete until the final point of this note, when the hour was late (I seem to remember) and prompted me to "get it over with"<sup>9</sup> (\*\*).

p. 438 But no sooner had I placed this point, or at least by the next day, than I realized that I was far from exhausting the subject of the Funeral Eulogy. It was only then that I felt completely to how these two texts, so short and innocuous on the surface, were rich in meaning, veritable mines in fact! And that I was far from having exhausted what they had to say, if only I would listen... .

(September 25) Last night, I had to cut my thoughts short again, even though they had only just started, it seemed to me. I'd been sitting in front of my typewriter for three and a half hours straight, and little signs were beginning to show me that it was time to get up and get moving.

I well remember the first time I was led to direct "intense, sustained attention" to written texts, and experienced day after day, for months on end, the amazing metamorphosis of a dull, flat "surface", coming to life and revealing a rich, precise meaning, an unsuspected "depth". It was also, at the same time, my first long-term meditation, in the spirit of a journey into the unknown, which would last as long as it lasted... . The starting material was the voluminous 1933 / 34 correspondence between my father (who had emigrated to Paris) and my mother (still in Berlin at the time, with me then aged five). My aim was to "get to know" my parents. I had discovered the previous year that the admiration I had devoted to them all my life, which had eventually congealed into a kind of filial piety, covered up and maintained a very great ignorance about them. This phenomenal ignorance, in which I had been happy to maintain myself all my life, only became fully apparent to me during the long-term meditation of the following year, from August 1979 to March 1980.

I had begun to "prepare the ground" throughout the month of July 1979, in particular by doing a first reading of the whole of this correspondence, alongside work on a "poetic work of my own composition"<sup>10</sup> (\*) which I was then putting the finishing touches to. Every evening, I spent a few hours reading three or four letters-answers, certainly with interest and, I would have said at the time without hesitation, with a great deal of pleasure.

attentive way. Yet I was dimly aware that I remained a stranger, an outsider to what I was doing.

p. 439 that the true meaning escaped me. What I was reading was often quite crazy, as if this man and this woman I saw living and parading before my eyes had nothing in common with those I had thought I knew - those whose clear, intangible image my memory restored to me. In the absence of patient, meticulous, demanding work on what I was reading, which I would have pursued as I went along, I was simply stunned, without more, by the (relatively) little in these letters that was "big" enough to catch my superficial attention. What was recorded in this way was superimposed on the "well-known", which had been the invisible and unchanging foundation of my life, of my sense of identity, since my early childhood and right up to the present day (without my ever realizing it, of course). Assuming I'd stuck to that first reading, surely the thin layer of new, undigested "facts" that had thus been superimposed on the master layers would soon have been eroded and washed away without leaving much trace, in the months and years that followed.

---

<sup>9</sup>(\*\*) All the more so, I'm sure, as on the same day I had already gone through the long and substantial reflection "Le massacre" (n° 87), to which, incidentally, I refer towards the end of the note "L'Eloge Funèbre - ou Les compliments" which had followed on from it.

<sup>10</sup>(\*) Allusion is made to this work and the episode in my life it represents, at the end of the section "Le Guru-pas-Guru, ou le cheval à trois pattes", n° 45, and in the note n° 43 to which it refers.

At the time of this preliminary work, my main investment was elsewhere, in the writing of a work that was absorbing most of my energy. I was well aware of the limits of a work done in parallel with another, and that I'd have to come back to it from start to finish, through a piecework project in which I'd put all my energy. I anticipated that it would be a matter of a few weeks - in fact I spent seven months in a row, devoted to a meticulous examination of the letters and writings left by my parents, of which the most "burning" part is surely the 1933 / 34 correspondence. Seven months, moreover, at the end of which I finally cut it short, realizing that the subject ("getting to know my parents") was as inexhaustible as ever. It had become more urgent to **get to know myself**, with the help of all the things I'd learned about my parents, and thus, indirectly at least... about my own forgotten childhood... .

I've just spent nearly two hours going through the beginnings of the notes of this meditation on my parents, begun on August 3, 1979. Contrary to what I thought I'd hastily remembered, I didn't then realize, except perhaps very dimly, the need to review thoroughly, "from beginning to end" (as I wrote earlier), the letters and other written traces of my parents that I'd read over the past month.

At least, I don't suggest anything to that effect in my notes. After a recapitulatory reflection by a

day or two, taking provisional stock of my multiple, tantōtinet confused impressions, aroused by p . 440

In no way do I pretend that I'm resuming this reading with meticulous piecework. Instead, I follow it up (as would be expected) with an equally brisk reading of **other** letters (notably a voluminous correspondence from my parents in the years 1937/39), and with a parallel reflection fuelled by my reading impressions. One thing leading to another, over the course of August and the following month, I began to learn what it's like to **work** on a letter (or any other written testimony of a life) in such a way as to apprehend its true, sometimes striking, meaning - a meaning, however, that the person writing often likes to ignore, to conceal from himself and from others, unseen and unknown! while managing to display it "between the lines" in a sometimes ostentatious, incisive way. And it must be rare for an insinuation or provocation (sometimes ferocious. . . ) not to reach the addressee, for it not to be perceived and "cashed in" by him at a certain level, while he too is careful not to let this perception, this knowledge penetrate the field of his gaze, and he too enters with all sails unfurled, into this same game of "neither seen nor known!". It is unfailingly the most obscure passages, those that seem to border on debility (or insanity. . . ) and defy all rational interpretation, that to the curious eye reveal themselves to be the richest in meaning: veritable mines, providing irreplaceable keys to penetrate further into the simple and obvious meaning behind the accumulation of apparent nonsense. Passages like these, frequent in the correspondence between my parents, and especially in the letters from my mother, who led the way, of course went completely "over my head" when I first read them in July. I began to pick up on them, here and there, over the course of the following month. It was only in September that various cross-checks made me realize that I'd definitely missed something essential in what I had to learn from the 1933/34 letters, and brought me back to them, prompting me to do a first "in-depth" reading of some of them. This reading immediately changed my childhood image of my parents and their relationship with me and my sister.

## 17.5. In Praise of writing

**Note** 102 (September 26) It's been two days since I've been in the midst of "autobiographical reminiscences", as I set off to write ("cold") the sequel to a certain note on a certain Eloge Fu- phique.

p. 441 nèbre. I don't know whether this digression will have warmed my ardor even a little! At the very least, it's about time I got to the point I had in mind when I launched into it <sup>before-□hier</sup>, a little in the direction of: "On the art of reading a message that pretends not to say what it has to say". This kind of text-message is much more frequent than I would have imagined... ..

It goes without saying that the question of the "how" of this "art" doesn't arise, as long as you're prepared (as I was for most of my life) to take at face value and to the letter everything you're told or written, and not to look for or see, in anything or anyone, any intentions other than those expressly expressed by the person concerned. On the other hand, the question arises when you are confronted with the indefinable expression that something is "not right" in a statement, tirade or narrative, that there's something fishy about it, that something has "passed", somewhere, that isn't supposed to have been said (what would you expect?). Sometimes, too, it's the elementary and disconcerting perception of an incoherence, an absurdity, sometimes so enormous and at the same time seemingly elusive, that it seems to defy all formulation, to the point of appearing to be debilitating or delirious. Such situations are often overloaded with anguish - and it was indeed by an instantaneous influx of anguish, never recognized as such but blurred and immediately retracted under a wave of violent, distraught anger, that I invariably reacted to such situations, where absurdity suddenly burst into my life: an inadmissible, incomprehensible absurdity, fraught with threats, each time shaking my serene vision of the world and of myself to the foundations! And so it was, at least until I discovered "meditation", when an intrepid, enterprising curiosity defused and took over from these waves of anger and anguish... ..

It was curiosity, i.e. the desire to know, that made me spontaneously find, under pressure of need, this "art" of deciphering a scrambled testimonial text - or more modestly speaking, a method that suited my limited means and cumbersome nature. No matter how hard I tried, and no matter how curious I was, on first reading (or even on second) of these weighty letters, all the essentials went right over my head - "I couldn't see a thing". Sometimes, commenting on a few often confused impressions, perhaps about this or that particularly obscure and disconcerting passage, I managed to penetrate further into the meaning of a text that had seemed hermetic. Along the way, I sometimes found myself copying, for quotation purposes, passages of greater or lesser length, distinguished either by obscurity, or because they gave me the impression of being "important", for one reason or another. □

p. 442 other. As the days and weeks went by, I realized that the simple act of **copying** a passage in extenso of the text I was examining, surprisingly altered my relationship with the passage, opening me up to an understanding of its true meaning.

This was completely unexpected, whereas my initial motivation (at least on a conscious level) had been a matter of pure convenience. I even remember that for a long time, there was a certain restrained impatience in me, to devote precious time to acting as a copyist, nothing more, nothing less, I'd eat my heart out to get to the end and write as fast as I could... . But there's no comparison between the speed of the eye reading written lines and the hand transcribing them word for word. No matter how fast you write, the "time factor" is absolutely not the same. And I suspect that this "time factor" does not act in a purely mechanical, quantitative way - or, to put it better, that it is only one aspect of a more delicate and richer reality. Nor, for me at least, is there any common measure between the action of the eye that scans lines that someone else has thought and written, and the act of the hand that letter after letter, word after word, rewrites those same lines. Surely, there is a profound symbiosis between the hand and the mind or thought; and at the very rhythm of the hand that writes, and without any deliberate purpose, the mind cannot help but reform, rethink the same words, assembling themselves into sentences laden with

meaning, and these in discourse. Provided that a desire to know animates this hand that reproduces letters, words and phrases, and that it animates this mind which, in unison, also "reproduces" them, at another level, - surely this double action creates a more intimate contact between myself and this message of which I make myself the scribe-writer, than the act, above all passive and without support or tangible trace, of the eye that is content to read.

This groping intuition is in line with a long-held observation - that for me, rhythm is the key to success. of working thought (be it mathematical work or any other, including the work I call "meditation") is most often (if not always) that of the hand that writes, and in no way that of the eye that reads<sup>11</sup> (\*). And the **written trace** *laid* by my hand (or sometimes, by the typewriter maneuvered

by my hands. ... ), at the pace of unhurried, never dawdling thought, is the indispensable material support of that thought - both its "voice" and its "memory". I suspect that the same is more or less true (though perhaps to a lesser degree) of most, if not all, "intellectual workers".

## 17.6. L'enfant et la mer - or faith and doubt

**Note** 103 (September 27) In any case, the fact remains that, just as I can only "enter" a mathematical theory by writing, I can only begin to enter a text-message, the "between the lines" of a message, by **rewriting** it. My first work of meditation "on texts" was transformed, an apparent platitude began to open onto a living depth, and the absurd to find a meaning, **from the** moment I began to rewrite in extenso the message, or (in the case of one of prohibitive dimensions) the passages that a flair made me feel were crucial.

In the absence of reliable "objective" criteria for guaranteeing the validity of an "interpretation", presented as the result or outcome of (so-called?) "work" on a text, let's say, we can make any text or discourse say exactly what we want, inventing whatever "message" we like to attribute to it. Nothing could be further from the truth, and sure-fire examples abound! Moreover, I doubt (except perhaps in a delimited discipline like history - and even then. . . ) that it would be possible to identify such criteria. It wouldn't do much good anyway: it wouldn't stop anyone inventing fanciful interpretations, nor would it enable anyone to fathom and discover the true meaning of a message, a situation or an event. Rules and criteria are the ingredients of a **method**, which has its own usefulness and importance (often overestimated, to the detriment of other factors and forces of a completely different nature), as a tool for discovery and consolidation in the development of scientific or technical knowledge, and in that of any kind of know-how: driving or repairing a car, etc. On the other hand, at the level of self-knowledge and discovery of oneself and others, the role of method becomes entirely incidental: it's the "stewardship" that certainly follows, when the essential is there. And being inspired by a method, or even clinging to it, does nothing to encourage the emergence of that more essential thing.

- quite the contrary!

To put it another way: he who sets out to find such and such a thing *decided* *advance* (which he will call "true",

or "truth") will have no trouble finding it, and even proving it to his complete satisfaction - and surely

<sup>11</sup>(\*) This circumstance, which seems to affect me to a greater degree than most of my fellow mathematicians, once made it difficult for me to fit into the collective work sessions of the Bourbaki group, finding myself unable to keep up with the readings as they went along. In fact, I've never really enjoyed **reading** mathematical texts, even beautiful ones. My spontaneous way of understanding maths has always been to **do** it, or to **redo** it (with the help, here and there, of ideas and indications provided by colleagues or, for want of a better word, books. . . ).

along the way, he'll find one or another, if not a whole crowd, happy to form an alliance with him and share his convictions and satisfaction. He's like the butterfly hunter, who sets off with a beautiful butterfly in his net (a stuffed one, as it happens), and takes it out all happy (and to his own satisfaction) when he returns from his "hunt".

And then there's the one who finds himself placed in front of an unknown, like a naked child in front of the sea. When the child wishes to know it, he enters and knows it - whether it is warm or cool, calm or agitated. Anyone who is attracted by something unknown, and sets out to discover it, will surely know it to a greater or lesser degree. With or without a net, he will find the truth, or at least **some** truth. His mistakes and his discoveries are all stages in his journey, or rather, in **his love affair** with what he wants to know.

I know what I'm talking about, because in my life I've been both this butterfly hunter and this naked child. There's no difficulty in distinguishing one from the other. I doubt that "objective criteria" will be of much help here, it's much simpler than that! All you have to do is use your eyes...

And there's no difficulty in distinguishing the successive stages, the successive decanting stages, in this journey I've just been talking about, from this "dead" stage where no presentiment surfacing to consciousness yet gives rise to the suspicion of "something", beyond a certain flat, amorphous surface presented to us by sleepy eyes, and which through successive "awakenings" leads us towards an increasingly delicate, more intimate, more complete apprehension of this "something". It's not essentially different in nature, whether we're talking about the discovery of mathematical things, or the discovery of ourselves and others. The feeling of **progress in knowledge**, which deepens little by little (even through an accumulation of errors, patiently, tirelessly corrected) - this feeling is as indisputable in the latter case as in the former.

This **assurance** is one side of an inner disposition, the other side of which is an **openness to doubt**: an attitude of curiosity, excluding all fear, towards one's own mistakes, which enables us to detect them.

p. 445  
ter and constantly correct them. The essential condition of this double foundation, of this **faith** indispensable to welcoming doubt as well as to discovery, is the absence of all fear (whether apparent or hidden).

about what will "come out" of the research we're undertaking - fear, in particular, that the reality we're about to discover will upset our certainties or convictions, that it will disenchant our hopes. Such fear acts as a deep paralysis of our creative faculties, of our power of renewal. We can discover and renew ourselves in sorrow and pain, but not in fear of what is about to be known, what is about to be born (any more than a man can know a woman and make her conceive, in a moment when he is afraid of her, or of the act that carries him into her). Such fear is no doubt relatively rare in the context of scientific research, or any other research whose theme does not involve our own person in any profound way. It is, however, a major stumbling block when it comes to self-discovery or the discovery of others.

However, the feeling that accompanies a discovery, large or small, is as compelling in the case of self-discovery or the discovery of others, as it is in the context of impersonal research, such as mathematics. I've already alluded to this feeling. It's a reflection, at the emotional level, of a perception of something that has just happened - the appearance of something **new** - and this "something" appears as tangible, as irrefutable (I apologize for the repetition!) as the appearance of a mathematical statement, let's say, or a notion or a demonstration, that we'd never thought of before. In fact, I find it difficult to distinguish or separate this feeling, which accompanies a particular discovery, from the feeling of progression I mentioned earlier, which accompanies an entire research project. Discoveries "big and small" are like the successive **steps** that materialize a progression, like

successive **thresholds** we have to cross. Progression is nothing other than this sequence of thresholds crossed, of accessions from each of these levels to the next.

The "feeling" or, better still, the perception that reflects and restores this process, is a sure and unmistakable "criterion".

- I don't remember it ever misleading me, either in maths or in meditation: that I had to realize, with hindsight, that this feeling would have been illusory. It often enables me, without any residual doubt, to distinguish the true from the false, or to discern the true in the false, and the false in what is supposed to be true. But above all, it is an irreplaceable **guide** in any true search - a guide ready to inform us at a moment's notice (provided we take the trouble to consult it) if we are on the wrong track, or are on the right track.

The willingness to listen to this sure guide is nothing more' <sup>it</sup> seems to me, than what in another p . 446

<sup>12</sup> (\*) I have named "rigor". It seems to me that this rigor is no different in essence from the demands of mathematical research, or from those of self-knowledge, without which there can be no such knowledge. But it goes without saying that this in no way means that the presence of this rigor, at the level of such intellectual work, is a guarantee or sign of its presence for the knowledge of oneself and of others. In fact, the opposite is true, as I have observed on countless occasions, starting with myself. In this respect, the "rigor" I'm talking about here came into my life at the same time as meditation. Or to put it another way, I can't really distinguish between one and the other. The moments of meditation in my life are none other than those when I examine myself (most often through my relationship with others) in such a state of extreme exigency with myself.

---

<sup>12</sup>(\*) In the section "Rigor and rigor", n° 26, where I refer to "rigor" as "delicate attention to the **quality of understanding** present at each moment" in a search.

2. A walk through a work or the Child and Mother

## 18.1. The Eulogy Funeral

### 18.1.1. (1) The compliments

**Note** 104 □(May 12)<sup>1</sup> (\*) Remarkably, in the little "topo" on my work that is done in this

p. 447

even in the brochure<sup>2</sup> (\*\*), the word "cohomology" or "homology" is never uttered! Nor is the word "schematic". Certainly (as circumstances demanded, when I was acting as the "first Fields Medal to be awarded to the IHES"), there's mention of the "titanic aspect" of my work, the number of volumes published, the essential problems identified, with the greatest natural generality (funny French for that), very careful terminology, allusion to "Grothendieck groups" (another of those greatest natural generalities, I bet!), and even topos and their usefulness in logic (but certainly not elsewhere!) . . . But there's no hint of a **result**, or a **theory** I'd developed that might have been useful - it must be that these twenty titanic volumes were rigorously empty, or just collections of problems (never solved) and notions, with the greatest natural generality it's understood: Grothendieck's group is awarded (since my name is already stuck to it afterwards), presented as the "ancestor" of algebraic K-theory (!) (which has nothing to do, of course, with topological *K-theory*, of which nothing is said)<sup>3</sup> (\*\*\*) ; as for the Riemann-Roch theorem, it must have been the descendants of the "ancestor" who took care of it - those who make the real theorems, the serious stuff!

At a time when it is fashionable to disregard generalities (persifuted by the ridiculous phrase "greatest natural generality"). . . ), □ the anonymous pen that took care of my praise here p. 448  
funèbre gratified me abundantly with what today is delivered to the disdain<sup>4</sup> (\*). I also appreciated (perhaps I'm the first. . . ) the humor of the same anonymous pen in this passage from the eulogy:

"He created a school of algebraic geometry at the IHES, gathered around the seminar he led and **nourished by the generosity with which he communicated his ideas**" (emphasis mine). Unfortunately, just like my "titanic work", this "school of algebraic geometry" that I nurtured so well is rigorously empty - not a single name is mentioned, and no one has come to complain that it has been forgotten, at least not to me.

Yet I seem to remember seeing the young Deligne faithfully haunting this (presumably empty) seminar between 1965 (when he must have been nineteen) and 1969, and learning in this seminar and in our tête-à-tête not only the technique of schemas, but also cohomological techniques and staggered cohomology - in other words, the very tools used on every page of his work (among those I've seen, at least). In

---

<sup>1</sup>(\*) (May 18) The following note is "from a footnote (to note no.° 47) that has grown prohibitively large". I've inserted it here, believing that this order is more natural than the chronological one.

Since the very moment this note was written, I've felt the need to develop it a little further - this will be done in a follow-up note to this one, which has not yet been written at the time of writing. The two notes together have now taken on the appropriate name: "L'Eloge Funèbre" (The Funeral Eulogy)!

<sup>2</sup>(\*\*) (May 18) This is the brochure published in 1983 by the IHES (Institut des Hautes Etudes Scientifiques) to mark its twenty-fifth anniversary. Reference is already made to it in the footnote "L'arrachement salutaire" (n° 42), and again at the beginning of the note "Refus d'un héritage - ou le prix d'une contradiction" (n° 47), to which the present note (L'Eloge Funèbre (1)) refers (see previous footnote).

<sup>3</sup>(\*\*\*) My work on the Riemann-Roch theorem is the first strong start of **algebraic** K-theory, and null-an "ancestor". **Topological** K-theory was born the same year (1957) that I proved the Riemann-Roch-Grothendieck theorem, following my presentation at the Hirzebruch seminar. The "ancestor" of this unspoken "descendant" hadn't another year! Algebraic K-theory (with Bass's introduction of the *K* functor in addition to the *K* functor I had introduced) developed in the years that followed, under the dual influence of the "ancestor" and his first "descendant".

In fact, as early as the second half of the sixties, I had already taken a step towards a description of the higher  $K^i$  (for a "monomial" category, e.g. additive), along the lines of Mrs. Sinh's thesis. This remained heuristic, being based on the intuition of the **enveloping  $\infty$ -category of Picard**, while no one at that time (or since) had taken the leisure to develop the notion of a (non-strict)  $\infty$ -category, i.e., the  $\infty$ -category of Picard. The notion I now call by the name of  $\infty$ -field (on the punctual topos) With the sketch of foundations for a cohomologico-homotopic formalism of fields I'm about to develop in the Pursuit of Fields (in the right file of the ideas I developed between 1955 and 1965), this "geometrical" approach towards a theory of higher *K-invariants* would enfin be available.

<sup>4</sup>(\*) (May 18) And I've gone on and on! For a complete quotation from my Eulogy, see the note "The Eulogy (2)".

p. 449 "topo" devoted to Deligne in the same brochure, no allusion either that might make the reader suspect he might have learned something from me. Yet, remarkably, my name is pronounced three times in this eulogy (by no means funereal) of Deligne ("third Fields medal of the IHES"). And even in a periphrase there's a reference, with the vague rigor that must surround every appearance of my modest person, to the fact that I would have "constructed the theory of cohomology in geometry over any body" - and surely still "with the greatest natural generality", it smells of grothendieckery<sup>5</sup> (\*). The full context quote is worth giving, it's a little masterpiece of the genre:

"Starting from there [classical Hodge theory] and from  $l$ -adic analogies suggested by Grothendieck [one wonders where Gr. found the time to learn such serious things, while redigging his twenty volumes of greater natural generalities], he [Deligne] derived the notion of mixed Hodge structure and equipped the cohomology of any complex algebraic variety with it. In  $l$ -adic cohomology, i.e. [?] for varieties over a finite field, he proved Weil's proverbially difficult conjectures. This result seemed all the more surprising [!!] since Grothendieck, after having constructed the theory of cohomology in geometry over any field [one wonders what else he went looking for there], had reduced the remaining conjecture [??] to a series of conjectures that are as unapproachable today as they were then."

Clearly, far from having contributed in any way whatsoever to proving this surprising result of such proverbial difficulty, these grothendieckeries (with a name that would scare off the most hardened generalist-naturalist) have been no more than good enough to encumber us again with **conjectures**, as is only right (he never makes any others!) and unaffordable what's more (one would have guessed), just as much today as when he had the preposterous idea to make them.

p. 450 ☐ Yet I seem to remember tackling them, these unapproachable conjectures, but that was probably because... that I was misinformed. It was around the time I left, I mean died, and my posterity, better informed than me, was careful never to put its nose in that stuff, since Deligne was formal: it was unapproachable!

I recognize the style: we've done our homework, quoted Grothendieck extensively (neither he nor anyone else will be able to claim that we're burying him on this solemn day), and even hinted at the " $l$ -adic analogies" that had played a role in getting the mixed Hodge theory off the ground. This must be the second time since the famous lapidary half-line thirteen years before<sup>6</sup> (\*); both allusions bear a strange resemblance to the "weighty considerations" of a certain 1968 article<sup>7</sup> (\*\*): one is "thumbed", and one has led the reader by the nose at the same time! Here, the solemn occasion helping, the thumb reference does more than drown the fish - the impression this text wants to suggest about this famous Grothendieck is precisely the one carried by this "wind" of fashion that I've been feeling for a few years - the one I've already had the opportunity to feel today<sup>8</sup> (\*\*\*), no longer in the tones of eulogy and special occasions

<sup>5</sup>(\*) (May 18) In the Eulogy, reference is made to my "great attention" to terminology. In the use of saucy expressions like "the greatest natural generality" or "the theory of cohomology in geometry over any body", I clearly perceive the intention to mock this attention.

The extreme care I take with the names given to things stems naturally from the respect I have for these things, whose name is supposed to express their essence, or at least some essential aspect of them. I've been shocked on more than one occasion by the disdain with which this attitude of respect seems to be treated today, a disdain which is sometimes expressed by the use of abracadabra names for important notions. On this subject, see also the note "Perversity" (n° 76).

<sup>6</sup>(\*) This "lapidary half-line" can be found in Deligne's report "Hodge Theory I" to the Nice International Congress in 1970. See comments in note n° 78<sub>2</sub>.

<sup>7</sup>(\*\*) On this subject, see the beginning of the note "Canned weight and twelve years of secrecy" (n° 49), and the more detailed review in the note "Eviction" (n° 63).

<sup>8</sup>(\*\*\*) See the note of the same day "The massacre", n° 87.

in front of a large audience, but in those of the massacre...

I'll continue the quote, it's worth it:

"This theorem (ex-Weil's conjectures) has helped to make *l-adic* cohomology a powerful tool... needless to name the brilliant and modest inventor of such a powerful tool... . . applicable to questions seemingly far removed from algebraic geometry, such as Ramanujam's conjecture.

More recently, he studied Hodge cycles on abelian varieties, taking the first step towards a "motivic" theory such as Grothendieck had dreamed of. He also demonstrated the algebraic mechanism of "intersection cohomology", the topological theory of Mac Pherson and Goresky. This made it possible to transpose it to *l-adic* theory, where it proved surprisingly useful."

So, one year after the publication of the "memorable volume"<sup>9</sup> (\*\*\*\*), an anonymous pen (I'm guessing the same one) has finally repaired a small "oversight" in the said volume. Perhaps someone had to ask a question anyway.

question, and Deligne is here to make up for the omission in his own way (it's nice of you to quote this dreamer, though

□ de Grothendieck, when it comes to, well, serious mathematics! ). And always deceiving the reader, p. 451  
given that the "first step" was taken as early as 1968 with Deligne's launch of the Hodge-Deligne theory, rooted in the yoga of motives which he had indeed "nourished" through my contact, throughout the four years that had preceded. This yoga, from which his work stems, from which he has never known how to detach himself while denying it, is in fact dispatched in the periphrase of the first quotation under the name of "*l-adic* analogies". An uninformed and attentive reader would certainly not suspect a link between these "*l-adic* analogies", which would have played a role as a starting point (but certainly not beyond. . .) for Hodge-Dixon's theory. ) for the Hodge-Deligne theory<sup>10</sup> (\*), and a "motivic theory" of which I had indeed dreamed (and a devilishly precise dream at that) - if not this link, that it's still this same dreamer Grothendieck who manages (by dint of greater natural generalities) to suggest analogies to real mathematicians, on condition that they do some real work.

As for the famous "algebraic mechanism of 'intersection cohomology'", here we are in the middle of the Colloque Pervers<sup>11</sup> (\*\*) (although the word "perverse" is not used). We've certainly taken the gloves off with the one

of the "four Fields □ medals of the IHES", given the solemnity of the occasion - but we don't have to embarrass ourselves with the student p. 452

posthumously by the same Grothendieck. My own burial on this exceptional occasion in the limelight, ministerial speech and all, is not burial by silence, but by **compliment**, skilfully measured and administered. But where Mac Pherson and Goresky are named, it goes without saying that for posthumous pupil Zoghman Mebkhout, silence is de rigueur, as it was two years earlier at the Colloque Pervers, and as it still is today.

<sup>9</sup>(\*\*\*\*) This is the Lecture Notes volume n° 900 published in 1982, referred to in the notes "Souvenir d'un rêve - ou la naissance des motifs" and especially "L'Enterrement - ou le Nouveau Père" (n° 51, 52). This is the volume in which the motifs are "exhumed" (after a twelve-year deathly silence on their subject), under an (implicit) alternative authorship.

<sup>10</sup>(\*) This Hodge-Deligne theory is still in its infancy, due to the failure to develop the notion of a "Hodge-Deligne complex" on any finite type scheme over  $\mathbb{C}$ , and the formalism of the six operations for these "coefficients". The need for such a theory was obvious to Deligne as much as it was to me, even before his first work on mixed Hodge structures, and it followed obviously from the yoga of patterns. But as soon as I left the mathematical scene, Deligne developed a "block" against the key ideas I had introduced into homological algebra (derived category, six operations, not to mention topos), which prevented the natural development of a theory that had got off to a spectacular start.

<sup>11</sup>(\*\*) On this Colloquium, see Cortège VII, "Le Colloque - ou faisceaux de Mebkhout et Perversité".

## 18.1.2. (2) Strength and the halo

**Note** 105 (September 29) The "previous" note, "L' Eloge Funèbre (1) - ou les compliments" (n° 104), is dated May 12 - more than four months old. It had begun as a footnote to "Refus d'un héritage, ou le prix d'une contradiction" (note n° 47, from the end of March), just to note in passing a little "funny" fact I'd only just become aware of. But as I was writing it, it became clear to me as I went on

lines and pages that these two short, seemingly innocuous texts on which I was commenting, without really planning or looking for it, were a real "mine"<sup>12</sup> (\*). It was also the day when I had already

to paint a picture of a massacre (note n° 87), a picture that had gradually emerged from the mists of time. of the past few weeks. There, it had suddenly materialized, had taken shape by the mere virtue of an enumerative description, and now it was calling out to me forcefully. The massacre and the "compliments" - a eulogy for the late man - were like two complementary parts of the same striking picture, both appearing on the same day!

It was certainly enough to satisfy me! The very next day, "my hands were tingling" to keep up the momentum and, in particular, to probe further into this little gem of a mine I'd just unexpectedly got my hands on. It became clear that the first thing to do was to quote in extenso the two passages in question from the jubilee booklet - at the same time, it would also be the best way to make contact.

with these texts and get a better grasp of their real message, the message "between the lines". . . <sup>13</sup>(\*\*).

p. 453

Without even having had the <sup>□</sup>loisir yet to copy the two texts, the previous day's contact had already been enough to arouse or awakened in me several associations of ideas, which I felt were juicy. I couldn't wait to pursue them, although I wasn't sure yet where they would lead. ...

In the end, I didn't keep up the momentum in the days and weeks that followed, though I did promise myself that I'd be back to it in the next few days. An unforeseen "health incident" put an end to all work on Harvest and Sowing for over three months, and indeed to all intellectual work whatsoever<sup>14</sup> (\*). The "hot moment" for pursuing this direction of reflection, which had just opened up in those days, has now passed. It's not certain that it'll come back, or even that I'll want to make the effort to "blow" (the heat!) to bring it back at all costs. To tell the truth, my real desire now is to come to the ultimate note, drawing a provisional **balance sheet of the** whole reflection named L' Enterrement - and to draw a **final line!** As far as this note is concerned, I'll at least give the full quotation I promised myself (and to the reader, for that matter); and perhaps at least a few summary indications, too, about certain associations of ideas that these two texts (and perhaps also the fact of rewriting them in black and white) will have aroused in me.

The two texts in question (pp. 13 and 15 respectively, from the 1983 jubilee brochure entitled "Institut des Hautes Etudes Scientifiques") are part of a series of "minute portraits" of the "permanents" and "long-term guests" who have passed through the IHES since its foundation in 1958, arranged in chronological order of entry. These are fairly brief texts, each about half a page in length, and each includes the dates on which the person joined the IHES, their position (professor or long-term visitor), their main honors, their main areas of interest and their most important contributions, with (where appropriate) the names of some of their collaborators. For my humble self, however, there's a remarkable gap in the last three.

---

<sup>12</sup>(\*) For some retrospective comments on this subject, see the beginnings of the September 24 note "Surface and depth" (no. 101).

<sup>13</sup>(\*\*) On this subject, see the note "Sur l'art de déchiffrer un message - ou éloge de l'écriture" (n° 102), which follows the note quoted in the previous footnote.

<sup>14</sup>(\*) On this subject, see the notes "The incident - or body and mind" and "The trap - or ease and exhaustion" , n° s 98, 99.

objective "aspects of a work and a personality - areas of interest, main contributions, principal collaborators or pupils - which void is filled by these "compliments" in dithyrambic style, some of which have already been noted and quoted in the previous note. ...

The series in question, which I have the honor of opening, is made up of the following mathematicians and physicists:

A. Grothendieck, L. Michel, R. Thom, D. Ruelle, P. Deligne, N.H. Kuiper, D. Sullivan, P. Cartier, H. Epstein, J. Fröhlich, A. Connes, K. Gawedzki, M. Gromov, O. Lanford.

I thought I remembered that Dieudonné had been a professor at the IHES at the same time as me, and I see from this list that this is not the case - he had been content to take on the role of director of Publications Mathématiques. However, I now realize, on page 3 of the brochure, in the IHES "Curriculum Vitae", that this is not the case, and that Dieudonné, like me, has been a "permanent professor" since 1958 (and until 1964), at least theoretically. A strange little contradiction! I'm copying here the beginning of the "Curriculum Vitae", at the first two "dates", 1958 and 1961:

**1958** Creation of the Institut des Hautes Etudes Scientifiques association in Paris, by Léon Motchane, assisted by world-renowned scientific advisors and a group of European industrialists.

The scientific activity was launched by two mathematicians: Jean Dieudonné (→1964) and Alexandre Grothendieck (→1970) appointed permanent professors. Issue no. 1 of "Publications Mathématiques de l'IHES" is published.

**1961** Recognized as a public utility.

.....

Incidentally, in this brief Curriculum Vitae, I thought it would be useful to mention the (somewhat symbolic) publication of issue no. 1 of Publications Mathématiques (consisting of a 24-page article by G.E. Wall, the author of which had no particular connection with the newly-born association), but not the algebraic geometry seminars (well known under the familiar acronyms SGA 1 and SGA 2). Wall, whose author had no particular connection with the newly-born association), but not the algebraic geometry seminars (well known under the familiar acronyms SGA 1 and SGA 2) through which I began to single-handedly ensure the scientific reputation of an institution, during years when it barely existed "on paper". Indeed, until around volume 24 of Publications Mathématiques, the bulk of these publications consisted of the successive volumes (1 to 4) of the "Eléments de Géométrie Algébrique"<sup>15</sup> (\*), all the other volumes tour<sup>16</sup>nant around fifty pages each (of high scientific standard, that goes without saying). Moreover, on page 19 (after the series of "minute portraits" from which Dieudonné was absent, God knows why<sup>16</sup> (\*)), we read, in a very "placard publicitaire" layout (with a tantalizing photo of the impressive stack of volumes in their entirety from the prestigious Publications):

#### Publications Mathematics

It was Jean Dieudonné alone [!] who, from 1959 onwards, took Publications Mathématiques to the pinnacle of world excellence.

Since 1979, they have appeared as a regular 400-page annual publication, under the direction of an editorial board headed by Jacques Tits.

Distribution is handled by... (etc)

<sup>15</sup>(\*) Of which I am the author, in collaboration with J. Dieudonné.

<sup>16</sup>(\*) (September 30) It occurred to me that the reason might well be this: so as not to have to say that during the years in question (1958-1964), Dieudonné's time was essentially divided between writing Eléments de Géométrie Algébrique (in which I unfortunately appear as principal author) and Bourbaki essays - apart from the piano and cooking (Dieudonné was both a musician and a cook), which, alas, could not be mentioned in this brochure, too selective for a passing smile to find its way

2. A walk through a work or the Child and Mother  
in. . .

The reason why Publications Mathématiques is singled out in this way - **here**, in this jubilee presentation of a prestigious institution whose main vocation has never been that of a periodical publisher - is undoubtedly to make people forget a certain fact that is unpleasant to some<sup>17</sup> (\*\*): that the said institution would undoubtedly have been written off and forgotten long ago, if for three or four critical years a certain quidam, stubbornly pursuing in his corner ideas of his own (which had the good fortune to catch the eye), had not been able to come up with a solution.

p. 456

some, including in the "big world"), had only brought it against all the odds<sup>18</sup> (\*\*\*) a caution and credibility that the "plus beaux statuts d'association du monde, et même les plus beaux "conseillers world-renowned scientists" (sic), are powerless to deliver.

(September 30) The style of this jubilee booklet (which I'm going to get to know very well!) is certainly not that of my friend Pierre, nor of Nico - they surely have other things to worry about, both of them, than composing this kind of occasional text. On the other hand, it's obvious that the two minute portraits I'm interested in, one of me and the other of Deligne, weren't written without Deligne at least providing the words.

-And it's equally clear to me that these two texts, at least, were not delivered to a printer without Deligne having first read them and given the go-ahead. So it seems clear to me from the outset that the two texts in question reflect in any case and first and foremost my friend's dispositions and intentions - the image he strives to give of myself and himself, both to himself and to the mathematical public. It is in this respect, of course, that these two passages interest me. This interest does not depend on whether or not Deligne is the author of these revealing lines, or whether the author is someone else (the one who undoubtedly "thought up" the brochure as a whole), who for one reason or another would have espoused this "message" that my friend wanted to get across.

At the end of these pages, you'll find the two minute portraits, taken from the portrait gallery (pp. 13-19) entitled "Activities of permanent and long-term visiting professors".

ALEXANDRE GROTHENDIECK, mathematician, professor at IHES from 1958 to 1970, Fields Medal.

p. 457

During his 12 years at the institute, A. Grothendieck renewed the foundations and methods of algebraic geometry, and opened up new applications for it, notably arithmetic. At the IHES he created<sup>a</sup> a school of algebraic geometry, based on the seminar he led and nourished by the generosity with which he communicated his ideas. The titanic aspect of his work is reflected in his publications, including the treatise "Eléments de géométrie algébrique", in collaboration with Jean Dieudonné (8 fascicules) and the 12 volumes of the "Séminaires de géométrie algébrique du Bois-Marie", in collaboration with numerous students.

In algebraic geometry, he identified the essential problems and gave each concept its greatest natural generality. The notions introduced have proved essential far beyond algebraic geometry. They often seem so natural that it's hard to imagine the effort they cost. If

<sup>17</sup>(\*\*) With all due respect to my friend Nico (who at the time had been director of the aforementioned jubilee institution for twelve years), who surely (on this occasion as on others) saw nothing but fire. ...

<sup>18</sup>(\*\*\*) Against all odds: throughout those four years, I didn't let myself be impressed by the persistent warnings and rumors of imminent bankruptcy of an "adventure" (as some well-informed friends would have us believe. . . ) that was entirely unrealistic, not to say a bit of a smokescreen! The fact is that, at the time, IHES had no financial or land base whatsoever, and its life was constantly dependent on short-term donations from a few more or less well-disposed industrialists. I didn't worry much about this, confining myself to trusting the founder-director Léon Motchane, who managed year after year to "save the day" through feats of financial prestidigitation and "public relations". After all, in these clement times, if things fell apart, I had a good chance of quickly finding a less problematic fallback position! On the other hand, if I won the bet I'd made on IHES (with the encouragement of Dieudonné, who knew Motchane and in whom I had every confidence), my position at IHES suited me better than any other I knew of.

This was undoubtedly facilitated by the great attention he paid to terminology. Let's not forget that the "Grothendieck groups", linked in algebraic geometry to the theory of intersections and used in topology, are the ancestors of algebraic *K-theory*. The topos introduced in algebraic geometry on a general base field to transpose results previously proved on  $\mathbb{C}$  by way of are now used in logic.

He left the IHES in 1970, at a time when his passion for mathematics was waning. Are we to believe that the problems he was tackling along the lines he had set himself had become too difficult?

.....

PIERRE DELIGNE, mathematician, professor at IHES since 1970, Fields Medal, Henri Poincaré Gold Medal, Foreign Associate of the Académie des Sciences.

The main thrust of his work is "understanding the cohomology of algebraic varieties". If the complex algebraic variety  $X$  is nonsingular projective, the theory of harmonic integrals provides a Hodge structure on  $H^*(X)$ . Based on this and on  $l$ -adic analogies suggested by Grothendieck, he derived the notion of mixed Hodge structure and equipped the cohomology of any complex algebraic variety with it. In  $l$ -adic cohomology, i.e. for varieties over a finite field, he proved Weil's proverbially difficult conjectures. This result seemed all the more surprising given that Grothendieck, having constructed the theory of cohomology over any field, had reduced the remaining conjecture to a series of conjectures that are still as unapproachable today as they were then.

This theorem has helped make  $l$ -adic cohomology a powerful tool, applicable to questions in seemingly far removed from algebraic geometry, such as Ramanujam's conjecture.

□ More recently, he has studied Hodge cycles on abelian varieties, taking a first step towards a "motivic theory", just as Grothendieck had dreamed. He also demonstrated the algebraic mechanism of "intersection cohomology", the topological theory of Mac Pherson and Goresky. This enabled it to be transposed into  $l$ -adic theory, where it proved surprisingly useful.

p. 458

He is currently interested in non-commutative harmonic analysis (theory of functions on real or  $p$ -adic Lie groups - or finite classical groups - and certain homogeneous spaces), as an extension of his work on automorphic forms (Ramanujam conjecture) and, with G. Lusztig, on representations of finite groups.

He is quick to assimilate and penetrate all mathematics, and as a result has enlightening and constructive reactions to every question put to him.

These two texts need to be supplemented by a third, in which Deligne and I appear in one breath. I found it in a loose leaf inserted in the brochure, under the same title "Orientation des recherches à l'IHES" as the chapter in which the "galerie de portraits" is inserted, with the subtitle: "Note sommaire sur les 'perspectives des activités scientifiques'". This is essentially a draconian "shortening" of the portrait gallery, reduced this time to just the "permanent professors" (present or past)<sup>19</sup> (\*), with two or three lines devoted to each. These are (in the order in which they are cited) myself, Deligne, Michel, Thom, Ruelle, Sullivan, Connes, Lanford III, Gromov. This is the order of the more detailed portrait gallery, except that this time Deligne has "moved up", for the benefit of being quoted in one breath with me. Amusingly, in this text the proper names of the eminences reviewed all appear underlined, with the sole exception of my modest self<sup>20</sup> (\*\*)! Here's the passage about my friend and me:

<sup>19</sup>(\*) (October 1) To keep things in perspective, we've also included Connes (although he's only a "visitor"), so that's one more "Fields Medal" for the collector. On the other hand, my friend Nico Kuiper has been left out. He wouldn't have made a difficult of stepping aside for the occasion. ...

<sup>20</sup>(\*\*) (October 1) The typographic effect of this brilliant process (which may not have been consciously intended) is that

Alexandre Grothendieck's theories of legendary depth and Pierre Deligne's brilliant discoveries (both Fields Medals) have linked topology, algebraic geometry and number theory in "interdisciplinary" ways (cohomology). More recently, this has enabled G. Faltings from Germany (who had previously worked at IHES) to prove a landmark theorem in number theory, which sheds light on the famous "Fermat theorem".

Incidentally, in this mini-gallery, the "Fields medals" have been given a capital M - and "interdisciplinarity" has been a favorite theme of its founder-director since the early days of the IHES. It is perhaps thanks to this circumstance, moreover, that this digest finally seems to imply that my person might have something to do with a certain "interdisciplinary means" called "cohomology" (which also happens to be the "guiding axis" of Deligne's work, by who knows what coincidence).

But here I am, taking this text by the scruff of the neck! The occasional reference to Faltings, who had overnight risen to the top ranks of scientific actuality with his sensational result (described here as "arduous", as if that's what it was all about - but that's beside the point... ) - it too is part of the "little bit" of the text: the scribe's "signature" in short, and hardly worth my attention. It's the first sentence about Deligne and me that obviously contains the essential "message" of the passage. It tells me a lot about certain dispositions in my friend and ex-student - and above all about a profound "Unsicherheit" (insecurity, lack of assurance, deep inner grounding)<sup>21</sup> (\*). Here, no more than in any of the published texts signed by him<sup>22</sup> (\*\*), or in the two minute portraits that preceded it, nothing could make one sup-

p. 460

I don't think my friend could have learned anything from me at some point. But here he is, in no uncertain terms, presenting himself as **another father** of a vast unifying vision "taken" from others<sup>23</sup> (\*), as if subjugated by the intimate conviction of his profound inability to conceive himself and allow **his own** visions, as vast or even more vast, to blossom within him ; and as if, in order to be and appear "great", all that remained to him was the derisory resource of **reclaiming for his own account** the halo with which it had pleased him since his youth to surround a prestigious and now defunct elder (or at least, declared as such by a providential consensus . . . ). To take hold of a **halo**, rather than let the still unformed and nameless things within him germinate and blossom, waiting to be born and named - rather than to live out **his own strength**, which lies within him, and which is also waiting. . .

(October 1) Last night, it seemed to me that I was once again at the heart of the conflict - the very one I mentioned in general terms at the very beginning of Harvest and Sowing, eight months ago (in the section

---

this passage, which is about to be quoted, appears to be dedicated to PIERRE DELIGNE (whose name appears typographically as the head of the "permanent" line, to the exclusion of my own), and that I am somewhat of a **collaborator**, a stranger to the establishment! Chronological order is certainly respected, nothing to say for sure - and yet the effect produced (and surely intended) is that of a role **reversal**, arousing familiar associations in me (evoked in notes such as "le renversement", "L'éviction", "Pouce", n°s 68', 63, 77). As a result, I've also rediscovered a certain **style of** appropriation - the "Pouce! - style, which clearly identifies me as **the real** author of the message.

<sup>21</sup>(\*) The German word "Unsicherheit" that came to me here has no equivalent in French, nor (I believe) in English. Its literal translation "insecurity" can hardly be applied to a psychological trait. The negative term "lack of assurance" is another makeshift approximation. It's understood that what we're talking about here is "assurance" at a deep level, the lack of which can be perceived on certain occasions, while superficially the impression of assurance, of perfect ease prevails; they form like a protective carapace, of an often considerable, foolproof inertia and "solidity". ...

<sup>22</sup>(\*\*) At least the ones I've seen so far.

<sup>23</sup>(\*) There's a particular irony in the fact, moreover, that this vision, taken here from others as a "halo" for himself, has in fact been scorned and systematically opposed since the master's "death", by the very same person acting as heir while at the same time standing out and repudiating the inheritance. On this subject, see the three notes "L'héritier", "Les cohéritiers. . .", ". . . and the chainsaw" (n° 90,91,92); and for further illustrations, the X procession (Le Fourgon Funèbre), made up of the four "coffins" 1 to 4 and the Gravedigger (notes n° 93 to 97).

"Infallibility (of others) and contempt (of self)", n° 4), and which I found again "in an extreme and particularly striking case", towards the beginning of the Burial (in the note "the knot", n° 65, April 26). This was again an unexpected encounter, at the turn of a quotation that I ended up including in the wake of the other two, out of a sense of conscience! I'd spotted the passage a few days ago, while leafing through the famous booklet, and it struck me at the time, but I didn't dwell on it. But yesterday, once I'd written it down in black and white, it immediately struck me as more meaningful, and more striking, than the two circumstantial passages I'd just copied down and which were supposed to form the main theme of the note I was writing. Yet there was no shortage of places that clicked in these two passages, eliciting associations that I would not have failed, even four months ago, to develop as dryly □ over another ten pages if not not twenty. But it suddenly seemed to me that what I could have developed in this way was basically, with one exception at most, something **already known** that I was finding confirmed, perhaps from a somewhat different angle, and above all: that these were **accessory** aspects after all, the kind of aspects I had dwelt on extensively in the previous "Compliments" note of May (and even throughout my reflection on the Burial). The third passage, on the other hand, brought me back to something **essential**, which I'd tended to lose sight of during the long "investigation" that was (among other things) my work on the Burial.

p. 461

I was tempted to leave it at that then, without at least trying to put into words what this single, pithy four-line sentence was saying to me, and which on some level was indeed "heard". In the end, I ignored it. The words came slowly and hesitantly, while the impression, diffuse at first, became clearer as I wrote. Once I'd written it down in black and white, and pruned away what seemed unnecessary, I knew I'd captured what I'd "heard" as well as I'd ever be able to.

It was getting prohibitively late, and I really had to stop there. I went to bed happy, but not yet sure whether I'd include what I'd just written in my testimonial for publication. After all, I might as well leave it to the reader, if he was interested in going beyond the surface of a message, to find out for himself what **he** heard in it! It was only today that I knew I would include this passage, which does express a certain perception or understanding I have (or think I have) of something that seems to me important, even crucial as the mainspring of this Burial.

## 18.2. THE KEY TO YIN AND YANG

### 18.2.1. (1) Muscle and gut (yang buries yin (1))

**Note** 106 (October 2) I'd still like to pursue at least one of the associations of ideas aroused by the three-part Funeral Eulogy (which I finally quoted in full yesterday). This association had occurred to me the day after May 12, when I had just written the note "L' Eloge Funèbre (1) - ou les

compliments" (n° 104). It touches on a certain aspect of things that often breaks unnoticed, and that I only began to really realize □ five or six years

ago  
p. 462

Between the lines in the texts examined, we see the cult of certain **values** asserting itself. Thus, what is emphasized about Weil's conjectures, proven by Deligne, is their "**difficulty**"<sup>24</sup> (\*)-not their

<sup>24</sup>(\*) (October 3) Diffi culty described as "proverbial", no less! It makes little sense, other than to impress those not in the know! The "diffi culty" of a conjecture can only really be appreciated once it has been demonstrated - it's its fruitfulness, on the other hand, that can be sensed from the outset, and which often manifests itself objectively, even before it has been demonstrated, through the work it has inspired. The "great" conjectures are not distinguished from the others by their "diffi culty" (which is unknown - even supposing the term has any meaning. . . ), but by their **fecundity**. I note in passing that this is one aspect

**beauty**, their simplicity, the vast perspectives they opened up from the very moment they were enunciated by Weil. I'm thinking, too, of the fruits of these glimpsed perspectives, long before they were demonstrated, and of other glimpsed fruits that now fall at the right moment, once the last step in the long journey to their demonstration has been taken. It is the beauty, the extraordinary internal coherence of these conjectures, and the previously unsuspected links they reveal, that have made them such a powerful and fertile source of inspiration for two generations of geometers and arithmeticians. The most profound part of my work (both the "fully completed" work and the "dream of motifs") is directly inspired by them (through Serre, who was able to capture and communicate the full force of the vision expressed in his conjectures). Without them, neither *l-adic* cohomology nor even the language of topos would probably have seen the light of day. To put it another way, the "vast unifying vision" of (algebraic) geometry, topology and arithmetic that I've been striving to develop over the last fifteen years of my life, is to be found in these "Weil conjectures". And as the vision gained in breadth and maturity, it was this vision itself, and the previously hidden things it enabled me to apprehend one by one, that told me step by step what to do, by which end to "take" what was at hand. The last step in the demonstration of Weil's conjectures was neither more nor less than one of the steps in a long and fascinating journey that began, I can't say when, long before I was born, and which, after my death, will not be completed any time soon!

p. 463 □ But following the spirit one detects in the quoted text, one could believe that Weil's "conjectures" were a question of weights: here's the weight to lift "à l'arrachée"! Two hundred kilos is no mean feat, the difficulty is proverbial, many have tried it and not one yet has been able to do it - until "H-day" (like "Hercules")! The result was astonishing (106<sub>1</sub>), just think of the two quintals - no one would have believed they'd ever manage it. ... The same spirit can be perceived in the laconic commentary on the "difficult theorem" proved by Faltings: here again, in the very designation of this new stage in our knowledge of things, it is the **difficulty** again that is highlighted, to arouse the admiration of the crowds - not the perspectives that open up, starting from a new summit crossed<sup>25</sup> (\*). It didn't even seem worth mentioning the name "Mordell's conjecture" (admittedly unknown to a non-mathematical audience) - as if the apprehension and formulation of the conjecture (here, by Mordell) were an accessory, because "easy". Instead, a biddon perspective on "Fermat's theorem" (which is supposed to be "enlightened"). It's true that the latter is universally known (even outside mathematical circles) as a weight of well over three hundred kilos (which has withstood three centuries of effort).

The first point I wanted to make is that the values exalted in these texts (with the discretion befitting the occasion, of course) are those that can be called the **values of muscle**, of the "cerebral muscle" in this case: the one that makes it possible to surpass, by sheer strength of wrist, proverbial records of "difficulty".

These are not just the values of the hero in the spotlight, like those of the author of a certain jubilee brochure (an anonymous author whom I think I recognize). They are also the values increasingly (does it not seem) dominate the mathematical world, and more generally, the scientific world. Even beyond this world, which is still relatively small, □ <sup>we</sup> can say that these are also, and increasingly, the values of a certain "culture", described as "Western"<sup>26</sup> (\*). Nowadays and since

p. 464 of a thing, while "diffi culty" is a typically "yang", "masculine" value.

<sup>25</sup>(\*) What struck me most, from the moment I held in my hands Faltings' preprint in which he proves three key conjectures, including Mordell's (discussed here), was on the contrary the extraordinary **simplicity** of the approach, by which he proves in some forty pages these results, which were supposed to be "out of reach"! (Compare note n° 3.)

<sup>26</sup>(\*) When I refer here to the "values" of our culture as they appear today, I'm of course referring to the "values" of our culture as they appear today.

It's been a long time since this "culture" and its values conquered the surface of our planet, wiping out all others as irrefutable proof of their superiority. The planetary symbol, the heroic embodiment of these values, is the cosmonaut in his waterproof armor, the first to set foot on some unimaginably remote and desolate planet, in front of millions of breathless TV viewers slumped in front of their screens.

These values, which in the absence of a closer definition I've limited myself to a brief term of symbolic value, "muscle", are not new. In ethnologist's jargon, we could also call them "patriarchal". One of the first written texts, it seems to me, in which their primacy is forcefully asserted (force without reply!) is the Old Testament (and more particularly, the book of Moses). And yet, one only has to read this fascinating document from a remote era to realize that the primacy of "patriarchal" values, that of man over woman, or that of "spirit" over "body" or "matter", was far from going as far as the negation or contempt of complementary values (which were perhaps not yet perceived as "opposed" or "antagonistic")<sup>27</sup> (\*\*). I don't know if the history of the vicissitudes of these two sets of complementary values has ever been written - and it must be a fascinating thing to pursue this history, through centuries and millennia, from the time of Moses to the present day. It's also the story, no doubt, of the gradual degradation of a certain balance of "values", "patriarchal" or "masculine" on the one hand, "matriarchal" or "feminine" on the other - of "muscle" and "guts", of "spirit" and "matter"; a degradation that has visibly moved in the direction of "male" values (or "yang", in traditional Eastern dialectics), to the detriment of "feminine" values.

□ It seems to me that our era is characterized as one of excessive exacerbation of this degradation. The last acts of this history include the closely interrelated "space race" between the two antagonistic superpowers (imbued with essentially identical values), and the arms race (nuclear in particular). As the final act and probable outcome of this relentless evolution in the outbidding of a certain type of "force" or "power", we can already foresee some nuclear holocaust (or other, there's an embarrassment of riches to choose from. . . ) on a planetary scale. Perhaps it will have the merit of solving all problems at once and once and for all... .

My intention here, however, is not to paint a tantalizing picture of the "end of the world" (they didn't wait for me to do that), and even less to wage war against "muscle", or "brain" (aka "mind"). I know that even my "guts" would have nothing to gain from it! I value my muscles and my brain, which I'm sure are very useful, just as I value my "guts", which are no less useful. Rather, I'd like to say a few words here (if I may) about how this profound conflict between these two types of values, conveyed by the surrounding culture, has played out in my own life. In more down-to-earth terms, it's also about the history of my attitudes (of acceptance or even exaltation, or rejection) of two equally real and tangible **aspects** or **faces** of my person, inseparable and complementary by nature, and in no way antagonistic in themselves. I could call them "**the man**" and "**the woman**" in me, or also (to take less "loaded" appellations, and which therefore offer less risk of misleading), the "**yang**" and the "**yin**".

It would seem that for most people, the "chips are down" from early childhood, when the

---

"official" values - those conveyed by schools, the media and the family, and which are the subject of a general consensus in various professional circles. This does not mean that these values are unreservedly accepted by all, nor that they form the basis of everyone's attitudes and behaviour. Indeed, it is with distress that honest people, the media and competent professional literature (from the pens of educators, sociologists, psychiatrists etc.) speak of a "certain youth" in particular, who decidedly don't "fit in" and who don't fit in with a certain picture!

<sup>27</sup>(\*\*) Mother worship, for example, is a deeply rooted tradition in Judaism, which no doubt serves to compensate for the "official" values (so to speak) emphasized in the sacred texts. This tradition is found again, in a modified and more exalted form, in the Catholic tradition, with the cult of (the Virgin!) Mary.

in place The essential mechanisms which, for the rest of our lives, will silently dominate our attitudes and behavior with the efficiency of a perfectly tuned automaton. At the heart of these mechanisms are those of affirmation or rejection of such and such traits in us, or of such deep-seated impulses, with either a yang or yin "signature", or of such and such "packages" of traits and impulses with a given signature, or even of the entire "yang" or "yin" package. It is these mechanisms which, to a very large extent, determine all the others. choice mechanisms (affirmation or rejection) structuring our "self".

p. 466 □ For reasons that still remain mysterious to me, in my own case the history of relationships (both (both in the "boss" himself and in the "worker", both of whom are dependent on the double yin-yang aspect of all things) - this history has been more eventful than usual. I can distinguish three periods. The last, in a sense, is the same as the first, which spans the first five years of my childhood. This third period, which I can call that of **maturity**, can be seen as a kind of "return" to that childhood, or as a gradual reunion with the "**state of childhood**", with the harmony of the uneventful marriage of "yin" and "yang" in my being. This reunion began in July 1976, at the age of forty-eight - the same year I made the discovery (three months later) of a hitherto unknown power within me, the power of meditation<sup>28</sup> (\*).

The dominant values of both my parents, my mother and my father, were yang values: willpower, intelligence (in the sense of intellectual power), self-control, dominance over others, intransigence, "Konsequenz" (which means, in German, extreme coherence in (or with) one's options, particularly ideological-logical), "idealism" in both political and practical terms... . In my mother's case, this valorization took on an exacerbated force from an early age, and was the flip side of a genuine hatred she had developed towards "the woman" in her (and from then on, towards the feminine in general). (I myself only discovered these things five years ago, three years after meditation came into my life). In such a parental context, it's a mystery (and yet a fact that's beyond doubt for me) that I was able to blossom fully during the first five years of my childhood - right up to the moment when my parents, my older sister and I were uprooted from our parental environment and my family of origin (made up of my parents, my older sister and myself) was destroyed by my mother's will and the political events of 1933.

p. 467 **Note 106<sub>1</sub>** □ (October 3) Neither I nor Deligne have ever had the slightest doubt that Weil's conjectures may not be valid, and I don't recall anyone expressing such doubts. Describing the "result" (i.e. the proof of these conjectures) as "surprising", again shows a deliberate intention to impress. In fact, at no time since the introduction of "topology" and scalar cohomology have I felt that these conjectures were beyond my grasp, but rather (from 1963 onwards) that they were bound to be proved within the next few years. When I left in 1970, I had little doubt that Deligne, who was in the best position of all, would soon prove them (which he did), along with the stronger "standard conjectures on algebraic cycles" (which, on the other hand, he set out to discredit).

Indeed, Deligne is right to express reservations about the validity of the latter conjectures, of which I'm no more convinced than he is. But the scope of a conjecture doesn't depend on whether it turns out to be true or false, any more than its so-called "difficulty" renders it "out of reach".

---

<sup>28</sup>(\*) See the two sections "Desire and meditation" and "Wonder", n°s 36 and 37.

- is entirely subjective. It depends solely on whether the **question** on which the conjecture puts its finger (and which had not been perceived, before it was asked) - whether this question touches on something truly essential to our knowledge of things. It's obvious (to me, at least!) that there can be no question of having a good understanding of algebraic cycles, nor of the so-called "arithmetic" properties of the cohomology of algebraic varieties (or, indeed, of "pattern geometry"), as long as the question of the validity of these conjectures remains unresolved. Even today, as at the Bombay Congress in 1968, I consider this question, along with that of the resolution of singularities, to be one of the two most fundamental issues in algebraic geometry. I'm well aware of the significance of both! This potential fruitfulness cannot fail to manifest itself, as soon as we no longer limit ourselves to bumbling around a conjecture that has been declared "too difficult", and someone finally takes the trouble to roll up their sleeves and get to grips with it!

## 18.2.2. (2) Story of a life: a cycle in three movements

### 18.2.2.1. (a) Innocence (the marriage of yin and yang)

**Note 107** □ (October 4) I have already had occasion to mention an important aspect of these first five p. 468 years of my life, as a "privilege" of great price<sup>29</sup> (\*): a deep and unproblematic identification with my father, which has never been touched by fear or envy. I became aware of this circumstance, and of the very existence, as well as the silent strength, of this identification with my father, only four years ago (during the meditation on my childhood and my life that followed the one from August 79 to March 80 on my parents). This identification was like the peaceful and powerful core of an identification with the family we formed, my parents, my sister (who was four years my senior) and me. I had boundless admiration and love for both my father and my mother. For me, they were the measure of all things.

This in no way means that my attitude towards them was one of automatic approval, of blissful admiration. I probably didn't know that they were the measure of all things to me, but I knew full well that they were fallible like me, and there was no fear in me that would have prevented me from noticing a disagreement and making it clear. In the conflicts that surrounded me, I wasn't afraid to take sides in my own way. This had nothing to do with a certain faith and self-assurance that formed the deep, unshakeable foundation of my being - rather, it flowed spontaneously from that very faith and self-assurance. Sometimes my father, in fits of impotent anger when my sister (without seeming to) took pleasure in provoking him, would strike her brutally - and each time I was outraged, in an outburst of unreserved solidarity with my sister. I think these were the only big clouds in my relationship with "my father" (there were none with my mother). It's not that I approved of my sister's sometimes pitiful tricks, nor, I think, that they really troubled me - **she** wasn't the measure of things for me. Her tricks (the reason for which surely escaped me as much as it did my father, who always "worked", or my mother, who never intervened either before or after) - in a way, these tricks didn't really have any consequences for me. She was my sister, just the way she was, that was the trick. But **my father** let himself be to such blind brutality...

The three people closest to me, who together formed the matrix of my early years, were torn apart by the conflict between <sup>each</sup>□<sup>of</sup> them and themselves, and between them and the other two: an insidious flict, aup between my mother and my sister, and violent conflict between my father and my mother of a

<sup>29</sup>(\*) See the note "The massacre", n° 87.

on the one hand, and my sister on the other, who each on her own account (and without anyone during my parents' lifetime ever pretending to notice. . . ) made it work in their own way. The mysterious, extraordinary thing was that, surrounded by conflict in these most sensitive, crucial years of my life, it remained **outside** me, that it didn't really "bite" into my being in those years and settle there permanently.

The division in my being, which has marked my life as much as anyone else's, didn't take hold in those years, but in the two or three that followed, from my sixth to my eighth year or so. At a certain point (which I thought I could pinpoint to within a few months of my eighth year), there was a certain **turning point**, after more than two years of separation from my parents (who didn't bother to give me any sign of life) and from my sister. It was above all a **break with my childhood**, "buried" from that moment onwards by effective forgetting mechanisms (which have remained in place, more or less, to this very day). At some deep level (not the deepest though. . . ) my parents were then declared by me to be "foreigners", just as my childhood was now declared to be "foreign". I **abdicated**, in a sense: to be accepted in the world that now surrounded me, I decided to be like "them", like the adults who made the law there - to acquire and develop the weapons that command respect, to fight on equal terms in a world where only a certain kind of "strength" is accepted and prized... .

It was this strength, too, that was favored by my parents, who had surrounded me in my early years. And here I come back to that "mysterious thing" (from which I've just moved away, following the thread of another association aroused by this thing), the **absence of division in me**, in those early years of my life.

Perhaps the mystery for me no longer lies in this absence, but rather in this: that my parents, both my father and my mother, then **accepted me in my totality**, and totally: in what in me is "virile", is "man", and in what is "woman". Or to put it another way: that my parents, both torn apart by conflict, each denying an essential part of their being - each incapable of a loving openness to himself and to each other, as of a loving openness to my sister... . that nevertheless they found such openness, such unreserved acceptance, toward me □ their son.

To put it another way: at no time in these first five years of my life have I felt **ashamed of who I am**, whether in my body and its functions, or in my impulses, inclinations and actions. At no time have I had to deny anything about myself in order to be accepted by those around me and live in peace with them.

p. 470

Of course, there were times when I did things that just didn't "fit": like all children, I was bound to be a pain, even unbearable, when I got down to it - and it was clear from time to time that I needed to put things right. I didn't lay down the law, nor was I tempted to, not having to compensate for some secret mutilation. And in my parents' love for me, there could have been no room for adulation, for indulgence in whims - for unconditional approval. But while I was bound to be "sent packing" by my father or my mother (just as the reverse could sometimes happen), neither of them ever made me feel ashamed of an act or behavior that didn't please them.

Against the backdrop of a deep, unambiguous identification with my father, I see myself as a child, imbued with both virility and femininity, both strong.

It seems to me that in each being and in each thing, in the indissoluble and fluctuating marriage of the yin and yang qualities within it that make it what it is, and whose delicate balance is its profound beauty,

the harmony that lives in this being or thing - that in this intimate union of yin and yang there is often (perhaps always) a background note, a "dominant", which is either yin or yang. This background note is not always easy to detect in a person, because of the more or less effective and complete mechanisms of repression, which distort the game by substituting a borrowed image for an original harmony. So my "brand image" for forty years was almost exclusively masculine - without ever being questioned or even detected as such, either by myself or (it seems to me) by others, until my forty-eighth year. I tend to believe, however, that the background note present at birth remains present throughout one's entire life, at least in deep layers that will perhaps never find their way to the outside world.

the opportunity to come out into the open. In my own case, strangely enough, I still don't know what to make of it. say what this dominant note is, the one therefore □ which permeated my early childhood and which was "mine"

p. 471

when I was born. Various signs have made me suspect more than once that this note is "yin", that it's the "feminine" qualities that dominate in my being, when it finds the opportunity to manifest itself spontaneously, in the moments when it's free from all kinds of conditioning that have accumulated in me since childhood. To put it another way: it could be that what is the creative force in my body and mind, what I've sometimes called "the child" or "the worker" in me (as opposed to the "boss" who represents the structure of the self, i.e. what is conditioned in me, the sum or result of the conditioning accumulated in my person) - that this force is even more "feminine" than "virile" (whereas by nature and necessity it is one, and the other).

This is not the place to go into all these "signs". The important thing is not whether this deep dominant note in me is "feminine", or whether it is "virile". Rather, it's that I know how to **be myself** at every moment, welcoming without reticence both the traits and impulses within me by which I am "woman", and those by which I am "man", and allowing them to express themselves freely.

When I was a child, in those early years, it wasn't unusual for strangers to mistake me for a girl - without this ever creating the slightest sense of unease or insecurity in me. It was mainly my voice, I think, that had this effect, a very clear, high-pitched voice - not to mention the fact that I had long hair (mostly disheveled), perhaps simply because my mother (who had plenty of other things to worry about) didn't often take the time to cut it for me. I was also as strong as a Turk, and I didn't mind playing violent or daredevil games, although I did have a penchant for silence, even solitude, and a penchant for playing with dolls<sup>30</sup> (\*). I don't remember anyone making fun of me for this, but it certainly happened here and there. If such incidents passed without leaving a trace of injury or humiliation, it's surely because they were not echoed or amplified by any feeling of insecurity in me, while the acceptance of who I was, by those who alone really mattered to me, was beyond question. Mockery couldn't have reached me, it could only be turned against the one who must have seemed so foolish to me, to pretend to find fault with the most natural thing in the world.

□ I was well aware, moreover, that this kind of rather strange silliness is by no means an uncommon thing, that the mere sight

p. 472

nudity can cause scandal! Yet for as long as I could remember, I'd had every opportunity to see my mother, father and sister naked, and every opportunity to satisfy my legitimate curiosity as to how each of them and myself were made. It was quite obvious that there was no cause for scandal in the conformation of either men or women, which seemed to me decidedly fine as it was.

---

<sup>30</sup>(\*) If this inclination seems rare in little boys, I think it's mainly because it's systematically discouraged by those around them.

it was - and more particularly (I made no secret of it) that of women.

### 18.2.2.2. (b) Superpère (yang buries yin (2))

**Note** 108 (October 5) It was in 1933, when I was in my sixth year, that the first crucial turning point in my life took place, which was at the same time a crucial turning point in the lives of both my mother and father, in their relationship to each other and to their children. It was the episode of the violent and definitive destruction of the family we four formed, a destruction of which I was the first and only person, forty-six years later, to acknowledge and follow the events, in my parents' correspondence and in one or two exsanguinated, enigmatic and tenacious memories, patiently probed and deciphered - long after my father's death and that of my mother<sup>31</sup> (\*).

It's not my place to expand here on what I've learned and understood in the course of this long work, about the significance and meaning of this episode. Three days ago, I already alluded to this turning point<sup>32</sup> (\*\*), as marking the abrupt end of the first of the three great periods in the history of the marriage of yin and yang within me. In December 1933, I found myself hurriedly dumped into a foreign family that neither I nor my mother, who had brought me there from Berlin, had ever seen. In fact, these unknown people she was taking me to were simply the first people who would take me in as a "boarder" for a very modest pension, and with no guarantee whatsoever that it would ever be paid.

p. 473 my mother was preparing to join my father as soon as possible, who was moping around waiting for her in Paris. It was an *en-tendu* thing between my parents that everything was going to be for the best so much for me in Blankenese (near Hamburg),

than for my sister, who for a few months had been dumped at the end of the day in an institution in Berlin for handicapped children (where she had been accepted, even though she was no more handicapped than me or our parents).

At the end of six strange months, heavy with dull menace and anguish, I found myself overnight in a world totally different from the only world I'd known in my life, the one formed by my parents, my sister and me. I found myself as one of a group of boarders, eating separately from the family and looking like second-class children to the children at home, who formed a world of their own and looked down on us. From my mother I received a hasty, stilted letter from time to time, and from my father never a line in his hand, during the five years I stayed there (until 1939, on the eve of the war, when I finally rejoined my parents under the pressure of events).

The couple who took me in quickly endeared themselves to me. Both he, a former pastor who had left the priesthood and lived on a meagre pension and private lessons in Latin, Greek and mathematics, and his vivacious and sometimes mischievous wife, were unusual people, endearing in many ways. He was a humanist of vast culture who had lost his way a little in politics, and had run afoul of the Nazi regime, which eventually left him alone. After the war, I renewed my acquaintance and remained in close contact with them until both died<sup>33</sup> (\*).

From him and especially from her, as from my parents, I received the best as well as the worst. Today, with the benefit of hindsight, I am grateful to them (as I am to my parents) for the "best", as well as for the "worst". It was this best and worst that I received, first from my parents, then from them, that formed the bulk of the voluminous "package" I received as a child (as everyone receives the

<sup>31</sup>(\*) My father died in Auschwitz in 1942, my mother in 1957. The work I'm talking about here took place between August 1979 and October 1980.

<sup>32</sup>(\*\*) See the end of the note "Yang buries yin - or muscle and guts", n° 106.

<sup>33</sup>(\*) She died at the age of 99, two years ago, and I was able to see her dead again, face to face with her, the day before the funeral.

his. . . )j, which it was up to me to unpack and examine. They are part of the substance, the richness of my past, and it's up to me to nourish my present.

My new environment was all very "proper" and conformist in many ways, with in any case the repressive attitudes de rigueur for everything to do with the body and, more particularly, sex. It took □pourtant several years, I think, before I internalized and took p . 474 back to myself. these attitudes, like the shame of showing myself naked, go hand in hand with an ambiguous relationship with my body. This shame, inculcated from an early age, is one aspect of a deep-seated division, where the body is the object of tacit contempt, while so-called "cultural" values (confused with intellectual capacity for memorization and the like) are held in high esteem. This division within me remained ignored until my forty-eighth year, when it began to be resolved. This was the second great turning point in my life, marking the advent of the "third period" in the history of my relationship to myself, i.e. if that of my relationship to my body, and to the "man" and "woman" in me. But before that, I had ample opportunity to help pass on this division to my children<sup>34</sup> (\*), whom I could see passing it on in turn. ...

I alluded yesterday<sup>35</sup> (\*\*) to the "changeover" that finally took place within me. Delayed by more than two years after the uprooting from the initial family environment (or, better said, after the **destruction of** this environment), this shift consecrates the setting up of the common repressive mechanisms, from which my childhood had until then had the rare good fortune to be exempt. So far, I've detected two major forces of a repressive nature, which dominated my adult life and a large part of my childhood (108<sub>1</sub>). I think it's fair to say that they didn't emerge gradually, but that in my case they appeared more or less overnight and in their full force, as the consequence of a deliberate **choice**, at an unconscious level. I described this choice earlier as "abdication", but at the same time it was also a powerful principle of action: "I'll be like 'them'" (and not "like me") also meant; I'm going to "bet" on "the head", no worse in me than in anyone else after all, and fight and "them" fight with their own weapons!

One of these mechanisms, and the one I'm most interested in here, is one of the most common: the **repression of my "feminine" traits** (or those felt as such by common consensus), in favor of "masculine" values. The other side of the coin was, of course, to invest fully in my traits and aptitudes. and the over-development of these, which have taken on a disproportionate role.

□If anything here is out of the ordinary, it is not of course the mere **presence of** this double mechanism, p . 475 nor (it seems to me) the strength of the "repressive" component itself, the strength of the repression of "yin" traits, attitudes and impulses. There's no comparison here with what happened to my mother, whose life (and that of her loved ones) was devastated by her lifelong hatred of what made her a woman. At no time, I think, were my ways entirely devoid of a certain gentleness, even tenderness, which stubbornly rounded out the character I'd carved out for myself as a child, and often won me sympathy and affection. The exceptional side of me is rather in the excessiveness of my investments, in the **excessiveness of** the energy I invest in my tasks, without letting myself be distracted by a glance to the right or to the left! When I'm not working, my mind is constantly focused on the completion of some stage of the job. This attitude ("Zielgerichtetheit" in German, "aimdirectedness" in English) is par excellence a yang attitude, an attitude of **tension**, of **closure** to everything that doesn't seem directly linked to the task.

This excess was likely to conjure up in others the image of a kind of "super-man" or "super-male",

<sup>34</sup>(\*) At least, the four of them I helped raise. The fifth and last one is being raised by his mother, and so far there hasn't been a single opportunity for us to get to know each other.

<sup>35</sup>(\*\*) See the beginning of the previous note "Ecllosion de la force - ou les épousailles", note n° 107.

admirable, alas (given prevailing values), but immediately arousing (at a level that remains unconscious most of the time) instinctive reactions of defense or even antagonism in the face of such a display of force, perceived as threatening or even aggressive, or in any case dangerous (108<sub>2</sub>). Above all, this image irrevocably evokes the image of the "**super-father**", and immediately sets in motion the ambiguous multiplicity of reactions of attraction and repulsion knotted around the age-old conflict with the father. ... This is **my** contribution to the **ambiguous** relationships that have been so common in my life, and with which I found myself confronted so many times in the course of Harvest and Sowing. This ambiguity is reinforced, not diminished, by the persistence of yin traits in me, which fuel a sympathy that the mere hypertrophy of yang traits into a kind of gigantic "superman" would be powerless to arouse.

And once again I can see, in these endless "relationships of ambiguity", that I'm still only reaping what I've sown myself, even if each time the harvest turns out to be unexpected (and unwelcome. . .)! For hasn't the motivation (or at least **one of** the motivations) that drives "the boss" in me to constantly surpass himself in the accumulation of works, been precisely to constantly force and boost the esteem of my peers (in the first place) and of my blunders (moreover); to hear some of the best lament that they can't keep up with me, at the rate I'm going?! Yes, there has been in me this secret desire to arouse in others (as in myself) this "larger-than-life" image, disproportionate-like the very one it reflects-and which obstinately returns only through the other: in clear, lofty words, through the praise expected (and cashed in like a due) - and **also**, through the deep, obscure channels of muted enmity and conflict... ...<sup>36</sup>(\*)

**Note 108** □ (October 6) I mean that the forces of a repressive nature at play in my life, seem to take mostly, if not exclusively, one of two specific forms: burying the past, and emphasizing my "virile" features to the detriment of my "feminine" ones. I don't mean to say that these two "forces", both repressive in nature (i.e., aimed at "repressing", at suppressing a certain reality), are the only ones that have "dominated my life"! To do so would be to forget the whole non-egotic aspect of my being, the drive for knowledge expressing itself at the level of the body as well as the mind. (On this subject, see

in particular "My passions", section n° 35.)

Even among the forces structuring the ego, emanating from the "boss", there is at least one which is not repressive in nature, which predates the forces of repression by far, and whose role in my life has been even more essential: identification with my father, who has been like "the peaceful and powerful heart" of the feeling of my own strength. This identification in no way exalted certain values or qualities (let's call them virile) to the detriment of others ("feminine"). Irrespective of the values my father professed, his personality (until 1933, when a shift took place in him<sup>37</sup> (\*)) was marked by a strong yin-yang balance, in which intuition and spontaneity were no less important than intellect and willpower.

Finally, another important "force" of an egotistical nature, intimately linked to repressive mechanisms (or, to put it better, of a "repressive" nature itself), is **vanity**, which has played as heavy a role in my life as in anyone else's. But this "force" is so universal in nature, as is the dominant role it plays in everyone's life (in more or less coarse or subtle form), that there's hardly any need to mention it. But this "force" is so universal in nature, just like the dominant role it plays in everyone's life (in a more or less coarse or subtle form), that there's hardly any point in expressly including it in a list of specific forms.

<sup>36</sup>(\*) (October 6) To tell the truth, the "secret desire" to which I've just put my finger, has not yet been consumed, even if it has been detected in the meantime (just a few years ago. . .), and is less all-consuming today than it was in the past.

<sup>37</sup>(\*) Remarkably, this "shift" in my father (then aged 43) was towards a **super-yin** state, towards a kind of pasha-like passivity, in close connivance with my mother, playing a super-yang role. She took charge of him instead of her children. (They were left to "profit and loss", at least until 1939, the year in which, under the pressure of events and against her will, she finally took me back to her... .) This relationship of dependence on my father, and the yin-yang role reversal between my parents, lasted until my father's death in 1942.

the forces and mechanisms that structure the ego and give it its particular physiognomy and foundation.

**Note 108** □(October 6) In this "deployment of force" there is no "aggressive" intention in the common sense p. 477 of the term, neither conscious nor unconscious, only an unconscious desire to impress, to force esteem. It's true that the term "forcing esteem", which comes back to me spontaneously, already carries a connotation of **constraint**, close to that of "aggression". This unconscious intention to coerce, also perceived at an unconscious level, must often be experienced as a kind of aggression (even though this experience remains hidden, as do the antagonistic reactions it triggers). At the same time, this experience must often be conflated with similar childhood experiences involving the father as the protagonist, where the latter appears as the main holder of repressive authority, or even as a crushing rival, envied and hated.

Even without such an amalgam, and independently of any perception in others of a "constraint" intention in me, there must often be the perception of a strong **imbalance**, a fundamental disharmony, in this exclusively yang "deployment of force" (in spirit and intention, at least). This excess is detrimental to the main person concerned, myself, and in fact "dangerous" to his very physical survival (as the health incidents of recent years have clearly shown me!). This is undoubtedly what I was thinking about when I wrote that "such a display of force" was felt "in any case to be dangerous" - dangerous "by nature", an example not to be followed... ! Surely such a feeling is enough to provoke "defensive reactions", even in the absence of any aggression or intention to aggress.

It's true that such relationships of ambiguity recurred after 1976, with some of my students in particular, at times when any mathematical investment was absent, and when there was no apparent "de- poyment of force" in my life. It's also true that the "deployments" in question in the **past** have created a **reputation**, which continues to stick to me, especially in my professional life, and which to some extent replaces the perception of who I am **in the present**. What's more, I've acquired such an ease in dealing with certain mathematical subjects that, even outside my mathematical periods and with the help of my reputation, this natural ease or mastery can already have the effect of a "deployment of force", on unmotivated students, and make them feel me to be (in spite of certain pleasant, even reassuring) as a kind of Superman (a little Superpère around the edges!).

□ Besides, as a flip side of the ease I'm talking about, I often tend to underestimate the difficulty that This tends to place them at odds with my expectations. (On this subject, see the note "Failed teaching (1)", n° 23 iv.) Such a situation must quite often be one of the important ingredients of a false relationship. to the father... p. 478

### 18.2.2.3. (c) The reunion (the awakening of yin(1))

**Note 109** (October 9) Four days ago, as I finished my previous note<sup>38</sup> (\*), I felt very happy. I found myself unexpectedly reconnecting with an intuition that came to me on a certain Sunday, October 17, 1976 (eight years ago, give or take a few days) - the intuition of the devastating effect, in my life as well as in my mother's, of a "certain force" within me. It was the first time in my life that I had given any thought, however brief, to what my life, and above all my childhood, had been like. It was also the day after

---

<sup>38</sup>(\*) See note "Yang buries yin - or the Superfather", n° 108.

of the day I had discovered the power of meditation<sup>39</sup> (\*\*), and it was the first time since then that I had made use of this power, so long ignored. It was not by design, but by the effect of a profound impulse, as if moved by a very sure instinct, that the reflection that day ended up being directed towards my childhood. Only in retrospect can I appreciate the extent to which it was the source of my true strength, as well as of the conflict and division within me, that a deep need to know had carried me to that point. For almost three years, I would not return to it, distracted as I was by the "order of the day", without realizing that I remained on the periphery of the conflict in my life, while stubbornly staying away from the heart of it: from that childhood drowned in mists, which seemed so infinitely far away... .

p. 479 I've just gone through again, "diagonally", the eighteen exceptionally dense leaves of this crucial meditation in my life. It was during the night that followed this meditation, or rather in the early hours of the morning after this night of meditation, that I had a dream of shattering force - the first dream of my life too, whose message I probed passionately. I was no more aware then of where I was going and what was happening, than I had been the day before when I was "discovering meditation". Du□rant four hours I delved into the meaning of this experience, this dream-parable, through successive layers of increasingly burning meaning, before arriving at the heart of the message, its simple and obvious meaning.
